4. Hardware: Stainless steel hardware for screens and associated fasteners.
5. Provide openings in stator endplates with access covers for checking motor air gap.

2.4 ACCESSORIES

A. Connection Box:

1. Cast or fabricated steel connection box.
2. Fabricated steel connection boxes shall have hinged covers secured by knurled screws.
3. Gasketed and provisions for grounding.

B. Main Terminal Boxes:

1. Size:
   a. For three main leads, incoming cable glands, and accessories.
   b. To accommodate components and accept power supply conductors, all per NEMA requirements.
2. Construction comparable with degree of enclosure indicated for motor itself.
3. Allot space for mounting of auxiliary devices such as stress cones.

C. Equipment Grounding Lugs: Provide within main terminal box, suitable to terminate equipment ground wire, sized as indicated. Ground path shall be direct to stator frame.

D. Auxiliary Terminal Boxes:

1. Provide separate boxes for termination of space heaters, stator and bearing RTD or thermocouple leads, vibration probe leads, and other factory-mounted instrumentation.
2. Space heater terminations shall be in a terminal box that is separate from control signal terminations.
3. Wire devices to auxiliary terminal boxes and terminate on suitable terminal blocks.

E. Space Heaters:

1. Provide to keep motor windings at least 5 degrees C to 10 degrees C above dew point during de-energized conditions.
2. Grid type in base of stator with easy access for maintenance.
3. Rated for 240V ac, single-phase power, but suitable for use on 120V ac, single-phase power.
4. Prewired to terminal junction box mounted on motor.
5. Provide warning label on space heater junction box and motor indicating space heater wiring is energized when motor is not running.

F. Equipment Identification Plates: Provide 16-gauge Type 316 stainless steel identification plate securely mounted on each separate equipment component in a readily visible location. Plate shall bear 1/4-inch high engraved or die-stamped block type black enamel filled equipment identification number and letters indicated in this Specification and as shown.

G. Frame Grounding Pads: Provide two stainless steel faced grounding pads and locate on opposite sides of motor frame diagonally apart. Grounding pads shall feature a tapped 1/2-inch national coarse (NC) thread drilling into motor frame.

H. Lifting Lugs: Provide suitably attached for equipment assemblies and components weighing over 100 pounds.

2.5 MOTOR BEARINGS

A. Bearings shall conform to provisions of driven equipment Specification, except as supplemented or modified by requirements of this Specification. Antifriction bearings shall be used for vertical machines provided the following conditions are met:

1. dN factor is less than 300,000.
2. Antifriction bearings meet ABMA L10 rating life of 100,000 hours with continuous operation at rated conditions or 50,000 hours at maximum axial and radial loads and rated speed.
3. Antifriction thrust bearings for vertical machines shall be rated for ABMA L10 life of 5,000 hours.

B. Vertical Motor Thrust Bearings:

1. Provide plate type, load-equalizing, thrust bearings located in oil reservoir at top of motor frame. Bearings shall be Kingsbury, Renk, or Waukesha.
2. Bearing Capacity: Rated for weight of pump motor rotating assembly plus maximum hydraulic down-thrust developed by pump. Capable of

operating at this rating in either direction of rotation up to runaway speed.

3. Up-thrust Capacity: As required for any operating condition.
4. Oil Lubrication System:
    a. Self-contained and self-circulating.
    b. Oil Reservoir:
        1) Cooling Coils:
            a) Sized to maintain a 40 degrees C, maximum, oil temperature rise.
            b) 90/10 Cu-Ni tube.
            c) Design for 30 degrees C, inlet water at 50 psig, and 0.001 fouling factor.
            d) 90/10 Cu-Ni threaded pipe connections.
        2) Contain an RTD to sense oil temperature.
        3) Water-cooling shall only be used with approval of Engineer.
5. Provide oil level sight glass, and threaded oil fill and drain plugs.
6. High Pressure Lift System:
    a. Provide where required to pressurize thrust bearing at startup and shutdown to reduce starting torque and minimize bearing wear.
    b. Mount oil pump, circulating piping and associated components on motor.
    c. Energize prior to motor start and stop end run for an adjustable time period.
    d. Operation of pumping unit without lift system shall not damage thrust bearing.
    e. Oil Pump: Three-phase, 460-volt, 60-Hz, no greater than 3 hp.
7. Thrust Bearing Temperature Elements:
    a. Provide each bearing with two 100-ohm platinum RTD each which shall be prewired to a terminal junction box mounted on motor.
    b. Elements shall be installed in two opposite thrust shoes of thrust bearing.
    c. Metal of bearings and mountings shall be drilled, milled, and tapped to place element at hottest points of bearings and within 1/16 inch of bearing metal.

C. Vertical Motor Guide Bearings:

1. Upper Guide Bearing: Sleeve type lubricated by oil in reservoir for thrust bearing.

2. Lower Guide Bearing: Split sleeve type with oil reservoir, oil level sight glass, and threaded oil fill and drain plugs. Lubrication system shall be self-contained and self-circulating.

3. Upper and lower bearings shall have spring-loaded RTDs to sense bearing metal temperature.

D. Hydrodynamic Radial Bearing Temperature: 93 degrees C, maximum.

E. Bearing Insulation: Electrically insulated in a manner to prevent circulating currents from passing through bearing surfaces. Provide grounding device in bearing housing on drive end.

2.6 VIBRATION MONITORING

A. Provide transducers and cables for each medium voltage induction motor, for installation into the vibration monitoring panel. See Section 26 09 13.

B. Vibration Transducers:

1. Timing Transducer:
   a. Consisting of a Bently Nevada Corporation Proximity Probe, calibrated extension cable, and Proximitor Sensor.
   b. Provide Keyphasor timing probe for motors; Bently Nevada Corporation Series 3300 XL 8mm radial Proximity Probe similar to radial vibration transducers permanently installed by motor manufacturer. Probe shall contain a minimum 8-millimeter tip diameter mounted in a 0.375-inch by 24 threads per inch stainless body.
   c. Proximitor Sensor: Bently Nevada Corporation Series 3300 XL Proximitor Sensor, linear range from 10 mils to 90 mils, plus or minus 6.5 percent accuracy.
   d. Cable: Bently Nevada Corporation Series 3300 XL Extension Cable, 75 Ω, 69.9 pF/m shielded, triaxial.
   e. Elements shall be fully protected in sealed weatherproof conduit and housings.
2. Radial Shaft Vibration Transducers:
   a. Each transducer shall consist of a Bently Nevada Corporation Series 3300 XL 8mm Proximity Probe, calibrated extension cable, and Proximitor Sensor.
   b. Provide permanently installed radial shaft displacement proximity probes on motors with sleeve bearings.
   c. Use Orthogonal X-Y Bently Nevada Corporation Series 3300 XL Proximity Probes at each radial bearing housing.
   d. Mount probes at plus or minus 45 degrees from true vertical centerline.
   e. Probes to contain a minimum 8-millimeter tip diameter mounted in a 0.375-inch by 24 threads per inch stainless steel body.
   f. Proximitor Sensor: Bently Nevada Corporation Series 3300 XL Proximitor Sensor, linear range from 10 mils to 90 mils, plus or minus 6.5 percent accuracy.
   g. Cable: Bently Nevada Corporation Series 3300 XL Extension Cable, 75 Ω, 69.9 pF/m shielded, triaxial.

h. Elements shall be fully protected in sealed weatherproof conduit and housings.

3. Bearing Housing Velocity Transducers:
   a. Use antifriction bearings and bearing housing velocity transducers permanently installed by motor manufacturer.
   b. Locate transducers at each bearing, measuring in axial, horizontal direction.
   c. Minimum rated operating frequency shall be less than minimum motor operating speed.
   d. Vibration element shall include shielded signal cable and enclosed in a NEMA 4X housing.
   e. Manufacturer and Product: Bently Nevada Corporation; Velomitor, piezo-velocity sensor.
4. Thrust Position Transducer:
   a. Each transducer shall consist of a Bently Nevada Corporation Series 3300 XL 8mm Proximity Probe, calibrated extension cable, and Proximitor Sensor.
   b. Use vertical synchronous motors, permanently installed axial shaft displacement proximity probes.
   c. Probes shall observe thrust collar or top end of shaft.
   d. Probes shall contain a minimum 8-millimeter tip diameter mounted in a 0.375-inch by 24 threads per inch stainless steel body.
   e. Proximitor Sensor: Bently Nevada Corporation Series 3300 XL Proximitor Sensor, linear range from 10 mils to 90 mils, plus or minus 6.5 percent accuracy.
   f. Cable: Bently Nevada Corporation Series 3300 XL Extension Cable, 75 Ω, 69.9 pF/m shielded, triaxial.
   g. Elements external to motor enclosure shall be fully protected in sealed weatherproof conduit and housings.
   h. Manufacturer and Product: Bently Nevada Corporation; Series 3300 series probes or latest model at each thrust bearing.
5. Motor Casing Velocity Transducers:
   a. For vertical motors over 250 horsepower, permanently installed velocity transducers.
   b. Each element shall be a velocity transducer with a velocity output in IPS RMS.
   c. Minimum rated operating frequency shall be less than minimum pump operating speed.
   d. Vibration element shall include shielded signal cable and enclosed in NEMA 4X housing.
6. Vibration transducer and timing transducer shall be prewired to terminal junction box mounted on motor.
7. Provide cables with transducers or as required by manufacturer.

2.7 MOTOR TEMPERATURE DETECTION

A. RTDs:

1. 100 ohm, 3 wire, platinum, and prewired to terminal junction box mounted on motor base.
2. Provide two bearing RTDs (one per bearing) and six stator winding RTDs (two per phase).
3. For motors with thrust bearings, provide two RTDs per thrust bearing.
4. For water-cooled motors, provide one air circuit RTD.

2.8 FACTORY TESTING

A. General:

1. Factory test motors in conformance with IEEE 112, IEEE 43, and NEMA MG 1.
2. Notify Engineer a minimum of 5 weeks prior to test.
3. No equipment shall be shipped until Engineer has approved test data.
4. Witnessed by Engineer and Owner's Representative.
5. Acceptance:
   a. In the event motor fails to meet above requirements or efficiencies make necessary modifications, repairs, or replace entire motor.
   b. Retest motor until found satisfactory.
6. Test Reports:
   a. Include documentation and results.
   b. Indicate test procedure and instrumentation used to measure and record data.
   c. Certified, signed, and dated by motor manufacturer's test personnel and responsible engineers.

B. Tests:

1. Routine:
   a. Measurement of winding resistance.
   b. No-load motoring readings of current, power, and speed at rated voltage and frequency.
   c. Measure and record air gap during assembly.
   d. Visually inspect bearing and bearing insulation.
   e. High potential test in accordance with NEMA MG 1-20.17.
2. Surge: Test stator coils individually after insertion into stator core, but prior to coil-to-coil connection, to ensure no turn-to-turn shorts. Repeat surge test after coil-to-coil connections are complete.
3. High Potential: High pot stator coils individually after insertion into stator core, but prior to coil-to-coil connection, to ensure no turn-to-turn shorts. Repeat high potential test after all coil-to-coil connections are complete.

4. Efficiency and Loss: Use any IEEE 112 Method B only. Included the following in determining efficiency per NEMA MG 1–20.21.
    a. Stator I^2R.
    b. Rotor I^2R.
    c. Core loss.
    d. Stray load losses.
    e. Friction and windage loss.
5. Phase Rotation:
    a. Apply phase sequence as called for on outline drawing and check for correct direction of rotation.
    b. Record direction of rotation and phase sequence.
6. Temperature:
    a. Perform heat run tests on motors via embedded detector, using either of the IEEE 112 8.2.3 methods of loading.
    b. Record stator and bearing temperatures every 30 minutes until machine reaches constant temperature.
    c. Determine temperature rise for service factor loading.
7. Blocked Rotor Test: With rotor blocked, take the following readings at highest voltage possible: line voltage, current, kW, torque, and induced field current.
8. Noise:
    a. In accordance with NEMA MG 1, Part 9.
    b. Mean A-weighted sound pressure level measured at one meter from major machine surface shall not exceed 85 dB (A) with motor operating at no-load, and rated frequency and voltage applied.
9. Vibration:
    a. Radial Shaft at Full Operating Speed: 2.0 mils peak-to-peak, maximum.
    b. Take vibration data at cold and hot operating conditions, at no-load during factory testing.
    c. Transient Shaft Vibration: 3.5 mils peak-to-peak, maximum, throughout normal startup and shutdown speed range.
    d. Values shall include shaft surface runout sensed by probes.
    e. Bearing Housing Vibration:
        1) At full operating speed shall be 0.15 inches per second (RMS), maximum.
        2) Take vibration data at cold and hot conditions, at no-load.
        3) Transient Vibration: 0.5 IPS RMS, maximum, throughout normal startup and shutdown speed range.
    f. Vibration Frequency:
        1) Record during vibration testing at cold and hot conditions.
        2) Record frequencies up to seven times line frequency.
        3) When operated uncoupled at rated speed, machinery shall not exhibit unusual or abnormal frequency components on either shaft or casing vibration measurements.

4) Normal frequency components are defined as excitations such as rotational speed, synchronous and multiples of synchronous frequency, or blade passing frequency that are inherent with mechanical construction of machinery.
5) Unusual or abnormal frequency components are excitations that are nonsynchronous or not related to known geometry of machinery.

10. Starting Characteristics: Determine speed-torque characteristics using any of the four IEEE 112-7.3.2 recommended methods.
11. Final Factory AC High Potential Test:
    a. Perform after above tests are completed to assure no damage to insulation during setup and testing.
    b. Apply 1,000 volts plus twice rated machine voltage across stator insulation and 2,500 volts across rotor insulation for one minute, per NEMA MG 1, Part 3.
12. Final Insulation Resistance: Take reading of armature insulation with mega-ohmmeter for one minute after high potential test has been completed.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install in accordance with motor manufacturer's written recommendations and written requirements of manufacturer of driven equipment.

B. Perform electrical work involving connections, controls, and switches in accordance with the applicable Sections of Division 26.

3.2 FIELD TESTING

A. Functional Tests: Perform the following prior to connection to driven equipment:

1. Check electrical supply at motor feeder cable terminations for any deviation from rated voltage, phase, or frequency.
2. Visually inspect motor mounting and coupling to driven equipment.
3. Visually check for proper phase and ground connections. Verify multi-voltage motors are connected for proper voltage.
4. Test insulation of all winding and bearing temperature detectors and space heaters.
5. Bump motor to test for proper rotation.
6. Test motor insulation in accordance with NEMA MG 1.
7. Take vibration data at no-load and maximum available load.
   Test motors for proper noise, temperature, and vibratory behavior following no less than 4 hours at maximum available load and full operating speed. Noise and vibration limits used for factory testing with

temporary machinery support shall also be applicable to field testing condition with proper rigid support structure below machinery.

END OF SECTION

SECTION 26 19 23
MEDIUM-VOLTAGE ADJUSTABLE FREQUENCY DRIVE SYSTEM

PART 1 GENERAL

1.1 SUMMARY

A. The Sub-supplier shall provide five 1,500 hp, air-cooled, active front end (AFE), pulse width modulated (PWM) variable frequency drive (VFD) units, designed, manufactured, assembled and tested to operate and be fully compatible with the specified induction motors and pumps. Each VFD shall power two 750 hp induction pump motors and operate both at same speed with same VFD output. Each VFD shall consist of an integral lineup of all the components listed herein and shall not exceed 236 inches wide, 50 inches deep, and 120 inches high (assembled). The VFD shipping height shall not exceed 104 inches. Liquid-cooled VFDs will be considered provided they are supplied with the liquid-to-air heat exchanger as an integral part of the VFD and require no external cooling water or air connection other than those described herein. The dimensions of the VFD and integral heat exchanger, including any required clearance between the two shall not exceed the above dimensions, no exceptions.

B. The variable frequency drives shall be furnished by the Supplier, as specified in Section 43 23 15, for unit responsibility.

C. Each variable frequency drive shall be manufactured, assembled and tested by the Sub-supplier at a facility owned or operated by the Sub-supplier, and under its direct supervision and control.

D. The Supplier shall coordinate and provide for all requirements and features of the induction motor with the VFD Sub-supplier.

1.2 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Commercial Standards:
   1. American National Standards Institute/National Fire Protection Association (ANSI/NFPA): 70, National Electrical Code (NEC).
   2. Institute of Electrical and Electronics Engineers (IEEE): 519, Recommended Practice and Requirements for Harmonic Control in Electrical Power Systems.
   3. National Electrical Manufacturers Association (NEMA): ICS 7, Industrial Control and System – Adjustable Speed Drives.
   4. Underwriters Laboratories (UL):
      a. 347 High Voltage Industrial Control Equipment

b. 347A Medium Voltage Power Conversion Equipment Preliminary Standard

1.3 SUBMITTALS

A. Action Submittals:

1. Preliminary harmonic analysis described in Article 2.2, Paragraph C, Item 2, Subitem b.
2. Record of calculations and measurements per Article 2.2, Paragraph C, Item 1 for VFD efficiencies at 60 and 100 percent speed.
3. Maximum continuous current and fault current withstand ratings of drive.
4. Complete outline description of proposed factory test procedure and sketch of test setup.
5. Harmonic analysis and results.
6. VFD output pulse maximum peak voltage, pulse rise time and pulse rate of rise. Include motor Sub-supplier certification that motor insulation shall operate continuously from the VFD output waveform throughout the specified speed range without overheating.
7. Complete system rating, including all nameplate data, continuous operation load capability throughout speed range of 10 percent to 100 percent rated speed.
8. Complete unit lineup dimensional drawings, weight, and information on size and location of space for incoming and outgoing power and control cables or conduit.
9. Maximum heat dissipation from enclosure, exhaust air flow requirements, location and dimensions of exhaust duct interface opening(s).
10. Layout of controller section face showing pushbuttons, switches, instruments, indicating lights, HMI display unit, etc.
11. Complete system operating description.
12. Complete system schematic (elementary) wiring diagrams, single and three line diagrams.
13. Complete system interconnection diagrams between controller, drive motor, pump, and all related components or controls external to system, including wire numbers and terminal board point identification.
14. One-line diagram of system, including component ratings.
15. Description of diagnostic features being provided.
16. Descriptive literature for all control devices such as relays, timers, etc.
17. Itemized bill-of-materials listing all system components.
18. Description of PLC, HMI, and motor protection relay being furnished, including a description of the equipment, installation, setup, and operations manuals.
19. Annotated and cross-referenced PLC and HMI program printout.

B. Informational Submittals:

1. Listing of references.

2. Operations and Maintenance Data per Section 01 78 23, Operation and Maintenance Data.
3. Warranty: The VFD warranty shall be per the General Conditions and shall include all costs for repair, parts, labor, and travel and living expenses for service technician.
4. List of spare parts: A complete list of recommended spare parts. Include item descriptions, recommended quantities, and unit costs. The recommended list should be based on a maintenance plan where the Owner will remove and replace failed items to the lowest replaceable module/component level.
5. Test Reports: Provide copies in triplicate of the required factory testing. Reports shall be certified by the VFD test technician.

1.4 EXTRA MATERIALS

A. Spare Parts: Furnish the following spare parts for each VFD:
1. Two power modules (Cells) or 20 percent, whichever is greater, with accompanying printed circuit boards.
2. Five spare LEDs of each type used.
3. Three spare fuses of each type used.
4. Two spare control relays of each type used.
5. Two spare sets of all replacement air filters.
6. One hoisting mechanism for removal and replacement of cells, if required.

1.5 QUALITY ASSURANCE

A. All inspection and testing procedures shall be developed and controlled under the guidelines of the supplier's quality system and must be registered to ISO 9001 and regularly reviewed and audited by a third party registrar.

B. The VFD shall be factory pre-wired, assembled and tested as a complete package.

C. The VFD manufacturer shall:
1. Have experience in the manufacture of medium voltage variable frequency drives for use in similar applications at the specified voltage and power ratings. A user list, complete with contact names and telephone numbers, shall be furnished upon request.
2. Have a record of service and own and operated factory-trained and authorized service facilities located within the United States. Support personnel shall be direct employees of the manufacturer.

1.6 SERVICES OF MANUFACTURER

A. Services of the manufacturer shall be provided as follows:

1. Inspection, startup and field adjustment: An authorized service representative of the manufacturer shall visit the site for not less than one day per drive system to check the installation, supervise start-up, and supervise testing and adjustment of VFDs.
2. Instruction of Owner's personnel: The authorized service representative shall instruct the Owner's personnel in the skills required for each Trade Group indicated and the duration indicated. This includes all aspects of drive operation and maintenance, including step-by-step troubleshooting procedures with necessary test equipment. Instruction of the Owner's personnel shall be conducted separate from the start-up and testing activities. Each of the Owners Trade Groups will be instructed individually, and no more than six hours will be scheduled in one day. Duration of instruction are:

Trade Group	**Class Hours**	**Field Hours**
Electricians and Electronics Technicians	4	4
Operations and Plant Maintenance Technicians	4	4

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Products of the type or model number indicated shall be manufactured by one of the following:
   1. TMEIC Corporation.
   2. ABB Automation, Inc.
   3. General Electric
   4. Rockwell Automation/Allen-Bradley.
   5. Eaton
   6. Or equal.

2.2 VARIABLE FREQUENCY DRIVES

A. General:
   1. Number of Drive Units: 5.
   2. Driven Equipment: Vertical Pump driven by an induction motor.
   3. Input Voltage: 4,160 volts, three-phase, 60-Hz.
   4. Drive Output Voltage: 0 to 4,160 volts (4,000-volt motor).

B. Service Conditions: The VFD shall be designed, manufactured, assembled and tested to operate within the following service conditions:
   1. Elevation: 0 feet to 3,300 feet, msl.
   2. Ambient Temperature Range: 0 degrees C to 40 degrees C.
   3. Atmosphere: Noncondensing relative humidity to 95 percent.
   4. AC Line Voltage Variation: Minus 5 percent to plus 10 percent.
   5. AC Line Frequency Variation: Plus or minus 3-Hz.

C. Operating Conditions:
   1. Minimum guaranteed VFD system efficiency shall be 95 percent at 100 percent speed and 100 percent torque and 87 percent at 60 percent speed based on nominal 1200-rpm motor with load horsepower to vary as the cube of speed. The measured VFD system efficiency shall include the active front end filter, VFD power section, all auxiliary cooling systems and output filter. The overall VFD system efficiency may be calculated based on measured VFD efficiency and calculated impact of 480 volt auxiliary loads.
   2. Total harmonic distortion with filtration shall be not more than five percent for voltage and as listed in table below for current as measured on the 4,160-volt bus at the 01-MSG-01 main switchgear (point of common coupling) in accordance with IEEE 519. Harmonic distortion shall also be calculated and measured when two, three and four VFDs are operating at full load.

Table 1	
Individual Harmonic Order (Odd Harmonics)	Harmonic Current Distortion Percent of Max. Demand Load Current I_L
h < 11	4.0
11 < h < 17	2.0
17 < h < 23	1.5
23 < h < 35	0.6
35 < h	0.3
Total Demand Distortion (TDD)	5.0

      a. The short circuit current at point of common coupling under utility operation will be 20,000-amps, rms at 4.16-kV, three-phase. This value shall be used in the harmonic calculations.
      b. A preliminary harmonic analysis shall be submitted which includes all voltage and current harmonics up to the 49th calculated with four VFDs operating at full load rating.
      c. Compliance will be verified with onsite field measurements of both the voltage and current harmonic distortion at the defined point of common coupling with (to measure the harmonic

contribution of the VFDs) and without (to measure the background harmonics) the VFDs operating.

d. The VFD shall not produce harmonics within the operating speed range that will excite the motor resulting in excessive vibration.

3. The VFD shall at no time experience any overcurrent during start-up and at any time while operating. All components shall be properly sized to avoid any premature VFD break down.
4. The maximum audible noise from the VFD shall comply with OSHA Standard 3074, Hearing Conservation, which limits noise level to 85 dB(A) at a distance of one meter from the front of the equipment (with doors closed at any speed or load condition).

2.3 GENERAL

A. VFD shall consist of the following:
1. Primary power cable termination section.
2. Medium voltage surge arresters.
3. Input disconnect switch.
4. Isolation contactor.
5. Active front end rectifier (PWM converter).
6. DC bus link with reactors (if required).
7. PWM output inverter.
8. Control logic section.
9. Motor protection relays for each motor powered from the VFD.
10. Output filter (if required to limit the output dv/dt to a value less than the voltage rating of the motor insulation).
11. Motor heater control.
12. Panel shall contain motor protection relays, auxiliary power sources, human-machine interface (HMI), and a programmable logic controller (PLC). VFD shall be capable of orderly shutdown and 3 seconds power dip ride through without the use of a UPS.
13. All components listed shall be integral to the VFD lineup, factory wired and tested as a complete system.

B. The motor shall be a squirrel cage inverter duty induction design in accordance with Section 26 19 00. The VFD shall be designed such that no component shall overheat and fail during start-up and shutdown and during prolonged and continuous operation of the pump. The VFD shall be rated for continuous operation at motor nameplate FLA and at no less than 110 percent of the nameplate FLA for 60 seconds for the actual motor being supplied, and 100 percent speed.

C. Construction:
1. The input section shall contain a suitably rated, load-break disconnect switch with current-limiting, solid material power fuses, interlocked with

the door. For safety, blade position shall be visible through the door. Interlock shall be provided with a defeater. The fused switch shall have a minimum short circuit interrupting capacity of 50-kA rms symmetrical. Incoming medium voltage cable terminations shall be located in this section and shall be suitable for bottom entry. NEMA 2-hole drilled bus termination pads shall be available to terminate power cables. Termination points higher than three feet above the floor shall require extra incoming cable support to maintain spacing and short-circuit withstand capability.

2. Each VFD shall be supplied with an active front end (AFE) rectifier. The VFD system shall have an AFE rectifier to ensure dramatically lower line-side harmonics and near-unity power factor. Symmetrical Gate Commutated Thyristers (SGCTs) or Insulated Gate Bipolar Transistors (IGBTs) shall be used in the rectifier.
3. The output of the converter shall feed a dc link. dc link reactors shall be provided in positive and negative busses if required. The output of the converter/inductor combination current source shall be regulated and limited. The converter shall be sufficiently fast and effective to protect against a sudden or random application of a short circuit to the output terminals.
4. The PWM inverter section shall utilize the same SGCT or IGBT devices as the converter and invert the dc power of the current source to adjustable frequency power to the motors. The VFD shall not induce excessive power losses in the motors. The worst case rms motor line current measured at rated speed, torque, and voltage shall not exceed 1.03 times the rated rms motor current for pure sine wave operation. Voltage waveform dV/dt applied to motor shall not produce standing waves or overvoltage conditions requiring nonstandard motor insulation systems or ratings above the VFD output voltage rating. VFD output waveform shall be suitable for operating a squirrel cage induction motor without derating or requiring additional service factor for motor cable distances that may exceed 500 feet. VFD output waveforms shall be coordinated with motor design to allow motor to operate within all specified temperature limits between 10 percent and 100 percent speed regardless of loading. If an additional dv/dt or sinewave filter is required, it shall be included within the VFD.
5. The VFD output shall produce no electrically induced pulsating torques to the output shaft of the mechanical system, eliminating the possibility of exciting a resonance caused by VFD-induced torque pulsations. The VFD Sub-supplier shall supply all data required by the Supplier to perform the torsional analysis. The VFD shall not cause micro-pitting of the motor shaft.
6. The control logic section shall be fully digital and not require analog adjustment pots or fixed selector resistors.

7. Fault log data storage memory shall be powered from a rechargeable source furnished with the VFD and with at least a 6-day capability or shall be nonvolatile EEPROM memory.
8. Medium voltage cables and components shall be isolated in separate compartments from the low voltage components. Sufficient space for power cable entry and termination shall be provided, all in accordance with NEC requirements.
9. VFD control power shall be from a separate external 480-volt, three-phase, 20-amp circuit. Provide a red nameplate "Warning, VFD has two sources of power: 4160V from 010MSG-01 breaker #X and 480V from Panel PP1-X,X,X". Provide fused 120-volt control transformer for control power requirements of the VFD.
10. The VFD inverter and rectifier devices shall be capable of being replaced within thirty minutes by a single plant technician without the need for any special tools or devices.

D. Basic Features: The VFD controller shall have the following basic features:
1. Speed Profile: Individual adjustable settings for start, stop, entry, slope, and minimum and maximum speed points. The maximum and minimum speed set points for each VFD shall be preset to the values specified in Section 43 23 15. Drives shall include "Critical Frequency Avoidance" logic. Initial acceleration setting shall be from zero to minimum speed in 15 seconds, and from minimum to maximum speed at a rate of no more than a flow increase rate of cfs per minute. The deceleration rate shall be no more than a flow decrease rate of cfs per minute.
2. Provide for an external 4 mA to 20 mA dc speed reference input signal. Provide a signal current isolator to ensure signal and galvanic isolation of the grounded or ungrounded input speed reference signal.
3. Status and alarm outputs each shall be SPDT electrically isolated auxiliary contacts rated 5 amps at 120V ac, 60-Hz.
    a. Alarm outputs shall consist of two separate outputs; VFD fault, and motor fault, which shall be wired together into a common "FAIL" alarm output for each fault. VFD fault outputs shall be activated by any of the following, as a minimum and shall be displayed on the operator terminal on the door of the VFD:
        1) Output or input under-voltage or over-voltage.
        2) Power unit over-temperature.
        3) Instantaneous overcurrent.
        4) Commutation failure (if applicable).
        5) Input power loss of phase.
        6) VFD output short circuit.
        7) Control power failure.

4. Motor fault outputs shall be activated by any of the following as a minimum and shall be displayed on the operator terminal on the door of the VFD:
    a. Motor short circuit.
    b. Motor overload.
    c. Motor ground fault.
    d. Motor over voltage.
    e. Motor over frequency.
    f. Motor phase reversal.
    g. Motor current unbalance.
5. Separate pump/motor high vibration shutdown input contacts from the remote vibration monitoring panel shall cause a normal VFD vibration shutdown and output to the PCM.
6. Separate temperature alarm outputs shall be provided for each pump/motor powered by the VFD and shall be displayed on the operator terminal or motor protection relay on the door of the VFD. Temperature alarm outputs shall include:
    a. Motor winding high temperature.
    b. Motor or pump bearing high temperature.
7. VFD and motor failure alarms shall normally latch in the trip mode and shall require an operator intervention to reset the alarms. An exception to this requirement are utility overvoltage, undervoltage or voltage failure alarms. These alarms shall automatically reset at the motor control and allow the operator to manually restart the pump after an adjustable 0-minute to 60-minute delay period after the alarm occurs and resets. If the alarm condition still exists, the pump shall not restart.
8. Normal and emergency shutdown contacts, each consisting of a remote contact closure rated 5-amp at 120V ac maximum shall be inputs to the VFD.
9. Provide the opening of the normal shutdown input contact via either the local panel mounted switch or through the PCM. Opening shall cause the motor speed to ramp down to zero speed by a controlled deceleration.
10. Provide opening of the emergency shutdown input contact, via either the local panel mounted switch or remote E-stop. Opening shall cause the VFD to be immediately de-energized. The motor shall continue to spin forward dissipating its inertia until the motor comes to a complete stop. The check valve shall completely close as the flow reverses.
11. Startup of the VFD shall be accomplished by the following procedure:
    a. The operator shall manually reset any alarms or failures pertaining to the VFD control system. Each pump shall be started locally at the VFD panel. When the HAND/OFF/REMOTE (H/O/R) selector switch, located on the local VFD panel, is selected to the HAND position and the operator activates the local START pushbutton, the pump VFD start sequence shall begin. A run permissive must

then be received from the Pump Station Master PLC. This permissive shall allow that VFD to be capable of starting. The pump shall start and begin to automatically ramp up to the minimum speed. If a low system differential pressure is sensed at the Pump Station Master PLC, a second control signal requiring throttling of the pump control valve will be sent to the VFD PLC. If this second control signal is received, the VFD PLC shall reference a preset differential pressure set point (30-feet of pressure) for the differential pressure controller of the pump control valve. The pump control valve shall open normally, except it will throttle its position to maintain a minimum of 30-feet of differential pressure across the pump control valve. As the pump control valve moves to its differential pressure set point, the pump VFD shall ramp up to maintain the flow set point provided by the Pump Station Master PLC. If two pumps are brought on-line with a required throttling signal from the Master PLC, the differential pressure set point across the pump control valves shall be 20-feet. If the low system differential head permissive is not required, the pump control valve differential pressure set point shall be 0 feet of differential, which shall move the pump control valve to a fully open position. Each pump shall be started manually, one at a time, in the MANUAL mode.

b. The speed of the pump shall be adjusted manually at the VFD panel when the MANUAL/REMOTE speed control selector switch is in the MANUAL position.

c. The pump can be manually shutdown, in a normal condition, by the operator pushing the STOP pushbutton, located on the VFD panel or by selecting the OFF position on the H/O/R switch. The pump shall ramp down to minimum speed and then shutdown.

d. In the event an emergency occurs, the pumps shall be shutdown by placing the EMERGENCY STOP mushroom style pushbutton switch, located on the local VFD panel, in the depressed position. The appropriate pumps shall immediately power down. The motors shall continue to spin forward dissipating its inertia until the motors come to a complete stop. The check valve shall completely close as the flow in the pump discharge line reverses.

e. The pump can be started remotely from the workstations by selecting the REMOTE position on the H/O/R selector switch. The PCM will provide a normally-open start contact to start the VFD. Upon closure of the contact, the VFD shall ramp up to minimum speed and then adjust output speed corresponding to the 4-20mA speed command input from the PCM.

12. Provide adjustable minimum to maximum frequency limits of 6-Hz to 60-Hz. The VFD shall be provided with a frequency limit stop to insure that the motor horsepower is not exceeded.
13. Provide independent, timed linear acceleration and deceleration functions, adjustable from 360 seconds to 700 seconds.
14. Provide terminal blocks for wires entering and leaving the VFD unit. Terminals shall be identified with alpha-numeric characters identical to the terminal identifiers indicated on the schematic and connection diagrams.
15. Provide drive control circuitry to energize both motor space heaters from an internally generated 120 volt power source whenever the motors are not running.
16. Frequency regulator shall operate within the following tolerances:
    a. Frequency regulator span shall be 4 mA at minimum speed and 20 mA at maximum speed.
    b. Frequency regulator accuracy shall be within 1.0 percent of span.
    c. Frequency regulator deadband shall be within 0.5 percent of span.
    d. Frequency regulator repeatability shall be within 0.5 percent of span.
    e. Frequency reference signal input resistance shall be no more than 550 ohms.

2.4 ENCLOSURE

A. The enclosure shall be a dead-front, freestanding assembly with cabinet base and maximum dimensions as indicated. Maximum height of any door mounted switch or indicator shall be 72 inches above the bottom of the VFD enclosure. Doors shall be minimum 12-gauge sheet steel. Removable lifting angles shall be provided.

B. The enclosure shall be NEMA 1 for an indoor application with gasketed doors and door openings. The enclosure shall be front access only. No rear or side access shall be required. The rear panel cover shall not be used for mounting of internal equipment. The enclosure shall be suitable for bottom cable entry and exit.

C. All VFD components, including input switch/compartment, cooling equipment, DC link, PLC, and motor protection relay shall be mounted and wired in a grounded continuous, multi-section enclosure meeting the following requirements without exception:
    1. Power conversion and auxiliary equipment enclosure sections shall be NEMA 1 design.
    2. All power conductors (bus or cable) shall be insulated, except the bus that is not accessible from VFD cabinet doors.
    3. All wiring shall be located internally within the VFD enclosure.

4. It shall be the responsibility of the Sub-supplier to provide all cooling or heating equipment for the internal components of the VFD in order for it to operate satisfactorily without breakdown per the Service Conditions herein.
5. VFDs shall be furnished with redundant cooling fans (complete with motor starters), and shall be capable of operating at full load with one cooling fan out of service. Automatic switchover controls shall be provided for redundant cooling fans.
6. Ventilation exhaust from each of the VFD cabinet sections shall be ducted to adapt to one common connecting duct, installed by the Installing Contractor, from an outlet at the top of each VFD enclosure. Cooling fans shall be designed to produce the required airflow against internal static pressure. External static pressure shall be negated by the exhaust fan as shown on the drawings.
7. Maximum door swing clearance shall not exceed 36 inches.
8. Enclosure shall be painted manufacturer's standard color and painting system.

2.5 PROTECTIVE FEATURES AND CIRCUITS

A. The controller shall include the following protective features:
1. Static instantaneous overcurrent and overvoltage trip.
2. Phase sequence detector and undervoltage protection.
3. Power unit over-temperature protection.
4. Electronic, motor inverse time, overload protection.
5. Responsive action to shutdown the VFD on high temperature from the motor winding or bearing temperature detectors or on high vibration from any bearing vibration system indicated. All analog temperature signals shall be converted to contacts by the use of RTD relays or similar devices. Contacts shall open on fault condition or loss of relay power. RTD relays or similar devices shall be selected and provided in coordination with the motor Sub-supplier. RTD relays or similar devices shall be mounted within the VFD cabinet. Each VFD shall be supplied with a GE Multilin, SR469, motor protection relay (MPR), with MODBUS RS-485 interface to the pump station control system. All VFD and MPR alarm contacts shall be configured to be normally closed, open in alarm condition, and open on loss of power.
6. The VFD shall be capable of transient operation with a line voltage dip of 15 percent of normal operating voltage on a variable torque load. During line dip, the VFD shall automatically provide a speed droop limiting maximum capable speed for the duration of the input voltage dip.
7. Vibration Monitoring System: Refer to Section 26 09 13. The vibration monitoring panel shall output normally-closed contacts from respective pumps and motors to shut down the VFD upon contact opening.

B. The power circuit design shall be such that the following fault conditions can occur without damage to the power circuit components:
   1. Single phase fault or three phase short circuit on VFD output terminals.
   2. Loss of three-phase input power due to opening of VFD input disconnect device or utility power failure during VFD operation.
   3. Loss of one phase of input power.

2.6 CONTROL DEVICES

A. Pilot devices and instruments shall be mounted on a VFD unit door. Pilot devices shall be heavy-duty type with contacts rated at 10 amps minimum at 600V ac. Indicating lights shall be LED, push-to-test type. Door-mounted indicating lights shall be removable without removing the related wiring. The control units of the same type and size shall be made interchangeable. Relays shall have energization indication.

2.7 PROGRAMMABLE LOGIC CONTROLLER

A. A programmable logic controller shall be provided and housed within each VFD enclosure. The PLC shall be capable of communicating to the pump station PCM via a ControlNet network. The PLC shall communicate to the VFD through a DeviceNet connection providing access to the VFD parameters for monitoring via the HMI touchscreen. The Manufacturer of the PLC shall be Allen- Bradley, ControlLogix Series, no substitution. The HMI shall communicate to the PLC via a serial connection. The HMI shall be an Allen-Bradley PanelView Plus 6 Graphic Terminal, or equal. The PLC shall be furnished with the following:
   1. Modular, field expandable design allowing the system to be tailored to this process control application. The capability shall exist to allow for expansion of the system by the addition of hardware and/or user software.
   2. The processor plus input and output circuitry shall be of a modular design with interchangeability provided for all similar modules. Modules are defined herein as devices that plug into a chassis and are keyed to allow installation in only one direction. The design shall prohibit upside down insertion of the modules as well as safeguard against the insertion of a module into the wrong slot.
   3. The PLC shall have downward compatibility whereby all new module designs can be interchanged with all similar modules in an effort to reduce obsolescence.
   4. All hardware shall be rated to operate at an ambient temperature of 0 degrees to 60 degrees C (32 degrees to 140 degrees F), with an ambient temperature rating for storage of minus 40 degrees to plus 85 degrees C (minus 40 degrees to plus 185 degrees F), and shall function continuously in the relative humidity range of 5 percent to 95 percent with no condensation. The PLC system shall be designed and tested to operate in the high electrical noise environment of an industrial plant.

5. The PLC shall have one dedicated serial port, which supports RS-232-C, RS-422, and RS-423A signals. It shall be accessible in control logic and provide support for Slave SCADA communication protocol systems. Alternatively, it shall be usable for programming purposes or for access to peripheral devices such as bar code scanners, CRTs, etc.

B. PLC Power Supply:

1. The PLC shall operate in compliance with an electrical service of 120V ac, single-phase and in the frequency range from 47-Hz to 63-Hz. The power supply shall be mounted in the PLC housing, be sized to power all modules mounted in that housing and an "average module load" for any empty housing slots plus 25 percent above that total. Power supply shall be by the same manufacturer as the PLC and shall be of the same product line. A single main power supply shall have the capability of supplying power to the CPU and local input/output modules. Auxiliary power supplies shall provide power to remotely located racks.
2. The power supply shall automatically shut down the PLC system whenever its output current is detected as exceeding 125 percent of its rated current. The power supply shall monitor the incoming AC line voltage for proper levels. When the power supply is wired to use 120V ac power, the system shall function properly within the range of 97V ac to 132V ac. If the voltage level is detected as being out of range for more than one-half line cycle, the power supply shall automatically shut down the system and remain disabled until the proper voltage level returns. In addition, the power supply shall provide surge protection, isolation, and outage carryover up to two cycles of the ac line.
3. Design features of the PLC power supply shall include diagnostic indicators mounted in a position to be easily viewed by the user. These indicators shall provide the operator with the status of the dc power applied. In addition, a means of disabling power to the CPU shall be possible from a power disconnect switch mounted in a position easily accessible by the operator.
4. At the time of power-up, the power supply shall inhibit operation of the processor and I/O modules until the dc voltages are within specifications.
5. The power supply shall include fuse protection.

C. Communications: The PLC shall be equipped to communicate to other PLCs via a ControlNet connection. The PLC shall also be equipped to communicate with the VFD via a DeviceNet connection. The communications from the PLC to the HMI shall be configured to be a serial connection or DeviceNet connection. A dedicated RS-232 programming port shall remain unused to allow for connection of a programming terminal.

D. PLC Input/Output (I/O) Modules:

1. I/O Modules General: All I/O housings and modules shall be suitable for hostile industrial environments as described above. All I/O modules shall be isolated and conform to surge withstand standards and noise immunity standards. The I/Os shall be 4-mA to 20-mA dc for all analog inputs and outputs and shall be 24V dc for discrete inputs and dry relay contacts for safe discrete outputs. Modules shall be removable without having to disconnect wiring from the module's terminals by means of a swing-arm or plug-in wiring connector. Each PLC I/O location shall contain the I/O modules required to provide all of the I/O points contained in the I/O Lists. As a minimum, each PLC I/O location shall contain an installed spare capacity of at least 20%. During normal operation, a malfunction in any remote input/output channel shall affect the operation of only that channel and not the operation of the CPU or any other channel. Any remote input/output channel shall be field selectable to shut down the CPU upon failure of that channel. Upon remote channel shutdown, the CPU shall see all inputs on the malfunctioning channel as they were when the shutdown occurred and all outputs shall de-energize on that channel. Circuit components for both remote input and output shall be mounted on plug-in modules and keyed to prevent module insertion into the wrong slot. Isolation shall be used between all internal logic and external power circuits. This isolation shall meet the minimum specification of 1,500-volts rms.
2. Discrete Input Modules: Defined as contact closure inputs from devices external to the programmable controller module. Individual inputs shall be optically isolated from low energy common mode transients to 1,500-volts peak from field wiring or other I/O Modules. The modules shall have LED's to indicate status of each discrete input. Input signal level shall be 120V ac. The input module shall have a maximum of 16 points each. The PLC system shall include discrete input hardware consisting of the following types:
    a. AC/DC input for devices which operate at 120V ac, 50/60-Hz or 120V dc, 220V ac, 50/60-Hz. or 220V dc.
    b. AC input for devices that operate at 24V ac, 50/60-Hz.
    c. DC input for devices that operate at 5V dc to 30V dc and 10V dc to 60V dc.
    d. Isolated ac input that provides isolation of 120V ac or 120V dc input signals.
    e. TTL (5V dc) input for transistor-transistor logic, either high or low true logic, compatible with input devices such as solid state control and measuring equipment.
3. Discrete Output Modules: Defined as contact closure outputs for ON/OFF operation of devices external to the programmable controller module. The output modules shall be optically isolated from inductively generated, normal mode and low energy, common mode transients to 1,500-volts

peak. All output modules shall have LED's to indicate status of each output point. Output contact rating shall be 2 amps minimum, 24V ac. Each output point shall be individually isolated and fused. Discrete output contacts which are used to operate motors greater than 10 horsepower or with NEMA 2 or larger starters shall be provided with interposing relays in the VFD. Both the automatic start/stop output contacts and the safety/power system permissive output contacts shall be provided with relays when the above condition is met. Both the automatic start/stop output contacts and the safety/power system permissive output contacts shall be provided with relays when the above condition is met. The PLC system shall also offer discrete input hardware consisting of the following types:

a. AC output for devices which operate at 120V ac, 50/60-Hz.
b. AC output for devices which operate at 220/240V ac, 50/60-Hz.
c. AC output for devices which operate at 24V ac, 50/60-Hz.
d. DC output for devices which operate at 10V dc to 60V dc.
e. DC power output for operating heavy-duty clutches, brakes, and solenoids. Available in 12 to 24, 48, and 125V dc versions.
f. Isolated AC output that provides six isolated outputs capable of switching 120V ac or 220V ac power.
g. TTL (5V dc) output which provides transistor-transistor logic, either high or low true logic, compatible for operating 5V dc level electronic devices.
h. Contact output that provides four normally open and four normally closed reed relay outputs.
i. Contact output that provides three normally open/normally closed reed relay outputs.

4. Analog Input Modules: Defined as 4 mA to 20 mA dc signals, where an analog to digital conversion is performed with 16-bit precision and the digital result is entered into the processor. The analog to digital conversion shall be updated with each scan of the processor. Input modules shall be source or sink to handle 2-wire or 4-wire transmitters respectively. Analog inputs shall also be available in the following ranges:
   a. Voltage Range: 0 to plus 5V dc, plus 1 to plus 5V dc, zero to plus 10V dc, minus 5 to plus 5V dc, minus 10 to plus 10V dc.
   b. Current Range: 0 mA to 20 mA, minus 20 to plus 20 mA.
5. Analog Output Modules: Defined as 4 mA to 20 mA dc output signals where each output circuit performs a digital to analog conversion minimum of 15-bit precision with each scan of the processor. Each analog output module shall have six isolated output points which shall be rated for loads of up to 550 ohms. Provide current loop isolators as required to break ground loops.

E. PLC Uninterruptible Power Supply:

1. General:
    a. Completely static uninterruptible ac power systems (UPS) shall be provided for power to the PLC. The UPS system shall be a self-contained unit consisting of a static inverter, batteries, bypass switch, rectifier charger and static transfer switch.
    b. The VFD/PLC panel shall be furnished with UPS to provide backup power at full load for 30 minutes.
2. Operation: On normal power, the PLC panel load shall be supplied from the ac power line through the static inverter and the rectifier charger which shall also maintain the battery in a fully charged "float" condition. During line power failure, the UPS shall provide same wave ac power to the load. It shall also provide the local PLC with a dry contact output for alarm and monitoring through the SCADA system. Upon return of normal power, UPS shall recharge the battery in preparation for future ac power line failure.
3. UPS shall have the following requirements:
    a. Input/Output Voltage: 120V ac, 60-Hz, single-phase.
    b. Brownout protection.
    c. Lightning and surge protection.
    d. Noise Isolation: 38-dB common mode, 47-dB normal mode.
    e. Output Capacity: Based on load calculation.
    f. Efficiency: 95 percent on line.
    g. Alarms: Low Backup time, overload, replace battery. Low battery.
4. Manufacturers: FERRUPS or Toshiba.

2.8 DIAGNOSTICS

A. A door-mounted flat panel screen operator terminal shall be furnished with the VFD and be capable of controlling the VFD and setting drive parameters. The operator terminal shall include the following features:
    1. The display shall present diagnostic messages and parameter values in English engineering units when accessed, without the use of codes. Provide the ability to switch to SI units.
    2. The keypad / touch screen shall allow the operator to enter exact numerical settings in English engineering units. A plain English user menu shall be provided in software as a guide to parameter settings, (rather than codes). Drive parameters shall be factory set in EEPROM and resettable in the field through the operator terminal.
    3. Password security shall be available to protect drive parameters from unauthorized personnel. The EEPROM stored drive variables shall be able to be transferred to a new board to reprogram spare boards. Provide the ability to reset the password.
    4. Individual "Help-Screens" shall be incorporated into the display allowing operators to be "guided" through the start-up and shutdown process, along with troubleshooting the VFD when a "Failure" occurs. These screens

shall be accessed directly from any operating page by pressing a "Help" button programmed into the display.

5. The VFD shall be capable of direct communication to a compatible computer for serial link setup of parameters, fault diagnostics, trending and diagnostic log downloading. An RS-232 port or Ethernet RJ45 jack shall be door-mounted for computer or printer interface. VFD parameters, fault log and diagnostic log shall be downloadable for hardcopy printout via the RS-232 port and a standard serial printer or from maintenance software via the RJ45 jack and printed as pdf..

B. The VFD shall be provided with the following diagnostics:

1. Indication of the following fault conditions:
   a. No fault.
   b. Blown power fuse.
   c. Control power failure.
   d. Under-voltage.
   e. Instantaneous overcurrent.
   f. Sustained overload.
   g. Over-temperature.
   h. Output over-voltage.
2. Diagnostic Features and Fault Handling:
   a. A "Fault Log" shall record, store, display and print upon demand, the following 30 most recent events:
      1) VFD mode (Auto/Manual).
      2) Date and time of day (of fault).
      3) Type of fault.
      4) Reset mode (Auto/Manual).
   b. A "Historic Log" shall record, store, display and print upon demand, the following control variables at 2.7-mSec intervals for the 50 intervals immediately preceding a fault trip:
      1) VFD mode (Manual/Auto/Inhibited/Tripped, etc.).
      2) Speed demand.
      3) VFD output frequency.
      4) Demand (output) amps.
      5) Feedback (motor amps).
      6) VFD output volts.
      7) Type of fault.
      8) Drive-in (on/off).
   c. The fault log record shall be accessible via a RS-232 serial link or Ethernet linkas well as page-by-page on the terminal display.

2.9 POWER FACTOR CORRECTION

A. The collective true power factor (displacement power factor x distortion power factor) of the VFD and the motors, when running between 50 percent and

100 percent speed, shall not be less than 0.98 measured at the Point of Common Coupling. A power factor compensation feature shall be provided to control power factor – leading or lagging.

2.10 FACTORY TESTING

A. Component Tests: All components (including furnished spares) shall be 100 percent tested. All printed circuit boards shall be burned-in continuously per the manufacturer's standard test procedure to ensure reliable operation. The printed circuit boards shall be tested after burn-in to insure they are functioning within specification. Every SGCT or IGBT shall have the following critical parameters tested at rated current: gating, turn-on, turn-off, high temperature, forward blocking, reverse blocking and waveform characteristics. All assembled phase cells shall be tested for cell balance at rated voltage, maximum current, maximum dV/dT and maximum dI/dT.

1. Control power shall be applied to microprocessors, printed circuit boards, diagnostic boards, PLC, LCD display, and similar devices including software to test for proper operation, sequencing, logic and diagnostics.
2. All wiring shall be checked for continuity and for functional compliance with the wiring diagrams.

B. System Tests: Testing shall proceed in the order given below.

1. Functional Test: Each VFD shall be completely functionally tested at the factory as a unit. The Sub-supplier shall give the Engineer a minimum of five weeks notice prior to the test. All costs for the Engineer's expenses shall be borne by the Supplier and included in the bid price. Such costs shall include travel and subsistence for 2 people, but shall exclude salaries. Base bid price on engineers located in San Diego, CA. Test results in triplicate shall be submitted to the Engineer and no equipment shall be shipped until the test data have been approved in writing by the Engineer. Test reports shall include the Sub-supplier's standard tests as well as functional tests of the motor protection relay, HMI, and PLC. The test report shall indicate the test procedure and instrumentation used to measure and record data. The test report shall be certified by the test personnel and be submitted to the Engineer.
2. Load Tests: Each VFD shall be factory load tested at 100 percent of its maximum rating for a continuous period of three hours without overheating or shutdown. The load shall be applied as a motor load, dynamometer load, or inductor at reduced voltage.

PART 3 EXECUTION

3.1 FIELD TESTING

A. Harmonic Analysis for All Drives: Onsite harmonic tests shall be performed at 100 percent and 80 percent speeds with four VFDs operating. Tests shall be conducted using a harmonic analyzer by Reliable or BMI/Dranetz. Tests shall prove that sufficient filtering has been provided to limit the harmonic distortion to a magnitude of five percent of both current and voltage at the point of common coupling. The output of each drive shall also be measured to record the harmonics present in the motor circuit.

B. Background harmonics shall be recorded for a minimum of 48 hours at the point of common coupling prior to the first pump field harmonics tests are recorded.

END OF SECTION

SECTION 26 20 00
LOW-VOLTAGE AC INDUCTION MOTORS

PART 1 GENERAL

1.1 RELATED SECTIONS

A. This section applies only when referenced by a motor-driven equipment specification. Application, horsepower, enclosure type, mounting, shaft type, synchronous speed, and deviations from this section will be listed in the equipment specification. Where such deviations occur, they shall take precedence over this section.

1.2 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Bearing Manufacturers Association (ABMA):
   a. 9, Load Ratings and Fatigue Life for Ball Bearings.
   b. 11, Load Ratings and Fatigue Life for Roller Bearings.
2. Institute of Electrical and Electronics Engineers, Inc. (IEEE):
   a. 112, Standard Test Procedure for Polyphase Induction Motors and Generators.
   b. 620, Guide for the Presentation of Thermal Limit Curves for Squirrel Cage Induction Machines.
   c. 841, Standard for Petroleum and Chemical Industry—Premium Efficiency Severe Duty Totally Enclosed Fan-Cooled (TEFC) Squirrel Cage Induction Motors—Up to and Including 370 kW (500 hp).
3. National Electrical Manufacturers Association (NEMA):
   a. 250, Enclosures for Electrical Equipment (1,000 Volts Maximum).
   b. C50.41, Polyphase Induction Motors for Power Generating Stations.
   c. MG 1, Motors and Generators.
4. National Fire Protection Association (NFPA): 70, National Electrical Code (NEC).
5. Underwriters Laboratories (UL):
   a. 83, Standard for Safety for Thermoplastic-Insulated Wire and Cables.
   b. 674, Standard for Safety for Electric Motors and Generators for Use in Division 1 Hazardous (Classified) Locations.
   c. 2111, Standard for Safety for Overheating Protection for Motors.

1.3 DEFINITIONS

A. CISD-TEFC: Chemical industry, severe-duty enclosure.

B. DIP: Dust-ignition-proof enclosure.

C. EXP: Explosion-proof enclosure.

D. Inverter Duty Motor: Motor meeting applicable requirements of NEMA MG 1, Section IV, Parts 30 and 31.

E. Motor Nameplate Horsepower: That rating after any derating required to allow for extra heating caused by the harmonic content in the voltage applied to the motor by its controller.

F. ODP: Open drip-proof enclosure.

G. TEFC: Totally enclosed, fan-cooled enclosure.

H. TENV: Totally enclosed, nonventilated enclosure.

I. WPI: Open weather protected enclosure, Type I.

J. WPII: Open weather protected enclosure, Type II.

1.4 SUBMITTALS

A. Action Submittals:

1. Descriptive information.
2. Nameplate data in accordance with NEMA MG 1.
3. Additional Rating Information:
    a. Service factor.
    b. Locked rotor current.
    c. No load current.
4. Enclosure type and mounting (such as, horizontal, vertical).
5. Dimensions and total weight.
6. Conduit box dimensions and usable volume as defined in NEMA MG 1 and NFPA 70.
7. Bearing type.
8. Bearing lubrication.
9. Bearing life.
10. Space heater voltage and watts.
11. Description, ratings, and wiring diagram of motor thermal protection.
12. Motor sound power level in accordance with NEMA MG 1.

13. Maximum brake horsepower required by the equipment driven by the motor.
14. Description and rating of submersible motor moisture sensing system.

B. Informational Submittals:

1. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection and Testing.
2. Operation and Maintenance Data: As specified in Section 01 78 23, Operation and Maintenance Data.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:

1. General Electric.
2. Reliance Electric.
3. MagneTek.
4. Siemens Energy and Automation, Inc., Motors and Drives Division.
5. Baldor.
6. U.S. Electrical Motors.
7. TECO-Westinghouse Motor Co.
8. Toshiba International Corp., Industrial Division.
9. WEG Electric Motors Corp.

2.2 GENERAL

A. For multiple units of the same type of equipment, furnish identical motors and accessories of a single manufacturer.

B. In order to obtain single source responsibility, use a single supplier to provide drive motor, its driven equipment, and specified motor accessories.

C. Meet requirements of NEMA MG 1.

D. For motors used in hazardous (classified) locations, Class I, Division 1, Groups B, C, and D, and Class II, Division 1, Groups E, F, and G provide motors that conform to UL 674 and have an applied UL listing mark.

E. Motors shall be specifically designed for the use and conditions intended, with a NEMA design letter classification to fit the application.

F. Lifting lugs on motors weighing 100 pounds or more.

G. Operating Conditions:

1. Maximum ambient temperature not greater than 40 degrees C.
2. Motors shall be suitable for operating conditions without reduction being required in nameplate rated horsepower or exceeding rated temperature rise.
3. Overspeed in either direction in accordance with NEMA MG 1.

2.3 HORSEPOWER RATING

A. As designated in motor-driven equipment specification.

B. Constant Speed Applications: Brake horsepower of driven equipment at any operating condition not to exceed motor nameplate horsepower rating, excluding service factor.

2.4 SERVICE FACTOR

A. 1.15 minimum at rated ambient temperature, unless otherwise noted.

2.5 VOLTAGE AND FREQUENCY RATING

A. System Frequency: 60 Hz.

B. Voltage Rating: Unless otherwise indicated in motor-driven equipment specification:

Voltage Rating		
Size	**Voltage**	**Phase**
1/2 hp and smaller	115	1
3/4 hp through 400 hp	460	3

C. Suitable for full voltage starting.

D. Suitable for accelerating the connected load with supply voltage at motor starter supply terminals dipping to 90 percent of motor rated voltage.

2.6 EFFICIENCY AND POWER FACTOR

A. For all motors except single-phase, under 1 hp, multispeed, short-time rated and submersible motors, or motors driving gates, valves, elevators, cranes, trolleys, and hoists:

1. Efficiency:
   a. Tested in accordance with NEMA MG 1, Paragraph 12.59.

b. Guaranteed minimum at full load in accordance with NEMA MG 1 Table 12-12, Full-load Efficiencies for NEMA Premium Efficiency Electric Motors Rated 600 Volts or Less (Random Wound), or as indicated in motor-driven equipment specification.

2. Power Factor: Guaranteed minimum at full load shall be manufacturer's standard or as indicated in motor-driven equipment specification.

2.7 LOCKED ROTOR RATINGS

A. Locked rotor kVA Code F or lower, if motor horsepower not covered by NEMA MG 1 tables.

B. Safe Stall Time: 12 seconds or greater.

2.8 INSULATION SYSTEMS

A. Single-Phase, Fractional Horsepower Motors: Manufacturer's standard winding insulation system.

B. Three-phase and Integral Horsepower Motors: Unless otherwise indicated in motor-driven equipment specification, Class F with Class B rise at nameplate horsepower and designated operating conditions , except EXP motors which must be Class B with Class B rise.

2.9 ENCLOSURES

A. Enclosures to conform to NEMA MG 1.

B. TEFC and TENV: Furnish with drain hole with porous drain/weather plug.

C. Explosion-Proof (EXP):

1. TEFC listed to meet UL 674 and NFPA 70 requirements for Class I, Division 1, Group C and D hazardous locations.
2. Drain holes with drain and breather fittings.
3. Integral thermostat opening on excessive motor temperature in accordance with UL 2111 and NFPA 70.
4. Terminate thermostat leads in terminal box separate from main terminal box.

D. Submersible: In accordance with Article Special Motors.

E. Chemical Industry, Severe-Duty (CISD-TEFC): In accordance with Article Special Motors.

2.10 TERMINAL (CONDUIT) BOXES

A. Oversize main terminal boxes for motors.

B. Diagonally split, rotatable to each of four 90-degree positions. Threaded hubs for conduit attachment.

C. Except ODP, furnish gaskets between box halves and between box and motor frame.

D. Minimum usable volume in percentage of that specified in NEMA MG 1, Section 1, Paragraph 4.19 and NFPA 70, Article 430:

Terminal Box Usable Values		
Voltage	**Horsepower**	**Percentage**
Below 600	15 through 125	500

E. Terminal for connection of equipment grounding wire in each terminal box.

F. Coordinate motor terminal box conduit entries versus size and quantity of conduits shown on Drawings.

2.11 BEARINGS AND LUBRICATION

A. Horizontal Motors:

1. 3/4 hp and Smaller: Permanently lubricated and sealed ball bearings, or regreasable ball bearings in labyrinth sealed end bells with removable grease relief plugs.
2. 1 hp through 400 hp: Regreasable ball bearings in labyrinth sealed end bells with removable grease relief plugs.
3. Minimum 100,000 hours L-10 bearing life for ball and roller bearings as defined in ABMA 9 and ABMA 11.

B. Vertical Motors:

1. Thrust Bearings:
   a. Antifriction bearing.
   b. Manufacturer's standard lubrication 100 hp and smaller.
   c. Minimum 50,000 hours L-10 bearing life.
2. Guide Bearings:
   a. Manufacturer's standard bearing type.
   b. Manufacturer's standard lubrication 200 hp and smaller.
   c. Minimum 100,000 hours L-10 bearing life.

C. Regreasable Antifriction Bearings:

1. Readily accessible, grease injection fittings.
2. Readily accessible, removable grease relief plugs.

D. Oil Lubrication Systems:

1. Oil reservoirs with sight level gauge.
2. Oil fill and drain openings with opening plugs.
3. Provisions for necessary oil circulation and cooling.

2.12 NOISE

A. Measured in accordance with NEMA MG 1.

2.13 BALANCE AND VIBRATION CONTROL

A. In accordance with NEMA MG 1, Part 7.

2.14 EQUIPMENT FINISH

A. Protect Motor for Service Conditions:

1. ODP Enclosures: Indoor industrial atmospheres.
2. Other Enclosures: Outdoor industrial atmospheres, including moisture and direct sunlight exposure.

B. External Finish: Prime and finish coat manufacturer's standard.

C. Internal Finish: Bore and end turns coated with clear polyester or epoxy varnish.

2.15 SPECIAL FEATURES AND ACCESSORIES

A. Screen Over Air Openings: Corrosion-resistant on motors with ODP, WPI, and WPII enclosures meeting requirements for guarded machine in NEMA MG 1, and attached with stainless steel screws.

B. Space Heaters:

1. Provide winding space heaters with leads wired out to motor terminal box.
2. Provide extra hole or hub on motor terminal box as required.
3. Unless shown otherwise, heater shall be suitable for 120V ac supply, with wattage suitable for motor frame size.

C. Nameplates:

1. Raised or stamped letters on stainless steel or aluminum.
2. Display motor data required by NEMA MG 1, Paragraph 10.39 and Paragraph 10.40 in addition to bearing numbers for both bearings.
3. Premium efficiency motor nameplates to display NEMA nominal efficiency, guaranteed minimum efficiency, full load power factor, and maximum allowable kVAR for power factor correction capacitors.

D. Anchor Bolts: Provide meeting manufacturer's recommendations and of sufficient size and number for specified seismic condition.

2.16 SPECIAL MOTORS

A. Requirements in this article take precedence over conflicting features specified elsewhere in this section.

B. Chemical Industry, Severe-Duty (CISD-TEFC):

1. In accordance with IEEE 841.
2. TEFC in accordance with NEMA MG 1.
3. Suitable for indoor or outdoor installation in severe-duty applications including high humidity, chemical (corrosive), dirty, or salty atmospheres.
4. Motor Frame, End Shields, Terminal Box, and Fan Cover: Cast iron.
5. Ventilating Fan: Corrosion-resistant, nonsparking, external.
6. Drain and Breather Fittings: Stainless steel.
7. Nameplate: Stainless steel.
8. Gaskets between terminal box halves and terminal box and motor frame.
9. Extra slinger on rotor shaft to prevent moisture seepage along shaft into motor.
10. Double shielded bearings.
11. 125,000 hours minimum L-10 bearing life for direct-connected loads.
12. External Finish: Double-coated epoxy enamel.
13. Coated rotor and stator air gap surfaces.
14. Insulation System, Windings, and Connections:
    a. Class F insulation, Class B rise or better at 1.0 service factor.
    b. Multiple dips and bakes of nonhygroscopic polyester varnish.
15. Service Factor:
    a. At 40 Degrees C Ambient: 1.15.
    b. At 65 Degrees C Ambient: 1.00.
16. Safe Stall Time Without Injurious Heating: 20 seconds minimum.

C. Severe-duty Explosion-proof: Meet requirements for EXP enclosures and CISD-TEFC motors.

D. Submersible Pump Motor:

1. Manufacturers:
   a. Reliance Electric.
   b. ITT Flygt Corp.
2. At 100 Percent Load:

Submersible Pump Motors		
Horsepower	**Guaranteed Minimum Efficiency**	**Guaranteed Minimum Power Factor**
5 through 10	80	82
10.1 through 50	85	82

3. Insulation System: Manufacturer's standard Class B or Class F.
4. Motor capable of running dry continuously.
5. Enclosure:
   a. Hermetically sealed, watertight, for continuous submergence up to 65-foot depth.
   b. Listed to meet UL 674 and NFPA 70 requirements for Class I, Division 1, Group D hazardous atmosphere.
   c. Seals: Tandem mechanical.
6. Bearing and Lubrication:
   a. Permanently sealed and lubricated, replaceable antifriction guide and thrust bearings.
   b. Minimum 15,000 hours L-10 bearing life.
7. Inrush kVA/horsepower no greater than NEMA MG 1 and NFPA 70, Code F.
8. Winding Thermal Protection:
   a. Thermal sensor and switch assembly, one each phase, embedded in stator windings and wired in series.
   b. Switches normally closed, open upon excessive winding temperature, and automatically reclose when temperature has cooled to safe operating level.
   c. Switch contacts rated at 5 amps, 120V ac.
9. Motor Seal Failure Moisture Detection:
   a. Probes or sensors to detect moisture beyond seals.
   b. Probe or sensor monitoring module for mounting in motor controller, suitable for operation from 120V ac supply.
   c. Monitoring module with control power transformer, probe test switch and test light, and two independent 120V ac contacts, one opening and one closing when flux of moisture is detected.
10. Winding thermal protection, moisture detection, and bearing overtemperature specified above may be monitored by single device providing two independent 120V ac contacts, one closing and one opening on malfunction.
11. Connecting Cables:

a. One cable containing power, control, and grounding conductors.
b. Each cable suitable for hard service, submersible duty with watertight seal where cable enters motor.
c. Length: 30 feet minimum.
d. UL 83 listed and sized in accordance with NFPA 70.

2.17 FACTORY TESTING

A. Tests:

1. In accordance with IEEE 112 for polyphase motors.
2. Routine (production) tests in accordance with NEMA MG 1. Test multispeed motors at all speeds.
3. For energy efficient motors, test efficiency and power factor at 50 percent, 75 percent, and 100 percent of rated horsepower:
   a. In accordance with IEEE 112, Test Method B, and NEMA MG 1, Paragraph 12.59. and Paragraph 12.60.
   b. On motors of 100 hp and smaller, furnish certified copy of motor efficiency test report on an identical motor.
4. Provide test reports for all polyphase motors.

B. Test Report Forms:

1. Routine Tests: IEEE 112, Form A-1.

PART 3 EXECUTION

3.1 INSTALLATION

A. In accordance with manufacturer's instructions and recommendations.

B. Align motor carefully and properly with driven equipment.

C. Secure equipment to mounting surface with anchor bolts.

END OF SECTION

SECTION 26 22 00
LOW-VOLTAGE TRANSFORMERS

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. Code of Federal Regulations (CFR): 10 CFR Part 431, DOE 2016 efficiency.
2. Institute of Electrical and Electronics Engineers (IEEE): C57.96, Guide for Loading Dry Type Transformers.
3. National Electrical Contractor's Association (NECA): 409, Recommended Practice for Installing and Maintaining Dry-Type Transformers.
4. National Electrical Manufacturers Association (NEMA):
   a. 250, Enclosures for Electrical Equipment (1000 Volts Maximum).
   b. ST 20, Dry-Type Transformers for General Applications.
5. National Fire Protection Association (NFPA): 70, National Electrical Code (NEC).
6. Underwriters Laboratories, Inc. (UL):
   a. 486E, Standard for Equipment Wiring Terminals for use with Aluminum and/or Copper Conductors.
   b. 489, Standard for Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures.
   c. 1561, Standard for Dry-Type, General Purpose, and Power Transformers.

1.2 SUBMITTALS

A. Action Submittals:

1. Descriptive information.
2. Dimensions and weight.
3. Transformer nameplate data, including efficiency.
4. Schematic and connection diagrams.
5. Anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:

1. Anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.

2. Test Report: Sound test certification for dry type power transformers (0 volt to 600 volt, primary).
3. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection, Observation, and Testing.

PART 2 PRODUCTS

2.1 GENERAL

A. UL 1561, NEMA ST 20, unless otherwise indicated.

B. Dry-type, self-cooled, two-winding, with copper windings.

C. Units larger than 5 kVA suitable for use with 75 degrees C wire at full NFPA 70, 75 degrees C ampacity.

D. Efficiency: Meet or exceed DOE 2016 efficiency requirements and transformers 15 kVA and larger shall comply with Title 20 and Title 24.

E. Maximum Sound Level per NEMA ST 20:

1. 40 decibels for 0 kVA to 9 kVA.
2. 45 decibels for 10 kVA to 50 kVA.
3. 50 decibels for 51 kVA to 150 kVA.
4. 55 decibels for 151 kVA to 300 kVA.
5. 60 decibels for 301 kVA to 500 kVA.

F. Overload capability: Short-term overload per IEEE C57.96.

G. Wall Bracket: For single-phase units, 15 kVA to 37-1/2 kVA, and for three-phase units, 15 kVA to 30 kVA.

H. Vibration Isolators:

1. 30 kVA and Above: Isolate core and coil assembly from transformer enclosure with integral vibration isolator.

I. Manufacturers:

1. General Electric Co.
2. Square D Co.
3. Eaton/Cutler-Hammer.
4. ABB

2.2 GENERAL PURPOSE TRANSFORMER

A. Insulation Class and Temperature Rise: Manufacturer's standard.

B. Core and Coil:

1. Encapsulated for single-phase units 1/2 kVA to 25 kVA and for three-phase units 3 kVA to 15 kVA.
2. Thermosetting varnish impregnated for single-phase units 37.5 kVA and above, and for three-phase units 30 kVA and above.

C. Enclosure:

1. Single-Phase, 3 kVA to 25 kVA: NEMA 250, Type 3R, nonventilated.
2. Single-Phase, 37-1/2 kVA and Above: NEMA 250, Type 2, ventilated.
3. Three-Phase, 3 kVA to 15 kVA: NEMA 250, Type 3R, nonventilated.
4. Three-Phase, 30 kVA and Above: NEMA 250, Type 2, ventilated.

D. Voltage Taps:

1. Single-Phase, 3 kVA and Above: Four 2-1/2 percent, full capacity; two above and two below normal voltage rating.
2. Three-Phase, 3 kVA and Above: Four 2-1/2 percent, full capacity; two above and two below normal voltage rating.

E. Impedance: 1.9 percent minimum on units 75 kVA and larger.

2.3 CAST COIL DRY TYPE TRANSFORMERS

A. Transformers 01-XFMR-03 and -04.

B. Vacuum cast coil dry type distribution transformer.

C. Primary voltage: 4160V, delta, 60kV BIL.

D. Secondary voltage: 480/277V, wye, 30kV BIL.

E. Impedance: 5.75%, +/- 7.5% tolerance.

F. Insulation class: 180F.

G. Temperature rise: 115F over 30F average, 40F ambient.

H. Taps: 2-2.5% FCAN, 2-2.5% FCBN.

I. Partial discharge maximum level of 10 pC per IEC 60076-11.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install in accordance with NECA and manufacturer's instructions.

B. Provide moisture-proof, flexible conduit for electrical connections.

C. Connect voltage taps to achieve (approximately) rated output voltage under normal plant load conditions.

D. Provide wall brackets for units where indicated as wall mounted on Drawings.

   d. PB 1, Panelboards.
   e. PB 1.1, General Instructions for Proper Installation, Operation and Maintenance of Panelboards Rated 600 Volts or Less.
3. National Fire Protection Association (NFPA): 70, National Electrical Code (NEC).
4. Underwriters Laboratories, Inc. (UL):
   a. 67, Standard for Panelboards.
   b. 98, Standard for Enclosed and Dead-Front Switches.
   c. 486E, Standard for Equipment Wiring Terminals for use with Aluminum and/or Copper Conductors.
   d. 489, Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit Breaker Enclosures.
   e. 508, Standard for Industrial Control Equipment.
   f. 870, Wireways, Auxiliary Gutters and Associated Fittings.
   g. 943, Ground-Fault Circuit-Interrupters.
   h. 1699, Standard for Arc-Fault Circuit-Interrupters.

1.2 SUBMITTALS

A. Action Submittals:

1. Manufacturer's data sheets for each type of panelboard, protective device, accessory item, and component.
2. Manufacturer's shop drawings including dimensioned plan, section, and elevation for each panelboard type, enclosure, and general arrangement.
3. Tabulation of features for each panelboard to include the following:
   a. Protective devices with factory settings.
   b. Provisions for future protective devices.
   c. Space for future protective devices.
   d. Voltage, frequency, and phase ratings.

e. Enclosure type.
f. Bus and terminal bar configurations and current ratings.
g. Provisions for circuit terminations with wire range.
h. Short circuit current rating of assembled panelboard at system voltage.
i. Features, characteristics, ratings, and factory settings of auxiliary components.
j. Anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:

1. Anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.
2. Manufacturer's recommended installation instructions.
3. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection, Observation, and Testing.

1.3 QUALITY ASSURANCE

A. Listing and Labeling: Provide products specified in this section that are listed and labeled as defined in NEC Article 100.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:

1. Eaton/Cutler-Hammer.
2. General Electric Co.
3. Square D Co.
4. Siemens.

2.2 GENERAL

A. Provide equipment in accordance with NEMA PB 1, NFPA 70, and UL 67.

B. Wire Terminations:

1. Provide panelboard assemblies, including protective devices, suitable for use with 75 degrees C or greater wire insulation systems at

NFPA 70, 75 degrees C conductor ampacity, and in accordance with UL 486E.

2. Lugs for termination of conductors shall comply with Section 26 05 05, Conductors.
3. Lugs for termination of copper feeder phase and neutral conductors shall be replaceable, bolted mechanical or crimp compression type.

C. Load Current Ratings:

1. Unless otherwise indicated, load current ratings for panelboard assemblies, including bus and circuit breakers, are noncontinuous as defined by NEC. Continuous ratings shall be 80 percent of noncontinuous rating.
2. Where indicated "continuous" or "100 percent", selected components and protective devices shall be rated for continuous load current at value shown.

D. Short Circuit Current Rating (SCCR): Integrated equipment short circuit rating for each panelboard assembly shall be no less than the indicated SCCR.

E. Series-Connected Short Circuit Current Ratings: Panelboards utilizing UL 67 listed, series-connected device ratings to achieve the required SCCR are acceptable where permitted by NFPA 70 and not otherwise indicated.

2.3 OVERCURRENT PROTECTIVE DEVICES

A. Overcurrent Device Mounting and Arrangement: Design panelboards to accommodate device installation and replacement without disturbing adjacent devices and without removing main bus.

B. Overcurrent Protective Devices: In accordance with NEMA KS 1, UL 98, and UL 489. Protective devices shall be adapted to panelboard installation.

C. Provisions for Future Overcurrent Device:

1. Provide space, mountings and bus connections such that like device may be installed without additional hardware.
2. Panel openings shall be closed with individual removable cover for each provision for future device.
3. Unless otherwise indicated, "spaces" in panelboards shall be fully equipped provision for future like devices.
4. Provisions for future devices shall be suitable devices rated no less than 60 amperes.

D. Protective Device Locking: Furnish provisions for handle padlocking for main, subfeed, and branch devices where indicated.

E. Branch Protective Devices:

1. Provide Wire Lug Load Connections: Mechanical or crimp compression type, removable/replaceable, and suitable for 75 degrees C rated conductors without derating switch nor conductor ampacity.
2. Provide a nameplate for each circuit, blanks for spares.

2.4 CIRCUIT BREAKERS

A. General: Thermal-magnetic unless otherwise indicated, quick-make, quick-break, molded case, of indicating type showing ON/OFF and TRIPPED positions of operating handle. Circuit breakers shall comply with Section 26 05 04, Basic Electrical Materials and Methods.

B. Bus Connection: Bolt-on circuit breakers in all panelboards.

C. Trip Mechanism:

1. Individual permanent thermal and magnetic trip elements in each pole.
2. Variable magnetic trip elements with a single continuous adjustment 3X to 10X for frames greater than 100 amps.
3. Two and three pole, common trip.
4. Automatically opens all poles when overcurrent occurs on one pole.
5. Test button on cover.
6. Calibrated for 40 degrees C ambient, unless shown otherwise.

D. Unacceptable Substitution:

1. Do not substitute single-pole circuit breakers with handle ties for multi-pole breakers.
2. Do not use tandem or dual circuit breakers in normal single-pole spaces.

E. Specialty Breakers: Where indicated, provide breakers with the following features:

1. Ground Fault Circuit Interrupter (GFCI): Rated to trip on 5-mA ground fault within 0.025 second (UL 943, Class A sensitivity, for protection of personnel). Ground fault sensor shall be rated same as circuit breaker. Breaker shall include push-to-test and reset buttons.
2. Heating and Air Conditioning Rated (HACR): Where indicated, provide breaker UL listed for the protection of such equipment.

2.5 ENCLOSURES

A. General:

1. Provide as specified in Section 26 05 04, Basic Electrical Materials and Methods.
2. Type 1, Type 3R, and Type 3S material code-gauge, hot-dip galvanized sheet steel with reinforced steel frame.
3. Provide surface-mount panelboard from trim with same dimensions as box front.

B. Finish: Rust inhibitor prime followed by manufacturer's standard gray baked enamel or lacquer. NEMA Type 1 enclosure box may be unfinished galvanized sheet steel.

C. NEMA 250 Type 1 Branch Panelboard Enclosure:

1. Secure front trim to box with concealed trim clamps.
2. Provide door in panelboard front trim, with concealed hinges, to access protective device operating handles.
3. Provide multi-point latching for doors over 30 inches in height.
4. Door Lock: Secure with flush catch and tumbler lock; all panelboards keyed alike, with two milled keys each lock.
5. Circuit Directory: Metal frame with transparent plastic face and enclosed card, mounted inside each panel door.

2.6 BUSSING AND TERMINAL BARS

A. Bus:

1. Material: Copper, full sized throughout length. Provide for mounting of future protective devices along full length of bus regardless of number of units and spaces shown. Machine, drill, and tap as required for current and future positions.

B. Equipment Ground Terminal Bus: Copper with suitably sized provisions for termination of ground conductors, and bonded to box.

1. Provide individual mechanical termination points no less than the quantity of breaker pole positions.
2. Provide individual termination points for all other grounding conductors such as feeder, grounding electrode, etc.
3. Termination points shall be bolted crimp compression lugs for conductors 6 AWG and larger.

C. Neutral Terminal Bus: Copper with suitably sized provisions for termination of neutral conductors, and isolated from box.

1. Provide individual mechanical termination points no less than the quantity of breaker pole positions.

2. Provide individual termination points for all other neutral conductors.
3. Termination Points: Bolted crimp compression lugs for conductors 6 AWG and larger.

D. Provision for Future Devices: Equip with mounting brackets, bus connections, and necessary appurtenances for future protective device ampere ratings indicated.

2.7 SPECIAL FEATURES

A. General: Where indicated on Drawings or schedules, provide special features as specified.

B. Surge Arresters:

1. Comply with Section 26 43 00, Surge Protection Devices.
2. Provide protective device within panelboard as disconnecting means and short circuit protection per manufacturer's recommendation.
3. Provide factory mounting within panelboard utilizing UL-recognized mounting device.

C. Fire Alarm Circuits: Identify all branch circuits feeding fire detection and alarm panels and equipment with a red, engraved to white core, plastic nameplate attached to the individual branch circuit breakers. Engrave nameplates with "FIRE ALARM CIRCUIT".

PART 3 EXECUTION

3.1 GENERAL

A. Install in accordance with NECA 407, NEMA PB 1.1, and manufacturers' written installation instructions.

B. Install securely, plumb, in-line and square with walls.

C. Install top of cabinet trim 78 inches above floor, unless otherwise shown. Install cabinet so tops of protective device operating handles are no more than 78 inches above the floor.

D. Ground Fault Protection: Install panelboard ground fault circuit interrupter devices in accordance with installation guidelines of NEMA 289.

E. Install filler plates in unused spaces.

F. Wiring in Panel Gutters: Train conductors neatly in groups; bundle and wrap with nylon wire ties.

G. Provide typewritten circuit directory for each panelboard.

H. Provide engraved identification for each protective device.

END OF SECTION

SECTION 26 24 19
LOW-VOLTAGE MOTOR CONTROL

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which shall be followed for this section:

1. Institute of Electrical and Electronics Engineers (IEEE): C2, National Electrical Safety Code (NESC).
2. National Electrical Contractors Association (NECA): 402, Standard for Installing and Maintaining Motor Control Centers.
3. National Electrical Manufacturers Association (NEMA):

   c. 845, Motor Control Centers.

1.2 DEFINITIONS

A. CT: Current Transformer.

B. LCD: Liquid Crystal Display.

C. N.C.: Normally Closed.

D. N.O.: Normally Open.

E. THD: Total Harmonic Distortion.

F. VT: Voltage Transformer.

1.3 SUBMITTALS

A. Action Submittals:

1. Descriptive information.
2. Itemized Bill of Material.
3. Dimensional drawings.
4. Front Panel Elevations.
5. Conduit entrance locations.
6. Bus data.
7. Protective Devices: Copies of time-current characteristics.
8. Anchoring instructions and details.
9. Typed Tabulation:
    a. Motor name; tag (equipment) numbers as shown on Drawings.
    b. Motor horsepower.
    c. Nameplate full load current.
    d. Measured load current and voltage.
    e. Heater model number and relay setting.
    f. Protective device trip settings.
    g. Manufacturer's solid state starter switch or dip switch or program settings.
    h. Attach above typed, tabulated data to a copy of starter manufacturer's overload heater or setting selection tables for starters provided.
10. Control diagrams.
11. One-line diagrams.
12. Schematic (elementary) diagrams.
13. Outline diagrams.

B. Informational Submittals:

1. Manufacturer's installation instructions.
2. Factory test reports, certified.
3. Operation and Maintenance Data as specified in Section 01 78 23, Operation and Maintenance Data.

1.4 QUALITY ASSURANCE

A. Provide products manufactured within scope of Underwriters Laboratories that conform to UL Standards and have applied UL Listing Mark.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Shipping Splits: Established by Contractor to facilitate ingress of equipment to final installation location within building.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:

1. Eaton Electrical/Cutler-Hammer.
2. GE Industrial Systems.
3. Schneider Electric/Square D Services.
4. Allen-Bradley.
5. Siemens.

2.2 GENERAL

A. Like Items of Equipment: End product of one manufacturer.

B. Make adjustments necessary to wiring, conduit, disconnect devices, motor starters, branch circuit protection, and other affected material or equipment to accommodate motors actually provided under this Contract.

C. Controllers: NEMA ICS 1, NEMA ICS 2, Class A.

D. Control Transformer:

1. Two winding, 120-volt secondary, primary voltage to suit.
2. Two current-limiting fuses for primary circuit.
3. One fuse in secondary circuit .
4. Mount within starter unit.

E. Suitable for use with 75 degrees C wire at full NFPA 70, 75 degrees C ampacity.

F. Lifting lugs on equipment and devices weighing over 100 pounds.

G. Anchor Bolts: Galvanized, sized seismically by a licensed structural engineer registered in the state where equipment is to reside, and as specified in Section 05 50 00, Metal Fabrications.

H. Seismic Zone and Importance Factor shall be as specified in Section 01 61 00, Common Product Requirements.

I. Operating Conditions:

1. Ambient Temperature: Maximum 40 degrees C .
2. Altitude: Zero feet above sea level.
3. Equipment to be fully rated.

J. Enclosures: In accordance with NEMA 250.

K. Equipment Finish:

1. Electrocoating process applied over rust-inhibiting phosphated base coating.
2. Exterior Color: Manufacturer's standard.

2.3 SEPARATELY MOUNTED MOTOR CONTROL

A. Manually Operated Starter, Fractional Horsepower:

1. Rating: 16 amperes continuous at 277 volts maximum.
2. Single-phase, nonreversing, full voltage with overload protection.
3. Toggle operated.
4. Enclosure: NEMA 250, Type 1, 3R, 4X, 7 and 9as shown.
5. Neon Light: Red
6. Handle guard/lock-off attachment.

B. Manually Operated Starter, Integral Horsepower:

1. Rating: Horsepower rated to maximum of 10 horsepower at 600 volts with overload protection.
2. Single-phase or three-phase, nonreversing, full voltage.
3. Control: Toggle.
4. Enclosure: NEMA 250, Type 1, 4X, 7 and 9 as shown on Drawings.
5. Red pilot light in series with auxiliary contact.
6. Locking in OFF position.
7. Two spare auxiliary, field-changeable contacts.

C. Combination Full-Voltage, Magnetic Starter:

1. Rating: Horsepower rated at 600 volts, UL labeled for 65,000 amperes at 480 volts short circuit capacity with overload protection.
2. Three-phase, nonreversing, full voltage.
3. Control: As shown on Drawings.
4. Disconnect Type: Motor circuit protector.
5. Enclosure: NEMA 250, Type 1, 4X, 7 and 9 as shown on Drawings.
6. Pilot Lights: Red–ON and Green–OFF.
7. Padlockable operating handle, capable of up to three locks.

D. Thermal Motor Overload Protection:

1. Inverse-time-limit characteristic.
2. Heater: Bimetallic overload, adjustable trip, or directly heated melting alloy, ratchet principle type element.

3. Relay Trip: Standard, Class 20.
4. Manual reset.
5. Provide in each ungrounded phase.
6. Mount within starter unit.

E. Solid State Motor Overload Protection:

1. Inverse-time-limit characteristic.
2. Phase loss, phase unbalanced and Class II ground fault protection.
3. Current operated electronic circuitry with adjustable trip.
4. Class 10/20/30 relay trip, switch selectable.
5. N.O. auxiliary contact for remote monitoring.
6. Manual reset.
7. Provide in each ungrounded phase.
8. Mount within starter unit.
9. Communications:

2.4 MOTOR CONTROL CENTERS

A. General:

1. In accordance with NEMA ICS 1, NEMA ICS 2, NEMA ICS 18, and UL 845.
2. Voltage Rating: 600 volts.
3. Short Circuit Rating: 65,000 amperes rms symmetrical at 480 volts for entire motor control center as a complete assembly.
4. Main and branch circuit breakers, controllers, wire connections, and other devices to be front mounted and accessible, unless otherwise noted.
5. NEMA ICS 18, Part 3.
   a. Class: II.
   b. Type: B.

B. Enclosure:

1. Type: NEMA 250 Type 1, indoor gasketed
2. Vertical Section Standard Indoor Dimensions for NEMA 1 Type:
   a. Nominal, 90 inches high, 20 inches wide, 21 inches deep.
   b. Alternative width dimensions of 24 inches and 30 inches are acceptable for oversize devices or panels.
   c. Do not exceed space shown.
3. Construction:
   a. Sheet steel reinforced with channel or angle irons.
   b. Butt sections flush, end-to-end against similar section without bolts, nuts, or cover plates causing interference.
   c. Removable top cover plates and bottom cover plates.

d. Removable plates on end panels for future bus extension.

4. Section Mounting: Removable formed-steel channel sills and lifting angles to meet specified seismic requirements.
5. Horizontal Wiring Compartments: Accessible from front, full width, top and bottom.
6. Vertical Wiring Compartment:
   a. Full height, isolated from unit starters with separate hinged door and tie supports.
   b. No terminal blocks allowed in vertical wireway compartment.
7. Terminal board compartment at unit space indicated with 20 percent spare terminals.
8. Unit Compartment: Individual compartments separated by steel barriers for each starter, feeder, or other unit capable of being wired from front without unit removal.
9. Compartment Doors: Separate hinged doors for each starter, feeder, or other unit.
10. Door Interlocking: Mechanically interlock starter and feeder doors so doors cannot be opened with unit energized. Provide defeater mechanism to allow intentional access and energizing at any time by qualified individual.
11. External disconnect handles with ON/OFF and trip positions showing, padlockable in OFF position with up to three-lock capability.
12. Cable Entrance: Main leads enter from bottom; control and feeder circuits enter from top and bottom.

C. Bus:

1. Horizontal Power Bus:
   a. Three-phase tin-plated copper, entire width of control center, rated as shown.
   b. Construct to allow future extension of additional sections.
   c. Pressure type solderless lugs for each incoming line cable.
   d. Isolated from top horizontal wireway.
   e. Provide Belleville washers on bus connection bolts.
2. Vertical Power Bus:
   a. Three-phase tin-plated copper, full height of section, rated 300 amperes, minimum.
   b. Sandwich type bus insulation providing deadfront construction with starter units removed except for bus stab openings.
   c. Insulated and isolated barrier, complete with shutters.
   d. Provide Belleville washers on bus connection bolts.
3. Neutral Bus:
   a. 50 percent neutral, entire width of control center.
   b. Copper, tin-plated.
   c. Provide Belleville washers on bus connection bolts.

4. Ground Bus:
    a. Copper, bare, rated 300 amperes, entire width of control center.
5. Bus Bracing: 65,000 amperes rms symmetrical.

D. Motor Controller Unit:

1. Provide indicated individual components and control devices including pushbuttons, selector switches, indicating lights, control relays, time delay relays, and elapsed time meters as specified in Section 26 05 04, Basic Electrical Materials and Methods.
2. Construction:
    a. Drawout combination type with stab connections for starters NEMA ICS, Size 5 and smaller.
    b. Bolt-on combination type with cable connection to riser for starters NEMA ICS, Size 6 and larger.
    c. Readily interchangeable with starters of similar size.
    d. Pull-apart unit control wiring terminal boards capable of accepting up to 2#14 AWG wires minimum on drawout units.
3. Starters:
    a. NEMA ICS 18, standard rating, except none smaller than NEMA ICS, Size 1.
    b. Rating: Horsepower rated at 600 volt, UL labeled for 65,000 amperes at 480 volts short circuit capacity with overload protection.
    c. Three-phase, nonreversing, unless specified otherwise.
    d. Disconnect Type: Motor circuit protector.
    e. Combination Full Voltage, Magnetic Starter:
        1) Control: As shown on Drawings.
        2) Pilot Lights: As shown on Drawings.
    f. Communications: None.
    g. Padlockable operating handle when de-energized with up to three-lock capability.
    h. Unit door interlocked to prevent opening when disconnect is in closed position.
    i. Mechanical interlocked to prevent placing disconnect in ON position when unit door is open.
    j. Minimum Dimensions: 12 inches high by full section width, less vertical wireway.
4. Disconnecting Device:
    a. As indicated.
    b. Padlockable in OPEN position for up to three locks.
5. Circuit Breaker:
    a. Meet requirements of UL 489.
    b. Molded case with manufacturer's recommended trip setting for maximum motor protection.

c. Thermal-magnetic trip or magnetic trip only as shown.
d. Tripping indicated by operating-handle position.
e. Interrupting capacity required for connection to system with short-circuit capacity indicated.

6. Solid State Motor Overload Protection:
   a. Inverse-time-limit characteristic.
   b. Phase loss, phase unbalance and Class II ground fault protection.
   c. Current operated electronic circuitry with adjustable trip.
   d. Class 10/20/30 relay trip, switch selectable.
   e. One N.O. auxiliary contact for remote monitoring.
   f. Manual reset.
   g. Provide in each ungrounded phase.
   h. Mount within starter unit.
   i. Communications: None.

E. Control Unit:

1. Disconnecting Device: Pull-apart terminal blocks capable of de-energizing external source control circuits in unit.
2. Control Devices: As indicated and as specified in Section 26 05 04, Basic Electrical Materials and Methods.
3. Control Wiring:
   a. Copper, 14 AWG, minimum.
   b. Permanent sleeve type markers with wire numbers applied to each end of wires.
   c. Terminate wires using insulated locking fork or ring type crimp terminals.
   d. Terminate current transformer leads on shorting type terminal blocks.

F. Incoming Line Terminal:

1. Construction: As specified in Paragraph, Motor Controller Unit.
2. Incoming Service Feeder: Cable.
3. Mechanical type CU-/AL lugs for 75 degrees C cable.

G. Main Protective Device and Feeder Unit:

1. Construction: As specified in Paragraph Motor Controller Unit.
2. Incoming Service Feeder: Cable.
3. Solid State Trip Circuit Breaker:
   a. In accordance with UL 489.
   b. Main protective device.

c. Insulated or molded case breakers with ambient insensitive solid-state trips and having current sensors and logic circuits integral in breaker frame.
d. Solid-state current control with adjustable ampere setting, adjustable long-time delay, adjustable short-time trip and delay band, fixed or adjustable instantaneous trip, and adjustable ground fault trip and delay band.
e. Setting adjustments to be covered by a sealable, tamper-proof, transparent cover (insulated case breakers only) or by compartment door for other breakers).
f. Locate trip button on front cover of breaker to permit mechanical simulation overcurrent tripping for test purposes and to trip breaker quickly in emergency situation.

4. Molded Case Circuit Breaker:
   a. In accordance with UL 489.
   b. Feeder protective device.
   c. Thermal-magnetic trip and interrupting capacity required for connection to system with short circuit capacity indicated.
   d. Indicate tripping by operating-handle position.
   e. Suitable for use with 75 degrees C wire at full NEC 75 degrees C ampacity.

5. Key Interlocking:
   a. Mechanical lock cylinders within main and generator breaker compartments.
   b. Key and Lock Cylinder Type: Kirk.
   c. Keys to be captive when breakers are closed.
   d. Two main and generator breaker arrangements.

H. Key Interlocks:

1. Two Main and One Generator Breaker Arrangement:
   a. Two keys available for each group of three locks.
   b. Both mains must be open to close generator breaker.

I. Automatic Transfer Switches: As specified in Section 26 36 23, Automatic Transfer Switch.

J. TVSS: As specified in Section 26 43 00, Transient Voltage Suppression.

K. Transformers: As specified in Section 26 22 00, Low-Voltage Transformers.

L. Pushbuttons, Indicating Lights, Selector Switches, Elapsed Time Meters, Control Relays, Time-Delay Relays, and Reset Timers: As specified in Section 26 05 04, Basic Electrical Materials and Methods.

M. Nameplates:

1. Laminated plastic; white, engraved to black core.
2. Provide for each motor control center and each unit.
3. Engrave with inscription shown on single-line diagram.
4. Provide blank nameplates on spaces for future units.
5. Attach with stainless steel panhead screws on face of control center.

2.5 SOURCE QUALITY CONTROL

A. Factory Testing:

1. Applicable Standards: NEMA ICS 18, UL 845, and NEC Article 430, Part VIII.
2. Perform standard factory inspection and tests in accordance with NEMA requirements to verify components have been designed to Specification, assembled in accordance with applicable standards, and each unit functions in accordance with electrical diagrams.
3. Actual operation shall be performed wherever possible. Otherwise, inspect and perform continuity checks.
4. Verify component devices operated correctly in circuits as shown on diagrams or as called for in Specification.
5. Control Circuits and Devices:
   a. Energize circuit at rated voltage.
   b. Operate control devices.
   c. Perform continuity check.
6. Instruments, Meters, Protective Relays, and Equipment:
   a. Verify devices functioned by energizing potential to rated values with connection to devices made at outgoing terminal blocks.
   b. Verify protective relays operated for functional checks and trips manually initiated to verify functioning of operation for indicator and associated circuits.
7. Perform dielectric tests on primary circuits and equipment, except potential transformers. Tests shall be made phase-to-phase and phase-to-around with 60-cycle test voltages applied for 1 second at 2,640 volts.
8. Verify equipment passed tests and inspection.
9. Provide standard factory inspection and test checklists, and final certified and signed test report.

PART 3 EXECUTION

3.1 INSTALLATION

A. General:

1. Install equipment in accordance with NEMA ICS 2.3, IEEE C2, NECA 402, Submittals, and manufacturer's written instructions and recommendations.
2. Secure equipment to mounting pads with anchor bolts of sufficient size and number adequate for specified seismic conditions.
3. Install equipment plumb and in longitudinal alignment with pad or wall.
4. Coordinate terminal connections with installation of secondary feeders.
5. Grout mounting channels into floor or mounting pads.
6. Retighten current-carrying bolted connections and enclosure support framing and panels to manufacturer's recommendations.
7. Motor Data: Provide typed, self-adhesive label attached inside each motor starter enclosure door displaying the following information:
    a. Motor served by tag number and equipment name.
    b. Nameplate horsepower.
    c. Motor code letter.
    d. Full load amperes.
    e. Service factor.
    f. Installed overload relay heater catalog number.

B. Circuit Breakers:

1. Field adjust trip settings of motor starter magnetic-trip-only circuit breakers.
2. Adjust to approximately 11 times motor rated current.
3. Determine motor rated current from motor nameplate following installation.

C. Overload Relay: Select and install overload relay heaters and switch settings after actual nameplate full-load current rating of motor has been determined.

3.2 MANUFACTURER'S SERVICES

A. Furnish manufacturer's representative in accordance with Section 01 43 33, Manufacturers' Field Services, for the following services at Job Site or classroom as designated by Owner, for minimum person-days listed below, travel time excluded:

1. One person-day for installation assistance, and inspection of installation.
2. One person-day for functional and performance testing.
3. One person-day for plant startup.
4. One person-day for training of Owner's personnel.

END OF SECTION

SECTION 26 27 26
WIRING DEVICES

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM): A167, Standard Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.
2. Federal Specifications (FS):
   a. W-C-596G, General Specification for Connector, Electrical, Power.
   b. W-S-896F, Switches, Toggle (Toggle and Lock), Flush Mounted (General Specification).
3. Institute of Electrical and Electronic Engineers, Inc. (IEEE):
   a. C62.41.2, Recommended Practice on Characterization of Surges in Low-Voltage (1000V and less) AC Power Circuits.
   b. C62.45, Recommended Practice on Surge Testing for Equipment Connected to Low-Voltage (1000V and less) AC Power Circuits.
4. National Electrical Contractors Association (NECA): 1, Standard Practice of Good Workmanship in Electrical Contracting.
5. National Electrical Manufacturers Association (NEMA):
   a. 250, Enclosures for Electrical Equipment (1000 Volts Maximum).
   b. FB 11, Plugs, Receptacles, and Connectors of the Pin and Sleeve Type for Hazardous Locations.
   c. WD 1, General Color Requirements for Wiring Devices.
   d. WD 6, Wiring Devices – Dimensional Specifications.
6. National Fire Protection Association (NFPA): 70, National Electrical Code (NEC).
7. Underwriters Laboratories Inc. (UL):
   a. 498, Standard for Safety for Attachment Plugs and Receptacles.
   b. 508, Standard for Safety for Industrial Control Equipment.
   c. 943, Standard for Safety for Ground-Fault Circuit-Interrupters.
   d. 1010, Standard for Safety for Receptacle-Plug Combinations for Use in Hazardous (Classified) Locations.
   e. 1436, Standard for Safety for Outlet Circuit Testers and Similar Indicating Devices.
   f. 1449, Standard for Safety for Surge Protective Devices (SPD).

1.2 SUBMITTALS

A. Action Submittals: Manufacturer's product data for wiring devices.

PART 2 PRODUCTS

2.1 SWITCHES

A. Switch, General Purpose:

1. NEMA WD 1 and FS W-S-896F.
2. Totally enclosed, ac type, with quiet tumbler switch and screw terminal.
3. Rivetless one-piece brass or copper alloy contact arm with silver alloy contact.
4. Capable of controlling 100 percent tungsten filament and fluorescent lamp loads.
5. Rating: 20 amps, 120/277 volts.
6. Automatic grounding clip and integral grounding terminal on mounting strap.
7. Special Features: Provide the following features in comparable devices where indicated:
   a. Three-way and four-way.
8. Manufacturers and Products, Industrial Grade:
   a. Cooper Arrow Hart; AH1220 Series.
   b. Bryant; 4901 Series.
   c. Hubbell; 1221 Series.
   d. Leviton; 1221 Series.

B. Switch, Motor Rated:

1. Type: Two-pole or three-pole, manual motor starting/disconnect switch without overload protection.
2. UL 508 listed.
3. Totally enclosed snap-action switch. Quick-make, slow-break design with silver alloy contacts.
4. Minimum General Purpose Rating: 30 amperes, 600V ac.
5. Minimum Motor Ratings:
   a. 2 horsepower for 120V ac, single-phase, two-pole.
   b. 3 horsepower for 240V ac, single-phase, two-pole.
   c. 15 horsepower for 480V ac, three-phase, three-pole.
6. Screw-type terminal.
7. Manufacturers and Products:
   a. Cooper Arrow Hart.
   b. Hubbell Bryant: HBL78 Series.
   c. Leviton.

2.2 RECEPTACLES

A. Receptacle, General Purpose:

1. NEMA WD 1 and FS W-C-596G.
2. Duplex, two-pole, three-wire grounding type with screw type wire terminals.
3. Impact resistant nylon cover and body, with finder grooves in face, unless otherwise indicated.
4. One-piece mounting strap with integral ground contact (rivetless construction).
5. Contact Arrangement: Contact to be made on two sides of each inserted blade without detent.
6. Rating: 125 volts, NEMA WD 1, Configuration 5-20R, 20 amps, unless otherwise indicated.
7. Size: For 2-inch by 4-inch outlet box.
8. Special Features: Provide the following features in comparable devices where indicated:
    a. Listed weather-resistant per NEC 406.8.
9. Industrial Grade Manufacturers and Products:
    a. Cooper Arrow Hart; 5362 Series.
    b. Hubbell Bryant; HBL5362 Series.
    c. Leviton; 5362 Series.

B. Receptacle, Ground Fault Circuit Interrupter:

1. Meet requirements of general-purpose receptacle.
2. Listed Class A to UL 943, tripping at 5 mA.
3. Rectangular smooth face with push-to-test and reset buttons.
4. Listed weather-resistant per NEC 406.8.
5. Feed-through Capability: 20 amps.
6. Manufacturers and Products:
    a. Hubbell Bryant; GFTR20 Series.
    b. Cooper Arrow Hart WRVGF20 Series.
    c. Leviton; 7899 Series.

C. Receptacle, Corrosion-Resistant:

1. Meet requirements of general-purpose receptacle.
2. Nickel coated metal parts.
3. Manufacturers and Products:
    a. Hubbell Bryant; HBL53CM62 Series.
    b. Leviton; 53CM-62 Series.
    c. Cooper Arrow Hart; 5362CR Series.

D. Receptacle, Special-Purpose:

1. Rating and number of poles as indicated or required for anticipated purpose.

2. Provide one matching plug with cord-grip features for each special-purpose receptacle.

2.3 HAZARDOUS (CLASSIFIED) LOCATION DEVICES

A. Wiring devices for hazardous (classified) locations shall comply with NEMA FB 11 and UL 1010.

B. Switch:

1. Industrial grade, totally enclosed, ac type, with tumbler switch.
2. Capable of three-way or four-way operation where indicated on Drawings.
3. Rating: 20 amps at 120/277 volts.
4. Material: Cast aluminum backbody and cover.
5. Hazardous Area Ratings: NEMA 7D suitable for Class I, Group C and Group D; Class 2, Groups E, F and G; and Class 3 locations.
6. Manufacturers and Products:
   a. Killark: XS Series.
   b. Appleton: EDS Series.

C. Switch, Motor Rated:

1. Enclosed manual motor starter-type, three-pole, nonreversing without overloads.
2. Minimum Motor Rating: 10 horsepower, 480V ac, three-phase, three-pole.
3. Enclosure: NEMA 250, Type 7.
4. Operator: External handle with padlocking provisions.
5. Manufacturer and Product: Eaton, Type B101.

D. Receptacles, General:

1. Contain integral switch which must be closed to energize circuit.
2. Design shall permit only an approved plug to be energized.
   a. Actuation of switch shall require plug be inserted and rotated approximately 45 degrees.
   b. Plug shall lock into this position preventing unintended disengagement.
   c. To remove, plug shall be turned opposite direction as engagement and pulled straight out.

E. General Purpose Receptacle, Explosion Proof, 125 Volts, 20 Amps:

1. Dead front, interlocked, circuit breaking.
2. Receptacle Cover: Spring loaded closes when plug is removed.

3. Enclosure: Corrosion-resistant, aluminum alloy with less than 0.4 percent copper.
4. Finish: Electrostatically applied and baked powder epoxy/polyester.
5. External Hardware: Type 316 stainless steel.
6. Switch Chamber: Factory sealed to contain switch's arcing components
7. Hazardous Area Ratings: Suitable for Class I, Division 2 NEMA 7D.
8. Provide matching plug with each receptacle.
9. Manufacturers and Products:
    a. Cooper Crouse-Hinds; Ark Guard 2, Series ENR.
    b. EGS/Appleton Electric; U-Line.
    c. Killark, a division of Hubbell Inc.; UGR/UGP.

F. Ground Fault Circuit Interrupter (GFCI), Explosion-Proof:

1. Meet requirements of general-purpose receptacle, except as otherwise indicated.
2. Hazardous Area Ratings: NEMA 7D suitable for Class I, Group C and Group D, Class 2, Groups F and G, and Class 3 locations.
3. Provide matching plug with each receptacle.
4. Manufacturers and Products:
    a. Killark; Acceptor series UGFI.
    b. Appleton; EFSXXX-2023GFI.

2.4 DEVICE PLATES

A. Sectional type plate not permitted.

B. Plastic:

1. Material: Specification grade, 0.10-inch minimum thickness, noncombustible, thermosetting.
2. Color: To match associated wiring device.
3. Mounting Screw: Oval-head metal, color matched to plate.

C. Metal:

1. Material: Specification grade, one-piece, 0.040-inch nominal thickness stainless steel.
2. Finish: ASTM A167, Type 302/304, satin.
3. Mounting Screw: Oval-head, finish matched to plate.

D. Cast Metal:

1. Material: Malleable ferrous metal with gaskets.
2. Screw: Oval-head stainless steel.

E. Sheet Steel:

1. Finish: Zinc electroplate.
2. Screws: Oval-head stainless steel.
3. Manufacturers:
   a. Appleton.
   b. Crouse-Hinds.

F. Engraved:

1. Character Height: 1/8-inch.
2. Filler: Black.

G. Weatherproof:

1. Receptacle:
   a. Gasketed, cast-aluminum, with individual cap over each receptacle opening.
   b. Mounting Screw and Cap Spring: Stainless steel.
   c. Manufacturers and Products:
      1) Crouse-Hinds; Type WLRD-1.
      2) Appleton; Type FSK-WRD.
2. Switch:
   a. Gasketed, cast-metal or cast-aluminum, incorporating external operator for internal switch.
   b. Mounting Screw: Stainless steel.
   c. Manufacturers and Products:
      1) Crouse-Hinds; DS-181 or DS-185.
      2) Appleton; FSK-1VTS or FSK-1VS.

H. Raised Sheet Metal: 1/2-inch high zinc- or cadmium-plated steel designed for one-piece drawn type sheet steel box.

I. Sheet Steel: Formed sheet steel or Feraloy designed for installation on cast-metal box.

2.5 OCCUPANCY SENSOR, WALL SWITCH

A. Description:

1. Passive-infrared type, 120/277-volt, adjustable time delay up to 30 minutes, 180-degree field of view, with a minimum coverage area of 900 square feet (84 square meters).
2. Provide dual switch unit where indicated.
3. Color: Manufacturer's standard white.

B. Manufacturers and Products:

1. Hubbell; WS1277.
2. Leviton; ODS 10-ID.
3. Pass & Seymour; WS3000.
4. Watt Stopper (The); WS-200.

2.6 FINISHES

A. Wiring device catalog numbers specified in this section do not designate device color. Unless otherwise indicated, or required by code, provide colors as specified below.

B. Wiring Device:

1. Office Areas: Gray.
2. Other Areas: Gray.

C. Special purpose and hazardous location devices may be manufacturer's standard color (black).

D. Corrosion-resistant receptacle may be manufacturer's standard color (yellow).

PART 3 EXECUTION

3.1 INSTALLATION, GENERAL

A. Comply with NECA 1.

B. Coordination with Other Trades:

1. Ensure device and its box are protected. Do not place wall finish materials over device box and do not cut holes for box with router that is guided by riding against outside of box.
2. Keep outlet box free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate raceway system, conductors, and cables.
3. Install device box in brick or block wall such that cover plate does not cross a joint, unless otherwise indicated. Where indicated or directed to cross joint, trowel joint flush with face of wall.
4. Install wiring device after wall preparation, including painting, is complete.

C. Conductors:

1. Do not strip insulation from conductors until just before they are spliced or terminated on devices.

2. Strip insulation evenly around conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
3. Length of free conductors at outlets for devices shall meet provisions of NFPA 70, Article 300, without pigtails.

D. Device Installation:

1. Replace devices that have been in temporary use during construction or that show signs they were installed before building finishing operations were complete.
2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
3. Do not remove surface protection, such as plastic film and smudge covers, until last possible moment.
4. Connect devices to branch circuits using pigtails that are not less than 6 inches (150 mm) in length.
5. Use torque screwdriver when a torque is recommended or required by manufacturer.
6. When conductors larger than 12 AWG are installed on 15-amp or 20-amp circuits, splice 12 AWG pigtails for device connections.
7. Tighten unused terminal screws on device.
8. Device Plates:
   a. Do not use oversized or extra deep plate.
   b. Repair wall finishes and remount outlet box when standard device plate does not fit flush or does not cover rough wall opening.

3.2 SWITCH INSTALLATION

A. Switch, General Purpose:

1. Mounting Height: See Section 26 05 33, Raceway and Boxes.
2. Install with switch operation in vertical position.
3. Install single-pole, two-way switch such that toggle is in up position when switch is on.

B. Switch, Motor Rated:

1. Mounting Height: See Section 26 05 33, Raceway and Boxes.
2. Install with switch operation in vertical position such that toggle is in up position when ON.
3. Install within sight of motor when used as disconnect switch.

C. Occupancy Sensor, Wall Switch: Install in accordance with manufacturer's instructions.

3.3 RECEPTACLE INSTALLATION

A. Duplex Receptacle:

1. Install with grounding slot down.
2. Ground receptacle to box with grounding wire only.
3. Weatherproof Receptacle:
    a. Install in cast metal box.
    b. Install such that hinge for protective cover is above receptacle opening.
4. Special-Purpose Receptacle: Install in accordance with manufacturer's instructions.

3.4 DEVICE PLATE INSTALLATION

A. Securely fasten to wiring device; ensure tight fit to box.

B. Flush Mounted: Install with all four edges in continuous contact with finished wall surface without use of mat or similar material. Plaster fillings will not be acceptable.

C. Surface Mounted: Plate shall not extend beyond sides of box, unless plate has no sharp corners or edges.

D. Install with alignment tolerance to box of 1/16 inch.

E. Engrave with designated title.

F. Type (Unless Otherwise Shown):

1. Office Areas: Plastic.
2. Other Areas: Metal.
3. Exterior:
    a. Switch: Weatherproof.
    b. Receptacle in Damp or Wet Locations: Weatherproof Type.

G. Interior:

1. Flush Mounted Box: Metal.
2. Surface Mounted, Metal Box:
    a. General Purpose Areas: Sheet Steel.
    b. Other Areas: Cast.
3. Surface Mounted, Aluminum Box:
    a. General Purpose Areas: Stamped.
    b. Other Areas: Cast.
4. Surface Mounted, Sheet Steel Box: Raised sheet steel.

5. Surface Mounted, Nonmetallic Box: Manufacturer's standard.

3.5 IDENTIFICATION

A. Use tape labels for identification of individual wall switches and receptacles in dry indoor locations.

1. Degrease and clean device plate surface to receive tape labels.
2. Use 3/16-inch Kroy black letters on white background, unless otherwise indicated.
3. Identify panelboard and circuit number from which item is served on face of plate.

B. Identify conductors with durable wire markers or tags inside outlet boxes where more than one circuit is present.

3.6 FIELD QUALITY CONTROL

A. Perform tests and inspections, and prepare test reports.

B. Test Instrument for 125-Volt 20-Amp Receptacle: Digital wiring analyzer with digital readout or illuminated LED indicators of measurement.

C. Using test plug, verify device and its outlet box are securely mounted.

D. Line Voltage Range: 105 volts to 132 volts.

E. Percent Voltage Drop under 15-Amp Load: Less than 6 percent; 6 percent or higher is not acceptable.

F. Ground Impedance: 2 ohms, maximum.

G. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.

H. Tests shall be diagnostic, indicating damaged conductors, high resistance at circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.

END OF SECTION

SECTION 26 36 23
AUTOMATIC TRANSFER SWITCHES

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. Institute of Electrical and Electronics Engineers (IEEE): C37.90.1, Standard for Surge Withstand Capability (SWC) Tests for Relays and Relay Systems Associated with Electric Power Apparatus.
2. National Electrical Manufacturers Association (NEMA):
   a. ICS 1, General Standards for Industrial Control and Systems: General Requirements.
   b. ICS 2, Industrial Control and Systems Controllers, Contactors, and Overload Relays not more than 2000 volts ac or 750 volts ac.
   c. ICS 6, Industrial Control And Systems: Enclosures 250, Enclosures for Electrical Equipment (1,000 Volts Maximum).
3. National Fire Protection Association (NFPA): 70, National Electrical Code (NEC).
4. Underwriters Laboratories, Inc. (UL): 1008, Transfer Switch Equipment.

1.2 SUBMITTALS

A. Action Submittals:

1. Descriptive product information.
2. Dimensional drawings.
3. Control diagrams.
4. Equipment ratings.

B. Informational Submittals:

1. Manufacturer's Certificate of Compliance, in accordance with Section 01 61 00, Common Product Requirements.
2. Operation and Maintenance Data: As specified in Section 01 78 23, Operation and Maintenance Data.

1.3 QUALITY ASSURANCE

A. Authority Having Jurisdiction (AHJ):

1. Provide the Work in accordance with NFPA 70, National Electrical Code (NEC). Where required by the AHJ, material and equipment shall be labeled or listed by a nationally recognized testing laboratory or other organization acceptable to the AHJ in order to provide a basis for approval under NEC.
2. Materials and equipment manufactured within the scope of standards published by Underwriters Laboratories, Inc. shall conform to those standards and shall have an applied UL listing mark.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. ASCO.

B. Russelectric.

2.2 GENERAL

A. Transfer switch to be product of a single manufacturer in order to achieve standardization for appearance, operation, maintenance, spare parts, and manufacturer's service.

B. In accordance with applicable standards of NFPA 70, NEMA ICS 1, NEMA ICS 2, NEMA ICS 6, IEEE C37.90.1, and UL 1008.

C. Transfer switch consisting of inherently double-throw power switch unit with interconnected control module.

D. Rated 100 percent, in amperes, for total system transfer of motor, electric heating, discharge lamp loads, and tungsten-filament lamp loads.

1. Switches rated 400 amperes and below suitable for 100 percent tungsten-filament lamp loads.
2. Switches rated above 400 amperes suitable for 30 percent tungsten-filament lamp loads.

E. Main and arcing contacts visible for inspection with cabinet door and barrier covers removed.

F. Terminal plate with pressure contacts for solidly connected neutral conductors.

G. Neutral transfer contacts for switched neutral conductors.

H. Suitable for 480/277 volts, three-phase, four-wire, grounded-wye electrical service having an available short circuit current at line terminals of 30,000 amperes rms symmetrical.

I. Switch Rating: As shown on the Drawings with continuous amperes in nonventilated enclosure.

J. Current carrying capacity of arcing contacts shall not be used to determine the transfer switch rating.

K. Suitable for use with 75 degrees C wire at full NFPA 70, 75 degrees C ampacity.

L. Operating Conditions:

1. Ambient Temperature: Maximum 40 degrees C.
2. Equipment to be fully rated without any derating for operating conditions listed above.

2.3 ENCLOSURE

A. Type: Open for mounting in motor control center.

2.4 TRANSFER SWITCH

A. Type: Electrically operated, mechanically held, double-throw.

B. Momentarily energized, single-electrically operated mechanism energized from source to which load is to be transferred.

C. Locking mechanism to maintain constant contact pressure.

D. Time delay in neutral position.

E. Silver alloy contacts protected by arcing contacts.

F. Main and arcing contacts visible when door is open and barrier covers removed.

G. Manual operating handle for transfer in either direction under either loaded or unloaded conditions.

H. Internal control wire connections made with ring or spade type terminals, lock washers, and sleeve type marking labels.

2.5 CONTROL MODULE

A. Completely enclosed and mounted separately from the transfer switch unit.

B. Microprocessor for sensing and logic control with inherent digital communications capability.

C. Plug-in, industrial grade interfacing relays with dust covers.

D. Connected to transfer switch by wiring harness having keyed disconnect plug.

E. Plug-in printed circuit boards for sensing and control logic.

F. Adjustable solid state undervoltage sensors for all three phases of utility and for one phase of standby source:

1. Pickup 85 to 100 percent nominal.
2. Dropout 75 to 98 percent of pickup setting.

G. Adjustable frequency sensors for standby source:

1. Pickup 90 to 100 percent nominal.
2. Dropout 87 to 89 percent of pickup setting.

H. Control module with adjustable time delays:

1. 0.5- to 6-second engine start delay.
2. 0- to 5-minute load transfer to emergency delay.
3. 0- to 30-minute retransfer to normal delay.
4. 0- to 30-minute unload running time delay.
5. Switch to bypass any of the above time delays during testing.

I. Form-C start contacts, rated 10 amperes, 32-volt dc, for two-wire engine control, wired to terminal block.

2.6 METERING INSTRUMENTS

A. Meters to be connected to load side of transfer switch.

B. Ammeter: LED digital type with current transformers, three-phase, line-to-line, OFF, four-position selector switch.

C. Voltmeter: LED digital type with three-phase, line-to-line, OFF, four-position selector switch and 600-volt scale.

2.7 INDICATORS

A. Type: Manufacturer’s standard.

B. Green lens to indicate switch position for utility power source.

C. Red lens to indicate switch position for standby power source.

D. White lens to indicate utility power source is available within parameters established by pickup and dropout settings.

E. Amber lens to indicate standby power source is available within parameters established by pickup and dropout settings.

F. Provide one normally open and one normally closed, 5 amperes, 120-volt contact for remote indication when transfer switch is in either position.

2.8 FACTORY TESTS

A. Test to Ensure Correct:

1. Operation of individual components.
2. Sequence of operation.
3. Transfer time, voltage, frequency, and time delay settings.

B. Dielectric strength test per NEMA ICS 1.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Mount within the motor control center.

END OF SECTION

SECTION 26 42 00
GALVANIC ANODE CATHODIC PROTECTION SYSTEM

PART 1 – GENERAL

1.1 WORK OF THIS SECTION

A. The Contractor shall provide all labor, materials, tools, and incidentals to install a cathodic protection system for the new 16-inch dielectrically coated Ductile Iron Pipe (DIP), 24-inch and 48-inch Cement Mortar Lined and Tape Coated/Mortar Coated (CML&TCMC). The cathodic protection system shall include all electrical connections, anodes, test stations, insulators, and all accessories required for a complete and operable system. The Contractor shall provide all labor, materials, tools, and incidentals to install a cathodic protection system for the new buried metallic piping associated with the Morena Pump Station Package A Yard Piping including all electrical connections, anodes, test stations, insulators, enclosures, and all accessories required for a complete and operable system.

B. The Contractor shall retain a qualified Corrosion Engineer to direct the construction of facilities specified herein. The Corrosion Engineer shall test and certify that the corrosion control facilities for this project are constructed properly and as specified, and are fully functional.

1.2 DEFINITIONS

A. Contractor: The licensed prime installer selected by the City.

B. Owner: The City of San Diego.

C. Corrosion Engineer: A qualified Corrosion Engineer retained by the Contractor who is either a Registered Professional Corrosion Engineer or NACE-International Certified Cathodic Protection Specialist or Corrosion Specialist.

D. Engineer: The City of San Diego's Resident Engineer or designated representative.

E. City's Corrosion Engineer: The Engineer's appointed representative from the City's Corrosion Section.

1.3 CONTRACTOR QUALIFICATIONS

A. All work must be conducted by qualified, experienced personnel working under continuous, competent supervision. Cathodic protection installation and testing shall be done under the direct supervision of a Corrosion Engineer. The Contractor doing the electrical installations shall have proper valid State of California licenses.

1.4 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. Commercial Standards:

1. A497 – Steel Welded Wire Reinforcement

2. ASTM A615 - Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement

3. AWWA C217 - Wax Coating Systems for Underground Piping Systems
4. Green Book - Standard Specifications for Public Works Construction, 2015 edition
5. Mil-C-18480-B - Coating Compound, Bituminous, Solvent, Coal Tar Base
6. NACE SP0169 - Standard Practice, Control of External Corrosion on Underground or Submerged Metallic Piping Systems
7. NACE SP0286 - Electrical Isolation of Cathodically Protected Pipelines
8. NEMA LE - Cotton Phenolic Resin – Electrical Grade
9. NEMA CE - Canvas Phenolic Resin - General Purpose Grade
10. NEMA G10 – Glass Reinforced Epoxy
11. UL 514 - Metallic Outlet Boxes
12. Standard Specifications of Public Works Construction City Supplement (White Book) latest edition
13. Standard Drawings for Public Works Construction latest edition.

1.5 CONTRACTOR SUBMITTALS

A. The Contractor shall furnish the following documents (Submittals) AS ONE SUBMITTAL PACKAGE:

1. Catalog cuts and other information for products to be used including:
   a. Conduit and Fittings
   b. Wire, Leads, and Cable
   c. Anode Shunts
   d. Ready Mix Concrete
   e. Plastic Warning Tape
   f. Exothermic Weld Kits
   g. Elastomeric Weld Caps
   h. Exothermic Weld Coating
   i. At-Grade Concrete Test Box
   j. Phenolic Test Board
   k. Flange Isolation Kits
   l. Wax Tape Coating System
   m. Standard Potential Galvanic Anode
2. As-Built Drawings: The Contractor shall maintain as-built drawings showing the exact locations of anodes, test stations, insulators, and wire trenching runs. Location changes shall be clearly indicated in red on a copy of the design drawings. These drawings shall be submitted to the Engineer before the work is considered complete. Provide sub-foot GPS coordinates for all test stations.
3. Certifications: The Contractor shall submit a notarized affidavit of compliance that all Work, materials and equipment required according to

this Section were properly constructed and manufactured in full conformance with these Contract Documents. The Contractor shall submit the manufacturers' Certificates of Compliance.

B. Test and Inspection Reports: The Contractor shall submit field test and inspection reports. Testing reports shall include at a minimum: native or baseline pipe-to-soil potentials; electrical isolation testing, insulating flange kit testing, electrical continuity for all metallic pipe sections containing non-welded joints or inline specials not intentionally electrically isolated, cathodic protection system activation, any deficiencies; and conclusions and recommendations. The final testing report issued for this project shall include all previous testing results, approved material submittals, and as-built drawings. The reports shall be submitted in an electronic PDF format. In addition all tabulated calculated data shall be submitted as a Microsoft Excel file format.

D. Qualifications: The Contractor shall submit documentation of the qualifications of the Corrosion Engineer.

1.6 PACKAGING AND SHIPPING

A. The Contractor shall coil wires, secure and package anodes as required to prevent damage during shipment.

1.7 NOTIFICATION FOR TESTING AND INSPECTION

A. The Contractor shall notify the Engineer at least seven days in advance of the installation of anodes, insulators, wiring, and test stations. The Engineer or the Owner’s Representative shall witness all corrosion control installations at their discretion.

1.8 CORROSION ENGINEER QUALIFICATIONS SUBMITTAL

A. Services of Corrosion Engineer: Obtain the services of a Corrosion Engineer to inspect, activate, adjust, and evaluate the effectiveness of the cathodic protection system. The Corrosion Engineer is herein defined as a registered Professional Engineer with certification or licensing that includes education and experience in cathodic protection of buried or submerged metal structures, or a person accredited or certified by NACE International at the level of Corrosion Specialist or Cathodic Protection Specialist (i.e. NACE International CP Level 4). The Corrosion Engineer shall directly oversee the Cathodic Protection Technician, review all cathodic protection specification sections related inspections and field measurements, and certify the accuracy and completeness of all cathodic protection submittals and reports.

B. Services of Cathodic Protection Technician: Obtain the services of a Cathodic Protection Technician to inspect, activate, adjust, and evaluate the effectiveness of the cathodic protection system. The Cathodic Protection Technician is herein

defined as a person accredited or certified by NACE International as a Cathodic Protection Level 2 Technician.

PART 2 – PRODUCTS

2.1 CONDUIT, FITTINGS, AND ACCESSORIES

A. All below-grade wire shall be run in schedule 40 PVC conduit. All above-grade conduit shall be rigid galvanized steel.

B. Fittings: Fittings for use with rigid steel conduit shall be galvanized cast ferrous metal, with gasket covers. Rigid metallic conduit fittings shall be galvanized conforming to UL 514. Fittings for use with either rigid nonmetallic conduit shall be PVC and shall have solvent weld-type conduit connections.

C. Elbows: All buried conduit elbows shall be long radius ell type.

2.2 WIRES

A. General: Conform to applicable requirements of NEMA WC 70. All wires shall be single conductor, unless otherwise specified. All wires shall be single conductor, stranded copper wire with 600-volt HMWPE insulation, unless otherwise specified.

B. Joint Bond for DIP: Two No. 6 AWG HMWPE.

C. Joint Bond for CML&TC Steel Pipe: Two No. 2 AWG HMWPE

D. Test Station Pipeline Leads: No. 8 AWG HMWPE.

E. Galvanic Anode Leads: No. 12 AWG THWN (WHITE).

2.3 SHUNTS

A. Galvanic Anode Test Stations: The shunt resistance shall be such that a 2-Amp current causes a voltage drop of 200-millivolts (i.e. 0.10-ohms). Shunts shall be flat manganin ribbon style as manufactured by Cott or approved equal.

2.4 CONCRETE

A. Reinforcing steel: ASTM A615, Grade 60 deformed bars and welded wire fabric.

B. Welded Wire Fabric: ASTM A497.

C. Formwork: Plywood, earth cuts may be used.

D. Concrete with minimum 3,000 psi compressive strength at 28 days.

2.5 ANCILLARY MATERIALS

A. Electrical Tape: Linerless rubber high-voltage splicing tape and vinyl electrical tape suitable for moist and wet environments. Use Scotch 130C and Scotch 88 as manufactured by 3M Products.

B. Wire Connectors: One-piece, tin-plated crimp-on lug connector as manufactured by Burndy Co., Thomas and Betts.

C. Insulating Resin: At Contractor's option, bitumastic coating (Koppers 50 or equal) may be used if allowed to dry completely before covering.

2.6 MARKING TAPE

A. Inert polyethylene, impervious to known alkalis, acids, chemical reagents, and solvents likely to be encountered in soil.

B. Thickness: Minimum 4-mils.

C. Width: 6-inches.

D. Identifying Lettering: Minimum 1-inch high, permanent black lettering imprinted continuously over entire length.

E. Color: Red with black lettering as follows: "CAUTION CATHODIC PROTECTION CABLES BURIED BELOW."

2.7 EXOTHERMIC WELDS

A. General: Wire sleeves, welders, and weld cartridges according to the weld manufacturer's recommendations for each wire size and pipe or fitting size and material. Welding materials and equipment shall be the product of a single manufacturer. Interchanging materials of different manufacturers will not be accepted.

B. Weld Caps: Exothermic welds shall be sealed with a pre-fabricated plastic cap filled with formable mastic compound on a base of elastomeric tape. Use Royston Handy Cap IP with integrated primer or approved equivalent.

C. Weld Coating: All bare metal shall be coated. Exothermic welds and weld caps shall be coated with a cold-applied, fast-drying mastic consisting of bituminous resin and solvents per MIL-C-18480B. Use Royston R28, Royston R28 Zero VOC, Royston A51 Plus, Royston A51 Low VOC, Tapecoat TC Mastic or approved equal.

2.8 AT-GRADE TEST STATIONS

A. At-Grade (Flush) Mounted:

B. Test Box: Concrete box of dimensions as shown on the Drawings. Use Brooks 3RT, Christy G-05, or approved equal, with a cast iron lid. The cast iron lid shall be South Bay Foundry Part #B1160 and #B6199 or approved equal and shall be cast with the letters "City of San Diego Corrosion Test Station".

C. Each CP Test Box shall include a 5 inch x 5 inch cross-laminated phenolic terminal board with a minimum thickness of 1/4-inch. The phenolic material shall be NEMA type CE or LE or phenolic grade xx. The terminal board shall contain individual electrical lugs for each wire entering the test station or junction box.

2.9 WAX TAPE COATING FOR BURIED SURFACES AND BURIED ISOLATION FLANGES

A. All buried pipe sections of pipe, specials, and fitting surfaces that are not tape wrapped or epoxy coated shall be wrapped with a petrolatum wax tape coating per

AWWA C217 with plastic outer wrap. No bare metallic surfaces shall be buried, backfilled, or in contact with the soil.

B. Apply a wax tape coating system which conforms to AWWA C217 and consists of three parts: surface primer, wax-tape, and outer covering.

C. The primer shall be a blend of petrolatum, plasticizer, and corrosion inhibitors having a paste like consistency. It shall have a pour point of 100-degrees F to 110-degrees F and a flash point of 350-degrees. Use Trenton Wax-Tape Primer, or approved equal.

D. The wax-tape shall consist of a synthetic-fiber felt, saturated with a blend of high melt microcrystalline wax, solvents, and corrosion inhibitors, forming a tape coating that is easily formable over irregular surfaces and which firms up after application. The tape shall have a saturant pour point between 125-degrees F and 130-degrees F and a dielectric strength equal to a minimum of 100-volts per mil. Tape thickness shall be 70-mils to 90-mils in 6-inch wide rolls. Use Trenton No. 1 wax-tape, or equal.

E. The outer covering shall consist of two layers of a plastic wrapper. The plastic wrapper material shall consist of three 10-mil thick clear polyvinylidene chloride, high cling membranes wound together as a single sheet. Use Trenton Poly-Ply, or equal.

2.10 STANDARD POTENTIAL MAGNESIUM ANODES

A. CAPACITY. Standard potential magnesium anodes shall have a theoretical energy content of 1000 ampere-hours per pound and have a minimum useful output of 500 ampere-hours per pound.

B. CHEMICAL COMPOSITION (STANDARD POTENTIAL MAGNESIUM) ASTM B843

aluminum	5.30 to 6.70 percent
manganese	0.15 to 0.70 percent
zinc	2.50 to 3.50 percent
copper	0.02 percent max
nickel	0.002 percent max
iron	0.003 percent max
silicon	0.10 percent max
others, total	0.30 percent max
magnesium	remainder

C. OPEN CIRCUIT POTENTIAL. The open circuit potential of all anodes, buried in the soil, shall be between 1.45 and 1.55 volts dc versus a copper-copper sulfate reference electrode.

D. INGOT SIZE AND WEIGHT. Anodes shall be 17-pound pre-packaged, standard potential ingots with a trapezoidal cross section. Ingot length shall be 25.25 inches long. The total packaged weight shall be 45 lbs.

E. ANODE CONSTRUCTION. Anodes shall be cast magnesium with a galvanized steel core rod recessed on one end to provide access to the rod for connection of the lead wire. Silver braze the lead wire to the rod and make the connection mechanically secure. Insulate the connection to a 600 volt rating by filling the recess with epoxy and covering any exposed bare steel core or wire with heat shrinkable tubing. The insulating tubing shall extend over the lead wire insulation by not less than 1/2 inch. The anode lead wire shall be stranded copper and shall be connected directly to the anode steel core as described above. There shall be NO wire splices between the anode steel core and the tag end at the test station.

F. ANODE PRE-PACKAGED BACKFILL MATERIAL. The anodes shall be completely encased and centered within a permeable cloth bag in a special low resistivity backfill mix with the following composition:

Gypsum	75%
Powdered bentonite	20%
Anhydrous sodium sulfate	5%

G. Backfill grains shall be such that 100 percent is capable of passing through a screen of 100 mesh. Backfill shall be firmly packed around the anode such that the ingot is approximately in the center of the backfill. The resistivity of the backfill shall be no greater than 50 ohm-cm when tested wet in a soil box. Total prepackaged weight shall be approximately 45 pounds.

2.11 PIPE FLANGE ISOLATION KIT

A. For purposes of this specification, the terms “Pipe Flange Isolation Kit”, “Insulating Flange”, “Insulating Joint”, and “Dielectric Flange” are used synonymously.

B. The Contractor shall over drill flange holes where insulating kits are to be used per AWWA C207 to accommodate insulating sleeves.

C. The Pipe flange isolation kit materials shall be designated by the manufacturer as suitable for service at the operating temperatures and pressures specified on the Plans.

D. Flange isolation kits shall consist of a one piece, full-face, insulating gasket, an insulating sleeve for each bolt, insulating washers, and steel washers. For nominal pipe diameters up to and including 36-inches, provide one insulating washer and one steel washer on each side of the flange for each flange bolt.

E. Insulating Gasket: Insulating gasket retainers shall be full face, Type E, NEMA G-10 glass reinforced epoxy retainers with an Ethylene Propylene Diene Monomer (EPDM) rubber rectangular cross section O-ring seal. Minimum total gasket thickness shall not be less than 1/8-inch. The gasket shall have the same outside diameter as the pipe flange. For steel pipe the gasket's inside diameter shall be equal to the inside diameter of the pipe's steel cylinder. At valve to pipe connections where the inside diameters are not equal, the gasket's inside diameter shall be equal to the smaller of the two inside diameters. Dielectric strength shall be not less than 550-volts per mil, and compressive strength shall be not less than 50,000-psi. The manufacturer's name and date of manufacture shall be marked on both sides of the gasket with minimum two-inch tall block letters using a durable marking ink or paint. The gasket shall be installed within 12 months of its date of manufacture. Do not store insulated flange gaskets at jobsites under direct sunlight or at temperatures exceeding 110 degrees Fahrenheit. Use PSI Linebacker insulating gasket, or approved equal.

F. Insulating Sleeves: Provide full length, one piece, NEMA G-10 glass reinforced epoxy insulating flange bolt sleeves. Dielectric strength shall be not less than 400-volts per mil. The length of the insulating sleeves shall provide an air gap between the end of the insulating sleeve and inside surface of the stud bolt nut with a tolerance of 1/32-inch minimum and 1/8-inch maximum. Insulating sleeve length must be adjusted for the actual thickness of the washers and insulating washer thickness.

G. Insulating Washers: Insulating washers shall be NEMA G-10 glass reinforced epoxy with a minimum thickness of 1/8-inch. Dielectric strength shall not be less than 550-volts per mil, and compressive strength shall not be less than 50,000-psi. The insulating washer's inside diameter shall be sized to fit over the insulating sleeve's outside diameter.

H. Steel Washers: Provide hardened steel washers that conform to ASTM F436 for insulated flanges greater than 36 inches in nominal diameter. Double steel washers (4 steel washers per flange bolt) are required for insulated flanges greater than 36 inches in nominal diameter. The inside and outside diameter of the steel washers shall match those of the insulating washers. The steel washers must be able to freely rotate around the insulating sleeve. Attention must be paid to the fit between the steel washers and the insulating sleeve in order to avoid the washers twisting and cracking the sleeves when the flange bolts are torqued.

I. Provide four extra insulating sleeves and eight extra insulating washers for each insulating flange upon successful inspection of the insulating flange by the Engineer.

J. Fill the internal groove between the two insulating flange faces with an

elastomeric sealant compatible with the host pipe lining. The elastomeric sealant shall be a non-sag, polyurethane based, sealant that is NSF approved for potable water contact. The elastomeric sealant shall be Sikaflex IA or approved equal.

PART 3 – EXECUTION

3.1 GENERAL

A. Work not specifically described herein shall conform to NACE SP0169, NACE SP0286, the Standard Specifications for Public Works Construction 2015 (Greenbook) and City Supplement White Book and Standard Drawings.

3.2 WIRE CABLES AND CONDUCTORS

A. Buried Wires, Cables and Leads: Buried pipeline, test station, or anode leads and conduits shall be at a 36-inch deep, minimum, below finished grade. Wires shall be free of splices. The Contractor shall compact wire trenches and re-pave in accordance with the Greenbook/Whitebook Standards.

B. Warning Tape: Bury warning tape in the trench 12-inches below grade and above underground conductors and conduits. Align parallel to and within 2-inches of the centerline of the conduit run.

3.3 CONDUITS

A. Securing Conduits: Secure conduits entering above-grade test station boxes with double locknuts, one on the outside and one on the inside.

B. Insulation Fittings: Install insulated bushings and insulated throat connectors on the ends of rigid metallic conduit.

C. Watertight Fittings: Use watertight couplings and connections. Install and equip boxes and fittings to prevent water from entering the conduit or box. Seal unused openings.

3.4 WIRE-TO-PIPE CONNECTIONS

A. Exothermic Weld:

1. Use exothermic weld method for electrical connection of copper wire to steel surfaces. Observe proper safety precautions, welding procedures, weld charge selection, and surface preparation recommended by the welder manufacturer. Assure that the pipe or fitting wall thickness is of sufficient thickness that the exothermic weld process will not damage the integrity of the pipe or fitting wall or protective lining. One exothermic weld shall be used for one wire only.

2. Preparation of Metal: Remove all coating, dirt, grime, and grease from the metal surface by wire brushing and/or use of suitable safe solvents. Clean the surface to a bright, shiny surface free of all pits and flaws. The surface must be completely dry.

3. Testing: After the weld connection has cooled, remove slag, visually inspect, and physically test wire connection by striking the weld with a 2-lb hammer while pulling firmly on the wire. All unsound welds shall be completely removed, the surface prepared again, and re-welded. All weld slag shall be removed from the weld before applying coating and weld cap.

B. Protective Coating: The Contractor shall furnish all materials, clean surfaces and repair any damage to protective coatings and linings damaged as a result of the welding. A coating shall be applied to all exothermic weld locations. The coating for dielectrically coated steel shall be as described in Section 2.11 above. All surfaces must be clean and dry and free of oil, dirt, loose particles and all other foreign materials before application of the coating. The coating must cure per the manufacturer's recommendations prior to backfill. The mortar rockshield shall be repaired per the manufacturer's recommendations.

3.5 MAGNESIUM ANODES

A. INSPECTION. All lead wires shall be inspected to ensure that the lead wire is securely connected to the anode core and that no damage has occurred to the lead wire. Lead wire failures shall require replacement of the complete anode and lead wire.

B. PRE-PACKAGED ANODE INSPECTION. Each anode shall be inspected to ensure that the backfill material completely surrounds the anode and that the cloth bag containing the anode and backfill material is intact. If the prepackaged anodes are supplied in a waterproof container or covering, that container or covering shall be removed before installation. The CONTRACTOR shall notify the ENGINEER at least seven (7) days in advance of installing the anodes.

C. LOCATION. Anodes are to be installed in augured holes as shown in the drawings. Anode positions can be adjusted slightly to avoid interference with existing structures. Alternate anode positions must be approved by the ENGINEER.

D. HANDLING. Care shall be taken to ensure that the anode is never lifted, supported, transported, or handled by the lead wire. All anodes shall be lowered into the hole using a sling or a rope.

E. ANODE HOLE SIZE AND DEPTH. Anodes shall be placed vertically at the bottom of a 12 feet deep augured hole, 12 inches in diameter (minimum).

F. SOAKING REQUIREMENTS, PRE-PACKAGED ANODES. Once the prepackaged anodes are in the hole, water shall be poured into the hole so that the anodes are completely covered with water. Allow the anodes to soak for a minimum of 30 minutes before any soil backfill is added.

G. SOIL BACKFILL. After the pre-packaged anodes are soaked, the hole is backfilled with stone-free, native soil. No voids shall exist around the anode bags and the

anode lead wire shall not be damaged. The backfill shall be tamped and compacted in 18 inch lifts above the anode taking care not to damage the anode lead wire.

3.6 AT-GRADE TEST STATIONS

A. LOCATION. Test boxes shall be located over the pipe where possible. Do not install in sidewalks, driveways, traffic lanes, or gutters. All test box locations shall be approved by the ENGINEER.

B. TEST BOX BOTTOM: Test boxes shall be set in native soil.

C. TEST LEAD ATTACHMENT. Test leads shall be attached to the pipe using the exothermic weld process. An 18-inch length of slack wire shall be coiled at each weld.

D. CONCRETE PAD. A 2-foot by 2-foot by 6-inch thick (2' X 2' X 6") reinforced concrete pad is required around each test station. Concrete pad shall extend 2-inches above grade and shall have a 2% slope.

3.7 EXTERNAL COATING

A. All insulating couplings shall be covered with a 3-layer wax tape coating system per AWWA C217 with plastic outer wrap. Additionally, all in-line valves, flanges couplings, and adapters that are not coated with a bonded dielectric coating shall be wax tape coated per AWWA C217 with plastic outer wrap.

B. Primer: Surfaces must be cleaned of all dirt, grime, and dust by using a wire brush and clean cloth. The surface shall be dry. Apply the primer by hand or brush. A thin coating of primer shall be applied to all surfaces and worked into all crevices. The primer shall be applied generously around bolts, nuts, and threads, and shall fully cover all exposed areas. The primer should overlap the pipe coating by a minimum of 3-inches.

C. Petrolatum Saturated Tape: The wax tape can be applied immediately after the primer. Short lengths of tape shall be cut and carefully molded around each individual bolt, nut, and stud end. For long bolts (such as in couplings), short lengths of tape shall be cut and circumferentially wrapped around each individual bolt. After the bolts are covered, the tape shall be circumferentially wrapped around the flange with sufficient tension to provide continuous adhesion without stretching the tape. The tape shall be formed, by hand, into all voids and spaces. There shall be no voids or gaps under the tape. The tape shall be applied with a 1-inch minimum overlap. Minimum thickness of 70 mils over flat surfaces. Minimum thickness of 140 mils over edges.

D. Outer Covering: A plastic outer cover shall be applied over the petrolatum-saturated tape. The plastic shall be a minimum of 50-guage (10-mils) and shall have two layers applied.

3.8 REBAR GROUND CABLE AT CONCRETE STRUCTURES

A. Minimum size #2 AWG, bare copper stranded grounding cable. The quantity of cable required should be sufficient to run two ground cables from a flush-to-grade concrete ground box down to two separate exothermic connections made to rebar inside each concrete encasement or major reinforced concrete structure. Locate the rebar ground text boxes adjacent to cathodic protection test boxes.

3.9 INSTALLATION OF FLANGE ISOLATION MATERIALS

A. Provide a minimum of five days advance notice to the Engineer before assembling insulated pipe flanges to allow for coordination and observance of its installation. The Engineer shall inspect the condition of the gasket's O-ring immediately before the gasket is installed to ensure it is free of cracks, dry rot, cuts, or other defects.

B. Install pipe flange insulating materials at the locations shown on the Plans. Install pipe flange insulating materials in accordance with the manufacturer's recommendations and NACE recommended practice SP0286, "Electrical Isolation of Cathodically Protected Pipelines. Particular attention shall be paid to properly aligning the flanges prior to inserting the insulating sleeves around flange bolts.

C. Prevent moisture, soil, or other foreign matter from contacting any portion of the insulated flange prior to or during installation. If moisture, soil, or other foreign matter contacts any portion of the insulated flange, disassemble it, clean with a suitable solvent and dry prior to reassembling. Follow the manufacturer's recommendations regarding the torque pattern of the bolts and the amount of torque to be used when installing the flange insulating kit. Do not use conductive grease on the flange bolts or any other flange components. Note: the following products have been tested for electrical conductivity and approved for use: Huskey 2000 Lubricating Paste & Anti-Seize compound, Triflow aerosol lubricant with Teflon additive, or approved equal.

D. All insulating flange kits that will be buried must be tested and approved by the City's Corrosion Engineer before burial. Failure to have written approval by the City before burial may require the contractor to re-excavate the insulating flange assembly for proper testing at the contractor's expense.

PART 4 – TESTING AND INSPECTION

4.1 General

A. The CP system shall be activated and adjusted by the Contractor's Corrosion Engineer. The Contractor is required to contact the City's Corrosion Section at

least 5 days in advance of all corrosion control/cathodic protection facility installations. The Engineer, City's Corrosion Engineer, or the Owner's Representative shall witness all testing and installations at their discretion. All test data shall be submitted to the City's Corrosion Engineer within seven (7) days of the completion of the testing. All testing shall be conducted under the supervision of a qualified Corrosion Engineer who is retained by the Contractor. All deficiencies found to be due to faulty materials or workmanship shall be repaired or replaced by the Contractor and at his/her expense.

4.2 TEST LEADS AND BOND WIRES

A. Responsibility: The Contractor shall be responsible for testing and inspecting all test leads, bond wires, and exothermic welds.

B. Test Method: All completed wire connections shall be tested by striking the weld with a 2-lb. Hammer while pulling firmly on the wire. Failed welds shall be completely removed, the surface re-prepared, and re-welded. Welds shall be spot tested by the Engineer. After backfilling, all test leads shall be tested using a standard ohmmeter.

C. Acceptance: The resistance between each pair of test leads shall not exceed 120% of the total wire resistance as determined from published wire data.

4.3 ANODE LEAD WIRE INSPECTION

A. Responsibility: The City's Corrosion Engineer will inspect each anode lead wire at the anode site. The Contractor shall assist the City's Corrosion Engineer and is responsible for inspecting/testing the anode lead wire insulation prior to storing and shipping.

B. Test Method: Inspection shall be visual and by feel, or by using a Holiday Tester. The Engineer shall inspect and run his or her hand along the full length of each anode lead wire cable just prior to installation in the well.

C. Acceptance: All anode lead wires shall be free of cuts, nicks, and abrasions. Cables with damage shall be rejected.

4.4 TEST LEAD TRENCHING AND BACKFILL

A. Responsibility: The Engineer, at his or her discretion, shall inspect wire trenches and backfill material and methods.

B. Test Method: The depth, trench bottom padding, and backfill material shall be visually inspected before backfilling.

C. Acceptance: Conformance with specifications.

4.5 CP TEST STATION WIRE INTEGRITY TESTING

A. Testing of Completed Welds: Exothermically welded wire-to-pipeline connections shall be inspected by the Engineer prior to backfilling the pipeline. At the Engineer's direction, tests to verify the soundness of the welds shall be conducted

by the Contractor. Tests for this purpose shall consist of striking the weld nugget with a 2-pound hammer while steadily pulling on the wire. Note that the wire near the weld shall not be unnecessarily cold worked during installation or testing. Remove and re-weld any welds that break loose or show signs of separating, as determined by the Engineer.

B. Wire Identification: The Engineer shall be given two day's advance notice to verify that buried pipe lead wires and anode lead wires are properly identified prior to backfilling the wires.

C. CP Test Wire Resistance Tests: After the pipeline is backfilled and the CP test wires are trenched to the CP Test Box or CP Monitoring Station, each pair of CP test wires shall be tested for integrity. The CP Technician shall measure the electrical resistance of one CP test wire to the pipeline and back on the second CP test wire. If more than twice the theoretical resistance of the total wire length installed is measured, the Contractor shall re-excavate the pipeline and replace or re-weld the CP test wires to the pipeline. Use the following copper wire unit resistance values to calculate the theoretical resistance of each pair of CP test wires.

1. No. 2 AWG wire 0.162 Ohms / 1000 feet
2. No. 4 AWG wire 0.258 Ohms / 1000 feet
3. No. 6 AWG wire 0.411 Ohms / 1000 feet
4. No. 8 AWG wire 0.653 Ohms / 1000 feet
5. No. 10 AWG wire 1.038 Ohms / 1000 feet
6. No. 12 AWG wire 1.650 Ohms / 1000 feet
7. No. 14 AWG wire 2.624 Ohms / 1000 feet

4.6 FLANGE ISOLATION KIT TESTING

A. Each buried insulating flange shall be tested for its electrical isolation effectiveness by and acceptable to the City's Corrosion Engineer prior to burial. The insulating flange shall be tested for electrical isolation before the wax tape coating is applied. Testing shall be performed and deemed as acceptable as described in the above grade testing procedure.

B. Each above grade or insulating flange within a vault shall be tested for its electrical isolation effectiveness. This testing shall be performed by the Contractor's Cathodic Protection Technician and witnessed by the City's Corrosion Engineer. The Contractor shall provide written notice of this testing to the Engineer a

minimum of two days in advance. If the insulated pipe flange will be buried, At the Engineer's option, the City of San Diego may repeat this testing during or immediately after the installation of the insulating flange. Replace or repair any insulated pipe flange that is determined to not meet the minimum electrical isolation requirements in this specification. The effectiveness of insulating flanges shall be determined using the following test techniques in the order shown until one of the criteria is achieved or as otherwise directed by the Engineer.

C. Electrical Potential Difference Test: Electrically bond the pipe on the vault or unburied side of the insulating flange to an electrical ground with a maximum resistance to remote soil of 5-Ohms. If the pipe on both sides of the insulating flange is mechanically connected to a minimum 50-feet of buried pipe, then the pipe does not need to be bonded to an electrical ground for this test. Measure the CP Potential of the pipe on both sides of the insulating flange using a copper/copper sulfate reference electrode. If the difference in CP Potentials is greater than or equal to 500-millivolts, the insulating flange is providing adequate electrical isolation. This test must be performed with all cathodic protection systems and anodes disconnected from the pipeline. If this criterion is not met, perform the Nilsson 400 Meter Direct Resistance Test to verify the effectiveness of the insulating flange.

D. Direct Resistance Test: Measure the electrical resistance across the insulated flange using a 97-Hertz square wave null balancing ohmmeter such as the Model 400 Nilsson Soil Resistance Meter and the four-wire resistance technique. A standard handheld digital multi-test meter's ohmmeter circuit (e.g. Fluke 97 or Beckman HD110) is not suitable for properly making these resistance measurements. Perform this test by connecting the meter's P1 and C1 terminals to one side of the insulating flange, using two wires, and then connecting the meter's P2 and C2 terminals to the other side of the insulating flange, using two additional wires. Use vise grips or temporary exothermic welds to make the wire connections to the flange or pipe. The criterion for a pipe filled with water is a minimum measurement of 5-Ohms. The criterion for a dry or a partially filled pipe is a minimum measurement of 100-Ohms. If none of the applicable criteria are met, perform the Inductive Ammeter Direct Resistance Test to verify the effectiveness of the insulating flange.

E. Inductive Ammeter Direct Resistance Test: Connect two separate wires via two separate connections to the pipe on both sides of the insulating flange. Use vise grips or temporary exothermic welds to make the wire connections. Use two pairs of test wires, one for current flow, one for voltage measurement. Using the first set

of test wires, apply a minimum 12-volt DC electrical current across the insulating flange. Using the second set of test wires, measure the voltage across the insulating flange developed by the DC current flow. Use an inductive ammeter hoop (e.g. Swain hoop) clamped around the pipe immediately adjacent to the insulating flange to measure the change in DC current flow in the pipe, through the insulated flange. Calculate the electrical resistance across the insulating flange in Ohms by dividing the change in DC Volts by the change in DC Amps (i.e. Ohm's Law). The criterion for a pipe filled with water is a minimum measurement of 5-Ohms. The criterion for a dry pipe is a minimum measurement of 100-Ohms. If either of the applicable criteria is not met, perform the NACE Insulating Flange Leakage Test, per NACE SP0286, to verify the effectiveness of the insulating flange.

F. NACE Insulating Flange Leakage Test: This test procedure shall conform to the "Leakage Test" described in the NACE Standard SP0286, Section 8, "Field Testing and Maintenance", Figure 12. The test current used shall be between 3 and 5 DC Amps. The criterion for a pipe filled with water is a maximum “electrical leakage value” of 10-percent of the test current. The criterion for a dry pipe is a maximum “electrical leakage value” of 5-percent of the test current.

G. Individual Flange Bolt Testing: For all insulated flanges to be buried and for all other insulating flanges that do not meet any of the other criteria, measure the electrical resistance of each flange bolt to both sides of the insulated flange using a Nilsson Model 400 Soil Resistance Meter and four-wire resistance technique. The measured resistance value for each flange through-bolt shall be a minimum of 1,000-Ohms, as measured from each bolt to both flanges. This criterion applies to the flange through-bolts and does not apply to valve cap bolts which are threaded on one side. Remove, inspect, and replace all dielectric flange bolt sleeves and washers that do not meet the minimum resistance criterion.

H. If an insulated flange with threaded cap bolts passes the resistance tests for all the “through-bolts” yet fails the other previous tests, remove all the threaded cap bolts, inspect and replace all imperfect dielectric flange bolt sleeve and washer materials and retest.

I. In order to make an accurate resistance measurement that passes any of these criteria it may be necessary to disable the pipe inside a vault, flow control facility, or pump station on one side of the insulated flange (or temporarily remove any electrically grounded appurtenances) so that the pipe is not grounded on one side of the insulated flange. This temporary change may eliminate an electrical path which interferes with making an accurate resistance measurement.

4.7 ELECTRICAL ISOLATION TESTING BETWEEN PIPE AND STEEL REINFORCEMENT

A. Prior to placing concrete, all pipe/wall/slab penetrations must be inspected by the City's Corrosion Engineer. Testing shall be performed and deemed acceptable as described herein. A seven-day notice is required before placing concrete.

B. Conduct visual and electrical testing at all steel pipe penetrations through reinforced concrete structures before and after the concrete is placed. This testing is required to demonstrate that all buried steel pipe is not in contact with any metallic objects embedded in the concrete wall or concrete slab including all of the following:

rebar

rebar tie wire

snap ties

shebolts

tie rods

taper ties

dowels

C. Perform this testing no more than 1 day before each concrete placement and no more than 1 day after each concrete placement. Correct all direct contacts detected between sections of pipe to be buried and concrete reinforcing components by trimming or repositioning the reinforcement components. If pipe to reinforcement contacts are detected after concrete is in place, use chipping hammers and other concrete demolition tools to remove as much concrete as is necessary to eliminate all metallic points of contact with the steel pipe. A representative from the City of San Diego, Water System Operations, Corrosion Section shall be notified a minimum of 7 days before the first pipe-vault penetration concrete is placed in order to witness and ensure proper electrical isolation. The failure for a new buried steel pipeline to pass this electrical isolation test may require concrete and reinforcing steel to be incrementally demolished by the contractor at no cost to the City of San Diego until the new pipeline passes the electrical isolation test.

D. Perform all electrical resistance measurements for this test using a 97-Hertz square wave null balancing ohmmeter such as the Nilsson Model 400 Soil Resistance Meter or the MC Miller Model 400A and the four-wire resistance technique to

compensate for the test wire and connection resistances. A standard handheld digital multi-test meter's ohmmeter circuit (e.g. Fluke 87) is not suitable for properly making these resistance measurements. Perform this test by connecting the meter's P1 and C1 terminals to the pipe, using two different wires and two different connections, and then connecting the meter's P2 and C2 terminals to the rebar, using two additional wires and connections. Use vise grips or temporary exothermic welds to make the wire connections to the pipe and rebar.

E. Rebar Ground Cable Connections at Pipe Encasements and Vault Penetrations: Select two exposed pieces of rebar separated by at least 2 feet that are wire tied to a minimum of 6 other perpendicular pieces of rebar for use as electrical ground reference test points. Using temporary connections such as vice grips or other compression clamps measure the electrical resistance between the two different pieces of rebar to ensure that the rebar test points are electrically continuous with the bulk of the rebar in the concrete structure. If either piece of rebar is not securely wire tied to all the other rebar in the encasement or vault, then the electrical resistance measurement will yield erroneous or misleading data. A maximum resistance of 0.10 Ohm between the two rebar test points is required before continuing with the electrical isolation test. Connect two unspliced lengths of minimum size #6 AWG bare copper stranded grounding cable to two different pieces of rebar. Each ground cable connection to the rebar shall be made with a separate exothermic weld or a separate mechanical compression ground clamp.

F. Direct Resistance Isolation Test: Testing shall first be performed using the Direct Resistance Test. Attach one pair of the resistance test leads to the pipe and one pair of resistance test leads to the rebar then measure the pipe to rebar resistance. If the resistance is 10 Ohms or more, the pipe is sufficiently electrically isolated from the rebar. If the test reading is less than 10 Ohms, proceed with the Steel Polarization Isolation Test described below.

G. Steel Polarization Isolation Test:

Step 1: Measure the baseline CP potentials of the buried pipeline and of the rebar using a stationary location for a copper sulfate reference electrode. Place the reference electrode in soil at an offset distance from the pipeline equal to approximately the length or width (whichever is greater) of the concrete structure under construction. If the difference between the readings of the pipe and rebar is 500 millivolts DC or more, that indicates sufficient electrical isolation. This test must be done with all nearby sources of cathodic protection electrical current turned off or disconnected, and with all welding equipment turned off. If the difference is

less than 500 millivolts DC, record the baseline CP Potentials and proceed to the next step.

Step 2: Set up a temporary DC power source such as a truck battery, a minimum 300 Watt, 2 to 4 Ohm, power rheostat, a calibrated electrical shunt, and two minimum #6 AWG test cables. Set up the DC power source with the positive cable connected to the rebar and the negative cable connected to the pipe. Initially adjust the rheostat for the largest resistance/smallest current and measure the current flow. Adjust the electrical power to a minimum current of 1 DC Amp, maximum of 10 DC Amps. Allow the DC current to flow for a minimum of 5 minutes then shut off the test current.

Step 3: Re-measure CP Potentials of the pipe and rebar using the same reference electrode in the same location with the test current off. These are called polarized CP potentials.

Step 4: Compare the polarized CP Potentials with the previously measured baseline CP Potentials. If the pipe is electrically isolated from the rebar, the test current will polarize the buried pipeline's steel cathodically (i.e. a more negative CP Potential) and shift the rebar anodically (i.e. a more positive CP Potential). If the difference between the polarized potentials of the pipeline and rebar is less than 300 millivolts DC there are one or more metallic contacts between the buried pipeline and the rebar. If the difference is 300 millivolts DC or greater the steel pipeline is sufficiently electrically isolated from the rebar.

H. In no case shall an electrical resistance measurement made with a hand held volt-ohm multimeter be accepted as an accurate isolation test procedure. In the event of a question regarding the electrical isolation of the pipeline, the Engineer shall make the final determination.

I. Electrical isolation tests shall be conducted for each pipeline encasement, each pipe to vault penetration, and any other reinforced concrete structure that a pipeline passes through. The electrical isolation tests must be performed by the City's Corrosion Engineer one day before concrete is placed, and the day after concrete is placed. The Engineer will witness the electrical isolation test conducted before the concrete is placed.

J. After the pipeline passes the rebar isolation test, direct bury the two bare copper ground cables connected to the rebar to a flush-to-grade concrete ground box near the pipe-vault penetration. Provide a cover for the test box marked "GROUND". Provide a minimum of two (2) feet of extra ground cable inside the rebar ground

test box. If there is a nearby cathodic protection test box, the rebar ground wires can be run into that box. If the rebar test wires are not long enough to reach the permanent test box, splice additional wire to them using two brass split bolts for each splice. No coating is required for the connections.

4.8 PIPELINE CONTINUITY THROUGH IN-LINE APPURTENANCES AND PIPE JOINTS

A. The CONTRACTOR'S CORROSION ENGINEER shall measure the linear resistance of sections of pipe in which in-line valves, non-welded pipe joints, or other flanged mechanical joints have been installed. All testing shall be done by the CORROSION ENGINEER in the presence of the ENGINEER.

B. TEST METHOD. Resistance shall be measured by the linear resistance method. A direct current shall be impressed from one end of the test section to the other (test station to test station). A voltage drop is measured for a given current level. The measured resistance (R) is calculated using the equation R=dV/I, where dV is the voltage drop between the test span and I is the corresponding current. The resistance shall be measured at least three (3) times for accuracy.

C. ALTERNATIVE METHODS. If other electrical continuity test methods are proposed, the CONTRACTOR shall prepare a written test procedure specifying the alternate method and equipment that will be used. A standard handheld digital multi-test meter's ohmmeter circuit (e.g. Fluke 87) is not suitable for properly making these electrical resistance measurements. Submit in writing the alternate proposed test method to the ENGINEER for approval a minimum of 30 days before the pipe laying begins. The alternative method must be acceptable to the City's Corrosion Engineer with written approval before being conducted by the Contractor.

D. ACCEPTANCE. Acceptance is a comparison between the measured resistance (from the field test data) and the theoretical resistance. The theoretical resistance must consider the pipe (length and wall thickness) and the resistance of the bond wires. The measured resistance shall not exceed the theoretical resistance by more than 120% to determine electrical continuity. The CONTRACTOR'S CORROSION ENGINEER shall submit, within seven (7) days of the completion of the testing, and in a report format, to the ENGINEER, all calculations of the theoretical resistance and measured pipe resistance for each section tested.

4.9 CATHODIC PROTECTION PERFORMANCE

A. Responsibility: The cathodic protection system shall be activated and tested by the Corrosion Engineer in the presence of the City's Corrosion Engineer. Upon completion of the performance testing, the Contractor shall adjust the level of protection in accordance with NACE SP0169 to a structure-to-electrolyte potential of –850 mV or more negative as measured with respect to a saturated copper/copper sulfate (CSE) reference electrode. This potential may be either a direct measurement of the polarized potential or a current-applied potential. Interpretation of a current-applied measurement requires consideration of the significance of voltage drops in the earth and metallic paths.

B. Test Method: Achievement of cathodic protection shall be accomplished by a pipe-to-soil potential survey at each test station of the pipeline. In the event that the full length of the pipeline has not been installed, then the extent of the survey shall be determined by the Engineer. Potential survey data shall include native pipe-to-soil potentials and instant-off pipe-to-soil potentials.

C. Acceptance Criterion for Steel Pipe With Dielectric Coating: The operation of the cathodic protection system for steel pipelines with a dielectric coating shall be tested to ensure that all portions of the buried pipeline are provided a full level of corrosion protection. The standard used to evaluate the CP potential measurements shall be as follows -0.850-VOLT CP Instant Off POTENTIAL - A negative voltage of at least -0.850-volt as measured between the buried pipeline and a copper sulfate reference electrode contacting the soil immediately over or adjacent to the pipeline in accordance with NACE SP0169. Determination of this voltage is to be made with the cathodic protection current momentarily interrupted. Voltage drops must be considered for valid interpretation of this voltage measurement.

4.10 COMPLIANCE WITH SPECIFICATIONS

A. Deficiencies: Any deficiencies or omission in materials or workmanship shall be rectified by the Contractor and at his expense. Deficiencies shall include, but not limited to: anode failures, electrical discontinuities, lack of electrical isolation, broken or missing test leads or test boxes, improper or unclean trench backfill, and other deficiencies associated with the workmanship, installation, and non-functioning equipment.

** END OF SECTION **

SECTION 26 43 00
TRANSIENT VOLTAGE SUPPRESSION

PART 1 GENERAL

1.1 SUBMITTALS

A. Submit product data on each suppressor type, indicating component values, part numbers, and conductor sizes. Include dimensional drawing for each, showing mounting arrangements.

B. Submit manufacturer's UL certified test data and nameplate data for each TVSS.

C. Submit electrical single-line diagram showing location of each TVSS.

1.2 QUALITY ASSURANCE

A. UL Compliance and Labeling:

1. For power and signal circuits, TVSS devices shall comply with UL 1449 and complimentary listed to UL 1283 as an electromagnetic interference filter. Provide units that are listed and labeled by UL.
2. For telephone circuit protection, TVSS devices shall comply with UL 497A.

B. ANSI Compliance: Use TVSS devices in compliance with the recommendations of IEEE C62.41.1, IEEE C62.41.2, and IEEE C62.45.

PART 2 PRODUCTS

2.1 GENERAL

A. All TVSS devices for power circuits, provided under this section, shall be the product of a single manufacturer.

B. TVSS devices shall be capable of performance at ambient temperatures between minus 40 degrees C and 60 degrees C, at relative humidity ranging from 0 percent to 95 percent, and at altitudes ranging from sea level to 12,000 feet.

C. TVSS devices shall be fused to disconnect the suppressor from the electrical source should the suppressor fail. The fusing shall allow full surge handling capabilities and to afford safety protection from thermal overloads and short circuits.

D. Design TVSS devices for the specific type and voltage of the electrical service. Single-phase and three-phase wye-configured systems shall have L-N, L-G, and N-G protection. Grounded delta-configured systems shall have L-L and L-G protection.

E. Power Filter: The TVSS shall include a high frequency extended range power filter complimentary listed to UL 1283 as an electromagnetic interference filter.

2.2 MANUFACTURER

A. Innovative Technology, VanGuard Series.

B. Advanced Protection Technologies, Inc.

C. General Electric.

2.3 MAIN DISTRIBUTION TVSS

A. Provide TVSS meeting IEEE C62.41.1 and IEEE C62.41.2 Location in accordance with Category C.

B. Surge current capacity shall be not less than the following:

1. L-N Capacity: 200 kA.
2. L-G Capacity: 120 kA.
3. N-G Capacity: 120 kA.

C. Suppressor housing shall be in an enclosure that has the same NEMA rating as the equipment it protects and painted to match.

D. UL 1449 maximum suppression voltage shall not be more than:

System Voltage	Phase	L-L or L-N Suppression Voltage
120	1	400
208Y/120	3	400
240	3	800
480Y/277	3	800

2.4 PANELBOARD TVSS

A. Provide TVSS meeting IEEE C62.41.1 and IEEE C62.41.2 Location Category B.

B. Surge current capacity shall be not less than the following:

1. L-L Capacity: 80 kA.
2. L-N Capacity: 80 kA.
3. L-G Capacity: 80 kA.
4. N-G Capacity: 80 kA.

C. Suppressor shall be in an enclosure that has the same NEMA rating as the panel it protects or the TVSS may be integral to a panelboard.

D. UL 1449 maximum clamp voltage shall not be more than:

System Voltage	Phase	L-L or L-N Clamp Voltage
120	1	400
208Y/120	3	400
240	3	800
480Y/277	3	800

2.5 ANNUNCIATION

A. Provide unit or separately mounted LED-type indication lights to show the normal and failed status of each module. Provide one normally open and one normally closed contacts which operate when the unit fails.

2.6 SURGE COUNTER

A. Provide each TVSS rated above 100 kA with a counter displaying the number of voltage transients that have occurred on the unit input. The counter shall be battery backed and retain the count through system power outages.

2.7 PAIRED CABLE DATA LINE INTERIOR SUPPRESSORS

A. Provide units meeting IEEE C62.41, Location Category A.

B. Use bi-polar 1,500-watt silicon avalanche diodes between the protected conductor and earth ground.

C. Provide units with a maximum single impulse current rating of 80 amperes (10 by 1,000 microsecond-waveform).

D. Breakdown voltage shall not exceed 36 volts.

2.8 PAIRED CABLE DATA LINE EXTERIOR SUPPRESSORS

A. Provide units meeting IEEE C62.41, Location Category A.

B. Suppressors shall be a hybrid design with a minimum of three stages, utilizing solid-state components and operating bi-directionally.

C. Suppressors shall meet or exceed the following criteria:

1. Maximum single impulse current rating of 10,000 amperes (8 by 20 microsecond-waveform).
2. Pulse Life Rating: 3,000 amperes (8 by 20 microsecond-waveform): 2,000 occurrences.
3. Maximum clamping voltage at 10,000 amperes (8 by 20 microsecond current waveform), shall not exceed the peak of the normal applied signal voltage by 200 percent.

PART 3 EXECUTION

3.1 APPLICATION REQUIREMENTS

A. Install TVSS when indicated on the Drawings and:

1. Main Distribution TVSS in each motor control center.
2. Panelboard TVSS in each distribution panelboard where a TVSS breaker is shown in the panel schedule.

B. Electronic Equipment Paired Cable Conductors: Install data line suppressors at the low voltage input and output of each piece of equipment, including telephone cable entrance.

1. Use secondary protectors on lines that do not exit the structure.
2. Use primary protectors on lines that exit and enter the structure.

3.2 GENERAL INSTALLATION REQUIREMENTS

A. Install suppressors according to manufacturer's recommendations.

B. Install suppressors directly to the cabinet which houses the circuit to be protected so that the suppressor leads are straight and short, with all conductors laced, running directly to the point of connection within the panel, without loops or bends. If bends are unavoidable, no bend may exceed 90 degrees and bending radius may not be less than 6 inches.

C. Connecting wires shall be as short as possible with gently twisted conductors, tied together, to prevent separation. Connecting wires shall not exceed 24 inches in length at any point.

D. Field installed conductors shall be the same as specified for building wire, not smaller than No. 8 AWG and not larger than No. 4 AWG. Device leads shall not be longer than the length recommended by the manufacturer, unless specifically reviewed and approved by the manufacturer.

E. Provide dedicated disconnecting means for TVSS devices installed at motor control centers. Provide dedicated 30-60-ampere circuit breakers (size dependent upon wire size used) with number of poles as required, as disconnecting means for TVSS devices installed at panelboards. The interrupting capacity of the circuit breakers shall be that specified for the other breakers at that location.

1.2 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
    a. General:
        1) Provide catalog data sheets and pictures for all products listed below.
        2) Proposed Luminaire Substitutions (Interior and Exterior): Provide an electronic photometric file in standard '.ies' file format per the Illumination Engineering Society of North America (IESNA) for any proposed luminaire substitution not identified on the project Luminaire Schedule. Obtain file from the luminaire manufacturer or approved independent photometric testing laboratory. Include the proposed substitute luminaire with all options identified on the project Luminaire Schedule.
    b. Interior Luminaires:
        1) Catalog data sheets with pictures.

2) Luminaire material, finish, dimensions, and metal gauge.
3) Lens material, pattern, and thickness.
4) Candle power distribution curves in two or more planes.
5) Candle power chart 0 degree to 90 degrees.
6) Lumen output chart.
7) Average maximum brightness data in foot lamberts.
8) Coefficients of utilization for zonal cavity calculations.
9) Mounting or suspension details.

c. Exterior Luminaires:
1) Catalog data sheets with pictures. Luminaire material, finish, dimensions, and metal gauge.
2) Lens material, pattern, and thickness. Filters.
3) IESNA lighting classification (BUG rating).
4) Isolux diagram.
5) Lighting distribution data and lighting distribution classification type as defined in IESNA HB 9.
6) Fastening details to wall, pendant, or pole.
7) For light poles, submit catalog sheet, wind loading, pole deflection with fixture attached, total weight, all accessories, complete dimensions, and finish.
8) Brackets and supports.
9) Pole foundations.

d. LED Source Systems:
1) General:
a) IESNA LM-80 test reports.
b) IESNA TM-21 ratings.
c) Operating temperature range. Data sheet (chart/graph) describing life as a function of temperature.
d) Warranty: Light engine and driver.
e) Rated life.
f) Surge protection.
g) Thermal control device, heat sink.
h) Enclosure and wiring information.
i) Operating voltage range.
2) Electronic Module/Light Engine:
a) Correlated Color Temperature (CCT).
b) Color Rendering Index (CRI).
3) Drivers:
a) Input Current Total Harmonic Distortion.
b) Power factor.
c) Sound rating.
d) Dimming system information.

e. Time Switches:
1) Wiring diagram.
2) Contact ratings.

3) Functional features.
4) Programmable capabilities.
5) Enclosure type, dimensions.

f. Lighting Contactor:
1) Type (mechanically or electrically held).
2) Enclosure.
3) Contact ratings and configuration.
4) Coil operating voltage.

g. Outdoor Motion Sensors.

h. Emergency Shunt Relay.

i. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:

1. Anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.
2. Manufacturer's printed installation instructions.
3. Operation and Maintenance Data as specified in Section 01 78 23, Operation and Maintenance Data.

1.3 QUALITY ASSURANCE

A. Authority Having Jurisdiction (AHJ):

1. Provide Work in accordance with NFPA 70, National Electrical Code (NEC). Where required by the AHJ, provide material and equipment labeled or listed by a nationally recognized testing laboratory or other organization acceptable to the AHJ to provide a basis for approval under NEC.
2. Provide materials and equipment manufactured within the scope of standards published by Underwriters Laboratories, Inc. in conformance with those standards and with an applied UL listing mark.

B. Standard Products:

1. Provide materials and equipment of manufacturers regularly engaged in the production of products specified in this section and that are of equal material, design, and workmanship.
2. Manufacturer shall have products that have been in satisfactory commercial or industrial use in similar applications under similar circumstances and of similar size.
3. Material and Equipment Manufacturing Date: Do not use products manufactured more than 3 years prior to date of delivery to Site.
4. Provide assembled fixture, complete with lamps, in accordance with California Code of Regulations Title 24 requirements.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Aluminum Poles:

1. Provide manufacturer's standard protection for the finish during shipment and installation. At minimum, spirally wrap each pole shaft with protective paper secured with tape, and ship small parts in boxes.
2. Do not store poles on ground.
3. Support poles so they are at least 1 foot above ground level and growing vegetation.
4. Do not remove factory-applied pole wrappings until just before installing pole.
5. Ship poles with bolt circle template, base cover, handhold cover, and shaft cap or tenon.

PART 2 PRODUCTS

2.1 LUMINAIRES

A. Specific requirements relative to execution of the Work of this section are located in Luminaire Schedule on Drawings.

B. Provide luminaires and components tested, listed, and labeled by UL, or other approved testing agency.

C. Provide luminaires with Illumination Engineering Society of North America (IESNA) formatted photometric files, ".ies" format, certified by the luminaire manufacturer for use with lighting software.

D. Luminaire Labels:

1. External label per ANSI C136.15.
2. Internal label per ANSI C136.22.

E. Provide luminaires rated by the manufacturer to start and operate to their full lumen capacity for rated life of the luminaire at the minimum low and maximum high ambient temperatures as defined in the Contract Documents at their installation location.

F. Feed-through type, or separate junction box.

G. Wire Leads: Minimum 18 AWG.

H. Component Access: Accessible and replaceable without removing luminaire from ceiling.

I. Exterior Installations:

1. UL Labeled: SUITABLE FOR WET LOCATIONS.
2. Ballast: Removable, prewired.
3. When factory-installed photocells are provided, entire assembly shall have UL label.

J. Illuminated Exit Signs:

1. Body: As scheduled.
2. Face: Stencil.
   a. Letters:
      1) 6-inch high by 3/4-inch stroke.
      2) Color: As scheduled.
3. Mounting: As scheduled.
4. Directional Arrows: As indicated on Drawings.

K. Emergency Lighting Units:

1. Power Pack: Self-contained, 120/277-volt selectable input transformer, inverter/charger, sealed nickel cadmium battery, and indicator switch in accordance with UL 924.
2. Lighted, push-to-test indicator.
3. Capable of providing full illumination for 1-1/2 hours in emergency mode.
4. Capable of full recharge in 24 hours, automatically upon resumption of normal line voltage.
5. Capable of protecting against excess charging and discharging.
6. Emergency Self-Diagnostic System:
   a. Solid state device with LED display and audible alarm.
   b. Automatic and manual test unit.
   c. Test for malfunction of lamps, battery, and charger board.

L. Hazardous Classified Areas:

1. UL Labeled: CLASS I, DIVISION 2, GROUPS C AND D.
2. Fixture Enclosure and Fittings: Copper-free, cast aluminum in accordance with UL 844.

2.2 LED SOURCE SYSTEMS

A. General:

1. Provide IESNA LM-80 test reports.
2. Provide Energy Star compliance for solid state luminaires.

3. Listed To: UL 8750 Standard for Safety for Light Emitting Diode (LED) Equipment for use in Lighting Products.
4. Provide RoHS compliant LED light source(s) and driver(s).
5. Warranty: 5 years minimum.

B. Electronic Module/Light Engine:

1. Mount all components to a single plate and factory prewired with quick-disconnect plugs.
2. Include a driver, thermal control device, thermal protector device, and surge protector device.
   a. Provide surge protector tested in accordance with IEEE/ANSI C62.41.2 to Category C Low.
3. Provide LEDs mounted to a metal-core circuit board and aluminum heat sink for optimal thermal management and long life.
4. Light Engine Rating per TM-21: 100,000 at 25 degrees C, L70.
5. Correlated Color Temperature (CCT): As indicated on the Luminaire Schedule.
6. Color Rendering Index (CRI): Minimum of 80.

C. Drivers:

1. General Requirements for LED Driver: Output of the driver shall comply with UL Recognized Class 2 Power Supply requirement for use in dry or damp location.
2. Expected life of 100,000 hours at 25 degrees C.
3. Provide drivers mounted in an all metal can.
4. Operating Voltage Range: 50/60-Hz input source of 120V to 277V with sustained variations of plus or minus 10 percent voltage with no damage to the driver.
5. Input Current Total Harmonic Distortion: Less than 20 percent up to 50 percent of full load rating.
6. Power Factor: Greater than 0.90 for primary application up to 50 percent of full load rating.
7. Sound rating: Class A.
8. Comply with NEMA 410 for inrush current limits.
9. Dimming:
   a. Continuously dimmable from 10 percent to 100 percent.
   b. Provide driver compatible with standalone dimming controls and/or dimming systems used.
10. Comply with Reduction of Hazardous Substances (RoHS) compliant.

2.3 LIGHTING CONTROL

A. Relay Panels:

1. Where indicated on the drawings, provide a factory pre-assembled relay panel. The panel shall be for surface or flush installation, with a hinged door assembly as required.
2. The panel shall be factory pre-assembled; ETL certified to UL/CSA standards, with capacities for 1 pole or 2 pole relays as required.
3. Panel shall include the following pre-assembled and pre-wired:
4. Suitable divider separating class 1 and class 2 compartments
5. Control transformer, UL/CSA approved for class 2 circuits,
6. 8 or 16 single pole relays, or 4 or 8 2-pole relays as required to switch circuits shown on plans or schedules.
7. External control devices as required.

B. Relays:

1. Lighting control relays shall be mechanically latching and shall come complete with a manual ON/OFF switch. The mechanical switch shall continuously display the true state of the relay's internal contacts. Single pole relays shall be rated and UL/CSA listed for 120, 277and 347 VAC lighting loads at 20 amps.
2. Each lighting control relay shall be capable of controlling incandescent, fluorescent, electronic ballast and H.I.D. lighting loads and have an inrush capability of 3000 amperes. Relays shall be complete with a 5 year Manufacturer's Limited Warranty.
3. Lighting control relays shall include captive screw terminals for both the line voltage and the low voltage connections. Switching the relay shall be accomplished with ONE signal wire and a common return. The signal wire shall be able to signal ON and OFF and shall carry status current that indicates if the relay is ON or OFF.

C. Control Electronic:

1. The central controller shall be field adjustable and shall have the following features:
   a. 8 outputs; each individually programmable
   b. 7 assignable programs, 64 events per program
   c. 32 annual holiday schedules
   d. Power loss protection: 7 days for time & indefinite for program memory
   e. Astronomic programming
   f. Automatic daylight savings and leap year adjustment (selectable)

g. Time-out function. Controller shall be capable of monitoring connected relays. Should a relay be switched ON the output shall switch OFF after a preset time
h. Group override switch is supplied that can be set to switch all or some of the outputs ON or OFF.
i. Photometric sensor shall be connected to the control electronic to provide up to 8 independent channels of light level control. Sensor range is 1 to 6000 footcandles.

D. Wall Switches

1. Switch hardware shall mount to standard wall boxes.
2. Individual switches shall include an integral LED to indicate both ON and OFF states (red=ON, green=OFF).Switches can be connected directly to relays or to system switch inputs.
3. Switches shall have color coded captive screw terminals. Use #18 AWG solid conductors.

E. Outdoor Photosensor:

1. Provide where required an exterior photometric sensor capable of sensing from 1-60,000 lux. The sensor shall connect to the panel-mounted control unit using two #18 AWG wires.
2. One exterior sensor shall permit different relays to switch at different light levels. Lights shall be controlled by 'sensor only' or by a combination of time & light level.

2.4 EMERGENCY SHUNT RELAY

A. Description: Normally closed, electrically held relay, arranged for wiring in parallel with manual or automatic switching contacts; complying with UL 924.

B. Coil Rating: 120/277V.

2.5 POLES

A. General:

1. Design for wind load as specified in Section 01 61 00, Common Product Requirements, while supporting luminaires and other appurtenances. Use effective projected areas (EPA) of luminaires and appurtenances in calculations specific to the actual products proposed on each pole.
2. Poles 40 feet and Shorter: One-piece construction.
3. Pole Height: As indicated on Luminaire Schedule.
4. Handhole:

a. Provide oval-shaped handhole having a minimum clear opening of 2.5 inches by 5 inches.
b. Secure cover with stainless steel captive screws.
c. Metal Poles: Provide an internal grounding connection accessible from handhole near bottom of each pole.

5. Do not install scratched, stained, chipped, or dented poles.

B. Aluminum Poles:

1. Manufactured of corrosion-resistant aluminum alloys. Seamless extruded or spun seamless type with minimum 0.188-inch wall thickness.
2. Shape: Roundand Straight.
3. Provide pole grounding connection designed to prevent electrolysis when used with copper ground wire.
4. Shaft Top: Fitted with cap.
5. Base:
   a. Anchor bolt mounted and machined to receive lower end of shaft.
   b. Welded joint between shaft and base.
   c. Base Cover: Cast aluminum alloy.
   d. Hardware, Except Anchor Bolts: either anodized aluminum alloy or stainless steel.
   e. Handhole.
6. Provide pole cast-in-place foundations with galvanized steel anchor bolts, threaded at the top end and bent 90 degrees at the bottom end.
7. Provide base covers to match pole and galvanized nuts and washers for anchor bolts.
8. Pole and Bracket Finish: Uniform satin finish to match fixture.

2.6 BRACKETS AND SUPPORTS

A. Features:

1. Not less than 1-1/4-inch aluminum secured to pole.
2. Slip-fitter or pipe-threaded brackets may be used, but coordinate brackets to luminaires provided. Provide identical brackets for use with one type of luminaire unless otherwise approved by Engineer.
3. Select brackets for pole-mounted street lights to correctly position luminaire no lower than mounting height indicated.
4. Mount brackets not less than 24 feet above street.
5. Provide special mountings or brackets as indicated on Drawings fabricated of metal which will not promote galvanic reaction with luminaire head.

2.7 POLE FOUNDATIONS

A. Anchor Bolts: Steel rod having a minimum yield strength of 50,000 psi; at minimum, galvanize the top 12 inches of the rod.

B. Concrete: As specified in Section 03 30 00, Cast-in-Place Concrete.

2.8 EQUIPMENT IDENTIFICATION

A. Manufacturer's Nameplate: Provide each item of equipment with a nameplate bearing manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; nameplate of distributing agent will not be acceptable.

B. Provide clear markings located to be readily visible to service personnel.

2.9 FACTORY FINISH

A. Provide electrical equipment with factory-applied painting systems that, at minimum, meet the requirements of NEMA 250 corrosion-resistance test.

PART 3 EXECUTION

3.1 LUMINAIRES

A. General:

1. Install in accordance with manufacturer's recommendations.
2. Provide proper hangers, pendants, and canopies as necessary for complete installation and meeting specified seismic requirements.
3. Provide additional ceiling bracing, hanger supports, and other structural reinforcements to building required to safely mount.
4. Install plumb and level.
5. Install each luminaire outlet box with galvanized stud.

B. Mounting:

1. General:
   a. Coordinate mounting, fastening, and environmental conditions with Section 26 05 02, Basic Electrical Requirements.
   b. Refer to Fastener Schedule in Section 05 50 00, Metal Fabrications.
2. Wall Mounted: Measure mounting heights from center of mounting plate to finished floor or finished grade, whichever is applicable.
3. Pendant Mounted:

a. Provide swivel type hangers and canopies to match luminaires, unless otherwise noted.
b. Space single-stem hangers on continuous-row fluorescent luminaires nominally 48 inches apart.
c. Provide twin-stem hangers on single luminaires.
d. Measure mounting heights from bottom of luminaire to finished floor or finished grade, whichever is applicable.

4. Pole Mounted:
   a. Provide cast-in-place concrete base.

C. Swinging Type: Provide, at each support, safety cable capable of supporting four times vertical load from structure to luminaire.

D. Finished Areas:

1. Install symmetrically with tile pattern.
2. Locate with centerlines either on centerline of tile or on joint between adjacent tile runs.
3. Install recessed luminaires tight to finished surface such that no spill light will show between ceilings and sealing rings.
4. Combustible Low Density Cellulose Fiberboard: Provide spacers and mount luminaires 1-1/2 inches from ceiling surface, or use fixtures suitable for mounting on low density ceilings.
5. Junction Boxes:
   a. Flush and Recessed Luminaires: Locate minimum 1-foot from luminaire.
   b. In concealed locations, install junction boxes to be accessible by removing luminaire.
6. Wiring and Conduit:
   a. Provide wiring of temperature rating required by luminaire.
   b. Provide flexible steel conduit.
7. Provide plaster frames when required by ceiling construction.
8. Independent Supports:
   a. Provide each recessed luminaire with two safety chains or two No. 12 soft-annealed galvanized steel wires of length needed to secure luminaire to building structure independent of ceiling structure.
   b. Select chain or wire with tensile strength and method of fastening to structure adequate to support luminaire weight.
   c. Fasten chain or wire to each end of luminaire.

E. Unfinished Areas: Locate luminaires to avoid conflict with other building systems or blockage of luminaire light output.

1. Fixture Suspension: Provide 1/4-inch threaded steel hanger rods. Scissor type hangers not permitted.
2. Attachment to Steel Beams: Provide flanged beam clips and straight or angled hangers.

F. Building Exterior: Flush-mounted back box and concealed conduit, unless otherwise indicated.

3.2 EMERGENCY LIGHTING UNIT

A. Install in accordance with manufacturer's recommendations.

B. Provide permanent circuit connections with conduit and wire.

C. Connect to branch circuit feeding normal lighting in area ahead of all local switches.

D. Provide separate circuit wiring to luminaire.

3.3 POLES

A. Electrical Installations: Conform to IEEE C2 and requirements specified herein.

B. Pole Setting:

1. Depth: As indicated on Drawings or footing detail.

C. Aluminum Poles: Install according to pole manufacturer's instructions.

1. Provide cast-in-place concrete base.
2. Provide branch circuit in-line fuses in pole base handhole.

D. Grounding: Ground noncurrent-carrying parts of equipment including metal poles, luminaires, mounting arms, brackets, and metallic enclosures as specified in Section 26 05 26, Grounding. Where copper grounding conductor is connected to a metal other than copper, provide specially treated or lined connectors suitable for this purpose.

3.4 FIELD FINISHES

A. Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Paint as specified in Section 09 90 00, Painting and Coating.

3.5 FIELD QUALITY CONTROL

A. Upon completion of installation, verify equipment is properly installed, connected, and adjusted. Conduct an operating test to show equipment operates in accordance with the requirements of this section.

B. Coordinate lighting and controls installation and testing with commissioning as specified in Section 01 91 14, Testing, Integration, and Startup.

3.6 MANUFACTURER'S SERVICES

A. Lighting Control Panel:

1. Perform startup service.
2. Furnish manufacturer's representative at Job Site in accordance with Section 01 43 33, Manufacturers' Field Services, to inspect installation, test unit, and put into service.
3. Provide, at Owner's facility, training necessary to familiarize Owner's personnel with operation, use, adjustment, and problem solving diagnosis of occupancy sensing devices and systems.

3.7 CLEANING

A. Remove labels and markings, except UL listing mark.

B. Wipe luminaires inside and out to remove construction dust.

C. Clean luminaire plastic lenses with antistatic cleaners only.

D. Touch up painted surfaces of luminaires and poles with matching paint ordered from manufacturer.

E. Replace defective lamps at time of Substantial Completion.

END OF SECTION

SECTION 31 10 00
SITE CLEARING

PART 1 GENERAL

1.1 DEFINITIONS

A. Interfering or Objectionable Material: Trash, rubbish, and junk; vegetation and other organic matter, whether alive, dead, or decaying; topsoil.

B. Clearing: Removal of interfering or objectionable material lying on or protruding above ground surface.

C. Grubbing: Removal of vegetation and other organic matter including stumps, buried logs, and roots greater than 2-inch caliper to a depth of 6 inches below subgrade.

D. Scalping: Removal of sod without removing more than upper 3 inches of topsoil.

E. Stripping: Removal of topsoil remaining after applicable scalping is completed.

F. Project Limits: Areas, as shown or specified, within which Work is to be performed.

1.2 SUBMITTALS

A. Action Submittals: Drawings clearly showing clearing, grubbing, and stripping limits.

1.3 QUALITY ASSURANCE

A. Obtain Engineer's approval of staked clearing, grubbing, and stripping limits, prior to commencing clearing, grubbing, and stripping.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 GENERAL

A. Clear, grub, and strip areas actually needed for waste disposal, borrow, or Site improvements within limits shown or specified.

B. Do not injure or deface vegetation that is not designated for removal.

3.2 LIMITS

A. As follows, but not to extend beyond Project limits.

1. Fill:
   a. Clearing and Grubbing: 5 feet beyond toe of permanent fill.
   b. Stripping 2 feet beyond toe of permanent fill.
2. Waste Disposal:
   a. Clearing: 10 feet beyond perimeter.
   b. Scalping and Stripping: Not required.
   c. Grubbing: Around perimeter as necessary for neat finished appearance.
3. Structures: 15 feet outside of new structures.
4. Roadways: Not required.

B. Remove rubbish, trash, and junk from entire area within Project limits.

3.3 TEMPORARY REMOVAL OF INTERFERING PLANTINGS

A. Remove and store, as specified in Section 32 93 00, plants, shrubs and trees that are not designated for removal but do interfere with construction or could be damaged by construction activities.

B. Photograph and document location, orientation, and condition of each plant prior to its removal. Record sufficient information to uniquely identify each plant removed and to assure accurate replacement.

3.4 CLEARING

A. Clear areas within limits shown or specified.

B. Fell trees so that they fall away from facilities and vegetation not designated for removal.

C. Cut stumps not designated for grubbing flush with ground surface.

D. Cut off shrubs, brush, weeds, and grasses to within 2 inches of ground surface.

E. Conform to Demolition Drawings for extent and location of tree and shrub removal.

3.5 GRUBBING

A. Grub areas within limits shown or specified.

3.6 SCALPING

A. Do not remove sod until after clearing and grubbing is completed and resulting debris is removed.

B. Scalp areas within limits shown or specified.

3.7 STRIPPING

A. Do not remove topsoil until after scalping is completed.

B. Strip areas within limits to minimum depths shown or specified. Do not remove subsoil with topsoil.

C. Stockpile strippings separately from other excavated material.

3.8 TREE REMOVAL OUTSIDE CLEARING LIMITS

A. Remove Within Project Limits:

1. Dead, dying, leaning, or otherwise unsound trees that may strike and damage Project facilities in falling.

B. Cut stumps off flush with ground, remove debris, and if disturbed, restore surrounding area to its original condition.

3.9 DISPOSAL

A. Clearing and Grubbing Debris:

1. Dispose of debris offsite.
2. Burning of debris onsite will not be allowed.
3. Woody debris may be chipped. Chips may be sold to Contractor's benefit or used for landscaping onsite as mulch or uniformly mixed with topsoil, provided that resulting mix will be fertile and not support combustion. Maximum dimensions of chipped material used onsite shall be 1/4 inch by 2 inches. Dispose of chips that are unsaleable or unsuitable for landscaping or other uses with unchipped debris.
4. Limit offsite disposal of clearing and grubbing debris to locations that are approved by federal, state, and local authorities, and that will not be visible from Project.

B. Scalpings: As specified for clearing and grubbing debris.

C. Strippings:

1. Dispose of strippings that are unsuitable for topsoil or that exceed quantity required for topsoil offsite.
2. Stockpile topsoil in sufficient quantity to meet Project needs. Dispose of excess strippings as specified for clearing and grubbing.

END OF SECTION

SECTION 31 23 13
SUBGRADE PREPARATION

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   a. D1557, Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 (2,700 kN-m/m^3)).

1.2 DEFINITIONS

A. Optimum Moisture Content: As defined in Section 31 23 23, Fill and Backfill.

B. Prepared Ground Surface: Ground surface after completion of clearing and grubbing, scalping of sod, stripping of topsoil, excavation to grade, and scarification and compaction of subgrade.

C. Relative Compaction: As defined in Section 31 23 23, Fill and Backfill.

D. Relative Density: As defined in Section 31 23 23, Fill and Backfill.

E. Subgrade: Layer of existing soil after completion of clearing, grubbing, scalping of topsoil prior to placement of fill, roadway structure or base for floor slab.

F. Proof-Rolling: Testing of subgrade by compactive effort to identify areas that will not support the future loading without excessive settlement.

1.3 SEQUENCING AND SCHEDULING

A. Complete applicable Work specified in Sections 02 41 00, Demolition; 31 10 00, Site Clearing; and 31 23 16, Excavation, prior to subgrade preparation.

1.4 QUALITY ASSURANCE

A. Notify Engineer when subgrade is ready for compaction or proof-rolling or whenever compaction or proof-rolling is resumed after a period of extended inactivity.

PART 2 PRODUCTS (NOT

USED) PART 3EXECUTION

3.1 GENERAL

A. Keep subgrade free of water, debris, and foreign matter during compaction or proof-rolling.

B. Bring subgrade to proper grade and cross-section and uniformly compact surface.

C. Do not use sections of prepared ground surface as haul roads. Protect prepared subgrade from traffic.

D. Maintain prepared ground surface in finished condition until next course is placed.

3.2 COMPACTION

A. Under Earthfill: Three passes with three-wheeled power roller weighing approximately 10 tons.

B. Under Earthfill: Compact upper 6 inches to minimum of 90 percent relative compaction as determined in accordance with ASTM D1557.

C. Under Structures: Compact upper 6 inches below the bottom of the structure foundations or slab-on-grade to minimum of 90 percent relative compaction as determined in accordance with ASTM D1557.

D. Under Pavement: Meet City of San Diego standard for pavement of city streets.

3.3 MOISTURE CONDITIONING

A. Dry Subgrade: Add water, then mix to make moisture content uniform throughout.

B. Wet Subgrade: Aerate material by blading, discing, harrowing, or other methods, to hasten drying process.

3.4 TESTING

A. Proof-roll subgrade with equipment specified in Article Compaction to detect soft or loose subgrade or unsuitable material, as determined by Engineer.

3.5 CORRECTION

A. Soft or Loose Subgrade:

1. Adjust moisture content and recompact, or
2. Over excavate as specified in Section 31 23 16, Excavation, and replace with suitable material from the excavation, as specified in Section 31 23 23, Fill and Backfill.

B. Unsuitable Material: Over excavate as specified in Section 31 23 16, Excavation, and replace with suitable material from the excavation, as specified in Section 31 23 23, Fill and Backfill.

END OF SECTION

SECTION 31 23 16
EXCAVATION

PART 1 GENERAL

1.1 DEFINITIONS

A. Common Excavation: Removal of material not classified as rock excavation.

B. Rock Excavation:

1. General: Removal of solid material which by actual demonstration cannot, in Engineer's opinion, be reasonably loosened or ripped by single-tooth, hydraulically operated ripper mounted on crawler tractor in good condition and rated at minimum 410 flywheel horsepower; and which must be systematically drilled and blasted or broken by power-operated hammer, hydraulic rock breaker, expansive compounds, or other similar means prior to removal.
2. Trench: Removal of solid material which by actual demonstration cannot, in Engineer's opinion, be reasonably excavated with minimum 135-horsepower backhoe in good condition and equipped with manufacturer's standard boom, two rippers, and rock points or similar approved equipment; and which must be systematically drilled and blasted or broken by power-operated hammer, hydraulic rock breaker, expansive compounds, or other similar means prior to removal.
3. Term "rock excavation" indicates removal of solid material, as specified above, and does not necessarily correspond to "rock" as implied by names of geologic formations.
4. Removal of boulders larger than 1/2 cubic yard will be classified as rock excavation, if drilling and blasting or breaking them apart with power-operated hammer, hydraulic rock breaker, expansive compounds, or other similar means is both necessary and actually used for their removal.

1.2 SUBMITTALS

A. Informational Submittals:

1. Excavation Plan, Detailing:
   a. Methods and sequencing of excavation.
   b. Proposed locations of stockpiled excavated material.
   c. Proposed onsite and offsite spoil disposal sites.
   d. Numbers, types, and sizes of equipment proposed to perform excavations.
   e. Reclamation of onsite spoil disposal areas.

1.3 QUALITY ASSURANCE

A. Provide adequate survey control to avoid unauthorized over excavation.

1.4 WEATHER LIMITATIONS

A. Material excavated when frozen or when air temperature is less than 32 degrees F shall not be used as fill or backfill until material completely thaws.

B. Material excavated during inclement weather shall not be used as fill or backfill until after material drains and dries sufficiently for proper compaction.

1.5 SEQUENCING AND SCHEDULING

A. Demolition: Complete applicable Work specified in Section 02 41 00, Demolition, prior to excavating.

B. Clearing, Grubbing, and Stripping: Complete applicable Work specified in Section 31 10 00, Site Clearing, prior to excavating.

C. Dewatering: Conform to applicable requirements of Section 31 23 19.01, Dewatering, prior to initiating excavation.

D. Excavation Support: Install and maintain, as specified in Section 31 50 00, Excavation Support Systems, as necessary to support sides of excavations and prevent detrimental settlement and lateral movement of existing facilities, adjacent property, and completed Work.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 GENERAL

A. Excavate to lines, grades, and dimensions shown and as necessary to accomplish Work. Excavate to within tolerance of plus or minus 0.1 foot, except where dimensions or grades are shown or specified as maximum or minimum. Allow for forms, working space, granular base, topsoil, and similar items, wherever applicable. Trim to neat lines where concrete is to be deposited against earth.

B. Do not over excavate without written authorization of Engineer.

C. Remove or protect obstructions as shows and as specified in Section 01 50 00, Temporary Facilities and Controls, Article Protection of Work and Property.

3.2 UNCLASSIFIED EXCAVATION

A. Excavation is unclassified. Complete all excavation regardless of the type, nature, or condition of the materials encountered.

3.3 TRENCH WIDTH

A. Minimum Width of Trenches, unless otherwise shown on plans:

1. Single Pipes, Conduits, Direct-Buried Cables, and Duct Banks:
   a. Less than 4-inch Outside Diameter or Width: 18 inches.
   b. Greater than 4-inch Outside Diameter or Width: 18 inches greater than outside diameter or width of pipe, conduit, direct-buried cable, or duct bank.
2. Multiple Pipes, Conduits, Cables, or Duct Banks in Single Trench: 18 inches greater than aggregate width of pipes, conduits, cables, duct banks, plus 12-inch space between.
3. Increase trench widths by thicknesses of sheeting.

B. Maximum Trench Width: Unlimited, unless otherwise shown or specified, or unless excess width will cause damage to existing facilities, adjacent property, or completed Work. Pipe of greater strength or superior pipe bedding, when approved in writing by Engineer, may be used in lieu of maintaining the pipe widths shown or specified.

3.4 PIPE BEDDING GROOVES FOR NONPERFORATED DRAIN LINES

A. Semicircular, trapezoidal, or 90-degree-V.

B. Excavated or plowed into trench bottom. Forming groove by compaction will not be acceptable.

3.5 EMBANKMENT AND CUT SLOPES

A. Shape, trim, and finish cut slopes to conform with lines, grades, and cross-sections shown, with proper allowance for topsoil or slope protection, where shown.

B. Remove stones and rock that exceed 3-inch diameter and that are loose and may roll down slope. Remove exposed roots from cut slopes.

C. Round tops of cut slopes in soil to not less than a 6-foot radius, provided such rounding does not extend offsite or outside easements and rights-of-way, or adversely impacts existing facilities, adjacent property, or completed Work.

3.6 STOCKPILING EXCAVATED MATERIAL

A. Stockpile excavated material that is suitable for use as fill or backfill until material is needed.

B. Post signs indicating proposed use of material stockpiled. Post signs that are readable from all directions of approach to each stockpile. Signs should be clearly worded and readable by equipment operators from their normal seated position.

C. Confine stockpiles to within easements, rights-of-way, and approved work areas. Do not obstruct roads or streets.

D. Do not stockpile excavated material adjacent to trenches and other excavations, unless excavation side slopes and excavation support systems are designed, constructed, and maintained for stockpile loads.

E. Do not stockpile excavated materials near or over existing facilities, adjacent property, or completed Work, if weight of stockpiled material could induce excessive settlement.

3.7 DISPOSAL OF SPOIL

A. Dispose of excavated materials, which are unsuitable or exceed quantity needed for fill or backfill, offsite.

B. Dispose of debris resulting from removal of underground facilities as specified in Section 02 41 00, Demolition, for demolition debris.

C. Dispose of debris resulting from removal of organic matter, trash, refuse, and junk as specified in Section 31 10 00, Site Clearing, for clearing and grubbing debris.

END OF SECTION

SECTION 31 23 19.01
DEWATERING

PART 1 GENERAL

1.1 SUBMITTALS

A. Informational Submittals:

1. Water control plan.
2. Well permits.
3. Discharge permits.
4. Water Level Elevations Observed in Observation Wells: Submit same day measured.
5. Settlement Benchmark Elevations: Submit weekly record.
6. Inflow Measurements: Submit weekly record.

1.2 WATER CONTROL PLAN

A. As a minimum, include:

1. Descriptions of proposed groundwater and surface water control facilities including, but not limited to, equipment; methods; standby equipment and power supply, means of measuring inflow to excavations, pollution control facilities, discharge locations to be utilized, and provisions for immediate temporary water supply as required by this section.
2. Drawings showing locations, dimensions, and relationships of elements of each system.
3. Design calculations demonstrating adequacy of proposed dewatering systems and components.
4. Shall meet dewatering standards described in the City's "WHITEBOOK" supplement to the Standard Specifications for Public Works Construction.

B. If system is modified during installation or operation revise or amend and resubmit Water Control Plan.

C. Water Control Plan should be prepared, reviewed and stamped by qualified and certified hydrogeologist in the state of California.

D. Data provided in the geotechnical reports, including boring logs and groundwater level measurements indicate the conditions at the borings and monitoring wells at the times and places indicated in the report. This information is not intended as a representation or warranty of continuity of conditions between borings nor the groundwater level at times other than

those reported. The owner is not responsible for interpretations or conclusions drawn by the contractor.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 GENERAL

A. Continuously control water during course of construction, including weekends and holidays and during periods of work stoppages, and provide adequate backup systems to maintain control of water.

B. Remove and control water during periods when necessary to properly accomplish Work.

3.2 SURFACE WATER CONTROL

A. See Section 01 50 00, Temporary Facilities and Controls, Article Temporary Controls.
B. Remove surface runoff controls when no longer needed.

3.3 DEWATERING SYSTEMS

A. Provide, operate, and maintain dewatering systems of sufficient size and capacity to permit excavation and subsequent construction in dry and to lower and maintain groundwater level a minimum of 5 feet below the lowest point of excavation. Continuously maintain excavations free of water, regardless of source, and until backfilled to final grade.

B. Dewatering systems shall include wells or well points, and other equipment and appurtenances installed outside limits of excavations and sufficiently below lowest point of excavation, or to maintain specified groundwater elevation.

C. Design and Operate Dewatering Systems:

1. To prevent loss of ground as water is removed.
2. To avoid inducing settlement or damage to existing facilities, completed Work, or adjacent property.
3. To relieve artesian pressures and resultant uplift of excavation bottom.

D. Provide sufficient redundancy in each system to keep excavation free of water in event of component failure.

E. Provide 100 percent emergency power backup with automatic startup and switchover in event of electrical power failure.

F. Provide supplemental ditches and sumps only as necessary to collect water from local seeps. Do not use ditches and sumps as primary means of dewatering.

3.4 MONITORING WELLS

A. Monitoring Groundwater Levels: Install and monitor observation wells at locations selected by Engineer. Measure water levels observed in each observation well at least weekly and whenever system or component failures are discovered and whenever any event, including but not limited to flood, storms, changes in water surface elevation of nearby water bodies, may have caused a change in the groundwater elevation.

B. After groundwater level observation wells are no longer needed for monitoring groundwater levels, abandon observation wells, as required by regulations.

3.5 MONITORING FLOWS

A. Monitor volume of water pumped per calendar day from excavations, as Work progresses. Also monitor volume of water introduced each day into excavations for performance of Work. Monitor flows using measuring devices acceptable to Engineer.

3.6 DISPOSAL OF WATER

A. Obtain discharge permit for water disposal from authorities having jurisdiction.

B. Treat water collected by dewatering operations, as required by regulatory agencies, prior to discharge.

C. Discharge water as required by discharge permit and in manner that will not cause erosion or flooding, or otherwise damage existing facilities, completed Work, or adjacent property.

D. Remove solids from treatment facilities and perform other maintenance of treatment facilities as necessary to maintain their efficiency.

3.7 PROTECTION OF PROPERTY

A. Make assessment of potential for dewatering induced settlement. Submit a settlement monitoring plan for review and approval based on the Dewatering methods selected.

B. Provide and operate devices or systems, including but not limited to reinjection wells, infiltration trenches and cutoff walls, necessary to prevent damage to existing facilities, completed Work, and adjacent property.

C. Securely support existing facilities, completed Work, and adjacent property vulnerable to settlement due to dewatering operations. Support shall include, but not be limited to, bracing, underpinning, or compaction grouting.

3.8 REMEDIATION OF GROUNDWATER DEPLETION

A. If dewatering reduces quantity or quality of water produced by existing wells, temporarily supply water to affected well owners from other sources. Furnish water of a quality and quantity equal to or exceeding the quality and quantity available to well owner prior to beginning the Work or as satisfactory to each well owner.

END OF SECTION

SECTION 31 23 23
FILL AND BACKFILL

PART 1 GENERAL

1.1 DESCRIPTION

A. This specification applies for fill and backfill within the Morena Pump Station boundaries shown on the contract document.

B. The work of the Contractor covered by these specifications consist of furnishing labor and equipment and performing all operations necessary to remove deleterious and undesirable materials from area of grading, to properly prepare areas to receive fill, and to excavate and fill to the lines and grades shown on the plans or as directed in writing by the Geotechnical Engineer.

C. The Contractor shall perform the work in strict accordance with these specifications, and the Contractor shall be responsible for the quality of the finished product notwithstanding the fact that the earthwork may be observed and tested by a Geotechnical Engineer. Deviations from these specifications will be permitted only upon written authorization from the Geotechnical Engineer.

D. The data contained in the geotechnical study and in any following addenda indicating subsurface conditions are not intended as representations of warranties of the accuracy of continuity of subsurface conditions between explorations. The interpretations of conclusions drawn from such data shall be the responsibility of the Contractor.

1.2 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   a. D75, Standard Practice for Sampling Aggregates.
   b. D1556, Standard Test Method for Density and Unit Weight of Soil in Place by the Sand-Cone Method.
   c. D1557, Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 (2,700 kN-m/m^3)).
   d. D4253, Standard Test Methods for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table.
   e. D4254, Standard Test Method for Minimum Index Density and Unit Weight of Soils and Calculation of Relative Density.
   f. D4829. Standard Test Method for Expansion Index of Soils.

g. D4318. Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils.
h. D6938, Standard Test Methods for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).
i. D6913. Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis.
j. D7928, Standard Test Method for Particle-Size Distribution (Gradation) of Fine-Grained Soils Using the Sedimentation (Hydrometer) Analysis.

1.3 DEFINITIONS

A. Geotechnical Engineer: shall mean a licensed civil engineer providing geotechnical engineering services to the project owner.

B. Owner: shall mean the owner of the project on whose behalf the earthwork is being performed and who has contracted with the Contractor to have the earthwork performed.

C. Relative Compaction:

1. Ratio, in percent, of as-compacted field dry density to laboratory maximum dry density as determined in accordance with ASTM D1556 or D6938 to laboratory maximum dry density as determined in accordance with ASTM D1557.
2. Apply corrections for oversize material to either as-compacted field dry density or maximum dry density, as determined by Engineer.

D. Optimum Moisture Content:

1. Moisture content in percent as determined in accordance with ASTM D1557

E. Relative Density: Calculated in accordance with ASTM D4254 based on maximum index density determined in accordance with ASTM D4253 and minimum index density determined in accordance with ASTM D4254.

F. Prepared Ground Surface: Ground surface after completion of required demolition, clearing and grubbing, scalping of sod, stripping of topsoil, excavation to grade, and subgrade preparation.

G. Completed Course: A course or layer that is ready for next layer or next phase of Work.

H. Lift: Loose (uncompacted) layer of material.

I. Geosynthetics: Geotextiles, geogrids, or geomembranes.

J. Borrow Material: Material from required excavations or from designated borrow areas on site or imported to site.

K. Select Backfill Material: Materials available that Engineer determines to be suitable for specific use.

L. Imported Material: Materials obtained from sources offsite, suitable for specified use.

M. Structural Fill: Fill materials as required under structures, pavements, and other facilities.

1.4 SUBMITTALS

A. Action Submittals:

1. Samples:
   a. Imported material taken at source.

B. Informational Submittals:

1. Manufacturer's data sheets for compaction equipment.
2. Certified test results from independent testing agency.

1.5 QUALITY ASSURANCE

A. Notify Engineer when:

1. Fill or backfill operations will be undertaken at the Morena Pump Station site.
2. Structure or tank is ready for backfilling, and whenever backfilling operations are resumed after a period of inactivity.
3. Soft or loose subgrade materials are encountered wherever embankment or site fill is to be placed.
4. Fill material appears to be deviating from Specifications.

1.6 SEQUENCING AND SCHEDULING

A. Backfill against concrete structures only after concrete has attained compressive strength specified in the project plans. Obtain Engineer's acceptance of concrete work and attained strength prior to placing backfill.

B. Backfill around water-holding structures only after completion of satisfactory leakage tests as specified in project plans.

C. Do not place granular base, subbase, or surfacing until after subgrade has been prepared as specified in GreenBook Section 300.

PART 2 PRODUCTS

2.1 SOURCE QUALITY CONTROL

A. Gradation Tests:

1. Conduct as many tests as necessary to locate acceptable sources of imported material.
2. During production of imported material, test for gradation and plasticity.

B. Samples: Collected in accordance with ASTM D75:

1. Clearly mark to show source of material and intended use.

2.2 GENRAL FILL

A. Materials for compacted fill shall contain no rocks or hard lumps greater than 6 inches in maximum dimension and shall contain at least 40% of material smaller than ¼ inch in size. Material of a perishable, spongy, or otherwise improper nature shall not be used in fills.

B. Select soil to be used at finish grade to the depths and at the locations specified on the grading plans and in the geotechnical report - "Geotechnical Report, Pump Station Portion, Morena Pump Station, WW Force Main, and Brine/Centrate Conveyance Predesign (NC01), San Diego, California," prepared by AECOM, dated January 5, 2018 provided in supplementary special provisions section 2-7, shall consist of material that contains no rocks or hard lumps greater than 6 inches in maximum dimension and that has an Expansion Index of 30 or less when tested in accordance with ASTM D4829.

2.3 TRENCH BACKFILL

A. Trench backfill above pipe bedding shall be in accordance with Section 31 23 23.15.

2.4 BACKFILL AROUND BURIED TANKS

A. Wall backfill materials shall be in accordance with Section 300 of the GreenBook

2.5 WATER FOR MOISTURE CONDITIONING

A. Free of hazardous or toxic contaminates, or contaminants deleterious to proper compaction.

B. Fill shall be place at or up to 3 % above the optimum moisture content.

PART 3 EXECUTION

3.1 GENERAL

A. Keep placement surfaces free of water, debris, and foreign material during placement and compaction of fill and backfill materials.

B. Place and spread fill and backfill materials in horizontal lifts of uniform thickness, in a manner that avoids segregation, and compact each lift to a relative compaction that is indicated by test to not be less than 90 percent prior to placing succeeding lifts. Slope lifts only where necessary to conform to final grades or as necessary to keep placement surfaces drained of water.

C. Each lift shall be less than 8-inch loose lift or smaller.

D. Compaction of fill by jetting shall not be permitted.

E. During filling and backfilling, keep level of fill and backfill around each structure and buried tank even.

F. Do not place fill or backfill, if fill or backfill material is frozen, or if surface upon which fill or backfill is to be placed is frozen.

G. Utility pipes and conduits shall be placed in accordance with Section 306 of the GreenBook.

H. Tolerances:

1. Final Lines and Grades: Within a tolerance of 0.1 foot unless dimensions or grades are shown or specified otherwise.
2. Grade to establish and maintain slopes and drainage as shown. Reverse slopes are not permitted.

I. Settlement: Correct and repair any subsequent damage to structures, pavements, curbs, slabs, piping, and other facilities, caused by settlement of fill or backfill material.

3.2 BACKFILL UNDER AND AROUND STRUCTURES

A. Under Facilities: Within influence area beneath structures, slabs, pavements, curbs, piping, conduits, duct banks, and other facilities, backfill with select fill, unless otherwise shown. Place select fill in loose lifts of 8 inches maximum thickness and compact each lift to minimum of 90 percent relative compaction as determined in accordance with ASTM D1557**.**

B. Influence are beneath structures includes an area 5 feet horizontally beyond the building structure and within an inclined plane at 1:1 horizontal to vertical leading from the horizontal limit down and away from the structure.

3.3 BACKFILL AROUND TANKS

A. Backfill to top of tank, unless otherwise shown, with select fill and thoroughly water settle by saturating backfill and vibrating saturated backfill with a concrete vibrator inserted through full depth of backfill on 1-foot maximum centers.

B. Backfill above top of tank with general fill placed in 8-inch loose lifts. Compact each lift to minimum 90 percent relative compaction as determined in accordance with ASTM D1557,

3.4 SITE TESTING

A. Gradation:

1. One sample from each 1,000 cubic yards of finished product or more often as determined by Engineer, if variation in gradation is occurring, or if material appears to depart from Specifications.
2. If test results indicate material does not meet Specification requirements, terminate material placement until corrective measures are taken.
3. Remove material placed in Work that does not meet Specification requirements.

B. In-Place Density Tests: In accordance with ASTM D1556 or D 6938. During placement of materials, test per 500 cubic yards of material placed or as directed by Geotechnical Engineer

3.5 PAYMENT

A. Payment shall be per cubic yard of soil material placed.

1.2 DEFINITIONS

A. Base Rock: Granular material upon which manhole bases and other structures are placed.

B. Bedding Material: Granular material upon which pipes, conduits, cables, or duct banks are placed.

C. Imported Material: Material obtained by Contractor from source(s) offsite.

D. Lift: Loose (uncompacted) layer of material.

E. Pipe Zone: Backfill zone that includes full trench width and extends from prepared trench bottom to an upper limit above top outside surface of pipe, conduit, cable or duct bank.

F. Prepared Trench Bottom: Graded trench bottom after excavation and installation of stabilization material, if required, but before installation of bedding material.

G. Relative Compaction: The ratio, in percent, of the as-compacted field dry density to the laboratory maximum dry density as determined by ASTM D1557. Corrections for oversize material may be applied to either as-compacted field dry density or maximum dry density, as determined by Engineer.

H. Relative Density: As defined by ASTM D4253 and ASTM D4254.

I. Selected Backfill Material: Material available that Engineer determines to be suitable for a specific use.

J. Well-Graded: A mixture of particle sizes that has no specific concentration or lack thereof of one or more sizes producing a material type that, when compacted, produces a strong and relatively incompressible soil mass free from detrimental voids. Satisfying both of the following requirements, as defined in ASTM D2487:

1. Coefficient of Curvature: Greater than or equal to 1 and less than or equal to 3.
2. Coefficient of Uniformity: Greater than or equal to 4 for materials classified as gravel, and greater than or equal to 6 for materials classified as sand.

1.3 SUBMITTALS

A. Action Submittals:

1. Shop Drawings: Manufacturer's descriptive literature for marking tapes.
2. Samples:
   a. Trench stabilization material.
   b. Bedding and pipe zone material.

c. Granular drain.
d. Granular backfill.
e. Earth backfill.
f. Sand(s).

B. Informational Submittals:

1. Catalog and manufacturer's data sheets for compaction equipment.
2. Certified Gradation Analysis: Submit not less than 30 days prior to delivery for imported materials or anticipated use for excavated materials, except for trench stabilization material that will be submitted prior to material delivery to Site.
3. Controlled Low Strength Material: Certified mix design and test results. Include material types and weight per cubic yard for each component of mix.

PART 2 PRODUCTS

2.1 MARKING TAPE

A. Nondetectable:

1. Inert polyethylene, impervious to known alkalis, acids, chemical reagents, and solvents likely to be encountered in soil.
2. Thickness: Minimum 5 mils.
3. Width: 6 inches.
4. Identifying Lettering: Minimum 1-inch high, permanent black lettering imprinted continuously over entire length.
5. Manufacturers and Products:
   a. Reef Industries; Terra Tape.
   b. Mutual Industries; Non-detectable Tape.
   c. Presco; Non-detectable Tape.
   d. Or Approved Equal.

B. Detectable:

1. Solid aluminum foil, visible on unprinted side, encased in protective high visibility, inert polyethylene plastic jacket.
2. Foil Thickness: Minimum 0.35 mils.
3. Laminate Thickness: Minimum 5 mils.
4. Width: 6 inches.
5. Identifying Lettering: Minimum 1-inch high, permanent black lettering imprinted continuously over entire length.
6. Joining Clips: Tin or nickel-coated furnished by tape manufacturer.
7. Manufacturers and Products:
   a. Reef Industries; Terra Tape, Sentry Line Detectable.

b. Mutual Industries; Detectable Tape.
c. Presco; Detectable Tape.
d. Or Approved Equal.

C. Color: In accordance with APWA Uniform Color Code.

Color*	Facility
Red	Electric power lines, cables, conduit, and lightning cables
Orange	Communicating alarm or signal lines, cables, or conduit
Yellow	Gas, oil, steam, petroleum, or gaseous materials
Green	Sewers and drain lines
Blue	Potable water
Purple	Reclaimed water, irrigation, and slurry lines
*As specified in NEMA Z535.1, Safety Color Code.	

2.2 TRACER WIRE

A. Material: Minimum 12-gauge solid copper or copper jacket with a steel core, with high-density polyethylene (HDPE) or high-molecular weight polyethylene (HMWPE) insulation suitable for direct bury.

B. Splices: Use wire nut or lug suitable for direct burial as recommended by tracer wire manufacturer.

C. Manufacturers:

1. Copperhead Industries, LLC.
2. Performance Wire & Cable Inc.
3. Pro-line Safety Products Company.

2.3 TRENCH STABILIZATION MATERIAL

A. Base Rock:

1. Clean, hard, durable 3-inch minus crushed rock or gravel, or pit run, free from clay balls, other organic materials, or debris.

B. Granular Backfill:

1. Clean gravel or crushed rock.
2. Maximum Particle Size: 1-inch.

3. Dry sand, accepted by Engineer, may be provided for trenches above maximum groundwater level.

2.4 BEDDING MATERIAL AND PIPE ZONE MATERIAL

A. Unfrozen, friable, and no clay balls, roots, or other organic material.

B. Clean or gravelly sand with less than 5 percent passing No. 200 sieve, as determined in accordance with ASTM D1140, or gravel or crushed rock within maximum particle size and other requirements as follows unless otherwise specified.

1. Duct Banks: 3/4-inch maximum particle size.
2. PVC Irrigation System Piping and Ductile Iron Pipe with Polyethylene Wrap: 3/8-inch maximum particle size.
3. Pipe Under 18-Inch Diameter: 3/4-inch maximum particle size, except 1/4 inch for stainless steel pipe, copper pipe, tubing, and plastic pipe under 3-inch diameter.
4. Pipe 18-Inch Diameter and Greater: 1-1/2-inch maximum particle size for ductile iron pipe, concrete pipe, welded steel pipe, and pretensioned or prestressed concrete cylinder pipe.
5. Perforated Pipe: Granular drain material.
6. Conduit and Direct-Buried Cable:
   a. Sand, clean or clean to silty, less than 12 percent passing No. 200 sieve.
   b. Individual Particles: Free of sharp edges.
   c. Maximum Size Particle: Pass a No. 4 sieve.
   d. If more than 5 percent passes No. 200 sieve, the fraction that passes No. 40 sieve shall be nonplastic as determined in accordance with ASTM D4318.

2.5 GRANULAR DRAIN MATERIAL (CLASS B)

A. Gradation: As follows:

Sieve Size	Percent Passing By Weight
1 inch	100
3/4 inch	90-100
3/8 inch	20-45
No. 4	0-10
No. 8	0-5

Sieve Size	Percent Passing By Weight
No. 200	0-2

2.6 EARTH BACKFILL

A. Soil, loam, or other excavated material suitable for use as backfill.

B. Free from roots or organic matter, refuse, boulders and material larger than 1/2 cubic foot, or other deleterious materials.

2.7 PROCESSED EARTH BACKFILL

A. Class A Backfill: Earth backfill, meeting the following additional requirement.

1. Free of boulders and cobbles that would be retained on a 3-inch sieve.
2. Cohesionless, free-draining material with 100 percent passing 3-inch sieve, at least 70 percent passing 1-1/2-inch sieve, and less than 15 percent passing No. 200 sieve.

2.8 CONTROLLED LOW STRENGTH MATERIAL (CLSM)

A. Select and proportion ingredients to obtain compressive strength between 50 psi and 150 psi at 28 days in accordance with ASTM D4832.

B. Materials:

1. Cement: ASTM C150/C150M, Type I or Type II.
2. Aggregate: ASTM C33/C33M, Size 7.
3. Fly Ash (Pozzolan): Class F fly ash in accordance with ASTM C618, except as modified herein:
   a. ASTM C618, Table 1, Loss on Ignition: Unless permitted otherwise, maximum 3 percent.
4. Water: Clean, potable, containing less than 500 ppm of chlorides.

2.9 CONCRETE BACKFILL

A. Provide as specified in Section 03 30 00, Cast-in-Place Concrete.

B. Mix: ASTM C94/C94M, Option A.

1. Cement: ASTM C150/C150M, Type I or Type II.
2. Coarse Aggregate Size: 3/4 inch(es).
3. Design for Minimum Compressive Strength at 28 Days: 3000 psi.

2.10 GRAVEL SURFACING ROCK

A. As specified in Section 32 11 23, Aggregate Base Courses.

2.11 SOURCE QUALITY CONTROL

A. Perform gradation analysis in accordance with ASTM C136 for:

1. Earth backfill, including specified class.
2. Trench stabilization material.
3. Bedding and pipe zone material.

B. Certify Laboratory Performance of Mix Designs:

1. Controlled low strength material.
2. Concrete.

PART 3 EXECUTION

3.1 TRENCH PREPARATION

A. Water Control:

1. Promptly remove and dispose of water entering trench as necessary to grade trench bottom and to compact backfill and install manholes, pipe, conduit, direct-buried cable, or duct bank. Do not place concrete, lay pipe, conduit, direct-buried cable, or duct bank in water.
2. Remove water in a manner that minimizes soil erosion from trench sides and bottom.
3. Provide continuous water control until trench backfill is complete.

B. Remove foreign material and backfill contaminated with foreign material that falls into trench.

3.2 TRENCH BOTTOM

A. Firm Subgrade: Grade with hand tools, remove loose and disturbed material, and trim off high areas and ridges left by excavating bucket teeth. Allow space for bedding material if shown or specified.

B. Soft Subgrade: If subgrade is encountered that may require removal to prevent pipe settlement, notify Engineer. Engineer will determine depth of over excavation, if any required.

3.3 TRENCH STABILIZATION MATERIAL INSTALLATION

A. Rebuild trench bottom with trench stabilization material.

B. Place material over full width of trench in 6-inch lifts to required grade, providing allowance for bedding thickness.

C. Compact each lift so as to provide a firm, unyielding support for the bedding material prior to placing succeeding lifts.

3.4 BEDDING

A. Furnish imported bedding material where, in the opinion of Engineer, excavated material is unsuitable for bedding or insufficient in quantity.

B. Place over full width of prepared trench bottom in two equal lifts when required depth exceeds 8 inches.

C. Hand grade and compact each lift to provide a firm, unyielding surface.

D. Minimum Thickness: As follows:

1. Pipe 15 Inches and Smaller: 4 inches.
2. Pipe 18 Inches to 36 Inches: 6 inches.
3. Pipe 42 Inches and Larger: 8 inches.
4. Conduit: 3 inches.
5. Direct-Buried Cable: 3 inches.
6. Duct Banks: 3 inches.

E. Check grade and correct irregularities in bedding material. Loosen top 1 inch to 2 inches of compacted bedding material with a rake or by other means to provide a cushion before laying each section of pipe, conduit, direct-buried cable, or duct bank.

F. Install to form continuous and uniform support except at bell holes, if applicable, or minor disturbances resulting from removal of lifting tackle.

G. Bell or Coupling Holes: Excavate in bedding at each joint to permit proper assembly and inspection of joint and to provide uniform bearing along barrel of pipe or conduit.

3.5 BACKFILL PIPE ZONE

A. Upper limit of pipe zone shall not be less than following:

1. Pipe: 12 inches, unless shown otherwise.
2. Conduit: 3 inches, unless shown otherwise.
3. Direct-Buried Cable: 3 inches, unless shown otherwise.
4. Duct Bank: 3 inches, unless shown otherwise.

B. Restrain pipe, conduit, cables, and duct banks as necessary to prevent their movement during backfill operations.

C. Place material simultaneously in lifts on both sides of pipe and, if applicable, between pipes, conduit, cables, and duct banks installed in same trench.

1. Pipe 10-Inch and Smaller Diameter: First lift less than or equal to 1/2 pipe diameter.
2. Pipe Over 10-Inch Diameter: Maximum 6-inch lifts.

D. Thoroughly tamp each lift, including area under haunches, with handheld tamping bars supplemented by "walking in" and slicing material under haunches with a shovel to ensure voids are completely filled before placing each succeeding lift.

E. Do not use power-driven impact compactors to compact pipe zone material. After full depth of pipe zone material has been placed as specified, compact material by a minimum of three passes with a vibratory plate compactor only over area between sides of pipe and trench walls. Take care to avoid damaging pipe and pipe coating.

3.6 COMPACTION REQUIREMENTS

A. Compaction shall be accomplished by mechanical means. Consolidation by water settling methods such as jetting or flooding is prohibited.

B. If the backfill fails to meet the specified relative compaction requirements, the backfill shall be reworked until the requirements are met. All necessary excavations for density tests shall be made as directed by the inspector, and as acceptable to the Engineer. The requirements of the Agency having jurisdiction shall prevail on all public roads.

C. Compaction tests shall be performed at random depths, and at random intervals not to exceed 150 feet, as directed by the inspector or City.

D. Relative compaction shall be determined by the impact or field compaction test made in accordance with ASTM D 1557 Procedure C.

E. Unless otherwise shown on the Approved Plans, Standard Drawings or otherwise described in the Specifications for the particular type of pipe installed, relative compaction in pipe trenches shall be as follows:

1. Pipe Zone – 90% relative compaction
2. Trench Zone – 90% relative compaction
3. Structural section in paved areas – per agency requirements, 95% minimum

4. Imported Granular Material for over excavation or foundation stabilization – 90% relative density

F. All excavations are subject to compaction tests.

3.7 MARKING TAPE INSTALLATION

A. Continuously install marking tape along centerline of buried piping, at depth of 2 feet. Coordinate with piping installation drawings.

1. Detectable Marking Tape: Install with nonmetallic piping and waterlines.
2. Nondetectable Marking Tape: Install with metallic piping.

3.8 TRACER WIRE INSTALLATION AND TESTING

A. Install tracer wire continuously along centerline of nonmetallic buried piping.

B. Attach wire to top of pipe using tape at maximum of 10-foot intervals. In areas where depth of cover is excessive for allowing detection of tracer wire with electronic pipe locator, install tracer wire within pipe backfill directly above pipe centerline at a minimum depth of 3 feet.

C. Install splices in accordance with manufacturer's instructions for direct bury applications. Tie ends of wire to be joined in a knot as required to reduce tension on splice.

D. Bring tracer wire to surface at each valve box, curb box, vault, air valve, blow off valve, hydrant, and pipeline marker. Tracer wire shall be brought to surface at least every 1,000 feet. If distance between pipe appurtenances exceeds 1,000 feet, install valve box to allow access to tracer wire. Mark valve box cover with the word "TRACER". Coil enough excess tracer wire at each appurtenance to extend wire 12 inches above ground.

E. Test continuity of tracer wire using electronic pipe locator in presence of Engineer prior to paving.

3.9 BACKFILL ABOVE PIPE ZONE

A. General:

1. Process excavated material to meet specified gradation requirements.
2. Adjust moisture content as necessary to obtain specified compaction.
3. Do not allow backfill to free fall into trench or allow heavy, sharp pieces of material to be placed as backfill until after at least 2 feet of backfill has been provided over top of pipe.

4. Do not use power driven impact type compactors for compaction until at least 4 feet of backfill is placed over top of pipe.
5. Backfill to grade with proper allowances for topsoil, crushed rock surfacing, and pavement thicknesses, wherever applicable.
6. Backfill around structures with same class backfill as specified for adjacent trench, unless otherwise shown or specified.

B. Class A Backfill (Native):

1. Place in lifts not exceeding thickness of 9 inches.
2. Mechanically compact each lift to a minimum of 95 percent relative compaction.

C. Concrete Backfill:

1. Place above bedding.
2. Minimum Concrete Thickness: 6 inches on top and sides of pipe.
3. Do not allow dirt or foreign material to become mixed with concrete during placement.
4. Allow sufficient time for concrete to reach initial set before additional backfill material is placed in trench.
5. Prevent flotation of pipe.
6. Begin and end concrete backfill within 4 inches of a pipe joint on each end.
7. Do not encase pipe joints except within the limits of the concrete backfill.

D. Controlled Low Strength Material:

1. Discharge from truck mounted drum type mixer into trench.
2. Place in lifts as necessary to prevent uplift (flotation) of new and existing facilities.

3.10 MAINTENANCE OF TRENCH BACKFILL

A. After each section of trench is backfilled, maintain surface of backfilled trench even with adjacent ground surface until final surface restoration is completed.

B. Gravel Surfacing Rock: Add gravel surfacing rock where applicable and as necessary to keep surface of backfilled trench even with adjacent ground surface, and grade and compact as necessary to keep surface of backfilled trenches smooth, free from ruts and potholes, and suitable for normal traffic flow.

C. Topsoil: Add topsoil where applicable and as necessary to maintain surface of backfilled trench level with adjacent ground surface.

D. Concrete Pavement: Replace settled slabs as specified in Section 32 13 13, Concrete Paving and Asphalt.

E. Asphaltic Pavement: Replace settled areas or fill with asphalt as specified in Section 32 13 13, Concrete Paving and Asphalt.

F. Other Areas: Add excavated material where applicable and keep surface of backfilled trench level with adjacent ground surface.

3.11 SETTLEMENT OF BACKFILL

A. Settlement of trench backfill, or of fill, or facilities constructed over trench backfill will be considered a result of defective compaction of trench backfill.

END OF SECTION

SECTION 31 32 19.16
GEOTEXTILE

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards that may be referenced in this section:

1. ASTM International (ASTM):
   a. D737, Standard Test Method for Air Permeability of Textile Fabrics.
   b. D4355, Standard Test Method for Deterioration of Geotextiles by Exposure to Light, Moisture and Heat in a Xenon Arc Type Apparatus.
   c. D4491, Standard Test Methods for Water Permeability of Geotextiles by Permittivity.
   d. D4533, Standard Test Method for Trapezoid Tearing Strength of Geotextiles.
   e. D4595, Standard Test Method for Tensile Properties of Geotextiles by the Wide-Width Strip Method.
   f. D4632, Standard Test Method for Grab Breaking Load and Elongation of Geotextiles.
   g. D4716, Test Method for Determining the (In-Plane) Flow Rate per Unit Width and Hydraulic Transmissivity of a Geosynthetic Using a Constant Head.
   h. D4751, Standard Test Method for Determining Apparent Opening Size of a Geotextile.
   i. D4833, Standard Test Method for Index Puncture Resistance of Geotextiles, Geomembranes, and Related Products.
   j. D4884, Standard Test Method for Strength of Sewn or Thermally Bonded Seams of Geotextiles.
   k. D4886, Standard Test Method for Abrasion Resistance of Geotextiles (Sand Paper/Sliding Block Method).
   l. D5199, Standard Test Method for Measuring the Nominal Thickness of Geosynthetics.
   m. D5261, Standard Test Method for Measuring Mass per Unit Area of Geotextiles.
   n. D6193, Standard Practice for Stitches and Seams.

1.2 DEFINITIONS

A. Fabric: Geotextile, a permeable geosynthetic comprised solely of textiles.

B. Maximum Average Roll Value (MaxARV): Maximum of series of average roll values representative of geotextile furnished.

C. Minimum Average Roll Value (MinARV): Minimum of series of average roll values representative of geotextile furnished.

D. Nondestructive Sample: Sample representative of finished Work, prepared for testing without destruction of Work.

E. Overlap: Distance measured perpendicular from overlapping edge of one sheet to underlying edge of adjacent sheet.

F. Seam Efficiency: Ratio of tensile strength across seam to strength of intact geotextile, when tested according to ASTM D4884.

1.3 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
    a. Manufacturer material specifications and product literature.
    b. Installation drawings showing geotextile sheet layout, location of seams, direction of overlap, and sewn seams.
    c. Description of proposed method of geotextile deployment, sewing equipment, sewing methods, and provisions for holding geotextile temporarily in place until permanently secured.
2. Samples:
    a. Geotextile: One-piece, minimum 18 inches long, taken across full width of roll of each type and weight of geotextile furnished for Project. Label each with brand name and furnish documentation of lot and roll number from which each Sample was obtained.
    b. Field Sewn Seam: 5-foot length of seam, 12 inches wide with seam along center, for each type and weight of geotextile.
    c. Securing Pin and Washer: One each.

B. Informational Submittals:

1. Certifications from each geotextile manufacturer that furnished products have specified property values. Certified property values shall be either minimum or maximum average roll values, as appropriate, for geotextiles furnished.
2. Field seam efficiency test results.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Deliver each roll with sufficient information attached to identify it for inventory and quality control.

B. Handle products in manner that maintains undamaged condition.

C. Do not store products directly on ground. Ship and store geotextile with suitable wrapping for protection against moisture and ultraviolet exposure. Store geotextile in way that protects it from elements. If stored outdoors, elevate and protect geotextile with waterproof cover.

1.5 SCHEDULING AND SEQUENCING

A. Where geotextile is to be laid directly upon ground surface, prepare subgrade as specified in Section 31 23 13, Subgrade Preparation, first.

B. Notify Engineer whenever geotextiles are to be placed. Do not place geotextile without Engineer's approval of underlying materials.

PART 2 PRODUCTS

2.1 WOVEN GEOTEXTILE

A. Composed of polymeric yarn interlaced to form planar structure with uniform weave pattern.

B. Calendared or finished so yarns will retain their relative position with respect to each other.

C. Polymeric Yarn: Long-chain synthetic polymers (polyester or polypropylene) with stabilizers or inhibitors added to make filaments resistant to deterioration due to heat and ultraviolet light exposure.

D. Sheet Edges: Selvaged or finished to prevent outer material from separating from sheet.

E. Unseamed Sheet Width: Minimum 6 feet.

F. Nominal Weight per Square Yard: Per ASTM D5261.

2.2 NONWOVEN GEOTEXTILE

A. Pervious sheet of polyester, polypropylene, or polyethylene fabricated into stable network of fibers that retain their relative position with respect to each other. Nonwoven geotextile shall be composed of continuous or discontinuous

(staple) fibers held together through needle-punching, spun-bonding, thermal-bonding, or resin-bonding.

B. Geotextile Edges: Selvaged or otherwise finished to prevent outer material from pulling away from geotextile.

C. Unseamed Sheet Width: Minimum**:** 6 feet.

D. Nominal Weight per Square Yard: Per ASTM D5261.

E. A: Nominal Thickness (mils): Per ASTM D5199.

2.3 SEWING THREAD

A. Polypropylene, polyester, or Kevlar thread.

B. Durability: Equal to or greater than durability of geotextile sewn.

2.4 SECURING PINS

A. Steel Rods or Bars:

1. 3/16-inch diameter.
2. Pointed at one end.
3. With head on other end sufficiently large to retain washer.
4. Minimum Length: 12 inches.

B. Steel Washers for Securing Pins:

1. Outside Diameter: Not less than 1.5 inches.
2. Inside Diameter: 1/4 inch.
3. Thickness: 1/8 inch.

C. Steel Wire Staples:

1. U-shaped.
2. 10 gauge.
3. Minimum Length: 6 inches.

PART 3 EXECUTION

3.1 LAYING GEOTEXTILE

A. Lay and maintain geotextile smooth and free of tension, folds, wrinkles, or creases.

3.2 SHEET ORIENTATION ON SLOPES

A. Orient geotextile with long dimension of each sheet parallel to direction of slope.

B. Geotextile may be oriented with long dimension of sheet transverse to direction of slope only if sheet width, without unsewn seams, is sufficient to cover entire slope and anchor trench and to extend at least 18 inches beyond toe of slope.

3.3 JOINTS

A. Unseamed Joints:

1. Overlapped.
2. Overlap, unless otherwise shown:
    a. Foundation/Subgrade Stabilization: Minimum 18 inches.
    b. Riprap: Minimum 18 inches.
    c. Drain Trenches: Minimum 18 inches, except overlap shall equal trench width if trench width is less than 18 inches.
    d. Other Applications: Minimum 12 inches.

B. Sewn Seams: Made wherever stress transfer from one geotextile sheet to another is necessary. Sewn seams, as approved by Engineer, also may be used instead of overlap at joints for applications that do not require stress transfer.

1. Seam Efficiency:
    a. Minimum 70 percent.
    b. Verified by preparing and testing minimum of one set of nondestructive Samples per acre of each type and weight of geotextile installed.
    c. Tested according to ASTM D4884.
2. Types:
    a. Preferred: “J” type seams.
    b. Acceptable: Flat or butterfly seams.
3. Stitch Count: Minimum three to maximum seven stitches per inch.
4. Stitch Type: Double-thread chainstitch according to ASTM D6193.
5. Sewing Machines: Capable of penetrating four layers of geotextile.
6. Stitch Location: 2 inches from geotextile sheet edges, or more, if necessary to develop required seam strength.

3.4 SECURING GEOTEXTILE

A. Secure geotextile during installation as necessary with sandbags or other means approved by Engineer.

B. Secure Geotextile with Securing Pins or Staples:

1. Insert securing pins with washers through geotextile.
2. Securing Pin Alignment:
   a. Midway between edges of overlaps.
   b. 6 inches from free edges.
3. Spacing of Securing Pins:

Slope	Maximum Pin Spacing
Steeper than 3:1	2 feet
3:1 to 4:1	3 feet
Flatter than 4:1	5 feet

4. Install additional pins across each geotextile sheet as necessary to prevent slippage of geotextile or to prevent wind from blowing geotextile out of position.
5. Push each securing pin through geotextile until washer bears against geotextile and secures it firmly to subgrade.
6. Where staples are used instead of securing pins, install in accordance with alignment and spacing above. Push in to secure geotextile firmly to subgrade.

3.5 PLACING PRODUCTS OVER GEOTEXTILE

A. Before placing material over geotextile, notify Engineer. Do not cover installed geotextile until after Engineer provides authorization to proceed.

B. If tears, punctures, or other geotextile damage occurs during placement of overlying products, remove overlying products as necessary to expose damaged geotextile. Repair damage as specified in Article Repairing Geotextile.

3.6 INSTALLING GEOTEXTILE IN TRENCHES

A. Place geotextile in a way to completely envelope granular drain material to be placed in trench and with specified overlap at joints. Overlap geotextile in direction of flow. Place geotextile in a way and with sufficient slack for geotextile to contact trench bottom and sides fully when trench is backfilled.

B. After granular drain material is placed to required grade, fold geotextile over top of granular drain material, unless otherwise shown. Maintain overlap until overlying fill or backfill is placed.

3.7 RIPRAP APPLICATIONS

A. Overlap geotextile at each joint with upstream sheet of geotextile overlapping downstream sheet.

B. Sew joints where wave run-up may occur.

C. Limit height of riprap fall onto geotextile to prevent damage.

1. Drop Height: 0 foot for greater than 200-pound rock.

3.8 GEOTEXTILE-REINFORCED EARTH WALL APPLICATIONS

A. Sew exposed joints; extend sewn seams minimum 3 feet behind face of wall.

B. Protect exposed geotextile from damage, ultraviolet light exposure, and deterioration until permanent facing is applied.

3.9 SILT FENCE APPLICATIONS

A. Install geotextile in one piece, or continuously sewn to make one piece, for full length and height of fence, including portion of geotextile buried in toe trench.

B. Install bottom edge of sheet in toe trench and backfill in a way that securely anchors geotextile in trench.

C. Securely fasten geotextile to wire mesh backing and each support post in a way that will not result in tearing of geotextile when fence is subjected to service loads.

D. Promptly repair or replace silt fence that becomes damaged.

3.10 REPAIRING GEOTEXTILE

A. Repair or replace torn, punctured, flawed, deteriorated, or otherwise damaged geotextile.

B. Repair Procedure:

1. Place patch of undamaged geotextile over damaged area and at least 18 inches in all directions beyond damaged area.
2. Remove interfering material as necessary to expose damaged geotextile for repair.
3. Sew patches or secure them with heat fusion tacking or with pins and washers, as specified above in Article Securing Geotextile, or by other means approved by Engineer.

3.11 REPLACING CONTAMINATED GEOTEXTILE

A. Protect geotextile from contamination that would interfere, in Engineer's opinion, with its intended function. Remove and replace contaminated geotextile with clean geotextile.

END OF SECTION

SECTION 31 45 19
STONE COLUMNS

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of testing and material standards which all relevant work shall comply with:

1. ASTM D-1241 – Aggregate Quality.
2. ASTM STP 399 – Dynamic Penetrometer Testing (if applicable).
3. ASTM D-422 – Gradation Soils
4. ASTM D344 - Static Cone Penetration Testing (CPT)

B. Installation of Stone Columns shall comply with the following:

1. Contract Documents
2. Project geotechnical report – "Geotechnical Report, Pump Station Portion, Morena Pump Station, WW Force Main, and Brine/Centrate Conveyance Predesign (NC01), San Diego, California," prepared by AECOM, dated January 5, 2018 & Geotechnical Report Addendums 1 and 2 dated August 13, 2018 and December 20, 2018.
3. Form of contract between Owner and General Contractor, Owner and Installation Contractor, and General Contractor and Installation Contractor as appropriate.

1.2 .DEFINITIONS

A. Vibro-placement method: inserting a probe by vibrating means into the ground to densify surrounding soil and filling the void created with gravel or stone as the probe is withdrawn.

1.3 DESCRIPTION OF WORK

A. Work shall consist of designing, furnishing and installing materials, and constructing a ground improvement system at the locations noted on the drawings and as specified herein. Ground improvement system shall be vibro-placed stone columns.

B. Provision of all equipment, material, labor, and supervision to design and install stone columns shall be included in the work. Design shall rely on subsurface information presented in the project geotechnical report - "Geotechnical Report, Pump Station Portion, Morena Pump Station, WW Force Main, and Brine/Centrate Conveyance Predesign (NC01), San Diego, California," prepared by AECOM, dated January 5, 2018.

C. The Installer shall locate and protect underground utilities and above ground utilities and other structures from damage during installation of the stone columns.

D. The Installer shall comply with all Cal OSHA requirements for safety for the project.

1.4 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Stone column detail drawings sealed by a California licensed professional engineer, where required by California state professional engineering regulations.

2. Product Data:
   a. Aggregate source and gradation.

B. Informational Submittals:

1. Statement of qualifications for stone column installation contractor.

2. Installation and monitoring plan describing installation means and methods used by the installation contractor, including aggregate gradation and approximate weight of aggregate to be placed per volume of installation probe advanced per foot.

3. Test data - The installation contractor shall furnish the Owner's Geotechnical Engineer a description of the installation equipment, installation record, complete test data and analysis of the test data and recommended design parameter values based on the Test Section and Cone Penetration Test (CPT) data results. The report shall be prepared under supervision of a California registered professional engineer.

4. Daily Progress Reports – The Installer shall furnish a complete and accurate record of stone column installation to the General Contractor. The record shall indicate the pier location, length, average lift

thickness and final elevations of the base and top of piers. The record shall also indicate the type and size of the densification equipment used. The Installer shall immediately report any unusual conditions encountered during installation to the General Contractor, the Designer and the Owner.

5. Verification Test Results – The Installer shall provide CPT results for the post-installation subsurface conditions to the Owner's Geotechnical Engineer to evaluate the ground improvement at the site.

6. Monitoring plan – The Installer shall provide a monitoring plan for nearby structures, including the Army Corps of Engineers levee to the south of the project, to monitor for settlement or lateral movement during installation of the stone columns. The monitoring plan shall be submitted to the Owner's geotechnical engineer for approval prior to stone column installation.

1.5 TEST SECTION

A. A test section at least 40 feet by 40 feet in plan dimension shall be installed prior to production installation of the stone columns at the site.

B. Two CPTs shall be advanced for the test section to evaluate the subsurface conditions to verify ground improvement for the stone column installation method. Results of the CPTs shall be submitted and reviewed by the Owner's Geotechnical Engineer prior to installation of the stone columns at the site.

1.6 STONE COLUMN DESIGN

A. The stone column design shall be verified by the results of the CPTs and the evaluation of liquefaction potential.

B. Stone Columns shall be designed in accordance with generally-accepted engineering practice and the methods described in Section 1 of these Specifications. The design shall meet the following criteria.

1. Minimum Stone column area coverage for test section: 40 foot by 40 foot grid pattern as shown in the drawings.
2. Minimum depth of stone columns as shown on plans.
3. Estimated post-liquefaction settlement after ground improvement: less than 2 inches.

C. The design submitted by the Installer shall consider the bearing capacity and settlement of all footings supported by stone columns, and shall be in accordance with acceptable engineering practice and these specifications. Total and differential settlement shall be considered.

D. The stone column system shall be designed to preclude plastic bulging deformations at the top-of–pier design stress and to preclude significant tip stresses. The results of the CPT tests shall be used to verify the design assumptions.

1.7 DESIGN SUBMITTAL:

A. The Installer shall submit one (1) set of detailed design calculations, construction drawings, and shop drawings, (the Design Submittal), for approval at least three (3) weeks prior to the beginning of construction. A detailed explanation of the design parameters for stone column spacing, diameter, and aggregate gradation shall be included in the Design Submittal. Additionally, the quality control test program for stone columns, meeting these design requirements, shall be submitted. All computer-generated calculations and drawings shall be prepared and sealed by a Professional Engineer, licensed in California.

1.8 QUALITY ASSURANCE

A. Qualifications:

Installer: Where required by state professional engineering regulations, ground improvement design shall be designed by an engineer licensed in the state of California.

1.9 QUALITY CONTROL REPRESENTATIVE

A. Installer shall have a full-time Quality Control (QC) representative to verify and report all QC installation procedures. The Installer shall immediately report any unusual conditions encountered during installation to the Design Engineer, the General Contractor, and to the Owner

B. Stone column installation shall be monitored by an on board computer monitoring system. Monitoring system shall log stone column number, time of installation, depth, hydraulic pressure applied during the boring process and during the compacting process. Recorded data for each stone column shall be plotted depth/pressure versus time. Installation records for each shall be made available upon request in electronic format within 24 hours of installation.

C. The QC procedures shall include the preparation of Stone Column Progress Reports completed during each day of installation and containing the following information:

1. Footing and stone column location.
2. Stone column length and drilled diameter (if pre-drilled).

3. Planned and actual stone column elevations at the top and bottom of the element.
4. Average lift thickness for each stone column.
5. Soil types encountered at the bottom of the stone column and along the length of the element.
6. Depth to groundwater, if encountered.
7. Documentation of any unusual conditions encountered.
8. Type and size of densification equipment used.

1.10 QUALITY CONTROL VERIFICATION PROGRAM

A. The installer shall be responsible for performing CPTs for the verification program to assure the quality of the construction. The program shall verify that the installed ground improvement system satisfies the performance requirements noted on the contract plans and the design requirements determined by the ground improvement system designer. At a minimum, the verification program shall include the following:

1. Quality control program to verify that the ground improvement system is installed in accordance with the designer's specifications and the requirements in this special provision. The quality control program shall include testing and observations employed by the ground improvement installer.
2. Perform CPTs at a minimum spacing of 40 feet in each direction.
3. CPT results to be submitted to the Owner's Geotechnical Engineer to evaluate the calculated post-liquefaction settlement after ground improvement.

1.11 RESPONSIBILITIES OF GEOTECHNICAL ENGINEER & INDEPENDENT ENGINEERING TESTING AGENCY

A. The Owner's Geotechnical Engineer shall review and approve the Installer's Design Submittal.

B. The Owner's Geotechnical Engineer shall monitor the installation of stone columns to verify that all work is performed in accordance with the approved Design Submittal.

C. The Owner's Geotechnical Engineer shall report any discrepancies to the Installer and General Contractor immediately.

PART 2 PRODUCTS

2.1 MATERIALS

A. Aggregate used for piers shall be selected by the installation contractor and be approved by the Owner's Geotechnical Engineer.

B. Potable water or other suitable source shall be used to increase aggregate moisture content where required. Access to water on site shall be provided by the Installer.

C. Installer to coordinate adequate and suitable marshalling areas on the project for the use of the Installer for the storage of aggregate and equipment.

PART 3 EXECUTION

3.1 STONE COLUMN

A. Install stone columns with a down-hole vibrator capable of densifying the aggregate by forcing it radially into the surrounding soil. The vibrator shall be of sufficient size and capacity to construct stone columns to the diameters and lengths shown on the installers approved drawings.

B. The probe and follower shall have visible markings at regular increments to enable measurement of penetrations depths.

C. The probe and follower tubes shall be of sufficient length to reach the elevations shown on the installer's approved construction drawings. The probe, used in combination with the available pressure to the tip jet shall be capable of penetration to the required tip elevation. Preboring shall be permitted if it is specified in the installer's approved construction procedure submittal.

D. Provide methods for supplying to the tip of the probe a sufficient quality of air or water to widen the probe hole to allow adequate space for stone backfill placement around the probe.

E. The probe shall penetrate into the foundation soil layer to the minimum depths required in the project drawings.

F. Lift thickness shall not exceed 4 feet. After penetration to the treatment depth, slowly retrieve the vibrator in 12-inch to 18-inch increments to allow backfill placement.

G. Compact the backfill in each lift by repenetrating it at least twice with the vibrating probe to densify and force the stone into the surrounding soil.

H. Install stone columns so that each completed column is continuous through its length.

3.2 PLAN LOCATION AND ELEVATION OF STONE COLUMN

I. The center of each stone column shall be within six inches of the plan locations indicated. The final measurement of the top of piers shall be the lowest point on the aggregate in the last compacted lift. Piers installed outside of the above tolerances and deemed not acceptable shall be rebuilt at no additional expense to the Owner.

J. The probe and follower tubes shall not be inclined more than 3 degrees from vertical during installation.

3.3 REJECTED STONE COLUMN

A. Stone columns improperly located or installed beyond the maximum allowable tolerances shall be abandoned and replaced with new piers, unless the Designer approves other remedial measures. All material and labor required to replace rejected piers shall be provided at no additional cost to the Owner.

END OF SECTION

SECTION 31 45 20
JET GROUTING

PART 1 GENERAL

1.1 SCOPE, PROJECT OBJECTIVES AND JOB SITE CONDITIONS

A. SCOPE

1. This Section specifies requirements for furnishing all labor, equipment, materials, and supplies necessary for soil stabilization ground improvement by jet grouting as required to meet the project objectives specified herein.

2. The work shall consist of installing, monitoring and testing of Jet Grout within the limits indicated beneath Diversion Structures 1,2, 3, and Junction Structure 1.

3. In connection with the Jet Grouting program, as shown on the drawings, the Jet Grouting Contractor shall provide all labor, materials and equipment to accomplish the following items of work:
   a. Mobilization & Demobilization
   b. Drilling
   c. Jet Grouting
   d. Quality Control/Quality Assurance and verification
   e. Spoil containment, collection and disposal.

4. This section is intended for a performance type specification in so far that the Contractor shall be responsible for selecting jet grouting parameters, equipment, and construction methods of the Jet Grouted elements to meet the requirements specified on the project plans.

1.2 PROJECT OBJECTIVES

A. Construction of a soil cement zone as overlapping Jet-grouted columns in single or multiple rows, with the following characteristics:

1. Minimum zone dimensions: 2 feet beyond outside dimensions of planned diversion or junction structures.

2. Minimum percentage of treatment for a defined volume of soil: 50 percent.

3. Minimum treatment area: 100 percent.

4. Minimum UCS: 250 pounds per square foot.

5. Vertical and horizontal tolerances: +/- 1 inch?

1.3 JOB SITE CONDITIONS

A. The project site conditions are reported in the AECOM Geotechnical Report titled "Design Development Report, Geotechnical Report, Pump Station Portion, Morena Pump Station, WW Force Main, and Brine/Centrate Conveyance Predesign (NC01), San Diego, California," dated January 5, 2018. Applicable information at the proposed jet grouting area includes geotechnical Borings DS-01 through DS-03 and DS-06 provided as part of supplementary special provisions section 2-7. The area of the proposed jet grouting is underlain by artificial fill to a depth of about 4 to 5 feet over alluvium. Potentially liquefiable loose granular alluvium exists to a depth of 50 feet.

B. The jet grouting is to mitigate the potential for liquefaction settlement to a depth of 50 feet below ground surface at the sites of the proposed pipe connections at Diversion Structures 1, 2, 3, and Junction Structure 1 within Friars Road.

C. Prior to submitting a bid price for the Jet Grouting, the grouting Contractor shall conduct a site inspection and review available subsurface information (including all geotechnical engineering and data reports). Prior to bid, Contractor shall verify the suitability of the methods for the project based on the conditions indicated by the subsurface information provided.

D. Due to the proximity of existing trolley track bridge pier, a pre-construction survey to document the existing condition of the structure shall be performed by the contractor.

E. A detailed utility location plan that identifies and distinguishes between abandoned, existing to be abandoned, existing to remain, and proposed new utilities will be provided by the Owner. The Contractor will be responsible to locate below ground utilities in the field.

F. Other project conditions shall include project constraints defined in the bid documents:

1. Environmental restrictions:

2. Noise Restrictions:

3. Work boundaries:

4. Hours for construction:

5. Hauling Restrictions:

6. Waste material handling and disposal:

7. Overhead Utilities:

8. Obstructions:

G. The contractor shall provide a monitoring plan for nearby existing improvements, including:

1. MTS light rail.

2. United States Army Corps of Engineers (USACE) levee north of and bordering Friars Road.

1.5 DEFINITIONS

A. Double Fluid Jet Grouting: The jet grouting technique where one fluid, typically neat cement grout, is injected at high velocity through horizontal radial nozzle(s) and is assisted by a second fluid, typically air, delivered through a coaxial nozzle(s), to directly erode and mix with the in-situ soil.

B. Fresh-on-fresh sequence (also referred to as wet-on-wet): Method that involves jet grouting elements successively without waiting for the grout to harden in the overlapping elements.

C. Jet Grouting Parameters: Pressure of the fluid(s) within the jet grouting string; flow rate of the fluid(s); grout composition; rotational speed of the jet grouting string; rate of withdrawal or insertion of the jet grouting string; and number and size of nozzles.

D. Jet Grouting String: Jointed rods with single, double or triple inner conduit that conveys the jet grouting fluid(s) to the monitor.

E. Jet Grouting Supervisor: The individual on site who is in practical and responsible charge for the jet grouting work.

F. Jet Grouting: An in-situ injection technique employed with specialized equipment that includes grout pump(s), grout mixer, drill rig, drill rods and injection monitor with horizontal radial nozzles delivering high velocity fluids to erode, mix, and stabilize in-situ soils using an engineered grout slurry.

G. Monitor (adjusted for single, double, and triple systems): A single, double, or triple fluid drill pipe attached to the end of a drilling string and designed to deliver one to three fluids of the Jet Grouting process, typically air, water, and/or grout. The monitor has one or more injection points (nozzles).

H. Pre-drilling: Method that utilizes traditional soil drilling techniques and/or equipment to pre-bore each jet grout hole prior to jet grouting.

I. Prejetting, precutting or prewashing: The method in which the jet grouting of an element is facilitated by a preliminary disaggregation phase consisting of jetting with water and/or other fluids.

J. Primary-secondary sequence: Method in which installation of an overlapping element cannot commence before a specified hardening time or achievement of predetermined strength of the adjacent previously constructed elements(s).

K. Single Fluid Jet Grouting: The jet grouting technique where a single fluid, typically neat cement grout, is injected at high velocity through horizontal radial nozzle(s) to directly erode and mix with the in-situ soil.

L. Soil-cement element: A column, partial column (sector) or panel (planar shape also known as fans), of soil-cement formed by jet grouting, used as a component of a soil-cement structure.

M. Soil-cement structure: A single zone or block of jet grout elements that are partially or fully interlocked as indicated on the Contract Drawings. Soil cement structures shall be comprised of soil cement elements of sufficient pattern and spacing as to stabilize the soil mass within the limits shown on the Contract Drawings to meet the performance requirements specified in this Section.

N. Soil-cement: Mixture of grout slurry and in-situ soils formed by the jet grouting process.

O. Specific energy: pressure times flow divided by lift rate.

P. Spoil Return: All materials including but not limited to liquids, semi-solids, and solids, which are discharged above ground surface during, or as a result of jet grouting. Spoils consist of native soil, ground water, grout, and erosional water (if any) injected as part of the jet grouting process.

Q. Structural reinforcement: members inserted into the jet grout column to provide additional strength, including deformed bars, high strength steel threadbars, steel casing, or steel beams.

R. Triple Fluid Jet Grouting: The jet grouting technique where one fluid, typically water, is injected at high velocity through horizontal radial nozzle(s) and is assisted by a second fluid, typically air delivered through a coaxial nozzle(s), to erode the in-situ soil, while a separate nozzle placed lower on the monitor delivers a third fluid, typically neat cement grout, at lower velocity to simultaneously fill the soil zone eroded by the cutting fluids (air and water).

S. UCS: Unconfined Compressive Strength at 28 days

T. Uniformity: The amount of uniformly mixed material measured by core recovery. It is calculated as the total length of recovered core minus the sum of the lengths of unmixed soil regions or lumps that extend across the entire diameter of the core divided by the total core run length expressed as a percentage.

U. Young's Modulus E50: Secant modulus of the stress strain curve at 50% of failure strength (UCS).

1.6 SUBMITTALS

The Engineer will approve or reject the Contractor's qualifications within 15 calendar days after receipt of a complete qualifications submission. Additional time required due to incomplete or unacceptable submittals will not be cause for time extension or impact or delay claims. All costs associated with incomplete or unacceptable submittals shall be borne by the Contractor.

A. Qualifications - The following shall be submitted to the Owner's representative by the specialty grouting Contractor six (6) weeks prior to the start of the work:

1. The following shall be submitted to the Owner's representative by the specialty grouting Contractor six (6) weeks prior to the start of the work:
   a. Resumes of the management, supervisory, and key personnel, for approval by the Owner's representative, in accordance with qualifications above.

B. Jet Grouting Equipment - The following shall be submitted to the Owner's representative by the grouting Contractor four (4) weeks prior to the start of the work:

1. Catalog cuts, details of grout mixers, pumps, drill rigs, and a plan view of the jet grout equipment arrangement proposed for use on this project, noting any equipment that has been modified or is of unique construction.

2. Examples of field data collection forms, including a sample copy of daily field report.

C. Grout Mix Design - The following shall be submitted to the Owner's representative by the grouting Contractor two (2) weeks prior to the start of the work:

1. Mix design for the project indicating sources and types of grout materials, including (if available) field test data from previous projects. If the specialty grouting Contractor intends to deviate from the materials defined in this specification: it shall submit evidence of satisfactory use of the proposed material from past projects with similar soil conditions or pre-construction trials.

2. Method for verifying grout mix proportions.

3. Field Demonstration Test Program

4. Details of proposed field demonstration test program for jet grouting, as specified below. This shall include location of test columns, layout of test pattern, jet grouting parameters to be used and variables to be tested during

test program, and details of proposed quality control/quality assurance testing to meet acceptance criteria specified in this specification. Test program plan shall be submitted to the Owner's representative by the specialty grouting Contractor four (4) weeks prior to the start of the work. The Engineer shall review and comment within 5 working days of receipt of complete submittal.

5. Following performance of the field demonstration test program and prior to beginning production jet grouting operations, submit a summary of the test program including details regarding as-built layout of test area, drilling procedures, grout mixture, jet grouting parameters, quality control/quality assurance records and test results, and proposed jet grouting parameters for use in production grouting based on test program. The Engineer shall review and comment within five (5) days of receipt of complete submittal.

D. Jet Grouting Procedure - The following shall be submitted to the Owner's representative by the grouting Contractor two (2) weeks prior to the start of the work:

1. General Work Procedures Plan outlining the spacing, location, depth and general sequence to achieve the specified criteria detailed in this specification. Jet Grout element locations shall be dimensionally referenced to the contract drawings and shown on layout plans of suitable scale to effectively indicate the details of the layout. If pre-drilling of jet grout holes is required, describe the methods and type of equipment to be used.

2. A general jet grout spoil return management plan outlining waste containment methods during jet grouting and treatment and removal plans for jet grout spoil return. Include estimated width of annulus for spoil return and corrective actions to be taken if spoil return is not free-flowing, interrupted or episodic.

3. Jet grout site specific safety plan or job hazard analysis.

4. Quality assurance, quality control and verification procedures to be used for the field test and production work.

5. Details of the procedures to obtain soil-cement samples; and catalog cuts or shop fabrication drawings of the soil-cement sampling device and curing boxes.

6. Proposed details and formats of all required tabular and graphical data presentations that will be submitted to the Engineer during the course of the Work. This will include submittal of a copy of the reports used for data monitoring and recording, as described below in this specification.

7. Details of column diameter and overlap verification.

E. Daily Reports - Within one business day after the end of a work shift, the daily reports as described in this specification shall be submitted to the Owner's representative by the specialty grouting Contractor.

PART 2 MATERIALS & EQUIPMENT

2.1 MATERIALS

A. The grout slurry may consist of a homogeneous mixture of any of the following materials:

1. Cement, Portland, type I or II, ASTM C-150 or AASHTO M85

2. Ground granulated blast furnace slag ASTM C989 Standard Specification for Ground Granulated Blast-Furnace Slag for Use in Concrete and Mortars

3. Flyash Class C or F, ASTM C618 or AASHTO M295.

4. Potable Water or approved other source shall be free of deleterious materials that may adversely affect the grout.

5. Bentonite, if required, powdered bentonite per API Standard 13A

6. The ratios of the material components, by weight, shall be proposed by the Contractor, confirmed during the preconstruction test program, and reviewed by the Engineer. Once accepted, grout slurry composition shall not be changed unless requested in writing by the Contractor and accepted in writing by the Engineer.

B. Equipment

1. General: All equipment used for drilling boreholes; lowering, raising and rotating jet monitors; mixing grout; supplying pressurized grout and air-water to jet monitors; and jet monitors shall have proven performance records for use in Jet Grouting work.

2. Drilling Equipment: Use drilling equipment of a type and capacity suitable for drilling required hole diameters and depths, and lowering, raising, and rotating jet grout monitors to the depths and at the rates required to perform the work as shown on the Contract Drawings and as specified herein. The drill rig shall be equipped with automated controls to regulate and maintain consistent rod lift rate and rod rotations per minute (RPM), and shall have pressure gauges and flow meters for all fluids injected.

3. Grout Mixing and Injection Equipment: Use grout mixers and holding tanks, water tanks, air compressors, and pumps of sufficient capacity to ensure adequate supply of grout, air, and water at required pressure to the

Jet Grouting monitors during a full work shift to produce grout elements of the quality and dimensions necessary.

4. Jet-Grouting pump: Shall be capable, with the nozzles proposed, of providing the required pressure and flow rate adequate for the execution of the work.

5. Compressor (for double and triple fluid Jet-Grouting): Shall be capable of producing the pressure and flow rate values proposed by the Contractor depending on the parameters chosen.

6. Filling grout pump (for triple Jet-Grouting): Shall be capable of producing the pressure and flow rate proposed by the Contractor depending on the parameter chosen.

7. Jet Grout Tools: Use Jet Grouting monitors with appropriate nozzles with the capacity suitable for producing jet grout elements in the soil types identified during Subsurface Explorations performed at the site, and of the size and depth shown on the Contract Drawings and as specified herein. The drill hole diameter shall be sufficiently large to be a clear path for continuous spoil return during all jetting operations.

8. Equipment Instrumentation: Provide instrumentation that allows continuous monitoring and automatic recording of data throughout the jet grouting operations. As a minimum, the following shall be provided:

9. Pressure gauges/devices at the drilling rig to automatically record pressures of cement grout, water, and air during the grouting process.

10. Flow meter(s) to monitor and record the rate and total volume of grouting fluids through the grouting monitor at every element.

11. Devices that automatically monitor and record the rate of monitor rotation and withdrawal.

PART 3 EXECUTION

3.1 TEST PROGRAM

A. Prior to production work, a test program shall be conducted by the Contractor in accordance with the accepted work plan. The test program shall be used to optimize/verify the various parameters including type of jet-grouting (single, double or triple), necessity of pre-jetting with water, grout mix composition, fluid(s) flows and pressures, rotational speed, lift rate, spoil return, grout, and number and size of nozzles; and confirm that resultant in situ soil-cement properties and dimensions meet required design criteria.

B. The test program will be observed, reviewed and verified for contract conformance by the Owner's Engineer. The test program shall be installed in areas near the planned production work at a location agreed upon between the Engineer and jet grouting subcontractor and in representative soils and depths anticipated to be found during production work.

C. Each test section shall consist of a plan of elements suitable to demonstrate feasibility and installed to the same elevations specified for the production jet grouting work.

D. The test elements shall be exposed by excavation (where possible) and measured for geometric properties. If full-depth excavation is not feasible, core samples or other testing method shall be used to demonstrate column size/geometry. In cases where excavation is not reasonable, coring at the centroid of a group of three (3) elements shall be carried out, as a minimum.

E. Where coring is used to verify diameter, verticality shall be measured for each test column and the coreholes to verify the location of the elements at the final depth.

F. Three acceptable/representative specimens or a number determined suitable by the Owner's Engineer from each column shall be sent to an independent Laboratory for the tests required to satisfy the criteria specified in this specification.

G. The results of the test program and the recommended jet grouting parameters for the production work shall be submitted in a report to the Owner's Engineer for review. The Contractor, at their expense, shall be required to repeat the construction of a test section if the results of the test program do not meet the project requirements. The test program shall confirm that the resultant soil-cement properties met the required design criteria prior to the Contractor proceeding with production work.

3.2 PRODUCTION WORK

A. Execute production jet grouting using the same jet grout tooling, materials, and procedures as demonstrated from the satisfactory set of test elements.

B. Install jet grout elements, such that continuous spoil return up the borehole annulus is achieved during all work. When spoils return is lost, the Contractor shall stop jetting and reestablish spoils return prior to resuming jet grouting.

C. Horizontal location and verticality/deviation shall meet the requirements of this specification.

D. The sequence of jet grout column installation and the need to perform pre-jetting is the responsibility of the jet grouting Contractor and will be based on the results of the successful test program.

E. Maintain a clean site and dispose of all spoil debris, water, and spilled material during jet grouting operations.

F. Equipment for mixing, holding, and pumping grout shall be in a secure location and shall be operated to minimize spillage of material. No material will be allowed to enter storm drains or other drainage courses.

G. Monitoring: The Contractor shall monitor nearby grade, structures and utilities during all jetting work. Contractor shall submit the monitoring plan for review and approval by the Owner's Geotechnical Engineer. Of particular concern is the western jet grouting locations near Diversion Structures 1 and 2 and Junction Structure 1, where the MTS trolley bridge support is near the grouting locations. The settlement or distress monitoring may include surface settlement points, telltales, and/or tiltmeters. Install instrumentation a minimum of one (1) week prior to installing the test sections or production grouting. A baseline reading shall be obtained one (1) day prior to grouting the test section. Monitoring of the instrumentation shall be performed daily for the entire period of grouting and shall continue one (1) week after the completion of the jet grouting program.

H. If jet-grouting is interrupted during the execution of a column, the re-start of the jetting shall be undertaken at least 6 inches below the stopping point.

I. Site access shall be provided to Owner's representatives for observation of the work.

J. If reinforcement is required, the Contractor shall install it at the design location in the fresh column, immediately after the completion of the jet-grouted column or shall install in a borehole drilled in the hardened column.

3.3 QUALITY CONTROL/QUALITY ASSURANCE

A. All Jet Grouting shall be performed in the presence of the Owner's quality control/quality assurance (QC/QA) Representative. Owner's QC/QA representative shall be notified prior to initiating jet grouting. Monitoring and logging of Jet Grouting operations for both test areas and production work shall be performed by the jet grouting Contractor.

B. The Contractor's equipment shall be configured to record and continuously show all fluid flows and pressures, rotational speed, depth and rod lift rates. The rod lift rate and rod RPM shall be set by the driller then automatically controlled by the drill rig and automatically recorded on the jet grout installation log during the entire jet grouting process. The Owner's QC/QA representative shall be provided means to monitor this information in real time on request.

C. All the data monitored and recorded, as described in this specification, shall be made available within one working day to the Owner's Engineer in a format previously agreed on prior to the work. The Contractor shall supply the Engineer

with the software used for this task. The software shall be capable of processing the recorded data and presenting the data graphically in a satisfactory manner.

D. Grout mix proportions shall be measured and documented by the Contractor per the submittal requirements above. Appropriate records shall be kept by the Contractor and submitted to the Owner's Engineer to verify that grout mixture(s) are as accepted. Include daily quantities of materials used in Daily Reports.

E. Throughout the jet grouting operations, perform continuous coring to full depth on three (3) percent of production columns to obtain drill cores of the jet grouted soil. The core will be evaluated by the Owner's Engineer for compliance with specific acceptance criteria defined herein. The Contractor shall be notified immediately if the soil-cement samples do not meet the acceptance criteria outlined herein.

3.4 DAILY REPORTS

A. Within one business day of a work shift, submit summary daily reports during production jet grouting that provide the information listed below. A sample of the report form proposed for use by the Contractor shall be submitted to the Owner's Engineer for approval prior to the start of work. Daily reports shall include the following:

1. Equipment and Personnel on site

2. Work initiated and completed

3. Production interruptions

4. Grouting Records
   a. Jet grout element number, size and location.
   b. Time and date of beginning and completion of each grout element, including interruptions to the jetting process or material supply.
   c. Grout mix data, including mix proportions and unit weight density measurements.
   d. Injection pressure of all fluids used to construct each grout element.
   e. Flow rates of all fluids used to construct each grout element.
   f. Rotation rate and lift rate of jet rods for each grout element.
   g. Total grout quantity used for each element.
   h. Top and bottom elevations of the jet grout element.
   i. Whether flow of spoils return was continuous.

5. Total quantities of materials used for that day.

6. Observations of any unusual, or unanticipated conditions including obstructions, stoppages, loss of circulation, etc., impacts on instrumentation or monitoring.

7. Applicable verification testing done.

8. Continuous recording of jet grouting parameters shall be provided for each production column to verify consistency with the test program results.

3.5 ACCEPTANCE CRITERIA

Installation records and daily reports documenting that the selected parameters from the test program were accurately repeated for the production work

A. Coring / Uniformity:

1. Full-depth core samples retrieved by the contractor shall be used to evaluate uniformity.

2. Core recovery (expressed as a percentage) is equal to the total length of recovered core divided by the total core run length. Length of recovered core includes lengths of treated and untreated soil.

3. Percent treatment is calculated as the total length of recovered core minus the sum of the lengths of unmixed soil regions or lumps that extend across the entire diameter of the core divided by the total core run length expressed as a percentage.

4. Uniformity is acceptable if percent treatment is at least 80 percent for every 5-ft core run. If the minimum percent treatment cannot be confirmed by coring in coarse sandy or gravelly soil, downhole camera/video can be used to confirm uniformity.

5. If the contractor uses core runs shorter than 5 ft (e.g., 3 ft), then the recovery and percent treatment can be calculated by adding equal amounts of core run length on either side of the short core run length to make up a total 5-ft run length for calculation purposes.

B. Unconfined Compressive Strength of Jet Grout Soil Cement Mix: At least 90 percent of all jet grout samples tested shall have a minimum 28-day unconfined compressive strength of 250 psi.

C. Minimum overlap thickness: shall be 12 inches

D. Borehole deviation and horizontal tolerances:

E. The center of the elements shall not be more than 3” from the indicated plan location. Deviations shall be less than required for adequate column overlap.

PART 4 MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

A. Jet Grouting shall be measured as follows:

B. Mobilization and demobilization will be measured on a lump sum basis. Mobilization pay item will be deemed complete when the Contractor's equipment is set up and ready to commence jet grouting operations. Demobilization item will be complete when all equipment is removed.

C. Test program, including verification testing, will be measured on a lump sum basis. Test program will be deemed complete when the test elements are installed, and the test grouting report is submitted and the results accepted by the Owner's Engineer.

D. Jet grouting will be measured on a lump sum basis. Jet grouting will be deemed complete when all the columns are installed and accepted by the Owner's Engineer.

E. No separate measurement will be made for the Contractor's Quality Assurance-Quality Control Program, including verification testing, all of which shall be considered part of the Work of jet grouting. However, if coring is utilized as a verification test, coring will be measured by the linear foot of core hole.

4.2 PAYMENT

A. Mobilization and demobilization shall be paid as lump sum items.

B. Test Program shall be paid as a separate lump sum item.

C. Jet Grouting shall be paid per Section 01 29 00, Payment Procedures.

D. No separate payment will be made for the Contractor's Quality Assurance-Quality Control Program, including verification testing, all of which shall be considered part of the Work of jet grouting. However, if coring is utilized as a verification test, payment will be made on a unit price basis per linear foot of core hole.

END OF SECTION

SECTION 31 50 00
EXCAVATION SUPPORT SYSTEMS

PART 1 GENERAL

1.1 WORK OF THIS SECTION

A. The Work of this Section includes support of temporary open excavations by means of sheet pilings, soldier piles and lagging, structural steel walls and struts, liner plates, and timber. The CONTRACTOR shall be responsible for the design and selection of methods in shoring conformance with the design criteria as specified herein.

B. The Work of this Section applies to temporary excavation support systems for demolition, construction of underground cast-in-place concrete structures, and installation of buried pipelines, and boring and receiving shaft or pits.

1.2 RELATED SECTIONS

A. The Work of the following Sections applies to the Work of this Section. Other Sections, not referenced below, shall also apply to the extent required for proper performance of this Work:

1. Section 31 23 19.01 Dewatering
2. Section 31 23 16 Excavation
3. Section 31 23 23.15 Trench Backfill
4. Section 03 30 00 Cast-in-Place Concrete
5. Section 05 50 00 Metal Fabrications

1.3 SPECIFICATIONS AND STANDARDS

A. Except as otherwise indicated, the current editions of the following apply to the Work of this Section:

1. ASTM A 36 Structural Steel.
2. ASTM A 328 Steel Sheet Piling.
3. AWS D1.1 Structural Welding Code-Steel.
4. UBC Chap. 25 Wood.
5. WCLIB Grading Rules.
6. WWPA Grading Rules.
7. AISC Manual of Steel Construction.
8. AASHTO, Section on Steel Tunnel Liner Plate

B. The Contractor shall comply with all Cal OSHA requirements for safety for the project. The Contractor shall also comply with the requirement of the MSHA.

1.4 CONTRACTOR SUBMITTALS

A. The following shall be submitted in compliance with Section 01 33 00:

1. The proposed excavation support system for each construction component where excavation support systems will be used.
2. Arrangement and details for each excavation support system, supporting design calculations, and construction methods to be used for the installation of each system.
3. Soldier pile installation methods, connection details, bracing preloading, and jacking procedures, as applicable.
4. Sheet pile or secant pile wall properties and installation methods, construction details, as applicable.
5. Depths below the main excavation bottom elevation to which the support system will be installed.
6. Elevations of ground surface, struts, and shores, as applicable.
7. Permissible depth to which excavation may be carried before supports must be installed and preloaded.
8. Full excavation depth load to be carried by various support system members.
9. Bracing loads for various stages of excavation, bracing removal, and concrete placement.
10. Preloads as required.
11. Proposed sequence of strut and shore removal as applicable and as related to concrete placement and backfilling operations.

B. The above Shop Drawings shall be coordinated with other shop drawing submittals for work specified elsewhere in which support of excavation is required.

C. The proposed method of installing sheet piling including sequence of installation, template, and equipment description, as applicable.

D. Contingency plan for alternative procedures to be implemented if the excavation support system is found to perform unfavorably.

E. Monitoring plan – The Contractor shall provide a monitoring plan for nearby structures, including the Army Corps of Engineers levee to the south of the project, to monitor for settlement or lateral movement during installation of excavation support. The monitoring plan shall be submitted to the Owner's geotechnical engineer for approval prior to stone column installation. The Contractor shall conduct pre and post video inspection.

1.5 QUALITY ASSURANCE

A. The design of all excavation support systems, including the design of all means of support and all member sizes and connection details, shall be designed, and Shop Drawings and calculations signed, by a Professional Civil or Structural Engineer, licensed to practice in the State of California and experienced in the design of excavation support systems. The work of this licensed Engineer shall be procured by the Contractor. All design drawings and calculations shall be checked and initialed by a checker. The design drawings, calculations, and support system drawings shall be submitted by the Contractor to the Owner's Representative for approval.

1.6 DESIGN CRITERIA

A. Shop Drawings with supporting calculations for the various excavation support systems shall be prepared in accordance with the following criteria:

1. Design the excavation support system and all components to support the earth pressures, unrelieved hydrostatic pressures, utility loads, equipment, traffic, and construction loads including impact, and other surcharge loads in such manner as will allow the safe and expeditious construction of the permanent structures, to minimize ground movement or settlement, and to prevent damage to or movement of adjacent buildings, structures, roadways and utilities.
2. Design support members to resist the maximum loads expected to occur during the excavation and support removal stages.
3. Design for staged removal shall conform to construction concrete placement, and backfill sequence shown. Design shall consider provisions for future construction, and limits on bracing level elevations as shown on the plans.
4. Maximum vertical center-to-center spacing of supports shall be 16 feet between top 2 support levels and 12 feet below second support level unless otherwise approved. If decking beams are not required, install the uppermost bracing tier at a vertical distance of not more than 6 feet below the top of excavation.
5. Where water flows from the face of excavation, the maximum height of unsupported excavation shall not exceed 15 inches.
6. In running sand and silt, provide positive means for securing timber lagging to the soldier piles to avoid shifting or falling off of the lagging, and positive means for containing such material behind lagging.
7. Review of the Contractor's Shop Drawings and methods of construction by the Owner's Representative does not relieve the Contractor of responsibility for the adequacy of the excavation support systems.

8. No portion of the excavation support system's vertical face will be permitted to penetrate the design lines as indicated on the Drawings for the permanent concrete structure to be constructed within the excavation.
9. Vertical support capacity shall be provided for wall systems and internal bracing elements, for loads due to vertical force components of tieback anchors, the weight of the structural systems themselves, and live load on any portion of the system.

B. Timber Support Systems and Members:

1. The minimum thickness of timber lagging between soldier piles spaced 5 to 7 feet center-to-center shall be 3 inches for excavations up to 25 feet in depth, and 4 inches for excavations deeper than 25 feet.
2. For other conditions and types of lagging, design calculations shall be submitted.

1.7 SAFETY

A. Except as otherwise indicated, the following codes apply to the Work of this Section:

1. Title 8, California Administrative Code, Chapter 4, Subchapter 4, Construction Safety Orders, Article 6, Excavations, Trenches, Earthwork.

1.8 PROJECT CONDITIONS

A. Utility agencies shall be notified, and caution exercised while exposing utility facilities by hand or other methods approved by utility owner.

B. If existing utility facilities interfere with the proposed method of support, the method shall be modified in a manner that will protect the facility and accommodate the proposed Work. Shop Drawings shall be revised and resubmitted along with design calculations required to account for the modified support method and to show the actual location of the existing utilities.

C. Provisions shall be made for contingencies as follows:

1. Monitor performance of support system components, for both vertical and horizontal movement, at regular intervals not to exceed 3 days.
2. Provide contingency plan for alternative procedures to be implemented if unfavorable performance is evidenced.
3. Keep on hand materials and equipment necessary to implement contingency plan.

D. Elements of the support system shall not be spliced unless approved by the Owner's Representative.

PART 2 PRODUCTS

2.1 MATERIALS

A. Steel sheet piling shall be continuous interlocking type ASTM A 328 of appropriate shape and provided with at least one 2-1/2-inch-diameter handling hole on the centerline of the web located at least 6 inches from each end of the sheet pile.

B. Fabricated connections and accessories, steel H-piles, WF shapes, and other structural steel shall conform to the requirements of ASTM A 36, unless otherwise approved.

C. Concrete shall be as specified in Section 03 30 00.

1. For encasement of steel soldier piles below the final level of excavation, minimum concrete strength of 2,500 psi shall be used.
2. For encasement of soldier piles above the final level of excavation, lean concrete shall be used, the strength of which shall be adequate to protect the excavated faces of the augured hole.

D. Wood lagging shall be dimension lumber with minimum allowable stress of 1100 psi.

1. The stress grade of the lagging shall be in conformance with the allowable stresses of the UBC, Chapter 25.
2. Lumber shall be grade marked by WWPA or WCLIB with species and grade conforming with those shown on approved Shop Drawings.

E. Jet grouted columns or Cast in Drilled Hole Secant Piles concrete shall be a minimum strength to resist lateral loading.

1. Steel reinforcement shall be designed to resiste the lateral loads applied.

PART 3 EXECUTION

3.1 GENERAL

A. The support system shall extend the main excavation bottom elevation to a depth adequate to prevent lateral movement and to adequately support applied vertical loads. In areas where additional excavation is required below the main excavation subgrade provisions shall be made to prevent movement of main excavation

supports. Damage to existing utilities during installation of excavation support system shall be avoided.

B. Water control measures shall be provided in accordance with the requirements specified in Section 31 23 19.01.

3.2 SOLDIER PILES

A. Soldier piles shall be installed by preboring or other approved pre-excavation methods to tip elevation shown on approved Shop Drawings. Prevent prebored or other pre-excavated holes from collapsing.

B. Prebored hole shall be filled with lean concrete from bottom of hole to subgrade dependent upon analysis of vertical support requirements.

C. Remaining pile length shall be filled with lean concrete, completely encasing the pile.

D. Concrete shall be placed from the bottom of the hole upwards by means of a flexible pipe connected to a hopper.

3.3 SHEETING AND LAGGING

A. Sheeting and lagging shall be installed with no gap between the boards unless specifically approved. As installation progresses, the voids between the excavation face and the lagging or sheeting shall be backfilled with sand or soil rammed into place. Materials such as hay or burlap shall be used where necessary to allow drainage of groundwater without loss of soil or packing material. If gaps in the lagging are allowed, the gap width between lagging boards shall be limited to 1/2 inch maximum.

B. If unstable material is encountered, suitable measures shall be taken to retain it in place or to otherwise prevent soil displacement.

C. Extend lagging down to final subgrade.

D. A sufficient quantity of material shall be on hand for sheeting, shoring, bracing, and other operations for protection of work and for use in case of accident or emergency.

3.4 STEEL SHEET PILING

A. Steel sheet piling may be used only where existing subsurface conditions are suitable for installation of sheet piling to the full depth of penetration required, and to proper alignment and plumbness, specified herein, without damage to the

sheet piling or rupture of its interlocks. The use of steel sheet piling will not be permitted where sheeting would be required to penetrate boulders, rock or other materials which may prevent the proper installation of sheet piling.

B. Steel sheet piling shall be installed in plumb position with each pile interlocked with adjoining piles for its entire length so as to form a continuous diaphragm throughout the length of each run of wall, bearing tightly against original ground. Install sheeting to depth required for design. Exercise care during installation so that interlocking members can be extracted, if required, without injury to adjacent ground. The installation equipment shall be suitable to the type and nature of the subsurface materials anticipated to be encountered. The equipment, and methods of installation, cutting, and splicing shall conform to the approved Shop Drawings.

C. Liner plate shall be installed to proper line and grade and dimensions.

3.5 INTERNAL BRACING SUPPORT SYSTEM

A. All bracing support members shall be installed and maintained in tight contact with each other and with the surface being supported.

B. Bracing members shall be preloaded by jacking the struts and shores in accordance with loads, methods, procedures, and sequence as described on the approved Shop Drawings. Coordinate excavation work with bracing installation and preloading. Use steel shims and steel wedges welded or bolted in place to maintain the preloading force in the bracing after release of the jacking equipment pressure. Use procedures so as to produce uniform bracing member loading without appreciable eccentricities, overstressing, or support member distortion.

C. Struts shall be provided with intermediate bracing as needed to enable them to carry their maximum design load without distortion or buckling. Provide diagonal bracing as necessary to maintain the stability of the system. Web stiffeners, plates, or angles shall be provided as needed to prevent rotation, crippling, or buckling of connectors at points of bearing between structural steel members. Allow for eccentricities resulting from field fabrication and assembly.

D. Excavations shall be to a depth no more than 2 feet below the elevation of the support member about to be placed. The support member shall be installed and preloaded immediately after installation and prior to continuing excavation.

3.6 JET GROUTED OR CIDH SECANT PILE SUPPORT SYSTEMS

A. Secant piles shall be designed in accordance with foundation improvements as well as horizontal shoring support.

B. Secant pile walls shall be water tight.

C. Struts shall be provided with intermediate bracing as needed to enable them to carry their maximum design load without distortion or buckling. Provide diagonal bracing as necessary to maintain the stability of the system. Web stiffeners, plates, or angles shall be provided as needed to prevent rotation, crippling, or buckling of connectors at points of bearing between structural steel members. Allow for eccentricities resulting from field fabrication and assembly.

D. Excavations shall be to a depth no more than 2 feet below the elevation of the support member about to be placed. The support member shall be installed and preloaded immediately after installation and prior to continuing excavation.

3.6 REMOVAL OF SUPPORT SYSTEMS

A. Where removal is required wholly or in part, such removal shall be performed in a manner that will not disturb or damage adjacent new or existing construction or utilities. Fill all voids immediately with lean concrete, or other approved means.

B. All elements of support systems shall be removed to a minimum depth of 6 feet below final ground surface. However, when a structure poured against the sheeting system extends above the 6-foot limit, removal of the sheeting system shall be to the top of the structure.

C. All damage to property resulting from removal shall be promptly repaired at no cost to the Owner. The Owner's Representative shall be the sole judge as to the extent and determination of the materials and methods for repair.

END OF SECTION

SECTION 31 71 19
MICROTUNNELING

PART 1 - GENERAL

1.1 SCOPE OF WORK:

A. The Work specified in this Section consists of installing plastic lined reinforced concrete (PLRCP) pipe along the alignment shown in the Contract Drawings and documents by Microtunneling. The soil material and hydrological conditions are described in the Geotechnical Data Report (GDR) and Geotechnical Baseline Report (GBR). "Geotechnical Report, Pump Station Portion, Morena Pump Station, WW Force Main, and Brine/Centrate Conveyance Predesign (NC01), San Diego, California," prepared by AECOM, dated January 5, 2018. Curved and straight microtunneling are specified the CONTRACTOR may adjust the shown curved alignment within the project easement boundary subject to OWNER's approval. CONTRACTOR shall furnish all labor, tools, and equipment, and perform operations necessary or incidental for the excavation and support of microtunneling operations including construction of the launching and receiving shafts and supply of suitable jacking pipes.

B. The support of excavation for shafts shall be in accordance with the Contract Documents, except as modified herein for microtunneling operations. This specification describes the additional measures that shall be provided by CONTRACTOR for each of the launching and receiving shafts used with the microtunneling method.

C. The shafts used for launching and receiving shall be made fully adequate for the microtunneling work and for any permanent structures situated within the shafts. CONTRACTOR shall be responsible for providing each launching shaft and each receiving shaft with the provisions necessary to perform the microtunneling operations. Furnish labor, equipment, material, and additional design, as necessary, to meet the minimum requirements as contained herein.

D. CONTRACTOR shall hire a California licensed Professional Engineer meeting the requirements as contained herein. CONTRACTOR is responsible for the work produced by this engineer. CONTRACTOR shall also hire a California licensed surveyor meeting the requirements as contained herein. CONTRACTOR is responsible for the work produced by this surveyor.

E. CONTRACTOR shall provide each launch shaft with thrust blocks, entrance seals, base slabs, pumping and drainage systems, ventilation systems, electrical systems, and lighting systems. CONTRACTOR's licensed engineer shall design the shaft support (SOE), thrust blocks, entrance seals, and base slabs including necessary modifications to the shoring. CONTRACTOR shall also be responsible for developing a Fluid Control Plan to be implemented by CONTRACTOR at each of the shaft sites in accordance with the requirements as contained herein.

F. CONTRACTOR shall provide each receiving shaft with exit seals, base slabs, and, as necessary, a pumping and drainage system to maintain dry working conditions. CONTRACTOR's licensed engineer shall design the exit seals including necessary modifications to the shoring.

G. CONTRACTOR shall prevent the inflow of ground and/or groundwater into the shafts during the microtunneling operations including but not limited to exit and entry of the shaft during the launching and receiving processes of the MTBM. The ground shall be improved, as necessary, to prevent any inflow of ground and/or groundwater in excess of specified tolerances as contained herein.

H. CONTRACTOR shall prevent the machine from veering off of the design alignment during the launching, jacking, and/or receiving process in excess of the specified tolerances as contained herein. CONTRACTOR shall redesign pipeline and associated structures at no additional cost to the OWNER, if and when necessary due to exceedance of the specified tolerances.

I. CONTRACTOR shall be responsible for ensuring that each of the shafts, including modifications, used with the microtunneling is fully adequate for installation of the permanent structures as shown on the Contract Documents. CONTRACTOR shall modify these shafts as necessary to accommodate the construction of these structures. Furthermore, CONTRACTOR's licensed engineer shall provide additional design necessary for completing this work.

J. The CONTRACTOR shall provide a microtunnel boring machine (MTBM) capable of excavating through the ground and any material as described in the GBR, furnishing and installing jacking pipe complete and operational as specified in the documents to the specified line and grade. Furnish and attempt to replace lubricant with grout behind the jacking pipes to completely fill any annular void between the pipe extrados and the excavated surface through grout holes in the pipes.

K. CONTRACTOR shall store, process, properly transport, and legally dispose of muck and/or excavated material in accordance with the Contract Documents.

L. Microtunneling operations will be carried out to minimize settlements to within limits established in the Contract Documents. CONTRACTOR shall be responsible for damage caused by construction activities to include damage by subcontractors, and conducting restoration of existing facilities for damages due to shaft construction and microtunneling related ground movment.

M. CONTRACTOR's engineer shall develop a Survey Plan in accordance with the requirements as contained herein. The Licensed surveyor shall perform survey readings associated with this plan.

N. The 60in PLRCP microtunnel drive between Junction Structure 1 jacking shaft and the pump station passes under a levee and buried levee RipRap as indicated in the GBR and on the drawings. Contractor is advised that pieces of RipRap may be found in the tunnel

alignment. Contractor will carry out at least 3 pilot bores of at least 150ft long from the jacking shaft to probe for obstructions in the crown of the tunnel alignment. Contractor will submit means and methods to complete the pipeline as per the drawings.

O. The 48in steel casing microtunnel drive from Custer Street to the 66in Overflow Pipe on Friars road passes under the Trolley tracks and a levee and as indicated on the drawings and GBR will pass through the bottom levee rip rap. Contractor must submit means and methods to remove or pass through the rip rap and complete the casing installation without causing movement to the trolley tracks.

1.2 REFERENCES:

A. American Association of State Highway and Transportation Officials (AASHTO).

B. American Society of Civil Engineers (ASCE).

C. California Occupational Safety and Health Administration (CAL-OSHA) – Particular attention is called to Sub-part S, Underground Construction, and Sub-part K, Electrical, of the Standards and Guidelines 29 CFR Part 1926,

D. Guidelines 2007 and ASCE 36 Standard Construction Guidelines for Microtunneling

1.3 DEFINITIONS:

A. Microtunneling: A continuously supported trenchless installation of a pipe by jacking the pipe directly behind a closed face, remotely controlled, steerable, guided, microtunnel boring machine (MTBM) which provides a continuous pressure on the face of the excavation to balance groundwater and earth pressures.

B. Microtunneling Boring Machine (MTBM) :The total system of the mechanized excavating equipment, consisting of a boring and articulated steering head, trailing shield segment(s), auxiliary and support equipment, and other items necessary for the sustained excavation operations of the microtunnel.

C. Jacking Pipe: pipe specifically designed to withstand jacking loads as defined herein, that serves as initial construction lining and tunnel support, and as the final carrier or casing pipe.

D. Hydraulic pipe joint : Specialty pipe joint system for jacking pipe through a curved drive to spread the jacking force or reduce force concentration over the pipe perimeter. It consists of a hose mounted in the pipe joint with controllable deformation and fluid pressure, which can be translated into forces acting on the pipe.

E. Ground Conditioning Agents: Used during microtunneling operations to control settlement, reduce cutting head torque, and prevent excessive wear on cutting tools and other MTBM components. These may include 1) foam (both simple surfactant/air/ water foam and polymer/surfactant/air/water foam); 2) polymers; 3) bentonite slurry.

F. Lubrication: Bentonite and/or polymer lubricant injected in the annular space between the pipe and surrounding ground during microtunneling to support the annular space and reduce friction between the pipe and soil.

G. Muck: Material excavated from shafts or tunnel including any ground treatment, lubrication, or slurry. Also referred to as spoils.

H. Spoil Transport System: A system of piping, pumps, valves, screw conveyors, or other equipment which transports the muck from the tunnel face to the surface. This includes the slurry treatment plant if a slurry based system is utilized.

I. Jacking Shaft: Excavation from which the MTBM is launched, which incorporates a thrust block to spread reaction loads to the ground. Also referred to as launching shaft.

J. Receiving Shaft: Excavation to which the MTBM is launched towards. A shaft can be used as both a jacking shaft and receiving shaft for adjacent microtunnel drives but is not required.

K. Jacking System: A system of hydraulic jacks installed inside the jacking shaft that provides thrust for the string of pipe in the ground and the MTBM. Capacity of jacks and extension rate is synchronized with excavation rate of the MTBM.

L. Intermediate Jacking Station (IJS): A fabricated steel cylinder fitted with hydraulic jacks installed at intermediate locations in the pipe string to allow selective shoving of discrete segments of the total pipe string and MTBM.

M. Laser: An optical system projecting a beam to a target to provide guidance for and location of the MTBM.

N. Guidance system : A sytem that may be based on a laser for straight drives or a Gyro or a automated or manual system based on suveyors total stations and prisms to provide position information for curved drives

O. Controls: The system which provides operational control to the MTBM including steering and synchronizes excavation, removal of the excavated material, and jacking of pipe to maintain overall balance to provide complete and adequate ground support at all times. The controls are generally containerized and located on the surface adjacent to the Jacking shaft.

P. Face Access: Provision of an opening in the MTBM pressure wall to give man access to the muck chamber behind the cutter wheel to allow cutter tool changes in stable ground

Q. AirLock: A system that allows access to the muck chamber behind the cutter head under pressure to change cutter tools if required

R. Contact Grouting: Grout used to fill the annular space between the pipe and the soil due to MTBM overcut upon completion of a microtunnel drive.

S. Dewatering: System of wells or excavations and pumps used for lowering the groundwater and/or removing groundwater from the microtunnel shafts.

T. Entrance Seal: A mechanism incorporated into the launching shaft, including any necessary ground improvement, to prevent the inflow of ground and/or groundwater into the shaft while launching the MTBM and jacking subsequent pipes.

U. Exit Seal: A mechanism incorporated into the receiving shaft, including any necessary ground improvement, to prevent the inflow of ground and/or groundwater into the shaft while in the process of recovering the MTBM at the receiving shaft.

V. Grade: Vertical alignment.

W. Launching: The machine is in the process of being launched at the beginning of a drive when passing through the entrance seal along the alignment beyond the outside edge of the launching shaft

X. Line: Horizontal alignment.

Y. Receiving: The machine is in the process of being received at the end of a drive when passing through the exit seal along the alignment beyond the outside edge of the receiving shaft.

Z. Shoring: Scheme of the shaft for supporting the excavation and controlling the groundwater.

AA. Thrust Block: A thrust block, including necessary ground improvement, is used to evenly distribute the jacking loads to the ground as part of the pipe installation process without excess movement or misalignment of the equipment.

BB. Pilot Bore: A small diameter test bore to be used to probe the ground on the tunnel alignment for obstructions.

1.4 SUBMITTALS:

A. Submit the following in accordance with the Contract Documents.

1. Coordination and Implementation Plans to demonstrate that applicable requirements from the Contract Documents as well as the requirements as contained herein, have been reviewed and coordinated by CONTRACTOR. Each of the subcontractors, if any, shall sign these plans.

2. Fluid Control Plan to ensure that the equipment operator maintains full control over fluid volumes and fluid pressures during microtunneling operations including slurries and/or lubricants. CONTRACTOR shall determine the construction activities at each launch shaft site location and describe these in detail. CONTRACTOR's engineer shall evaluate these activities and develop a plan including recommendations to ensure that fluid control is not impeded to any degree

by any construction activity occurring at the site including but not limited to backfilling operations, leakage in the shoring, dewatering activities, and induced flow of groundwater. Consideration shall be given to the ground and groundwater conditions as defined in the GBR. CONTRACTOR's engineer shall sign this plan.

3. Shaft Layout and Details: For each microtunneling shaft and drive from it, provide complete details, drawings, and schematics, as applicable. Show layout of shaft, including equipment, drawn to scale. Demonstrate that proposed layout of shafts is adequate for sequence of construction, equipment operations, and means and methods of pipe installation including required acceptance testing. Describe in detail provisions for the working slab, invert treatment, and pump and drainage systems. Include details of lighting, ventilation, hydraulic, and electrical systems.

4. Structures Shown on Contract Documents: Evaluate each microtunneling shaft and demonstrate that each shaft is adequate for installation of the permanent structures as shown on the Contract Documents including each stage of construction and backfilling. Provide detailed descriptions, procedures, shop drawings, schematics, and explanations. Furthermore for design modifications to accommodate these structures, provide fully developed design details, material requirements, standards, calculations, shop drawings, procedures, construction stages, and explanations signed and sealed by CONTRACTOR's engineer. Evaluate ground improvement schemes and contingency measures to be implemented as part of the design.

5. Contractor will submit means and methods to carry out pilot tube probing under the levee on the drive between Junction structure 1 jacking shaft and the pump station, and if obstructions are found in the tunnel alignment a method for completing the drive as per the contract drawings.

6. Contractor will submit specific means and methods to complete the 48in casing drive through the levee riprap and under the trolley tracks between custer street and the 66in Overflow pipe.

7. Survey Techniques: Provide complete details that fully describe the survey techniques to be used for transfer of line and grade.

8. Provide details of site monitoring plan including provision of measuring ground movements at shafts and along the tunnel alighnment and the monitoring of any existing structures within 100ft of the centerline of the excavation and tunnel alignment. Submit a plan for actions to be taken in the case of ground movements or movements of structures exceeding the allowable movement limits (Unless otherwise submitted 1/2in movement requires action to be taken as per the plan)

9. Qualifications of key personnel to include CONTRACTOR's California licensed engineer, project superintendent, MTBM operators, shift supervisors, and licensed surveyor.

10. Field Inspections, not less than once per week, in accordance with requirements as contained herein.

B. Shop Drawings (Minimum of 60 days before microtunneling is scheduled to begin):

1. Calculations and working drawings signed and sealed by a Professional Engineer registered in the State of California, showing jacking and reception shafts support, including shaft exit cut outs and thrust blocks designed to resist maximum jacking loads.

2. Working drawings indicating limits of jacking and reception shafts showing layout of tunneling and ancillary equipment.

3. MTBM shop drawings including:

a. Configuration of cutterhead and over cut.

b. Ventilation system details for personnel entry to the MTBM.

c. Provision for cutter tool replacement during a drive

d. If an Airlock is supplied the Airlock operational manual

e. Jacking pipe lubrication system details.

f. Grade and alignment control system details.

g. MTBM emergency groundwater control provisions.

h. Details of slurry pumping and separation control if applicable.

4. Jacking pipe calculations and details as required by the Contract Documents.

5. Calculations and working drawings signed and sealed by a Professional Engineer registered in the State of California for methods of controlling groundwater, in accordance with the Contract Documents, during microtunneling.

6. Show pertinent dimensions, spacing, and layout of Microtunneling components. Indicate sizes, shapes, material specifications, and elevations, as related to depth of excavation. Include plan, elevations, sections, and details showing the arrangement and method of installation during intermediate construction stages in addition to providing the final stages.

C. Design calculations:

1. Include design assumptions, and for computer software, provide the program input.

2. Demonstrate the integrity of the pipe design and conformance to applicable design standards. Account for loads, sequences, and conditions during the various construction stages.

3. Provide analyses to determine impacts with existing site improvements including but not limited to structures and utilities.

4. For backfilling of shafts after microtunneling operations, provide analyses for end bearing capacity, skin friction/down-drag, and settlement.

D. Show existing structures, utilities, trees, and other site improvements located within each of these shaft areas.

E. Product Data (Minimum of 60 days before microtunneling is scheduled to begin):

1. Submit details of muck or slurry conditioning additives used to reduce machine applied torque and maintain muck flow and pressure holding capability.

F. Examples of Shift reports & Data Recording printouts (Minimum of 60 days before microtunneling is scheduled to begin):

1. A sample of the Data log printout or manual log of the jacking operation to be used, which will include the following items and be provided every 24hrs:

a. Position of the MTBM in relation to the design line and grade.

b. Jacking forces exerted on the pipe and at each intermediate jacking station if applicable.

c. Date, starting time, and finish time of each pipe joint.

d. Instantaneous jacking rate and total distance jacked.

e. Position of the steering jacks.

f. Pitch and roll of the MTBM.

g. Cutterhead RPM & torque.

h. Details of problems, obstructions, or delays: including the conjectured cause.

i. Rotational speed of screw conveyor if applicable.

j. For slurry based system: The volume of slurry in both the supply and return side of the slurry loop, indication of slurry bypass valve position, and indication of pressure in face support chamber.

k. Face water jet use .

l. For slurry based system the viscosity and density of the slurry supply fluid to the MTBM

m. Shift report identifying the operating crew, weather , any downtime and reasons, description of the ground being excavated,

2. A sample of the visual inspection form to be used.

3. Settlement monitoring report showing ground movements for each monitoring point and for each monitored structure. Monitoring survey will be carried out daily for all monitoring points within 100ft of the MTBM during excavation.

G. Special Equipment and Repair (Minimum of 60 days before microtunneling is scheduled to begin):

1. Certification by the original MTBM manufacturer of the thrust, torque, condition, and operational characteristics of equipment to be used for installing the specified pipe. The microtunneling equipment shall employ a spoil removal system with a pressure balance system that is capable of equalizing pressures between the tunnel face and the microtunneling machine head to positively and continuously support the face of the excavation to balance groundwater and earth pressures.

2. Manufacturer's literature describing in detail the microtunneling system to be used. If the contract documents specify curved microtunneling , provide a detailed description of at least one similarly sized microtunnel project on which this system or similar has been successfully used in a curved drive application. Provide the names, addresses and telephone numbers of owner's representatives for these projects as well as the length, diameter, curve properties, and pipe material used. Indicate whether the machine proposed for this contract currently exists, or will be newly manufactured.

3. Details of special precautions required and the inspection procedures to be taken when stopping the machine for repair, weekends, holidays etc. to ensure that the pipe string does not become "locked" by soil pressure and face stability is not compromised during the shutdown including contingency measures to be implemented if problems arise or in groundwater control if power is lost.

H. Installation and inspection data (Minimum of 45 days before microtunneling is scheduled to begin.):

1. A detailed technical description of the microtunneling procedure, and construction techniques to provide the access required to install the specified pipe in conformance with the Contract Documents to include:

a. Intended machine parameters to achieve pressure balance at the tunnel face, including cutterhead rotation speed, torque, thrust, pump or screw conveyor speeds, and discharge rates, rate of advance, and volumetric control.

b. Details of muck handling system, rock crushing and spoil separation methods if required, including proposed additive formulations and calculations of the system capacity to handle flows at all distances and changes of elevation to and from the MTBM.

c. Details of conditioning agents to be used, including concentration, injection rate, injection point, and ratios of these conditioning agents.

d. Details of main jacking system, intermediate jacking stations, hydraulic joints (if proposed) and their proposed spacing, method of operation and thrust capacity. Include calculations of anticipated jacking forces required to advance the pipe and calculations of maximum jacking force permissible on straight and curved sections for the selected jacking pipe material. Include details and supporting compression calculations for joints used with intermediate jacking stations and hydraulic joints. Describe controls to prevent the maximum jacking force from being exceeded during the curved drive including use of hydraulic joints and/or other measures to prevent pipe overstress.

e. Description of guidance system and procedures for maintaining line and grade.

f. Method of spoil disposal conforming to the Contract Documents.

g. A startup plan for the MTBM and the method of launching through the launching shaft wall into the ground, and the plan for exiting the drive at the reception shaft.

h. A plan for contact grouting after the pipe has been installed. The details shall include injection pressure, method of controlling grout pressures, and method for verifying complete filling of the void space between the pipe and the surrounding ground.

i. Complete information on CONTRACTOR's safety plan for personnel conducting the tunneling or jacking operations and appurtenance installation in accordance with OSHA and local regulations. The plan shall include provisions for lighting, ventilation, and electrical safety.

j. Contingency Plan, detailing measures to be taken when surface settlement exceeds the maximum values as described herein and in the Contract Documents.

k. A procedure (method statement) for remedial grouting to reduce infiltration rates to specified levels, if applicable.

I. Performance reports and test data (daily when MTBM is operating):

1. Jacking operation data log containing the data detailed in this Specification taken at intervals no more than 1 minute apart and a minimum of 10 times per pipe section. If the data is collected digitally it shall be submitted in both hard copy and digital format on an appropriate storage media.

2. If the electronic data log is not submitted or available in a digital format then a CD video recording of the operator's console shall be required. Video shall show a real- time clock that matches the time scale used in the manual log, and information used by the operator in machine operation, guidance, and control. Indicators for the MTBM being viewed by the CD recorder shall indicate when the MTBM is excavating and the number of the pipe joint that is being pushed. (The video disk shall be submitted to the OWNER each week and a complete video recording at the end of each drive)

3. Separate log tracking pipe lubricant used in gallons, its measured viscosity, and pumping pressure,

4. Separate log tracking the volume of muck removed from the tunnel excavation for each pipe section and from the site each day.

J. Survey Plan:

1. This plan shall be developed by CONTRACTOR's engineer to transfer line and grade from the surface to the working floor of the shaft and to complete the as-built survey of the pipe installed by microtunneling.

2. In pipes over 48in inside diameter Include the survey techniques to be used for acquiring the as-built line and grade. The surveyed points along the installed pipe shall be spaced at a distance not to exceed 10 feet but not less than one survey reading shall be taken per pipe. Additionally, survey low or high points will be indicated.

3. Provide interpretation of this data; compare with specified tolerances for line and grade as contained herein as well as in the Contract Documents. Whichever are more restrictive.

4. Submit as-built survey data to OWNER at the end of each drive.

1.5 QUALITY ASSURANCE:

A. Experience Requirements:

1. Microtunnel construction is deemed specialty contractor work. The specialty subcontractor or CONTRACTOR, if the CONTRACTOR elects to self-perform this work, shall have experience using MTBMs of the types specified for this project.
2. CONTRACTOR's engineer shall be licensed by the State of California with experience designing microtunneling and shafts in similar ground conditions. This engineer shall meet applicable regulatory criteria for each system design. Experience and education shall be documented in a resume with a detailed description of the work actually performed on each of the reference projects.

Include contact details for each of the reference projects to include the current phone number, e-mail address, and title of a senior project representative familiar with his/her work. Descriptions of reference project shall include the number of shafts designed, dimensions, shoring methods, modifications to shoring, base slab details, ground and groundwater conditions, and thrust block details. Also indicate method of analyses, standards, computer programs, and materials used for constructing the shafts to include the entrance and exit seal. Provide sample design documents.

3. The Licensed surveyor, to be hired by the City, shall be registered in the State of California.

4. Provide a project superintendent with tunneling experience who has worked on microtunneling/pipe jacking projects in similar ground conditions and curved alignment using equipment similar to the equipment selected for this project.

5. Provide a MTBM operator and a shift supervisor for each shift with tunneling experience who has worked on microtunneling/pipe jacking projects using equipment similar to the equipment selected for this project, in similar ground conditions, and if proposed, curved alignment experience.

B. CONTRACTOR Design Responsibilities:

1. Design and details of jacking unit thrust collar to be used for symmetric and uniform transfer of jacking forces to the pipe.

2. Design and arrangement of shafts, including dimensions, capacity and location of the jacking reaction thrust block, frame alignment and interface with the pipe, support system for shaft walls, and provisions for control of groundwater. The excavation and excavation support shall be coordinated with construction of the permanent structure, tunnel access and manhole facilities.

3. Design and arrangement of microtunneling system including:

   a. An MTBM specifically designed for excavating and installing pipe from the jacking shaft through the geological materials as described in the GDR and GBR, for the soil and rock types, density, strength, abrasivity and maximum hydrostatic, and earth pressures. The MTBM shall also be designed to cut through boulders or obstructions as described in the GBR. The excavated diameters shall be suitable for the installed pipe diameters along the alignment specified in the Contract Documents.

b. A spoil transport system specifically designed for matching the excavation advance rate to the spoil removal rate while conveying the tunnel muck from the face for geologic materials as described herein and in the GBR. Including a surface separation plant if a recycled slurry based microtunneling system is selected, and additives, such as foams, or other muck conditioners.

c. A jacking system specifically designed for maintaining microtunnel advance as prescribed in the Contract Documents through the geologic materials as described in the GBR.

d. Design and arrangement of intermediate jacking stations, including jacking and reaction plates and their interface with the pipe, external shield, and jack capacity and location.

e. A laser, theodolite or gyro guidance control system specifically designed for maintaining tunnel tolerances as it is advanced along the required alignment as prescribed in the Contract Documents through the subsurface environment as described in the GDR and GBR.

4. Methods of excavation at the face, and details of cutting head tooling.

5. For MTBM over 60in outside diameter, provision of entry to the cutter / muck chamber for changes of cutter tools or removal of obstructions.

6. Locations where pipe lubricant is to be used and lubrication procedure.

7. Requirements for ports in pipe wall, for introduction of lubricant and contact grouting.

8. Procedure for operation of the MTBM to maintain tunnel face stability and minimize surface settlements at all times and under all conditions indicated during both excavation operations and periods of MTBM shutdown.

9. For personnel entry provide provisions for adequate ventilation in tunnels and shafts.

10. Provision for gas monitoring in the MTBM and shafts

11. Provisions for adequate lighting to facilitate as required the work in tunnels and shafts. Power and lighting circuits shall be separate as per regulations.

C. Design Criteria:

1. The geotechnical conditions including groundwater elevations to be encountered during microtunneling as detailed in the GBR.

2. Minimum shaft design loadings as provided in the GBR, plus additional construction loads such as erection, handling, storage and jacking forces necessary for installation of the pipe and other structures. Truck loading shall be minimum HS-20 vehicle loading distributions in accordance with AASHTO.

3. At Friars Rd jacking shaft take into account the multiple drives to be undertaken from a single shaft and the shaft wall MTBM launch cut outs required to ensure shaft structural stability is not compromised.

4. Internal pipe diameter, alignment, and invert location and elevations shall conform to those shown in the Contract Documents.

5. All electrical equipment should be suitable for CAL OSHA Potentially Gassy Conditions in the MTBM with an automatic power shut down to the MTBM if elevated LEL is detected. Ventilation fans will require continuous power and, if located within the tunnel, be designed for M1 operation for Class 1 Zone 1. Ventilation systems will be operated as required by CAL OSHA at no additional cost to the Owner.

6. The MTBM shall meet the following minimum requirements:

    a. Providing continuous positive face support in excess of the in-situ pressure during all phases of tunnel excavation and shutdown.

    b. Articulated to enable controlled steering in both the vertical and horizontal directions to the tolerances indicated in the Contract Documents.

    c. All functions shall be controlled remotely from the surface under normal operation.

    d. Capable of controlling shield rotation of the MTBM in the ground.

    e. Capable of injecting lubricant from the back of the MTBM and around the exterior of the pipes being jacked. Lubricant shall be refined, processed natural high swelling montmorillonite clay or other product as approved by the OWNER as necessary to produce satisfactory lubrication and earth support.

    f. Capable of controlling heave and settlement to the acceptable tolerances as specified in the Contract Documents.

    g. Provide access to the rear of the cutter wheel via an access door on MTBM that are over 60in outside diameter and on MTBM with an outside diameter over 72in with the provision of compressed air and an air lock if required.

    h. Capable of boring through the anticipated geotechnical conditions and any obstruction as described in the GBR.

7. The main and intermediate jacking system shall each consist of an even number of thrust cylinders arranged symmetrically. Each cylinder of the mainjacking system shall have individual activation, synchronized activation and individual thrust control. Cylinders shall not exert force when idle but shall resist displacement. The installed thrust capacity shall be at least 20 percent greater than the maximum theoretical combined reactions from the hydrostatic pressure, pipe friction, earth pressure, and cutter forces of the proposed drive.

1.6 COORDINATION DOCUMENTATION:

A. CONTRACTOR's engineer shall inspect, to the extent necessary, and certify that construction operations were performed in accordance with the approved design submittals. Deficiencies shall be immediately corrected by CONTRACTOR and reported to OWNER.

1.7 CONDITIONS:

A. The entire length of tunnel is classified as "Potentially Gassy." Perform work as specified herein, in accordance with the Contract Documents, and with current applicable CAL OSHA regulations for potentially gassy conditions and codes of Federal, State, and local agencies. Comply with applicable provisions of 29 CFR Part 1926, Subpart S, "Underground Construction" Standard Number 1926.800 by OSHA and Subpart P, "Excavations", latest revision. Should there be conflict between these specifications and OSHA requirements, the more restrictive will apply.

B. CONTRACTOR shall comply with applicable codes, standards, and regulations.

C. CONTRACTOR shall assess existing conditions, including property rights of adjacent properties whether private or public. Be responsible for the proposed temporary works and construction methods.

D. CONTRACTOR shall provide access to OWNER at all times during construction operations to perform inspections.

1.8 TOLERANCES:

A. Inflow of Ground and Groundwater: Not more than a total of one (1) cubic foot of ground shall enter into the shaft. Not more than one (1) gallon per minute of groundwater shall enter into the shaft during the course of the drive. If the groundwater is mixed with slurry and/or lubricant, it shall be prevented from entering the shaft in accordance with Fluid Control Plan.

B. Line and Grade during the Launching and Receiving Operations: During launching and receiving operations, line shall be maintained within ± 3 inches and grade shall be maintained within ± 1.5in

C. Maximum variation from lines and grades shown on the Contract Documents: +/-3inches in lateral alignment and +/-1.5infor vertical grade, providing that the final grade of flow

line shall be in the direction shown. In the case of variation outside the required tolerance correction of the line and grade will not exceed 1inch in 25ft.

D. Maximum ground settlements and/or differential settlements shall not exceed the limits provided in the ground movement monitoring plan.

PART 2 - PRODUCTS

2.1 MATERIALS:

A. Sewer jacking pipe shall consist of plastic lined reinforced concrete pipe (PLRCP), as required to provide a safe, stable tunnel excavation and acceptable in-place pipe. Pipe materials shall be in accordance with the Contract Documents and specifications.

B. CONTRACTOR shall be responsible for selecting and designing appropriate pipes and pipe joints to safely carry the loads imposed during construction, including jacking forces. Pipe joints shall be flush with the inside and outside of the pipe surface when pipes are assembled. Special consideration shall be given for a " jack control" system using hydraulic joints and/or other means on the curved segment of the alignment.

2.2 EQUIPMENT:

A. Microtunnel Boring Machine (MTBM)

1. The Microtunneling Boring Machine (MTBM) shall have a closed face capable of providing positive supporting pressure to the full excavated area (face) at all times and must have the capability of controlling and measuring the pressure at the face. The balancing of earth and groundwater pressures shall be achieved by the use of slurry pressure, auger earth pressure balance system, or a combination of the two. The system shall be capable of any adjustment required to maintain face stability for anticipated ground conditions. For equipment that uses a slurry spoil transportation system the earth and groundwater pressure at the face shall be controlled by the use of a variable flow slurry pumping system, pressure control valves and a minimum of two flow meters, one on the supply side and one on the return side. For equipment that uses an auger spoil transportation system the earth and groundwater pressures at the face shall be managed by controlling the volume of spoil removal relative to the advance rate (Earth Pressure Balance) and shall be augmented by the application of compressed air or soil conditioning agents if conditions require.

2. The MTBM shall be capable of controlling rotation or roll by means of bi-directional drive on the cutter head and/or by use of fins or grippers.

3. The MTBM cutter head shall be electro or hydro mechanically powered and shall provide sufficient torque to cut the face, crush material as required and feed the excavated material to the spoil transportation system.

4. The MTBM shall be articulated and fully steerable, both vertically and horizontally.

5. Automated Spoil Transportation

   a. The MTBM system shall include an automated spoil transportation system that has the capability of matching the excavation rate to the rate of spoil removal such that settlement tolerances can be maintained.

   b. A separation process shall be provided when using a slurry spoil transportation system. The separation process shall be designed to provide adequate and efficient separation of solids from the slurry so that clean slurry can be returned to the cutting face for reuse and the solids can be disposed of in an efficient manner.

B. Control Systems

1. A remote control system shall be provided that allows for the operation of the system without the need for personnel to enter the tunnel for routine operation of the system. The control equipment shall integrate the system of excavation, removal of spoil and its simultaneous replacement by a pipe. As each pipe section is jacked forward, the control system shall synchronize all of the operational functions of the system. The system shall provide complete and adequate ground support at all times.

2. Line and grade shall be controlled by a guidance system that relates the actual position of the MTBM to a design reference established by a surveying system. Typically in straight drives by a laser beam transmitted from the jacking shaft to a target mounted in the MTBM. The laser shall be mounted in the jacking shaft independent of the jacking frame and thrust block..For long or curved drives Laser guided tachimetry or theodolite or gyroscope is also acceptable and in any case shall be used for guidance through the curved portions of the alignment. The guidance system shall be checked and calibrated at least every 50ft of pipe jacking or once every day whichever is the sooner. The active steering information shall be monitored and transmitted to the operation console. The minimum information available to the operator at the control console shall include the position of the MTBM relative to the reference, roll, inclination, attitude, rate of advance, installed length, thrust force, and cutter head torque.

C. Jacking Equipment

1. Each pipe section shall be jacked forward as the excavation progresses in such a way as to provide complete and adequate ground support at all times. A jacking frame shall be provided for developing a uniform distribution of jacking forces around the perimeter of the pipe.

2. The thrust reaction block shall be properly designed and constructed and shall be perpendicular to the jacked pipe alignment. The thrust reaction block shall be designed to support the maximum estimated jacking force with a factor of safety of at least two.

3. Intermediate jacking stations shall be provided to maintain total jacking forces within the capacity of the main jacking system and the thrust reaction block. Intermediate jacking stations shall be provided of sufficient numbers and spacing to ensure completion of the drive and be of individual capacity compatible with the maximum safe jacking capacity of the pipe including through the curve.

PART 3 - EXECUTION

3.1 CONSTRUCTION:

A. General Requirements:

1. Do not begin work on the microtunneling and shafts until relevant submittals have been approved.

2. All permits have been issued by the relevant authorities

3. Construction techniques required to provide access for microtunneling shall be such as to ensure the safety of the work, at all times and during all stages of the work.

4. Support excavations and control movement of the ground, pavement, utilities or structures outside of the excavation. Ensure support of excavation conforms to applicable Local Safety Standards, OSHA Standards, trenching, and shoring standards.

5. If, at any time, the method being used by the CONTRACTOR for supporting any material or structure adjacent to excavation is not safe in the opinion of the OWNER or applicable Federal, State, or local inspection authorities, provide additional bracing and support necessary to furnish the added degree of safety required by the OWNER. Provide such added bracing and support by such method approved by the OWNER as the CONTRACTOR may elect to use but the taking of such added precautions shall in no way relieve the CONTRACTOR of their sole final responsibility for the safety of lives, work, and structures. The use of such additional bracing and support shall be at no additional cost to the OWNER. The absence of an order for additional bracing shall in no way relieve the CONTRACTOR of the sole and final responsibility.

6. Ventilation and air quality monitoring shall conform to the requirements of OSHA 3115-06R 2003 Underground Construction regulations for Gassy or Potentially Gassy Operations. The ventilation design shall be determined by the CONTRACTOR.

7. Furnish necessary labor, material, equipment, power, water, and utilities to complete the work. Additionally:

   a. Select the means and methods for performing the work.

b. Select, design, and install the thrust blocks. The thrust blocks shall be sufficiently reinforced, isolated, and otherwise anchored, to include necessary ground improvement measures, to prevent movement from occurring within the launching shaft and/or misalignment of the jacking frame.

c. Select, design, and install the entrance seals, including necessary modifications to the shoring, for the launching shafts.

d. Select, design, and install the base slabs, including necessary modifications to the shoring, for the launching shafts.

e. Select, design, and install the exit / entry seals, including necessary modifications to the shoring, for the receiving shafts.

8. Construct the shafts to accommodate the installation of the pipe, MTBM, and jacking device. Execute microtunneling such that settlement is maintained below maximum levels detailed in this Section of the specification, such that the in-place pipe shall have full bearing against earth, and such that voids shall be fully filled with grout.

9. Damaged and/or deficient materials shall be repaired and/or replaced as directed by OWNER.

10. Provide surface drainage during the period of construction to protect the work.

11. Control of Line and Grade:

a. The OWNER will establish the baselines and benchmarks indicated on the plans. The CONTRACTOR shall check these baselines and benchmarks at the beginning of the contract period and report errors or discrepancies to the OWNER. Use these baselines and benchmarks to furnish and maintain reference lines and grades for microtunnel construction. Use these lines and grades to establish the starting location of the microtunnel.

b. Mount guidance system in a manner than isolates it from effects of movement by the jacking forces.

c. When the excavation is off line or grade, return to the plan line and/or grade at a rate of no more than 1 inch per 25 feet.

12. Grouting:

a. A uniform mixture of 1:6 maximum (cement:sand) cement grout shall be placed to fill voids, which exist between the pipe and the ground in accordance with the requirements of this Section and the Contract Documents. Grout shall have a minimum 28-day compressive strength of 500 psi.

13. Protect the existing improvements at the site from damage including but not limited to structures, utilities, and culverts.

3.2 INSTALLATION:

A. Perform work in accordance with the approved submittals.

B. The licensed surveyor shall be responsible for verifying control points identified in the Contract Documents. CONTRACTOR's surveyor shall check baseline and/or benchmarks shown prior to starting and report errors or discrepancies to OWNER.

C. Notify OWNER immediately upon detecting larger than predicted deformation, distress, or damage to the excavation support system.

D. Notify OWNER immediately of any structural element that is not in accordance with the approved design submittals.

E. Do not resume construction activities until corrective measures have been fully implemented.

F. Microtunnel each pipe section as the excavation progresses in such a way to provide complete and adequate ground support at all times. Utilize a jacking frame that develops a uniform distribution of jacking forces around the periphery of the pipe. Design and construct the thrust block to sustain jacking reactions and construction forces. The thrust block shall be normal (square) with the proposed pipe alignment and designed to support the maximum obtainable jacking pressure with a factor of safety of at least 2.0. The jacking system, including intermediate jacks used, shall be capable of continuously monitoring the jacking pressure and rate of advancement.

G. On drives over 500ft utilize an automated (ABIS) lubrication system that injects a lubricant from the rear of the MTBM and at intervals along the pipeline to the external surface of the pipe, which lowers the friction developed on the outside of the pipe during jacking. Spacing of lubricant points along the pipe train shall be at the CONTRACTOR's option. Modify this system as required to prevent pipe binding or stoppage at no additional cost to the OWNER.

H. Utilize a spoil transportation method capable of handling and removing the expected excavated materials as indicated herein and in the GBR.

I. Limit the overcut on the tunnel shield to no more than ½ inch on radius for pipe 48in or less in diameter and ¾ inch on radius for pipes over 48in in diameter unless approved by the OWNER. The annular space created by the overcut shall be filled with a lubricant that has been proven suitable for the particular ground conditions to be tunneled.

J. After completion of microtunneling, attempt to replace lubricant between the pipe exterior and surrounding ground with a cement grout. Control the pressure and the amount of grout to prevent damage and displacement of the pipe.

K. Use additive as required in muck conditioning system to reduce machine applied torque and maintain muck flow and pressure holding capability.

L. If a slurry system is used then a slurry separation plant shall be used. The plant shall clean the excavated spoil from the slurry for disposal and return the slurry back to the MTBM face for reuse. The type of separation plant used shall be designed by the CONTRACTOR.

M. Dispose of excavated material off-site in accordance with applicable permit and regulatory requirements and in accordance with the Contract Documents.

3.3 FIELD INSPECTION:

A. CONTRACTOR's engineer shall conduct visual inspections to verify:

1. Shafts and modifications to the shoring were constructed in accordance with the approved design submittals.

2. Entrance/exit seals were constructed in accordance with the approved design submittals.

3. Thrust Blocks were constructed in accordance with the approved design submittals.

4. Base slabs were constructed in accordance with the approved design submittals.

5. Layout of shaft is generally in accordance with approved submittals.

B. Details of these visual inspections shall be written into a field inspection report and submitted to OWNER.

C. Submit to the OWNER copies of field notes used to establish lines and grades; however, the CONTRACTOR remains fully responsible for the accuracy of the work and the correction of it, as required.

D. Record locations where the jacking pipe has deflected more than 3in off line or 1in off grade

AGGREGATE BASE COURSES

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Association of State Highway and Transportation Officials (AASHTO):
   a. T11, Standard Method of Test for Materials Finer Than 75□m (No. 200) Sieve in Mineral Aggregates by Washing.
   b. T27, Standard Method of Test for Sieve Analysis of Fine and Coarse Aggregates.
   c. T89, Standard Specification for Determining the Liquid Limit of Soils.
   d. T90, Standard Specification for Determining the Plastic Limit and Plasticity Index of Soils.
   e. T96, Standard Specification for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine.
   f. T99, Standard Specification for the Moisture-Density Relations of Soils Using a 2.5 kg (5.5 pound) Rammer and a 305 mm (12 in) Drop.
   g. T180, Standard Specification for Moisture-Density Relations of Soils Using a 4.54 kg (10-lb) Rammer and a 457 mm (18-in) Drop.
   h. T190, Standard Specification for Resistance R-Value and Expansion Pressure of Compacted Soils.
   i. T265, Standard Method of Test for Laboratory Determination of Moisture Content of Soils.
   j. T310, Standard Specification for In-Place Density and Moisture Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).
2. ASTM International (ASTM):
   a. C88, Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate.
   b. D1883, Test Method for CBR (California Bearing Ratio) of Laboratory Compacted Soils.
   c. D2419, Test Method for Sand Equivalent Value of Soils and Fine Aggregate.
   d. D4791, Test Method for Flat Particles, Elongated Particles, or Flat and Elongated Particles in Coarse Aggregate.

1.2 DEFINITIONS

A. Completed Course: Compacted, unyielding, free from irregularities, with smooth, tight, even surface, true to grade, line, and cross-section.

B. Completed Lift: Compacted with uniform cross-section thickness.

C. Standard Specifications: When referenced in this section, shall mean the Standard Specifications for Public Work Construction (Green Book), as supplemented by the White Book**.**

1.3 SUBMITTALS

A. Action Submittals:

1. Samples: Submit for specified materials 20 days prior to delivery to Site.

B. Informational Submittals:

1. Certified Test Results on Source Materials: Submit copies from commercial testing laboratory **20** days prior to delivery of materials to Project showing materials meeting the physical qualities specified.
2. Certified results of in-place density tests from independent testing agency.

PART 2 PRODUCTS

2.1 BASE COURSE

A. Clean, hard durable, pit run gravel or crushed stone graded from coarse to fine containing enough fines to bind material when compacted.

B. Physical Qualities:

1. Abrasion, AASHTO T96: 35 percent maximum wear.
2. Fractured Face: C**:** 75 percent minimum particles.
3. Liquid Limit, AASHTO T89: Maximum 30 percent.
4. Plasticity Index, AASHTO T90: Maximum 6 percent.
5. Sand Equivalency, ASTM D2419: 35 percent, minimum.
6. Resistance (R) Value, AASHTO T190: 75 minimum.
7. CBR Value, ASTM D1883: 100 percent, minimum.
8. Soundness, ASTM C88: 12 percent, maximum.
9. Flat and Elongated Particles, ASTM D4791: 8 percent, maximum.

C. Gradation, AASHTO T27, Based on U.S. Standard Sieves:

Table 1 Gradation Percent Passing by Weight		
Sieve Designation	**Material**	
(Square Opening)	**Aggregate Base Course**	**Leveling Course**
50 mm (2")		
38 mm (1-1/2")	100	
25 mm (1")		100
19 mm (3/4")	90-100	70-100
(3/8")		
4.75 mm (1/4")	35-55	
(No. 8)		20-50
2.00 mm (No. 10)		
1.20 mm (No. 16)		
(No. 30)	10-30	
425 □m (No. 40)		
(No. 50)		8-28
177 □m (No. 80)		
150 □m (No. 100)		
75 □m (No. 200)	2-9	2-6

2.2 LEVELING COURSE AND GRAVEL SURFACING

A. As specified in the Standard Specifications.

B. Clean, tough, uniform quality, durable fragments of crushed rock, free from flat, elongated, soft or disintegrated pieces, or other objectionable matter occurring either free or as coating on stone. Gradation as specified in Table 1.

C. Physical Qualities: Same as for base course.

2.3 SOURCE QUALITY CONTROL

A. Perform tests necessary to locate acceptable source of materials meeting specified requirements.

B. Final approval of aggregate material will be based on test results of installed materials.

C. Should separation of coarse from fine materials occur during processing or stockpiling, immediately change methods of handling materials to correct uniformity in grading.

PART 3 EXECUTION

3.1 SUBGRADE PREPARATION

A. As specified in the Standard Specifications.

B. As specified in Section 31 23 13, Subgrade Preparation.

C. Obtain Engineer's acceptance of subgrade before placing base course or surfacing material.

3.2 EQUIPMENT

A. In accordance with the Standard Specifications.

B. Compaction Equipment: Adequate in design and number to provide compaction and to obtain specified density for each layer.

3.3 HAULING AND SPREADING

A. In accordance with the Standard Specifications.

B. Hauling Materials:

1. Do not haul over surfacing in process of construction.
2. Loads: Of uniform capacity.
3. Maintain consistent gradation of material delivered; loads of widely varying gradations will be cause for rejection.

C. Spreading Materials:

1. Distribute material to provide required density, depth, grade, and dimensions with allowance for subsequent lifts.
2. Produce even distribution of material upon roadway or prepared surface without segregation.
3. Should segregation of coarse from fine materials occur during placing, immediately change methods of handling materials to correct uniformity in grading.

3.4 CONSTRUCTION OF COURSES

A. Construction of Courses: In accordance with the Standard Specifications.

B. Untreated Aggregate Base Course:

1. Maximum Completed Lift Thickness: 6 inches.
2. Completed Course Total Thickness: As shown.
3. Spread lift on preceding course to required cross-section.
4. Lightly blade and roll surface until thoroughly compacted.
5. Add keystone to achieve compaction and as required when aggregate does not compact readily due to lack of fines or natural cementing properties, as follows:
   a. Use leveling course or surfacing material as keystone.
   b. Spread evenly on top of base course, using spreader boxes or chip spreaders.
   c. Roll surface until keystone is worked into interstices of base course without excessive displacement.
   d. Continue operation until course has become thoroughly keyed, compacted, and will not creep or move under roller.
6. Blade or broom surface to maintain true line, grade, and cross-section.

C. Leveling Course**:**

1. Maximum Completed Lift Thickness: 4 inches.
2. Completed Course Total Thickness: As shown.
3. Spread on roadway or preceding course to depth, grade, and cross-section shown.
4. Lightly blade surface and roll until thoroughly compacted to line and grade shown.
5. Maintain moisture levels to prevent loss of fines during processing.

D. Gravel Surfacing**:**

1. Maximum Completed Lift Thickness: 9 inches.
2. Completed Course Total Thickness: As shown.
3. Spread on preceding course in accordance with cross-section shown.
4. Blade lightly and roll surface until material is thoroughly compacted.

3.5 ROLLING AND COMPACTION

A. In accordance with the Standard Specifications.

B. Commence compaction of each layer of base after spreading operations and continue until density of 95 percent of maximum density has been achieved as determined by AASHTO D: T99 and T180.

C. Roll each layer of material until material does not creep under roller before succeeding layer is applied.

D. Commence rolling at outer edges and continue toward center; do not roll center of road first.

E. Apply water as needed to obtain specified densities.

F. Place and compact each lift to required density before succeeding lift is placed.

G. Remove floating or loose stone from surface of preceding course before placing leveling course.

H. Surface Defects: Remedy by loosening and rerolling. Reroll entire area, including surrounding surface, until thoroughly compacted.

I. Finished surface shall be true to grade and crown before proceeding with surfacing.

3.6 SURFACE TOLERANCES

A. Blade or otherwise work surfacing as necessary to maintain grade and cross-section at all times, and to keep surface smooth and thoroughly compacted.

B. Finished Surface of Untreated Aggregate Base and Leveling Course: Within plus or minus 0.04 foot of grade shown at any individual point.

C. Gravel Surfacing: Within 0.04 foot from lower edge of 10-foot straightedge placed on finished surface, parallel to centerline.

D. Overall Average: Within plus or minus 0.01 foot from crown and grade specified

3.7 DRIVEWAY RESURFACING

A. Replace gravel surfacing on driveways that were gravel surfaced prior to construction.

B. Provide compacted gravel surfacing to depth equal to original, but not less than 4 inches.

C. Leave each driveway in as good or better condition as it was before start of construction.

3.8 FIELD QUALITY CONTROL

A. In-Place Density Tests:

1. Provide Owner two (2) hours advance notification prior to testing.
2. Show proof that areas meet specified requirements before requesting that Owner identify density test locations.
3. Refer to Table 2 for minimum sampling and testing requirements for aggregate base course and surfacing.

Table 2
Minimum Sampling and Testing Requirements

Property	Test Method	Frequency	Sampling Point
Gradation	AASHTO T11 and AASHTO T27	One sample every 500 tons but at least every 4 hours of production	Roadbed after processing
Moisture Density (Maximum Density)	AASHTO T180 , Method D	One test for every aggregate grading produced	Production output or stockpile
In-Place Density and Moisture Content	AASHTO AASHTO T265 for moisture content	One for each 500 ton but at least every 10,000 sq ft of area	In-place completed, compacted area

3.9 CLEANING

A. Remove excess material from the Work area. Clean stockpile and staging areas of all excess aggregate.

1.2 SUBMITTALS

A. Provide as required in Section 03 30 00, Cast-in-Place Concrete.

B. Action Submittals:

1. Product Data: Admixtures.
2. Design Data:
   a. Concrete mix design signed by concrete mix designer.
   b. Minimum Information:
      1) Name of ready-mix plant.
      2) Project.
      3) Engineer.
      4) Contractor.
      5) Mix design number.
      6) Specified concrete strength.
      7) Water-cement-fly ash ratio.
      8) Maximum aggregate size.
      9) Cement content.
      10) Fly ash content.
      11) Water content.
      12) Type, name, and amount of admixtures.
      13) Unit weight.
      14) Slump.
      15) Ingredient proportions corrected for average moisture content for particular times of year.
3. Jointing Drawings: Identify location and spacing of each type of joint.
4. Gradation for coarse and fine aggregates, and combined gradation. List percent passing each sieve size.
5. Detailed plan for cold weather placements, including curing and protection.
6. Detailed plans for hot weather placements, including curing and protection.

C. Informational Submittals:

1. Manufacturers' Certificate of Compliance:
   a. Portland cement.
   b. Admixtures.
   c. Fly ash.
   d. Aggregates.
2. Statements of Qualifications:
   a. Mix designer.
   b. Batch plant.
   c. Testing laboratory.
3. Test Reports:
   a. Admixtures: Chemical ingredients and percentage of chloride in each admixture and fly ash.
   b. Fly Ash: Source test analysis and amount used in accordance with ASTM C94/C94M, Section 16.
   c. Mix Design: For each trial, signed by qualified mix designer.
   d. Laboratory Mixes: Cylinder test results.
4. Concrete Delivery Tickets:
   a. For each batch of concrete before unloading at Site.
   b. Minimum Delivery Ticket Information:
      1) Name of ready-mix plant.
      2) Serial number of ticket.
      3) Date and truck number.
      4) Name of Contractor.
      5) Job name and location.
      6) Mix design number.
      7) Amount of concrete (cubic yards).
      8) Type and amount of admixtures.
      9) Amount of water added at batch plant.
      10) Time of loading, arriving at Site, and unloading.
      11) Volume of water added by receiver of concrete and their initials.
   c. Record of drum revolution counter, type, and brand.

1.3 QUALITY ASSURANCE

A. Provide as required in Section 03 30 00, Cast-in-Place Concrete.

B. Qualifications:

1. Mix Designer: Licensed professional engineer registered in the state of Project or a certified concrete mix designer approved by local Department of Transportation.
2. Testing or Inspection Agency: In conformance with ASTM E329.

3. Batch Plant: Currently certified by the National Ready Mixed Concrete Association.

C. Prepaving Conference:

1. Held between Contractor, Subcontractor involved in concrete paving, and Engineer.
2. To be conducted a minimum of 14 days prior to commencing paving.
3. Conference cannot be held until mix design and admixture Submittals have been received by Engineer.
4. Items to discuss shall include, but not be limited to:
   a. Mix design.
   b. Method of placement.
   c. Curing.
   d. Finishing schedule.
   e. Traffic control.
   f. Protection of work.

D. Hot Weather Concreting: Conform to ACI 305R.

E. Cold Weather Concreting: Conform to ACI 306R.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Transporting of ready-mix concrete shall be in accordance with ASTM C94/C94M.

PART 2 PRODUCTS

2.1 CONCRETE MATERIALS

A. Cement:

1. Furnish cement for Project from one source.
2. Provide as required in Section 03 30 00, Cast-in-Place Concrete.
3. Portland cement shall be Type III meeting the requirements of the Standard Specification**.**
4. In accordance with ASTM C150.
5. Pozzolan: As specified in Section 03 30 00, Cast-in-Place Concrete.

B. Aggregates:

1. General:
   a. As specified in Section 03 30 00, Cast-in-Place Concrete.

b. Aggregate for portland cement concrete mixture shall be 1-inch maximum size stone meeting requirements of the Standard Specification.
c. Material: Natural aggregates, free from deleterious coatings.
d. Aggregates shall not be potentially reactive as defined in ASTM C33.
e. Aggregates not in compliance with soundness and durability requirements of ASTM C33 may be used with prior approval of Engineer; provided it can be shown by special testing or record of past performance that these aggregates produce concrete of adequate strength and durability. Aggregate soundness testing for fine and coarse aggregates shall be in accordance with ASTM C33 and ASTM C88.

2. Fine Aggregates:
   a. Grading Class meeting requirements of the Standard Specifications.
   b. Must be graded coarse to fine within the following limits.

General Requirements	
Sieve Size Passing	**Percentages by Weight**
3/8"	100
No. 4	90-100
No. 8	55-85
No. 16	45-75
No. 30	25-55
No. 50	5-30
No. 100	0-8

   c. Sand: Equivalent of not less than 68.
   d. Materials finer than 200 sieve shall not exceed 4 percent.

3. Coarse Aggregate:
   a. Grading Class meeting requirements of the Standard Specifications.
   b. Materials finer than 200 sieve shall not exceed 0.5 percent.
   c. Size: 1-1/2 inch to No. 4.

Grading Requirements		
Sieve Size Passing	**Separated Sizes 1-1/2 Inch to 3/4 Inch**	**Percentages (by Weight) 3/4 Inch to No. 4**
2"	100	
1-1/2"	90-100	
1"	30-65	100
3/4"	0-15	90-100
3/8"		20-50
No. 4		0-10

C. Physical Properties:

1. Meet requirements of AASHTO M80 for Class B.
2. In accordance with the Standard Specifications.

D. Water: ASTM C94/C94M.

E. Admixtures:

1. Add admixtures to mix at batch plant.
2. Air Entraining: ASTM C260.
3. Water Reducing:
   a. ASTM C494/C494M, Type A, normal, containing no chlorides and compatible with air-entraining admixtures.
   b. Type E, accelerating water reducing type, may be used with prior approval by Engineer.
   c. Do not use calcium chloride, salt, or antifreeze agents.

2.2 ANCILLARY MATERIALS

A. Tie Bars: Grade 40 deformed steel bars conforming to Section 03 21 00, Reinforcing Steel**.**

B. Dowels: Conform to requirements of AASHTO M227/M227M, Grade 70.

C. Joint Filler:

1. Preformed expansion joint filler conforming to as specified in Section 03 15 00, Concrete Joints and Accessories
2. Fillers furnished under AASHTO M213 shall be tested in accordance with ASTM D1751.

D. Joint Sealant:

1. Preformed elastomeric joint seal conforming to AASHTO M220.
2. Hot-poured elastomeric joint seal conforming to AASHTO M282.
3. Hot-applied, jet-fuel-resistant joint sealant conforming to ASTM D3569**.**
4. Cold-applied single component joint sealant conforming to ASTM D5893.
5. Elastomeric joint sealant conforming to ASTM C920.

E. Backer Rod:

1. Backer material conforming to ASTM D5249.
2. Cylindrical sealant backing conforming to ASTM C1330.

F. Curing Compound: ASTM C309, suitable for spray application.

G. Curing Membranes:

1. White polyethylene sheeting.
2. Waterproof paper.
3. Cotton or jute mats.

H. Evaporation Retardant: Confilm as manufactured by Master Builders Company.

2.3 EQUIPMENT

A. Ready-Mix Concrete Batch Plants: Certified by NRMCA.

B. Batch Plants:

1. Conform to requirements of Section of the Standard Specifications.
2. Bins shall have adequate separate compartments for fine aggregate, each separate size of coarse aggregate and cement. Bins and compartments shall be tight and ample to prevent spilling from one bin to another. Separate compartments, including weighting hoppers, shall discharge freely and efficiently.
3. Scales for weighing aggregates and cement may be either beam type or springless dial type. They shall be accurate within 0.5 percent under operating conditions throughout the range of use and, tested and adjusted as often as Engineer may deem necessary to assure their continued accuracy.
4. Equipment for dispensing water and admixtures shall provide a separate feed, accurate quantity measurement, and shall inject water and

admixture at a time in mixing process to ensure thorough and complete mixing throughout batch of portland cement concrete.

5. Automatically controlled batchers shall have automatically interlocked mechanisms providing the following:
    a. Positive weighing and discharge of cement and of each separate size of aggregate.
    b. Interlocking between weighing hoppers to prevent part of batch from being discharged until each separate hopper has been filled with correct proportion.
    c. Simultaneous discharge of hoppers.
    d. Lockable compartment containing time setting controls.
6. Equip mixers with a timing device that will not permit batch to be discharged until specified mixing time has elapsed. The means of storing, measuring and introducing water into mixer shall provide positive control and accurate measurement.

C. Ready-Mix Concrete Trucks:

1. Agitator mixer type.
2. Equipped with operable electrically actuated drum revolution counters.
3. Use of nonagitator equipment will not be permitted.
4. Each mixer shall carry a clearly visible manufacturer's plate showing capacity of mixer and other pertinent operating rates and limits.
5. Provision shall be made at mixer for controlled addition of air-entraining admixtures or other special components of mix.
6. Mixing Speed: 70 to 100 revolutions at a mixing speed recommended by truck mixer manufacturer.

D. Hauling Equipment:

1. Hauling equipment shall conform to AASHTO M157, Paragraph 11.6 and Paragraph 12.
2. Upon delivery of each batch of concrete to Site, a trip ticket shall be submitted to Engineer.

E. Paving Equipment:

1. Slipform Paver:
    a. Place portland cement concrete with two separate machines, one a spreader and one a slipform paver. Machines, when operating in tandem shall spread, consolidate, screed, and float finish freshly placed portland cement concrete in one pass with a minimum of hand finishing. Each machine shall be fully self-propelled and equipped with electronic controls to control line and grade from both sides.

b. Spreader shall be able to deliver mix without segregation or displacing reinforcing steel.
c. Able to vibrate portland cement concrete for full width and depth and be equipped with vibrating tubes or arms to work in portland cement concrete. Sliding forms shall be held together rigidly to prevent them from spreading. Form shall be long enough so slumping of portland cement concrete will not exceed 1/4 inch.
d. Supports of paver and other equipment which ride on previously placed pavement shall be equipped to prevent marring, edge breaking, or chipping of previously placed pavement.

2. Bridge Deck Finisher/Paver: A bridge or similar finishing/paving machine utilizing previously constructed and cured curb and gutter as side forms and support for machine rails may be used with prior approval of Engineer.

F. Concrete Saws:

1. Provide power driven concrete saws for sawing joints or finishing concrete, adequate in number of units and power to complete sawing at required rate.
2. Saws and related equipment shall be of proven adequacy and design to perform efficiently and shall be subject to immediate replacement, if specified results are not obtained.
3. Standby saw shall be available at Site.

G. Smoothness Testing Equipment: Supply two 12-foot straightedges for determining smoothness.

2.4 CONCRETE MIX DESIGN

A. As specified in Section 03 30 00, Cast-in-Place Concrete, with a minimum flexural strength of 650 psi.

B. Compressive strength of 4,000 psi minimum and flexural strength of 650 psi minimum, both at 28 days.

1. If the 650 psi flexural strength specification requires a compressive strength in excess of 4,000 psi, the higher compressive value shall be used as a standard minimum for compressive strength cylinder tests taken during construction.
2. The relationship between compressive strength f_c and modulus of rupture f_r shall be:

$$f_r = k\sqrt{f_c}$$

with k derived from the tests results.

C. Concrete target strengths shall be in accordance with ACI 318/318R.

D. Maximum water-cement ratio or water-cement plus pozzolan ratio, if applicable, shall not exceed 0.48.

E. Replacement of cement with pozzolan shall not exceed 20 percent.

F. Maximum Aggregate Size: 3/4 inch(es) minus.

G. Allowable Slump: 3 inches, plus or minus 1 inch.

H. Allowable Air Entrainment: 5 percent, plus or minus 1 percent by volume.

I. Concrete shall contain water reducer. Amount of admixture added to concrete shall be in accordance with manufacturer's written instructions.

J. Use of set-retarding admixtures shall be subject to prior approval by Engineer.

K. Do not use frozen materials or materials containing ice or snow.

L. Concrete temperature as delivered to site ready for placement shall be above 50 degrees F and below 90 degrees F.

M. If Contractor proposes to use a current mix design that meets these Specifications, has been used on a previous similar project, and less than 1 year has elapsed since it was last used; Contractor shall submit documentation of production of concrete produced from that mix design to Engineer for review. If review verifies concrete produced meets these Specifications and strength requirements, and establishes a correlation between compressive strength and flexural strength, no trial batches for proposed mix design will be required.

2.5 ASPHALT

A. New asphalt shall meet the following requirements: 6 inches of asphalt above 12 inches of aggregate base. Asphalt mix design shall be ¾-inch Type III, Class B3. Top 6 inches of aggregate base shall be asphalt treated permeable base, which shall conform to the applicable requirements of Section 68-3.02B(1) "Asphalt Treated Permeable Material" of the State of California, Department of Transportation, Standard Specifications, and Section 301-4 "Bituminous Stabilized Base" of the Standard Specifications for Public Works Construction. Bottom 6 inches of aggregate base shall be Class II aggregate base material.

PART 3 EXECUTION

3.1 WEATHER LIMITATIONS

A. Concrete shall not be placed:

1. Until the air temperature in the shade is 35 degrees F and rising and is forecast to remain above 35 degrees F.
2. On frozen ground.
3. During periods of rain or snow.

B. Concrete placement shall not continue when air temperature drops below 40 degrees F.

C. Protect concrete pavement from inclement weather for 7 days after it has been placed, when rain is imminent, and when air temperature drops or is forecast to drop below 35 degrees F.

3.2 PREPARATION

A. Prepare base as specified in Section 32 11 23, Aggregate Base Courses. Dampen base thoroughly prior to concrete placement; standing water will not be permitted.

B. Formwork shall be complete prior to placement of concrete. Area in which concrete is to be placed, shall be smooth and free of ruts, projections, debris, spilled concrete, mud, sloughed soil, standing water, organic and other objectionable materials.

C. Construction Joints: Inspect prior to placement of concrete.

D. Prior to placing paving equipment in position, full width and length of the area on which the tracks of the paving equipment is to operate shall be brought to density and surface tolerances required.

E. Protect existing exposed surfaces such as grates, catch basins, air valves, manholes, and cleanout lids from splattered and spilled concrete during concrete placement by use of durable waterproof paper.

F. Furnish operable backup vibrator on Site prior to concrete placement.

3.3 SLIP FORM PAVING

A. Deliver from hauling vehicles to paving machine hopper.

B. Contractor's equipment hauling portland cement concrete or reinforcement will not be permitted on subgrade, but will be allowed on base, with turns or

other maneuvering kept to a minimum. Damage to subgrade or base shall be corrected to satisfaction of Engineer.

C. Place in final position uniformly in one layer, so a minimum of finishing will be necessary to provide a dense, homogenous pavement conforming to true grade and cross section.

1. Spreader shall receive portland cement concrete mixture in its hopper and uniformly spread and strike it off at proper thickness for full width of area being paved.
2. Paver shall vibrate, consolidate, and finish slab to proper grade and cross section.

D. Paver:

1. Operated with as continuous forward movement as possible.
2. Coordinate mixing, delivering, and spreading portland cement concrete to provide uniform progress.
3. Stopping and starting paver shall be held to a minimum. If, for any reason, it is necessary to stop forward motion of paver, vibratory and tamping elements shall also be stopped immediately.
4. No external force shall be applied to paver, except with approval of Engineer.

E. While placing portland cement concrete, provision shall be made for constructing joints, placing dowels, tie bars, and other devices as called for by Drawings and as provided in Article Joints.

F. Portland cement concrete shall be rejected if it:

1. Is not in place within 1 hour after being mixed.
2. Has begun to take an initial set prior to placement.
3. Has been retempered with water.

G. If necessary, supplemental hand spreading and distributing shall be with shovels. Rakes will not be permitted.

H. Portland cement concrete shall not be fouled with foreign matter.

I. Use vibrators to consolidate portland cement concrete pavement at least 6 feet each side of construction joints and expansion joints.

3.4 STATIONARY SIDE FORM CONSTRUCTION

A. Where width of pavement is narrow, tapering, or of irregular pattern not lending itself to being constructed by prescribed machine methods, Contractor

shall be permitted to place concrete as specified in Section 03 30 00, Cast-in-Place Concrete. Perform strike off, consolidation, final floating, and surface finishing with equipment, tools, means, labor, and methods other than those specified, provided the Work meets approval of Engineer and the following requirements:

1. As concrete is being placed, striking off and consolidating portland cement concrete shall be done without causing segregation of material and shall include thorough uniform vibration throughout the mass until it is uniformly compacted.
2. Portland cement concrete shall be struck off by means of templates or screeds designed and manipulated to shape portland cement concrete to specified cross section between forms, carrying a slight excess of portland cement concrete in front of leading edge of templates or screeds at all times. Tamp portland cement concrete to reduce voids to a minimum.
3. Floating shall follow vibrating, striking off, and tamping operations and shall include transverse floating or other smoothing and finishing action. This shall provide a surface and evenness within a 12-foot straightedge tolerance of 0.01 foot. Test hardened surface in presence of Engineer. Surface shall be free from laitance, soupy mortar, marks, or irregularities.

B. Defects:

1. Fill areas of minor honeycomb or other minor defect in composition of portland cement concrete along exposed edges of portland cement concrete with a stiff mortar of cement and fine aggregate. Apply to moistened portland cement concrete to satisfaction of Engineer.
2. Area showing serious defects in composition of concrete shall be removed and replaced with pavement of specified quality for full width of strip between longitudinal joints or edges and for a length not less than between the nearest transverse joints.

3.5 JOINTS

A. General:

1. Referred to as contraction or construction, either of which may be transverse or longitudinal, as called for by Drawings or as approved by Engineer.
2. Joints, backer material, joint filler and joint sealants shall extend to pavement edges or to each other, as the case may be, and shall be constructed perpendicular to surface of pavement.

3. Joints shall not vary from specified or indicated line by more than 1/4 inch.
4. Contractor shall submit jointing plan and details to Engineer for approval. Take into consideration placement of joints in curb and gutter, at catch basins, and position of manholes and other large structures, as well as other limitations herein mentioned.
5. Place manhole or similar large structure in line of joint, or if impractical, isolate structure from pavement with premolded joint filler, 1/2-inch wide, conforming to AASHTO M213 and ASTM D1751.

B. Contraction Joints:

1. Sawed Type with Poured Filler:
   a. Sawing shall be to a depth as shown on Drawings with a maximum width of 1/4 inch and a minimum width of 1/8 inch, in straight lines as shown or as approved by Engineer.
   b. Perform saw cuts as soon as portland cement concrete has set enough to permit sawing without tearing or raveling, before uncontrolled cracking results, and within 24 hours of placing portland cement concrete.
   c. Saws may be single or tandem, as Contractor may elect, and shall be controlled by guides to true line.
   d. Clean joints thoroughly of foreign matter before pouring approved rubber asphalt filler.
   e. Tops of joint filler shall be true to pavement cross section within 1/8 inch and shall be protected from damage by portland cement concrete operations.
   f. Areas containing uncontrolled cracks shall be removed and replaced.
   g. Restore curing agents broken or damaged by sawing operations.
2. Space longitudinal joints as shown on Drawings at the interface between lanes, normally at intervals between 12 feet to 16 feet.
3. Transverse joints shall be as shown on Drawings or as approved by Engineer, with intervals of 12 feet to 16 feet.

C. Construction Joints:

1. Construct when there is an interruption of longer 45 minutes in portland cement concrete placing operations or where specified.
2. Place parallel with intended contraction joint.
3. Tool both free edges of joints with 1/8 inch radius rounder to remove laitance and mortar resulting from finishing operations and to provide clean rounded edge. Tooling shall not form ridges on surface of concrete.

4. New portland cement concrete placed contiguous to joint shall conform to proportions and consistency of previously placed concrete.
5. Transverse Construction Joint:
    a. Doweled type using No. 8 by 36-inch long dowels at 12-inch centers coated with plastic, grease, heavy oil or other approved material that will neither bond with nor be harmful to operation at a depth of 1/2 the pavement thickness parallel to centerline.
    b. If sufficient portland cement concrete has not been mixed at the time of interruption to place a construction joint at least 3 feet from a planned contraction joint, remove excess portland cement concrete back to a position to satisfactorily meet these criteria and to satisfaction of Engineer.
    c. Fill joint which has opened to a width of 1/8 inch or greater during construction or maintenance periods with poured filler.
    d. Do not construct within 3 feet of a transverse contraction joint.
6. Longitudinal Construction Joint:
    a. Tied type using No. 5 x 36-inch deformed tie bars at 12-inch centers.
    b. Tie Bars:
        1) Not required at construction joint between portland cement concrete pavement and gutter, except where shown on Drawings and mentioned above.
        2) Placement:
            a) Plastic Portland Cement Concrete: Insert before vibrating and finishing portland cement concrete; or
            b) Hardened Concrete:
                (1) Drill hole, insert, and grout tie bars into place.
                (2) Drill holes large and deep enough to allow tie bars to be inserted with grout.
                (3) Perform any time after portland cement concrete has attained enough strength to resist any damage caused by drilling.
                (4) Tie bars shall be grouted a maximum of 3 hours prior to placement of adjacent portland cement concrete.
        3) Replace loose tie bars by drilling and grouting as described.

D. Scored Joints:

1. Configuration: 1/4-inch wide by 1/4-inch deep at locations indicated on Drawings formed by tooling of concrete while it is still fresh.
2. Do not fill or seal.
3. Layout of joints shall be straight and true and shall not vary from indicated line by more than 1/4 inch.

3.6 SURFACE FINISHING

A. Use temporary screeds. Wet screeding and jitterbugging shall not be permitted.

B. Pavement shall have surface tolerance of 1/4 inch in 10 feet in accordance with ACI 325.9R.

C. Salting, spreading of cement or cement and sand mixture to speed up hardening shall not be permitted.

D. Exposed pavement edges shall be edged to a 1/2-inch radius after finishing. Edging shall not form ridges on pavement surface.

E. Pavement shall be treated and protected by use of evaporation retardant applied in accordance with manufacturer's written instructions. Flat surfaces shall be treated immediately after screeding and floating or if time period greater than 15 minutes occurs between finishing operations.

F. Pavement shall be screeded, floated, and given skid-resistant surface.

3.7 CURING OF PORTLAND CEMENT CONCRETE

A. Immediately after the final floating, surface finishing, and edging has been completed, and while portland cement concrete surface is still moist, cover and cure entire exposed surface for at least 72 hours in accordance with one of the following provisions:

1. Liquid Membrane-Forming Compounds: Apply compound uniformly to portland cement concrete by pressure spray methods at a rate which will form an impervious membrane, but at least at a rate of 1 gallon per 150 square feet.
2. Other Membranes:
    a. Apply to damp portland cement concrete as soon as it can be placed without marring surface.
    b. Place in contact with surface, extend beyond sides or edges of slabs or forms, and fasten down to hold it in position as a waterproof and moistureproof covering.
    c. Laps shall be sufficient to maintain tightness equivalent to sheeting.
    d. Transverse laps for waterproof paper shall be at least 18 inches, and longitudinal seams shall be cemented.
    e. Cotton or jute mats shall be saturated with water prior to placing and kept fully wetted during curing period.

B. Concrete shall be cured by use of curing compound, for minimum of 7 days after concrete placement, in accordance with ACI 308. Curing compounds shall be applied in accordance with manufacturer's written instructions.

C. Exposed surfaces shall be sprayed with curing compound immediately after free surface water has disappeared from finished surface.

D. Concrete temperature shall be maintained in accordance with ACI 306R.

E. Curing compounds shall not come in contact with hardened concrete that is to be concreted against.

3.8 FIELD QUALITY CONTROL

A. Retain independent testing or inspection agency to perform inspection, sampling, and testing.

B. Concrete Sampling: In accordance with ASTM C172. Take sample not less than every 5,000 square feet or fraction thereof of concrete placed each day.

C. Perform following tests on each sampling:

1. Slump: ASTM C143/C143M.
2. Air Content: ASTM C231.
3. Compressive Strength: ASTM C39/C39M.
4. Flexural Strength: ASTM C78.

D. Strength Tests:

1. Make and cure cylinders and beams in accordance with ASTM C31/C31M.
2. Cylinders: Make four, standard 6-inch diameter by 12 inches high. Cure one in field and three in laboratory.
3. Beams: Make three, standard 6 inches by 6 inches by 21 inches. Cure in field.
4. Compressive: Test one field-cured cylinder at 7 days and two laboratory-cured cylinders at 28 days. Test last cylinder at 56 days if 28-day cylinder is below specified strength.
5. Flexural: Test one beam at 7 days and two beams at 28 days.

E. Acceptance of concrete shall be in accordance with ACI 318/318R.

F. Concrete with compressive strength less than specified, as evidenced by cylinder tested at 56 days, shall be additionally tested as follows:

1. Less Than 500 psi Low in Compression or Less Than 75 psi Low in Flexure:
   a. Penetration Resistance Test: ASTM C803.
   b. Rebound Hammer Test: ASTM C805.
   c. Perform tests within 24 hours of noncomplying strength tests.
2. More Than 500 psi Low in Compression or More Than 75 psi Low in Flexure:
   a. Concrete Coring: Take three standard cores from concrete representing original specimens.
   b. Take and prepare cores in accordance with ASTM C42/C42M.
   c. Test cores in accordance with ASTM C39/C39M.
   d. Take cores within 24 hours of noncomplying strength test.

G. Pay Factor:

1. Portland cement concrete shall be accepted according to average compressive strengths of four or more cylinders taken for 28-day tests for each 500 cubic yards placed and the following acceptance schedule.

Acceptance Schedule Compressive Strength	
Pay Factor	**Percent of Specified Strength**
1.00	95 percent or higher
0.90	90 to 95 percent
0.70	80 to 90 percent
Remove and replace	Less than 80

2. Whenever percentage of specified compressive strength falls below the level of 80 percent, Engineer may require the portland cement concrete be removed and replaced to meet required Specifications.
3. If the compressive strength, f_c, to comply with the flexural strength requirement is greater than 4,000 psi, then the specified strength shall be multiplied by:

$$\frac{F_c}{4000}$$

3.9 CLEANING

A. Clean concrete splatter from exposed surfaces.

B. Thoroughly broom and wash concrete surfaces before opening to traffic.

3.10 PROTECTION OF CONCRETE

A. Do not operate construction equipment or allow traffic on newly placed portland cement concrete until the following requirements are met:

1. Joints have been filled as per Article Joints.
2. Concrete has attained a compressive strength of at least 4,000 pounds per square inch.

B. Protect new concrete from construction operations, mechanical disturbances, water flow, and soiling until open for traffic.

C. Erect and maintain suitable barriers to protect concrete from traffic or other detrimental trespass until pavement is opened to traffic.

D. Maintain watchmen after normal working hours for at least a 24-hour period to ensure barriers are not removed or destroyed, and that trespass and vandalism upon pavement does not occur.

E. Wherever it is necessary that traffic, including Contractor's vehicles and equipment, be carried from one side of pavement to the other, construct suitable bridges over pavement, and maintain them in good condition as long as they may be required. Leaving gaps in pavement to facilitate movement of traffic will not be allowed, unless prior written permission is obtained from Engineer.

F. Protect new concrete from dirt, asphalt, and other deleterious substances that may be tracked onto new pavement from construction activities.

G. Pavement damaged by traffic or damaged from any other cause, prior to its official acceptance, shall be repaired or replaced to the satisfaction of Engineer.

END OF SECTION

SECTION 32 14 00
UNIT PAVERS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section. Adhere to City of San Diego Whitebook for all related requirements.

1.2 SUMMARY

A. This Section includes the following:

1. Permeable Concrete pavers set in aggregate setting beds to comply with recommendations published by the Interlocking Concrete Pavement Institute, Brick Industry Association or National Concrete Masonry Association..
2. Permeable Bedding Course and Subgrade.
3. Aluminum edge restraints.

B. Related Sections include the following:

1. Division 31 "Earthwork" for excavation and compacted subgrade.
2. Section 32 13 13 – Concrete Paving and Asphalt.

1.3 SUBMITTALS

A. Product Data: For pavers, aggregates, and edging materials.

B. Product Data: For the following:

1. Permeable Concrete Pavers, manufactured to meet ASTM C936, 'Hydrologic' Pavers by RCP Block or Approved Equal.
   Pavers shall be 3.15" thick, 8000 psi with5/16s gaps to provide 5%-15% drainage with 'Permeable Paver Fill'
2. Pavers shall have a Stone-top Texture, Char-Brown color, Random Pattern of Jumbo (11" width), Rectangle (8.25" width), Square (5.5" width).Bedding Course shall be #8 Aggregate (2" depth).
3. Subgrade shall be #2 open graded aggregate as storage reservoir (min. 12" depth).
4. Aggregate joint filler to be #8.
5. Edge restraints.

C. Sieve Analyses: For aggregate setting-bed materials, according to ASTM C 136.

D. Samples for Initial Selection: For the following:

1. Each type of unit paver indicated.
2. Joint materials.
3. Edge restraints.

1.4 QUALITY ASSURANCE

A. Contractor shall provide documentation demonstrating training in construction of the permeable pavement systems or acceptable experience and references in the construction of permeable pavement systems.

B. Source Limitations: Obtain each type of unit paver, joint material, and setting material from one source with resources to provide materials and products of consistent quality in appearance and physical properties.

Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

C. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination."

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store pavers on elevated platforms in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied.

B. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.

PART 2 PRODUCTS

2.1 CONCRETE PAVERS

A. Permeable Pavers: paving units complying with ASTM C 936, made from normal-weight aggregates.

1. Pavers shall be shall be, 8000 psi with5/16s gaps to provide 5%-15% drainage, ‘Hydrologic’ Pavers as manufactured by RCP Block or approved equal.

2. Thickness: 3.15” thick
3. Face, Size, and Shape: Pavers shall have a Stone-top Texture, Random Pattern of Jumbo (11” width), Rectangle (8.25” width), Square (5.5” width).
4. Color: Char-Brown color

2.2 ACCESSORIES

A. Metal edge restraints: Provide ‘GEOEDGE’ Aluminum Green Build Edging System, as manufactured by Permaloc Corporation or approved equal. Edging to be ‘Mill Finish’ aluminum in 7.5" X 8.5" size with minimum .25” thick exposed top lip.

B. Geotextile Fabric if required by City.

2.3 AGGREGATE SETTING-BED MATERIALS

A. Aggregate for Sub-base: Min. 12” depth of #2 open graded crushed stone aggregate as storage reservoir.

B. Aggregate for Bedding Course: Min. 2” depth of #8 gravel complying with ASTM D 2940 base material (Class II road base).

C. Joints: Fill joints with RCP Permeable Paver Joint Fill rock 1/8"-1/4" (#4 Stone) or approved equal.

PART 3 EXECUTION

3.1 EXAMINATION

Examine areas indicated to receive paving, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Do not use unit pavers with chips, cracks, voids, discolorations, and other defects that might be visible in finished work.

B. Mix pavers from several pallets or cubes, as they are placed, to produce uniform blend of colors and textures.

C. Exercise care in handling and cutting of pavers to prevent chipping or breakage.

D. Joint Pattern: Random pattern as indicated by manufacturer.

E. Tolerances: Do not exceed 1/32-inch (0.8-mm) unit-to-unit offset from flush (lippage) nor 1/8 inch in 10 feet (3 mm in 3 m) from level, or indicated slope, for finished surface of paving.

F. Tolerances: Do not exceed 1/16-inch (1.6-mm) unit-to-unit offset from flush (lippage) nor 1/8 inch in 24 inches (3 mm in 600 mm) and 1/4 inch in 10 feet (6 mm in 3 m) from level, or indicated slope, for finished surface of paving.

G. Provide edge restraints as indicated. Install edge restraints per manufacturer's guidelines before placing unit pavers.

1. Install edge restraints to comply with manufacturer's written instructions. Install stakes at intervals required to hold edge restraints in place during and after unit paver installation.
2. For metal edge restraints with top edge exposed, drive stakes at least 1 inch (25 mm) below top edge.

3.3 AGGREGATE SETTING-BED APPLICATIONS

A. Compact soil subgrade uniformly to at least 95 percent of ASTM D 698, ASTM D 1557 laboratory density.

B. Proof-roll prepared subgrade to identify soft pockets and areas of excess yielding. Excavate soft spots, unsatisfactory soils, and areas of excessive pumping or rutting, as determined by Architect, and replace with compacted backfill or fill as directed.

C. If required, place separation geotextile over prepared subgrade, overlapping ends and edges at least 12 inches (300 mm).

D. Place aggregate sub-base, compact by tamping with plate vibrator, and screed to depth indicated.

E. Place aggregate base, compact to 100 percent of ASTM D 1557 maximum laboratory density, and screed to depth indicated.

F. If required, place drainage geotextile over compacted base course, overlapping ends and edges at least 12 inches (300 mm).

G. Place leveling course and screed to a thickness of 1 to 1-1/2 inches (25 to 38 mm), taking care that moisture content remains constant and density is loose and constant until pavers are set and compacted.

H. Set pavers with a minimum joint width of 5/16 inch being careful not to disturb leveling base. If pavers have spacer bars, place pavers hand tight against spacer bars. Use string lines to keep straight lines.

I. Vibrate pavers into leveling course with a low-amplitude plate vibrator capable of a 3500- to 5000-lbf (16- to 22-kN) compaction force at 80 to 90 Hz. Perform at least three passes across paving with vibrator. Vibrate under the following conditions:

1. After edge pavers are installed and there is a completed surface or before surface is exposed to rain.
2. Before ending each day's work, fully compact installed concrete pavers to within 36 inches (900 mm) of the laying face. Cover pavers that have not been compacted, and leveling course on which pavers have not been placed, with non-staining plastic sheets to protect them from rain.

J. Fill joints immediately after vibrating pavers into leveling course. Vibrate pavers and add filler until joints are completely filled.

K. Do not allow traffic on installed pavers until joints have been wetted and set.

L. Repeat joint-filling process 30 days later.

3.4 REPAIRING AND CLEANING

A. Remove and replace unit pavers that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units. Provide new units to match adjoining units and install in same manner as original units, with same joint treatment and with no evidence of replacement.

END OF SECTION

SECTION 32 16 00
CURBS AND GUTTERS

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Association of State Highway and Transportation Officials (AASHTO): T 99, Standard Specification for the Moisture-Density Relations of Soils Using a 2.5 kg (5.5 pound) Rammer and a 305 mm (12 in.) Drop.
2. American Concrete Institute (ACI): 304R, Guide for Measuring, Mixing, Transporting, and Placing Concrete.
3. ASTM International (ASTM):
   a. C94, Standard Specification for Ready-Mixed Concrete.
   b. C309, Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete.
   c. D994, Standard Specification for Preformed Expansion Joint Filler for Concrete (Bituminous Type).

1.2 SUBMITTALS

A. Action Submittals:

1. Form Material: Information on metal forms, if used, including type, condition, surface finish, and intended function.
2. Complete data on concrete mix, including aggregate gradations and admixtures in accordance with requirements of ASTM C94.

B. Informational Submittals:

1. Curing Compound: Manufacturer's Certificate of Compliance, in accordance with Section 01 61 00, Common Product Requirements**,** and application instructions.
2. Ready-mix delivery ticket for each truck in accordance with ASTM C94.

1.3 QUALITY ASSURANCE

A. Regulatory Requirements: Conform to the State of California Standard Specifications for Highway Construction.

PART 2 PRODUCTS

2.1 MATERIALS

A. Conform to the requirements of the Standard Specification.

2.2 EXPANSION JOINT FILLER

A. Preformed asphalt-impregnated, expansion joint material meeting ASTM D994, 1/2- inch thick.

2.3 CONCRETE

A. Ready-mixed meeting ASTM C94, Option A, with compressive strength as specified in Section 03 30 00, Cast-in-Place Concrete.

B. Maximum Aggregate Size: 1-1/2 inch.

C. Slump: 2 inches to 4 inches.

2.4 CURING COMPOUND

A. Liquid membrane forming, clear or translucent, suitable for spray application and meeting ASTM C309, Type 1.

PART 3 EXECUTION

3.1 INSTALLATION

A. Perform Work in accordance with the Standard Specification.

3.2 FORMWORK

A. Lumber Materials:

1. 2-inch dressed dimension lumber, or metal of equal strength, straight, free from defects that would impair appearance or structural quality of completed curb and sidewalk**.**
2. 1-inch dressed lumber or plywood may be used where short-radius forms are required.

B. Metals: Steel in new undamaged condition.

C. Setting Forms:

1. Construct forms to shape, lines, grades, and dimensions.
2. Stake securely in place.

D. Bracing:

1. Brace forms to prevent change of shape or movement resulting from placement.
2. Construct short-radius curved forms to exact radius.

E. Tolerances:

1. Do not vary tops of forms from gradeline more than 1/8 inch when checked with 10-foot straightedge.
2. Do not vary alignment of straight sections more than 1/8 inch in 10 feet.

3.3 PLACING CONCRETE

A. Prior to placing concrete, remove water from excavation and debris and foreign material from forms.

B. Place concrete as soon as possible, and within 1-1/2 hours after adding cement to mix without segregation or loss of ingredients, and without splashing.

C. Place, process, finish, and cure concrete in accordance with applicable requirements of ACI 304, and this section. Wherever requirements differ, the more stringent shall govern.

D. To compact, vibrate until concrete becomes uniformly plastic.

3.4 CURB CONSTRUCTION

A. Construct ramps at pedestrian crossings.

B. Expansion Joints: Place at maximum 45-foot intervals and at the beginning and end of curved portions of curb. Install expansion joint filler at each joint.

C. Curb Facing: Do not allow horizontal joints within 7 inches from top of curb.

D. Contraction Joints:

1. Maximum 15-foot intervals in curb.
2. Provide open joint type by inserting thin, oiled steel sheet vertically in fresh concrete to force coarse aggregate away from joint.
3. Insert steel sheet to full depth of curb.
4. Remove steel sheet with sawing motion after initial set has occurred in concrete and prior to removing front curb form.
5. Finish top of curb with steel trowel and finish edges with steel edging tool.

E. Front Face:

1. Remove front form and finish exposed surfaces when concrete has set sufficiently to support its own weight.
2. Finish formed face by rubbing with burlap sack or similar device to produce uniformly textured surface, free of form marks, honeycomb, and other defects.
3. Remove and replace defective concrete.
4. Apply curing compound to exposed surfaces of curb upon completion of finishing.
5. Continue curing for minimum of 5 days.

F. Backfill curb with earth upon completion of curing period, but not before 7 days has elapsed since placing concrete.

1. Backfill shall be free from rocks 2 inches and larger and other foreign material.
2. Compact backfill firmly.

3.5 SIDEWALK CONSTRUCTION

A. Thickness:

1. 4 inches in walk areas.
2. 6 inches in driveway areas.

B. Connection to Existing Sidewalk:

1. Remove old concrete back to an existing contraction joint.
2. Clean the surface.
3. Apply a neat cement paste immediately prior to placing new sidewalk.

C. Expansion Joints: Place in adjacent curb, where sidewalk ends at curb, and around posts, poles, or other objects penetrating sidewalk. Install expansion joint filler at each joint.

D. Contraction Joints:

1. Provide transversely to walks at locations opposite contraction joints in curb.
2. Dimensions: 3/16-inch by 1-inch weakened plane joints.
3. Construct straight and at right angles to surface of walk.

E. Finish:

1. Broom surface with fine-hair broom at right angles to length of walk and tool at edges, joints, and markings.

2. Mark walks transversely at 5-foot intervals with jointing tool; finish edges with rounded steel edging tool.
3. Apply curing compound to exposed surfaces upon completion of finishing.
4. Protect sidewalk from damage and allow to cure for at least 7 days.

END OF SECTION

SECTION 32 31 00
FENCES AND GATES

PART 1 GENERAL

1.1 WORK INCLUDED

This specification covers fabricated steel fencing, rolling gates, and swing gates for the Morena Pump Station site perimeter.

1.2 RELATED WORK

Division 03 – Concrete
Division 31 – Earthwork

1.3 SYSTEM DESCRIPTION

The Contractor shall supply powder-coated steel fence, rolling gates and swing gates as shown and specified. The system shall include all components (i.e., pickets, rails, gate uprights, wheels and hardware) required. The gate schedule for the project is as follows:

Item	Quantity	Total Width	Height	Location	Notes
Double-leaf swing gate	1	25 ft	8 ft	Main Entrance	Automated
Rolling gate	1	10 ft	8 ft	SDGE Access from Custer Street	Automated with recessed V-track
Rolling gate	1	25 ft	8 ft	Exit to Custer Street	Automated with recessed V-track
Double-leaf swing gate	1	35 ft	8 ft	Entrance from Sherman Street	Automated with recessed V-track
Wrought Iron Fence	--	--	Height as shown on Drawings	Site perimeter	Fence sections shorter than 8 feet required above masonry wall where shown on Drawings

1.4 QUALITY ASSURANCE

The contractor shall provide laborers and supervisors who are thoroughly familiar with the type of construction involved and materials and techniques specified.

1.5 REFERENCES

A. ASTM B117 - Practice for Operating Salt-Spray(Fog) Apparatus.
B. ASTM D523 - Test Method for Specular Gloss.
C. ASTM D714 - Test Method for Evaluating Degree of Blistering in Paint.

D. ASTM D822 - Practice for Conducting Tests on Paint and Related Coatings and Materials using Filtered Open-Flame Carbon-Arc Light and Water Exposure Apparatus.
E. ASTM D1654 - Test Method for Evaluation of Painted or Coated Specimens Subjected to Corrosive Environments.
F. ASTM D2244 - Test Method for Calculation of Color Differences from Instrumentally Measured Color Coordinates.
G. ASTM D2794 - Test Method for Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact).
H. ASTM D3359 - Test Method for Measuring Adhesion by Tape Test.

1.6 SUBMITTALS

The manufacturer's submittal package shall be provided prior to installation. Submit the following:

A. Motor cutsheets, with statement that motor horsepowers selected are sufficient for continuous duty for the opening and closing torques required. Provide estimated maximum required torques for all gates.
B. Detailed dimensional cut sheets for all gates and entire length of fence including fence specials.
C. Complete list of materials of construction.
D. Separate submittal for gate automation, remote access, keypad entry, and photo eye systems.

1.7 PRODUCT HANDLING AND STORAGE

Upon receipt at the job site, all materials shall be checked to ensure that no damages occurred during shipping or handling. Materials shall be stored in such a manner to ensure proper ventilation and drainage and to protect against damage, weather, vandalism and theft.

PART 2 MATERIALS

2.1 MATERIAL

A. Steel material for roll gate components (i.e. pickets, rails, diagonals and uprights), shall be commercial steel with a minimum yield strength of 45,000 psi (344 MPa).

B. Provide 3-rail fence and gate design. Ornamental fence picket material shall be 1" square x 14 Ga. Tubing. Picket spacing shall be 4-5/8". Material for gate toprails, uprights and diagonals rails shall be 1-1/2"

square x 12 Ga. Material for the bottom rail shall be 2" x 4" x 11 Ga. Posts shall be a minimum of 4" square x 11 Ga. Gate and fence post embedment shall be 4 feet below ground surface. Provide ornamental curved top pickets on all fences and gates as shown on Drawings. Horizontal projection of curved top pickets shall be 10 inches.

2.2 FABRICATION

A. Pickets, rails, uprights and posts shall be precut to specified lengths. Diagonals shall be precut to specified lengths and angles. Frame materials shall be joined by welding. Pickets shall be face welded to roll gate frame, except for Invincible gates over 18' long. Invincible style gates over 18' long shall have pickets face-welded to 2" x 2" angle iron to form panels equal in length to the gate frame bay width.

B. All fences and gates shall be subjected to the PermaCoat® or equal thermal stratification coating process (high-temperature, in-line, multi-stage, multi-layer) including, as a minimum, a six-stage pre-treatment/wash (with zinc phosphate), an electrostatic spray application of an epoxy base, and a separate electrostatic spray application of a polyester finish. The base coat shall be a thermosetting epoxy powder coating (gray in color) with a minimum thickness of 2 mils (0.0508mm). The topcoat shall be a "no-mar" TGIC polyester powder coat finish with a minimum thickness of 2 mils (0.0508mm). The finished color shall be black.

C. Completed gates shall be capable of supporting a 200 lb. load applied at midspan without permanent deformation.

2.3 LOOP DETECTORS

A. All gates shall have traffic loop detectors, which shall consist of continuous 6 ft x 12 ft, 14 gauge standard wire with cross-linked polyethylene insulation manufactured by LiftMaster or approved equal. Installation of loops shall be per manufacturer requirements.

B. Wiring:
   1. Plug the loop detector into the desired slot (exit, inside and outside safety) on the expansion board of the operator.
   2. Insert the twisted wires from the loop into the corresponding terminal (exit, inside and outside) on the expansion board of the operator.

2.4 MOTORS

A. Provide 24VDC continuous duty motors suitable for gate travel at 12 inches per minute.

B. Operator Duty Rating: high-cycle, high-temperature continuous duty.

C. Chassis: Constructed with ¼" gold zinc-plated steel for rust prevention.

D. Worm Gear Reduction: commercial oil bath gearbox providing 10:1 worm gear reduction.

E. Cover: high-density, UV-resistant polycarbonate.

.

2.5 TRACKS

A. Provide V-notch recessed tracks provided by the gate automation supplier.

2.6 AUTOMATION AND PHOTO EYE

A. Gate automation shall be packaged and provided by the gate manufacturer through an automation supplier, Doorking or equal.

B. Provide photo-eye assembly for each gate. Photo eye assembly with 6 foot cable, photo eye bracket, photo eye hood, square reflector, reflector hood, reflector bracket, mounting hardware.

C. Provide 10 wireless remote control units to the Owner, for each gate.

D. Contractor shall furnish and install a keypad entry system for each gate, suitable for exterior vehicle access.

E. Contractor shall furnish and install an intercom system for the Main Entrance swing gate.

2.7 MANUFACTURER

A. Furnish gates and fencing as follows:

1. Ameristar PassPort Commercial Ornamental design series, Invincible style and 3-rail frame configuration manufactured by Ameristar Fence Products, Inc. in Tulsa, Oklahoma.
2. Or approved equal.

PART 3 EXECUTION

3.1 PREPARATION

All new installation shall be laid out by the contractor in accordance with the Drawings.

3.2 INSTALLATION

Gateposts shall be set in accordance with the spacing's shown in the construction plans. The "Earthwork" and "Concrete" sections of this specification shall govern post base material requirements. 6" wheels shall be bolted to the gate (between the wheel plates welded near the ends of the gate bottom rail). The gate shall be set upright with the V-grooved wheels positioned over the pre-installed steel V-track that traverses the gate opening. Roller guides shall be affixed to the gateposts at a height even with the gate toprail to hold the gate in a vertical position. Gate stops shall be welded to the end of the gate or track so gate cannot pass rollers in either direction.

3.3 CLEANING

The Contractor shall clean the jobsite of excess materials; post hole excavations shall be scattered uniformly away from posts.

3.4 COATING PERFORMANCE REQUIREMENTS

Table 1 – Coating Performance Requirements

Quality Characteristics	ASTM Test Method	Performance Requirements
Adhesion	D3359 – Method B	Adhesion (Retention of Coating) over 90% of test area (Tape and knife test).
Corrosion Resistance	B117, D714 & D1654	Corrosion Resistance over 1,000 hours (Scribed per D1654; failure mode is accumulation of 1/8" coating loss from scribe or medium #8 blisters).
Impact Resistance	D2794	Impact Resistance over 60 inch lb. (Forward impact using 0.625" ball).
Weathering Resistance	D822 D2244, D523 (60˚ Method)	Weathering Resistance over 1,000 hours (Failure mode is 60% loss of gloss or color variance of more than 3 delta-E color units).

END OF SECTION

SECTION 32 71 00
COMPACT BIOFILTRATION BASIN

PART 1 GENERAL

1.1 PURPOSE

A. The purpose of this specification is to establish criteria for Modular Subsurface Flow Wetland Units MW-01 and MW-02 used for biofiltration of stormwater runoff including dry weather flows and other contaminated water sources. Units MW-01 and MW-02 are shown on the Civil Drawings. These units shall comply with all requirements identified in the City of San Diego Storm Water Standards Manual.

1.2 DESCRIPTION

A. Modular Subsurface Flow Wetland Systems (MSFWS) are used for filtration of stormwater runoff including dry weather flows. The MSFWS is a pre-engineered biofiltration system composed of a pretreatment chamber containing filtration cartridges, a horizontal flow biofiltration chamber with a peripheral void area and a centralized and vertically extending underdrain, the biofiltration chamber containing a sorptive media mix which does not contain any organic material and a layer of plant establishment media, and a discharge chamber containing an orifice control structure. Treated water flows horizontally in series through the pretreatment chamber cartridges, biofiltration chamber and orifice control structure.

1.3 MANUFACTURER

A. The manufacturer of the MSFWS shall be one that is regularly engaged in the engineering design and production of systems developed for the treatment of stormwater runoff, and which have a history of successful production, acceptable to the engineer of work. In accordance with the drawings, the MSFWS(s) shall be a filter device Manufactured by BioClean A Forterra Company, or approved equal.

1.4 SUBMITTALS

A. Shop drawings are to detail the MSFWS and all components required and the sequence for installation, including:
    1. System configuration with primary dimensions
    2. Interior components
    3. Any accessory equipment called out on shop drawings
    4. Statement from each manufacturer that both units comply with stated design criteria on Civil Drawings for MW-01 and MW-02.

5. Material specification for concrete, media bed, pre-filter cartridge, grating, hatch, f low control riser, and underdrain manifold.

B. Inspection and maintenance documentation submitted upon request.

PART 2 PRODUCTS

2.1 SHIPPING, STORAGE AND HANDLING

A. Shipping – MSFWS shall be shipped to the contractor's address or job site, and is the responsibility of the contractor to offload the unit(s) and place in the exact site of installation.

B. Storage and Handling– The contractor shall exercise care in the storage and handling of the MSFWS and all components prior to and during installation. Any repair or replacement costs associated with events occurring after delivery is accepted and unloading has commenced shall be born by the contractor. The MSFWS(s) and all components shall always be stored indoors and transported inside the original shipping container until the unit(s) are ready to be installed. The MSFWS shall always be handled with care and lifted according to OSHA and NIOSA lifting recommendations and/or contractor's workplace safety professional recommendations.

PART 3 EXECUTION

3.1 GENERAL

A. The installation of the MSFWS shall conform to all applicable national, state, state highway, municipal and local specifications.

3.2 INSTALLATION

A. The Contractor shall furnish all labor, equipment, materials and incidentals required to install the (MSFWS) device(s) and appurtenances in accordance with the drawings and these specifications.

B. Grading and Excavation site shall be properly surveyed by a registered professional surveyor, and clearly marked with excavation limits and elevations. After site is marked it is the responsibility of the contractor to contact local utility companies and/or DigAlert to check for underground utilities. All grading permits shall be approved by governing agencies before commencement of grading and excavation. Soil conditions shall be tested in accordance with the governing agencies requirements. All earth removed shall be transported, disposed, stored, and handled per governing agencies standards. It is the responsibility of the contractor to install and maintain proper erosion control measures during grading and excavation operations.

C. Compaction – All soil shall be compacted per registered professional soils

engineer's recommendations prior to installation of MSFWS components.

D. Backfill shall be placed according to the geotechnical engineer's recommendations, and with a minimum of 6" of gravel under all concrete structures.

E. Concrete Structures – After backfill has been inspected by the governing agency and approved the concrete structures shall be lifted and placed in proper position per plans.

F. Subsurface Flow Wetland Media shall be carefully loaded into area so not to damage the Wetland Liner or Water Transfer Systems. The entire wetland area shall be filled to a level 9 inches below finished surface.

G. Planting layer shall be installed per manufacturer's drawings and consist of a minimum 3" grow enhancement media that ensures greater than 95% plant survival rate, and 6" of wetland media. Planting shall consist of native plants recommended by manufacturer and/or landscape architect. Planting shall be drip irrigated for at least the first 3 months to insure long term plant growth. No chemical herbicides, pesticides, or fertilizers shall be used in the planting or care and maintenance of the planted area.

3.3 MAINTENANCE AND INSPECTION

A. Inspection – After installation, the contractor shall demonstrate that the MSFWS has been properly installed at the correct location(s), elevations, and with appropriate components. All components associated with the MSFWS and its installation shall be subject to inspection by the engineer at the place of installation. In addition, the contractor shall demonstrate that the MSFWS has been installed per the manufacturer's specifications and recommendations. All components shall be inspected by a qualified person once a year and results of inspection shall be kept in an inspection log.

B. Material Disposal - All debris, trash, organics, and sediments captured by the MSFWS shall be transported and disposed of at an approved facility for disposal in accordance with local and state requirements. Please refer to state and local regulations for the proper disposal of toxic and non-toxic material.

3.4 QUALITY ASSURANCE

A. WARRANTY

1. The Manufacturer shall guarantee the MSFWS against all manufacturing defects in materials and workmanship for a period starting from the date of delivery to the job site. The manufacturer shall be notified of repair or replacement issues in writing within the warranty period. The MSFWS is limited to the recommended application for which it was designed.

END OF SECTION

SECTION 32 84 23
LANDSCAPE IRRIGATION SYSTEMS

PART 1 GENERAL

1.1 REFERENCES

A. The General and Special Conditions of the contract apply to the work of this section the same as though written herein.

B. The General and Special Conditions of the contract apply to the work of this section the same as though written herein.

C. Contractor shall comply with State Codes, Regional Standard Drawings, as well as City of San Diego Whitebook and Greenbook Specifications.

D. The following is a list of standards which may be referenced in this section:

1. American Society of Mechanical Engineers (ASME): B16.5, Pipe Flanges and Flanged Fittings NPS 1/2 through NPS 24.
2. ASTM International (ASTM):
   a. A53/A53M, Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
   b. A615/A615M, Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
   c. B32, Standard Specification for Solder Metal.
   d. B88, Standard Specification for Seamless Copper Water Tube.
   e. B584, Standard Specification for Copper Alloy Sand Castings for General Applications.
   f. D1784, Standard Specification for Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds.
   g. D1785, Standard Specifications for Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120.
   h. D2241, Standard Specification for Poly (Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR Series).
   i. D2466, Standard Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40.
   j. D2467, Standard Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80.
3. National Fire Protection Association (NFPA): NFPA No. 70, National Electrical Code (NEC).

1.2 SUBMITTALS

A. Action Submittals:

1. Contractor shall furnish the articles, equipment, materials or processes specified by name in the drawings and specifications. No substitution will be allowed without prior written approval by Landscape Architect.
   a. Product Data:
      1) Valves
      2) Valve access boxes.
      3) Controllers, timers, wiring, operation manual.
      4) Backflow prevention devices, assemblies and enclosures.
      5) Pipe and fittings.
      6) Tree Bubbler Assemblies
2. Qualifications:
   a. CLT Certificates for project foreman in charge of irrigation system installation.
3. Operation and Maintenance Data and Manuals.
4. Record Drawings: Redline mark-up with accurate dimensions of completed irrigation system.

1.3 QUALIFICATIONS

A. Contractor shall employ only Certified Landscape Technicians (CLT's) certified in Irrigation by the California Landscape Contractors Association (CLCA), as foremen for all irrigation installation work.

B. System Installer: Experience installing systems of similar complexity and size, thoroughly familiar with materials specified for installation and methods of installation to be present onsite and with authority to direct Work under this section throughout its installation.

1.4 EXTRA MATERIALS

A. Furnish the following:

Quantity	Item
2 sets	Special wrenches for removal and installation of each type of sprinkler head provided
1 set	Valve keys for manual operation of valves

PART 2 PRODUCTS

2.1 PIPE BASE MATERIAL

A. 1/4-inch minus clean sand.

2.2 GRAVEL

A. 3/4-inch minus, 1/2-inch plus, clean, washed, round gravel.

2.3 PIPE AND FITTINGS

A. Plastic pipe shall be extruded from 100% virgin polyvinyl chloride (PVC) Type 1, Grade 1 as manufactured by Lasco Industries, Pacific Plastics, John-Manville, or approved equal. All pipe shall be new and unused.

B. All plastic pipe shall be continuously and permanently marked with the following information: manufacturer's name, nominal pipe size, PVC 1120, SDR (Standard Dimension Ratio) and/or the pressure rating in PSI, NSF (National Sanitation Foundation)

C. All plastic pipe to be installed on the non-pressure side of the valves shall be PVC 1220, Schedule 40, Type I, Grade I, conforming to ASTM D-1745, unless otherwise shown on the drawings, details, or legend. All plastic pipe to be installed on grade on the non-pressure side of the valves shall be PVC 1220, Schedule 40, Type I, Grade I, conforming to ASTM D-1745, and shall be UV Resistant.

D. All pipe to be installed on the pressure side of valves shall also be PVC 1220, Schedule 40 (meeting these same specifications) for sizes up to and including 1-1/2 inch, Class 315 for sizes larger than 1-1/2 inch.

E. Plastic fittings for pressure side of valves shall be PVC 1220, IPS Schedule 80. Plastic fittings for non-pressure pipe shall be PVC 1220, IPS Schedule 40, NSF slip fittings and Schedule 40 threaded fittings. Fittings shall be as shown in the details and as manufactured by Lasco, Pacific, Western, or approved equal.

F. Solvent-weld glue shall be Lasco #711 Grey Heavy Body, or approved equal. All pressure-side pipe shall be primed with Lasco “Purple Primer” solvent before gluing. Fit and glue pipe per manufacturer’s specifications.

G. All threaded nipples shall be standard weight Schedule 80 molded threads. All threaded nipples exposed above grade shall be gray in color.

H. Pipe for sleeving shall be PVC 1120, Schedule 40, sized as indicated on the drawings. Provide pull rope 10 feet longer than sleeve.

2.4 VALVES

A. Ball Valves:

1. Zone Shutoff Valves 2 Inches and Smaller: Bronze, double disc wedge type with integral taper seats.
2. 2-1/2 Inches and Larger: Iron body, brass trimmed, double disc wedge type with integral taper seats.
3. Service rated (nonshock cold water) at not less than 200 psi. Cast or stamp manufacturer's identification on valve body.

B. Electric Remote Control Zone Valves:

1. Normally closed type with automatic shutoff in event of power failure.
2. Close or not open in less than 4 seconds.
3. Capable of manual control during power failure.
4. Flow control device: To eliminate effects of flow on opening or closing of valve.
5. Corrosion-resistant plastic.
6. Waterproofed for burial.
7. Union for supply line connection.
8. Operation not dependent on pressure loss through valves.
9. Include flow control mechanism.
10. UL listed.

C. Quick-Coupling Valves:

1. Allow for attachment of hose swivels and for air blowout of system.
2. Body:
   a. One- or two-piece type with locking cap.
   b. Heavy-duty brass in accordance with ASTM B584, 81-3-7-9 type, or heavy-duty bronze.
   c. Cap: Brass, bronze, or other noncorrosive metal.
3. Watertight before and after coupler is inserted.
4. Mechanism designed so valve seat is closed before coupler is removed.
5. Manufacturer's casting or stamp on valve body.
6. Valve design compatible with valve couplers, keys, and hose swivels.
7. Provide keys for locking caps.

2.5 VALVE ACCESS BOXES AND COVERS

A. Box: Thermoplastic to house remote control, manual control, zone shutoff, gate, automatic drain valves and globe valves that will not be installed with valve markers.

B. Each ball valve shall be housed in a round box, HDPE plastic type, model #910, green color, as manufactured by Carson-Brooks, or approved equal.

C. Lids shall be model #910-3B, green color, bolt down, with stainless steel locking bolt. Lids shall be marked "IRRIGATION SHUT-OFF."

2.6 AUTOMATIC CONTROL SYSTEM

A. General: UL listed, and manufactured expressly for control of automatic circuit valves of underground irrigation systems. The number and kind of circuit controls is as shown on drawings.

B. Control Enclosure: As shown on drawings.

C. Allow for manual or semiautomatic operation without disturbing preset automatic operation.

2.7 ELECTRICAL CONDUCTORS AND CONDUIT

A. Conductors:

1. Power Source to Controller or Timer: Conduit encased copper, minimum size No. 10, Type TW, consisting of two conductors and bare copper ground wire.
2. Wire Sizes: All wire shall be insulated, solid copper conductor of type approved for direct burial. Use color-coded wire for pilot wires, a different color for all valves of each controller, and install per valve manufacturer's specifications and wire chart. Common wire for each controller shall be white with stripe of same color as pilot wires. Spare wires shall be black. Colors different from all pilot and extra wires shall be used for master valve and flow sensor wires.
3. Sizing of wire shall be in accordance to manufacturer’s recommendations, in no case less than #14 in size.
4. Connections on 24 volt wire shall be made by Dri-Splice DS-100 as manufactured by the Spears, or approved equal.
5. Higher voltage line connections or 110 volt shall be made by clamp and waterproofed with 3M Company Scotchcast splicing kits or approved equal.

B. Conduit:

1. Aboveground: Galvanized, rigid steel, electrical type.
2. Underground: Schedule 40 PVC electrical type.
3. Meet requirements of Section 26 05 04, Basic Electrical Materials and Methods.

2.8 ELECTRICAL CONNECTORS

A. Manufacturers and Products:

1. Rain Bird; Pen-Tite wire connectors, or equal.

2.9 TREE BUBBLER ASSEMBLY

A. Manufactured Assembly as shown on drawings.

2.10 BACKFLOW PREVENTION ASSEMBLIES

A. Reduced Pressure Backflow Preventer Assembly shall be per City of San Diego requirements.

PART 3 EXECUTION

3.1 TRENCH EXCAVATION, PREPARATION AND BACKFILL

A. Commence irrigation system construction only after soil has been fine graded.

B. Backfill: Trench Backfill shall be clean washed sand, no rocks or cobbles.:

1. Pipe Base Material: Place and firmly tamp sand to 2-inch depth to provide continuous solid foundation for pipe.
2. To a point 4 inches above pipe, place and compact pipe base material.
3. Place backfill in layers not exceeding 6 inches, thoroughly compact each layer, up to finished grade, except in planting areas.
4. Smooth up and make clean and free of excess materials and debris those areas disturbed by operations performed under this Specification.

3.2 INSTALLATION OF PIPE AND FITTINGS

A. Plastic Pipe:

1. Use only strap wrenches on threaded joints.
2. Follow manufacturer's recommendations in use of solvent cement.
3. Do not subject unthreaded pipe joints to hydrostatic pressure for 48 hours after making joints.
4. Lay pipe on the prepared pipe base, snaking pipe from one side of trench to the other to provide for subsequent contraction.

5. Start backfill activities only after successful completion of hydrostatic pressure testing.

B. Pipe under Improved Areas (Curbs, Walks, Pavements): Install inside sleeves.

C. All PVC distribution lateral lines shall have a minimum clearance of 6" from each other. Parallel lines shall not be installed directly over one another.

D. Provide 6 inch vertical clearance between crossing lines.

E. Provide minimum cover of 18 inches for all pressure supply lines.

F. Provide minimum cover of 18 inches for all control wire runs.

G. Provide minimum cover of 12 inches for all non-pressure lines.

H. All lines under driveway and roadway pavement shall have a 24 inch minimum cover.

3.3 SLEEVES

A. Provide a minimum cover of 18 inches where installed under improved areas.

3.4 INSTALLATION OF VALVES AND VALVE ACCESS BOXES

A. Valves: Install with a union.

1. With Handles: Set at a depth to provide clearance between top of handle and box cover, or sleeve in which placed, when the valve is in open position and the cover is closed.
2. Quick-Coupling: 4 inches above finished grade for flower beds and 12 inches from the edge of lawns, curbs, pavement, or graveled surfaces.

B. Valve Access Boxes and Sleeves: Install with brick blocking on a gravel base to provide foundation, ease of leveling, and proper drainage.

3.5 BACKFLOW PREVENTION DEVICES

A. Install with a union on the discharge side of the assembly, except those with flange type fittings.

B. Connecting Pipe: Galvanized steel of at least same size as component parts used with the assembly, from supply line to 10 feet beyond the assembly.

C. Reduced Pressure Backflow Preventer Assembly:

1. Install in the supply line ahead of the section control valves they serve and immediately after the meter or pump.
2. Assemblies may be installed at a lower elevation than the sprinkler heads, but install assembly centerline 2 feet above grade with adequate drainage.
3. Do not place where assembly could be submerged in water.

3.6 IRRIGATION LINE CLEARANCES

A. Same Trench: Minimum 6-inch horizontal clearance.

B. Crossing Lines: Minimum 2-inch vertical clearance.

C. Other Utilities: Minimum 12-inch clearance in any direction.

3.7 SYSTEM DRAINAGE

A. Drain Valves: Locate at low points of pipelines so entire system is drained.

B. Slope line(s) to ensure entire system effectively drained to drain valves.

3.8 AUTOMATIC CONTROLLER AND WIRING

A. Install in accordance with manufacturer's recommendations.

3.9 TREE BUBBLER ASSEMBLIES

A. Set perpendicular to finished grade at manufacturer's recommended height.

3.10 FLUSHING

A. Flush supply lines and laterals to clear lines of all dirt and debris.as follows:

1. Before installation of valves and fittings.
2. Reflush after installation of valves and fittings.
3. Install sprinkler heads, filter screens, and nozzles immediately after flushing operation is completed.

3.11 PRESSURE TESTING

A. All pressure lines shall be tested under hydrostatic pressure of 150 PSI, and all non-pressure lines shall be tested under the existing static pressure and both be proven watertight.

B. Pressure shall be sustained in lines for not less than two (2) hours. If leaks develop, the joints shall be replaced and the test repeated until the entire system is proven watertight.

C. Tests shall be observed and approved by City Representative prior to backfill.

3.12 RECORD DRAWINGS

A. Contractor shall provide measurements and field notes for preparation of accurate "project record" drawings. Show dimensions from two permanent points of reference such as building corners for locations of all valves, equipment, wire runs and pipe runs.

3.13 CONTROLLER CHART

A. Contractor shall provide reduced plan mounted to inside of Controller cabinet.

1. Color coded showing areas of coverage for each valve zone.

3.14 CLEAN UP AND REPAIR

A. Contractor will be responsible for all maintenance and repair of entire irrigation system, including vandalism and theft, until final acceptance.

3.15 GUARANTEE

A. The entire irrigation system shall be guaranteed FOR material and workmanship, including settling of backfilled areas and trenches for a period of one year following the date of final acceptance of the work.

B. Should any operational difficulties in connection with the sprinkler system develop within the specified guarantee period, which in the opinion of the Owner may be due to inferior material and/or workmanship, said difficulties shall be immediately corrected to the satisfaction of the City's Representative, at no additional cost.

END OF SECTION

SECTION 32 93 00
PLANTS

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. City of San Diego Whitebook and Greenbook
2. American Association of Nurserymen (AAN): Z60.1, Nursery Stock.
3. Federal Housing Administration (FHA), Section 1103-103.
4. Hortus Third, Liberty Hyde Bailey, Hortorium, 1976.

1.2 DEFINITIONS

A. Measurement:

1. Take trunk caliper 6 inches above the ground level (up to and including 4-inch caliper size) and 12 inches above the ground level for larger trees.
2. Measure size of container-grown stock by height and width of plant.
3. Measure herbaceous perennials pot size, not top growth.

1.3 SUBMITTALS

A. Submittals:

1. Plant materials photographs of current nursery stock, with nursery source listed for each plant type.
2. Product data on all manufactured products specified, including root barriers, tree stakes and ties, tree drainage standpipes, aluminum edging.
3. Inorganic Rock Mulch Samples
4. Organic Bark Mulch Sample
5. Pre-emergent Herbicides
6. Product data on soil amendments, fertilizers, import soil, compost, specialty soils, etc.
7. Agronomic Soil Analysis of 3 samples taken from existing soil at the site shall be submitted to an approved Agronomic Soil Lab (Wallace Labs or Soil & Plant Laboratories, Inc.). Test shall include pH, N-P-K, SAR, minerals, micro-nutrients, EcE, boron levels, soil particle size, percolation rates, and a full textural evaluation.
8. Operation and Maintenance Data with Schedule and description for care, and maintenance of each type of plant for 120 day period in climate and location of the Project.

9. Guarantee in writing for all new trees.

B. Informational Submittals:

1. State Landscape License and CLT Certificate for Foreman.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Cover plants during shipment with a tarpaulin or other suitable covering to minimize drying.

B. Plant Protection: Plants shall be handled carefully to protect foliage, branches, and roots. Plants shall be adequately protected at all times from drying out and from other injury. Protect root balls and pots of plants which cannot be planted within twelve (12) hours of delivery with soil or other suitable materials. Where possible, store plants in the shade. Keep all plant roots moist before, during, and after planting. Plants shall be watered as soon as they arrive on the site and shall be kept moist until they are planted.

C. Store fertilizers and soil amendments in dry conditions away from any contaminants.

D. Store root control barriers in secure location with dry conditions. Do not store directly on the ground.

1.5 GUARANTEE

A. Guarantee shall provide for removal and replacement with new plants for plants found to be defective, diseased, severely damaged, not in a vigorous, thriving condition or dead during a period of 120 days for shrubs and groundcovers, and for a period of 365 days for all trees. Guarantee shall begin upon date of Substantial Completion. Duties and obligations for correction or removal and replacement of defective Work as specified in the General Conditions.

B. Replace defective plants with new plants free of dead or dying branches and branch tips, and bearing foliage of a normal density, size, and color. Closely match new plants to adjacent specimens of the same species and meet requirements of this Specification.

C. Plants damaged due to Project occupancy, vandalism, or proven acts of neglect by others may not be subject to this special guarantee.

1.6 MAINTENANCE

A. Commence to maintain plant life immediately after planting and maintain for 120 days after notice of Substantial Completion.

B. In accordance with accepted Submittal on care and maintenance of plants and as follows:

1. Maintain by watering, pruning, cultivating, and weeding as required for healthy growth.
2. Tighten and repair stake and guy supports and reset trees and shrubs to proper grades or vertical position as required.
3. Spray as required to keep trees and shrubs free of insects and disease.
4. Maintenance includes temporary protection fences, barriers, and signs as required for protection.
5. Coordinate watering to provide deep root watering to newly installed trees.

1.7 SCHEDULING AND SEQUENCING

A. Plant Deliveries: Notify Engineer at least 2 days in advance of each delivery.

B. Planting Season: Conduct planting during times of year that are normal for such work as determined by accepted local practice.

C. Plant trees and shrubs after final grades are established

PART 2 PRODUCTS

2.1 PLANT MATERIALS

A. Provide quantity, size, genus, species, and variety of trees and shrubs indicated; comply with applicable requirements of AAN Z60.1.

B. Nomenclature (Names of Plants): In accordance with “Hortus Third”.

C. Plant Size:

1. Nursery-grown, habit of growth normal for species.
2. Sound, healthy, vigorous, and free from insects, diseases, and injuries.
3. Equal to or exceeding measurements specified in plant list. Measure plants before pruning with branches in normal position.
4. Root System: Well developed and well distributed throughout the container, such that the roots visibly extend to the inside face of the growing container. (not rootbound).

5. Sizes: Dimensional relationship requirements of AAN Z60.1 for kind and type of plants required.

D. Plant Quality and Condition:

1. Trees and/or shrubs will be rejected if any one of the following characteristics are present:
    a. Enlarged cankers or galls at base of trunk, just above the soil level.
    b. Topped leaders or crooked trunks.
    c. Scars or trunk damage, broken branches, or trees that have been recently pruned back.
    d. Non-structural branching or rootbound condition.
2. Root System of Container-Grown Plants: Well developed and well distributed throughout the container, such that the roots visibly extend to the inside face of the growing container. (No rootbound plants will be accepted)
3. Container-Grown Plants: Grown in delivery containers for at least 6 months but not over 2 years with well-established root systems, sufficient to hold earth together after removal from container, without being root bound.
4. Label at least one tree and shrub of each variety with securely attached waterproof tag bearing legible designation of botanical and common name

E. Plant List**:** On Drawings.

F. Replacement Shrubs and Trees: Same species, size, and quality as specified for plant being replaced.

2.2 TREE STAKING MATERIALS

A. Wood Stake: Lodgepole Pine 2 inches by 2 inches by 10 feet.

B. Tree Ties: Vinyl tree ties as manufactured by Cinch Tie or equal.

2.3 TREE ROOT BARRIERS

A. Contractor shall furnish and install tree root barriers as specified. The tree root barriers shall be product #UB 24-2 as manufactured by Deep Root or approved equal. The barriers shall be black, injection molded panels, of 0.085-inch wall thickness in modules 24-inches long by 24-inches deep; manufactured with a minimum 50% post-consumer recycled polypropylene plastic with added ultraviolet inhibitors; recyclable

B. Each panel shall have not less than four (4) molded integral vertical root deflecting ribs of a minimum 0.085-inch thickness protruding ½-inch at 90° from interior of the barrier panel, spaced 6-inch apart.

C. Each panel shall have a double top edge consisting of two parallel, integral, horizontal ridges of a minimum 0.085-inch thickness, 3/8-inch wide and 1/4-inch apart with the lower rib attached to the vertical root deflecting ribs.

D. Each panel shall have a minimum of 9 anti-lift ground lock tabs consisting of integral horizontal ridges of a minimum 0.085-inch thickness in the shape of a segment of a circle, the 2-inch chord of the segment joining the panel wall and the segment, protruding 3/8-inch from the panel. The nine ground locks on each panel shall be about equally spaced between each of the vertical root deflecting ribs (3 between each set of ribs).

E. Each panel shall have preassembled self-locking flexible (0°-180°) joiner strips to connect one panel to the next.

2.4 LANDSCAPE EDGING

A. Edging shall be 3/16" x 5.5" high strength aluminum (6063 extruded aluminum alloy) with pre-fabricated locking strips, and 12" long stakes, as manufactured by Sure-loc Edging Corporation.

B. Finish to be Silver Mill Finish fabricated in sections with loops pressed from or welded to face of sections to receive stakes.

C. Stakes: Minimum 12 inches long.

2.5 MULCH

A. Free from noxious weed seed and foreign material harmful to plant growth.

B. Organic Bark: Medium grind, fir, pine; maximum 3/4-inch particle size.

C. Stone Mulch:

1. Round river rock shall be 3"-8" size, washed, with no fines for use in tree wells along street and along all curb lines and building foundations.

2. Pea gravel for use in larger landscape beds to be min. 1 inch washed, with no fines.

2.6 HERBICIDE

A. Selective, pre-emergent, surface-applied herbicide shall be wetable powder or granular type, appropriate to site area, soil type, indigenous weeds to be

controlled, and type of ground cover to be planted. Follow all manufacturer's precautions and label instructions. Comply with all local jurisdictional restrictions and ordinances.

2.7 PLANTING BACKFILL MIX

A. Amend backfill soil with organic amendments, compost, and additives to meet requirements/recommendations of agronomic soil analysis.

B. Compost product shall be fully composted 100 percent recycled organic product, consisting of 35 percent digested, centrifuged, composted bio-solids and 65 percent aged wood fibers. Contractor shall submit a specification sheet along with a fresh sample of proposed material for agronomic testing, not more than 30 days old, including description of particle size, total N (nitrogen), NH4-N (ammonia), NO3-N (nitrate), EcE, pH, micro nutrients, and metals.

2.8 FERTILIZER

A. Commercial Fertilizer shall be organic, granular controlled release fertilizer containing amount recommended per soil test, or the following minimum percentages, by weight, of plant food nutrients:

1. 14 percent available nitrogen
2. 7 percent available phosphorus
3. 3 percent available potassium
4. 5 percent sulfur
5. 3 percent iron

B. Fertilizer Tablets shall be 21 gram and 5 gram tablets, with 20-20-5 formulation, "Agriform" as manufactured by Sierra Industries or approved equal installed per details.

PART 3 EXECUTION

3.1 SCHEDULING

A. Inspection: Prior to starting work, carefully inspect previously installed work by other trades and verify that such work is complete to the point where work of this section may properly and safely commence.

B. Irrigation system shall be fully operational including automatic controller, before commencing planting operations.

C. Code Compliance: Verify that work of this Section may be installed in strict accordance with the original design, all pertinent codes and regulations, and all pertinent portions of the referenced standards.

3.2 LOCATION OF PLANTS

A. Locate new trees, shrubs and groundcovers as shown on Drawings, unless obstructions are encountered. Locations of all plant materials shall be reviewed and approved by City Representative prior to digging holes. Locate no planting, except ground cover, closer than 18 inches to pavements, pedestrian pathways, and structures.

3.3 PREPARATION

A. Planting Soil: For pit and trench type backfill, mix planting soil prior to backfilling and stockpile at Site.

B. Trees:

1. Pits, Beds, and Trenches: Excavate with vertical and scarified sides.
2. Trees: Make excavations at least twice as wide as root ball.
3. Fill excavations with water and allow to percolate out prior to planting.
4. Dig holes for tree standpipes to a depth of 36” below bottom of tree pit and install 4” diameter PVC tube covered with filter fabric sock. Backfill hole around outside of the PVC tube with crushed gravel and place removable drain grate lid on top of pipe at soil surface.

3.4 BACKFILLING

A. Backfill with planting soil, except where existing soil is suitable according to top soil analysis.

3.5 TREE STAKING

A. Support trees immediately after planting to maintain plumb position.

B. Install 2 lodgepole pine stakes for each tree, per City Standard detail. Position stakes spaced equally about each tree, not piercing the rootball.

3.6 TREE ROOT BARRIERS

A. Install the tree root barriers in a linear fashion adjacent to paving, sidewalk, or curb in all conditions where trees are to be planted closer than 6-feet to these improvements. Root barriers shall extend 10-feet in each direction from

center of tree as measured along length of improvement. Only full panels shall be used.

B. Vertical root deflecting ribs shall be facing inwards to the root ball and the double top edge shall be ½-inch above grade.

C. Panels shall be connected with the flexible joiner strips to the required length for the linear application.

3.7 EDGING

A. Anchor edging with stakes in locking devices to 12" depth, with top of stake at 1 inch below top elevation of edging.

3.8 FERTILIZER

A. Add 21 gram plant tablets in plant pits, adhering to the following schedule: 1 tablet for each I gallon; 2 tablets for each 5 gallon; 3 tablets for each 15 gallon; and 4 tablets for each 24-inch box tree.

B. Commercial Fertilizer:

1. Follow Soil Test recommendations for all plant materials.
2. On 80th day of the establishment period, all ground cover areas shall receive top dressing of 5-pounds of 16-8-8 commercial fertilizer per 1,000 square feet.

3.9 MULCHING

A. Cover planting area around each tree with 3-inch thick layer of mulch immediately after planting. Moisten planting area with water.

3.10 PRUNING AND REPAIR

A. Prune only after planting and in accordance with standard horticultural practice to preserve natural character of the plant. Perform in presence of Engineer. Remove all dead wood, suckers, and broken or badly bruised branches. Use only clean, sharp tools. Do not cut lead shoot.

3.11 WEED CONTROL

A. Maintain a weed-free condition within planting areas. Apply pre-emergent selective herbicide to mulched beds at manufacturer's recommended rate of application.

3.12 ESTABLISHMENT AND MAINTENANCE

A. Throughout the entire 120 day maintenance period, Contractor shall apply water to plants by monitoring climate and plant conditions and adjusting water levels on a regular basis to maintain plants in a healthy and vibrant condition until final acceptance of work.

B. Comply with all local and regional watering limitations, water quality requirements pertaining to runoff, and overspray restrictions.

C. Plants that cannot be watered efficiently with an automated water system shall be watered with a hose by the Contractor.

D. Immediately after planting, apply water to each tree and shrub by means of a hose. Apply water in a moderate stream in the planting hole until the material about the roots is completely saturated from the bottom of the hole to the top of the ground.

E. Ground cover planting shall be immediately sprinkled to avoid drying out until the entire planted area is thoroughly watered and the soil soaked to the full depth of each plant hole.

F. Fertilize all areas every 30 days after start of maintenance period at the rate of 5 lbs. per 1000 square feet with ammonium sulfate 21-0-0, or as recommended in soil analysis. There shall be a minimum of 3 applications.

G. On the 80th day of the establishment period, all ground cover areas shall receive top dressing of 5-pounds of 16-8-8 commercial fertilizer per 1,000 square feet.

3.13 CLEAN UP AND REPAIR

A. All areas shall be kept in a neat and orderly condition on a daily basis.

B. Contractor shall remove all trash, excess soil, empty plant containers, or other accumulated debris from the site at no extra cost.

C. Contractor shall repair any damage to project area caused by work operations.

3.14 WEED AND PEST CONTROL

A. Weeds, Nut grass, Dallas grass, Johnson grass, Bermuda grass, and any other noxious grass species shall be removed and disposed of as they appear.

B. Contactor shall provide constant diligence to detect the presence of disease, insects, and/or rodent infestations and proper preventative or control measures taken at his own expense.

3.15 PLANT REPLACEMENT

A. During the 120 day maintenance period, any plant indicating weakness or probability of dying, shall be replaced by the Contactor

3.16 MAINTENANCE PERIOD

A. Upon completion of the 120 day maintenance period, all areas included in the contract shall be substantially clean and free of debris and weeds. All plant materials shall be live, healthy, and free of infestations.

B. Any erosion or slippage of soil caused by watering shall be repaired by the Contactor at his expense.

C. All walks, curbs, and gutters shall be kept clear of debris, mud, dust, and standing water by sweeping, mopping or hosing down as required to maintain cleanliness throughout.

3.17 PROTECTION OF INSTALLED WORK

A. Protect planting areas and plants against damage for duration of maintenance period.

END OF SECTION

SECTION 33 05 01
CONVEYANCE PIPING—GENERAL

PART 1 GENERAL

1.1 GENERAL

A. This section applies to the potable/domestic water pipelines serving the site.

1.2 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Concrete Institute (ACI): 301, Specifications for Structural Concrete.
2. American Water Works Association (AWWA):
   a. C110/A21.10, Ductile-Iron and Gray-Iron Fittings.

   c. C207, Steel Pipe Flanges for Waterworks Service - Sizes 4 in. Through 144 in. (100 mm Through 3,600 mm).
   d. C209, Cold-Applied Tape Coatings for Steel Water Pipe
   e. C210 Liquid-Epoxy Coating Systems for the Interior and Exterior of Steel Water Pipelines.
   f. C213, Fusion-Bonded Epoxy Coating for the Interior and Exterior of Steel Water Pipelines.
   g. C214, Tape Coatings for Steel Water Pipelines
   h. C217, Petrolatum and Petroleum Wax Tape Coatings for the Exterior of Connections and Fittings for Steel Water Pipelines.
   i. C219, Bolted, Sleeve-Type Couplings for Plain-End Pipe.
   j. C221, Fabricated Steel Mechanical Slip-Type Expansion Joints.
   k. C606, Grooved and Shouldered Joints.
3. ASTM International (ASTM):
   a. A497/A497M, Standard Specification for Steel Welded Wire Reinforcement, Deformed, for Concrete.
   b. A615/A615M, Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
   c. C94/C94M, Standard Specification for Ready-Mixed Concrete.
   d. C150/C150M, Standard Specification for Portland Cement.
   e. F593, Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
4. NSF International (NSF):
   a. NSF/ANSI 61, Drinking Water System Components - Health Effects.

b. NSF/ANSI 372, Drinking Water System Components - Lead Content.

1.3 DESIGN REQUIREMENTS

A. Where pipe class or wall thickness is not indicated, design piping system for maximum stress based on the test pressure and earth loads**.**

1.4 SUBMITTALS

A. Action Submittals:

1. Detailed pipe fabrication drawings showing pipe details, special fittings and bends, dimensions, coatings, and other pertinent information.
2. Layout drawing showing location of each pipe section and each special length.
3. Pipe pressure class.
4. Wall thickness, reinforcing, and strength calculations.
5. Product Data: Manufacturer's data for couplings, saddles, gaskets, and other pipe accessories. Indicate maximum rated working pressure and test pressure for each item.

B. Informational Submittals: Manufacturer's Certificate of Compliance, in accordance with Section 01 61 00, Common Product Requirements.

1.5 DELIVERY, STORAGE, AND HANDLING

A. In accordance with manufacturer's recommendations and as specified in individual Specification(s) following this section**.**

B. Marking at Plant: Mark each pipe and fitting at plant. Include date of manufacture, manufacturer's identification, specification standard, diameter of pipe, dimension ratio, pipe class, pipe number for laying purposes, and other information required for type of pipe.

C. Pipe, specials, and fittings received at Project Site in damaged condition will not be accepted.

D. Gasket Storage: Store rubber gaskets in cool, well ventilated place, and do not expose to direct rays of sun. Do not allow contact with oils, fuels, petroleum, or solvents.

E. Store and support pipe securely to prevent accidental rolling and to avoid contact with mud, water, or other deleterious materials.

F. Handling:

1. Pipe shall be handled with proper equipment in a manner to prevent distortion or damage. Use of hooks, chains, wire ropes, or clamps that could damage pipe, damage coating or lining, or kink and bend pipe ends is not permitted.
2. Use heavy canvas, or nylon slings of suitable strength for lifting and supporting materials.
3. Lifting pipe during unloading or lifting into trench shall be done using two slings placed at quarter point of pipe section. Pipe may be lifted using one sling near center of pipe, provided pipe is guided to prevent uncontrolled swinging and no damage will result to pipe or harm to workers. Slings shall bear uniformly against pipe.
4. Pipe and fittings shall not be stored on rocks or gravel, or other hard material that might damage pipe. This includes storage area and along pipe trench.

PART 2 PRODUCTS

2.1 GENERAL

A. Components and Materials in Contact with Water for Human Consumption: Comply with the requirements of the Safe Drinking Water Act and other applicable federal, state, and local requirements. Provide certification by manufacturer or an accredited certification organization recognized by the Authority Having Jurisdiction that components and materials comply with the maximum lead content standard in accordance with NSF/ANSI 61 and NSF/ANSI 372. For this project, those requirements apply only to domestic water piping for bathrooms and lavatories.

1. Use or reuse of components and materials without a traceable certification is prohibited.

2.2 PIPE

A. As specified in the individual specification(s) following this section.

2.3 JOINTS

A. As specified in the individual specification sections following this section.

2.4 COUPLINGS

A. General:

1. Coupling linings for use in potable water systems shall be in conformance with NSF/ANSI 61.
2. Couplings shall be rated for appropriate operating pressure and hydrostatic test pressure.
3. Exposed, bolted, sleeve-type couplings shall be lined and coated with fusion bonded epoxy in accordance with AWWA C213.
4. Buried, bolted, sleeve-type couplings shall be lined and coated with fusion-bonded epoxy in accordance with AWWA C213 and wrapped with petroleum wax tape in accordance with AWWA C217**.**

B. For Pipe with Plain-Ends:

1. Bolted, sleeve-type coupling, in accordance with AWWA C219.
2. Fabricated steel, mechanical slip-type expansion joints, in accordance with AWWA C221.

C. For Pipe with Grooved Ends:

1. Grooved couplings, in accordance with AWWA C606. System shall provide for flexible or rigid joints as shown on Drawings**.**
2. Exposed couplings shall be lined and coated with fusion-bonded epoxy in accordance with AWWA C213.
3. Buried couplings shall be lined and coated with fusion-bonded epoxy in accordance with AWWA C213 and wrapped with petroleum wax tape in accordance with AWWA C217.

D. For Pipe with Flanged Ends:

1. Flanged coupling adapters, in accordance with AWWA C219.
2. Dismantling joints for connecting flanged pipe shall be AWWA C219 compliant. Provide studs and nuts to seal gasket separate and independent from tie-bar restraint system.
3. Rubber expansion joints shall allow compression, extension, and lateral deflection of the pipes being joined.

E. Bolting Materials for Couplings: Type 316 Stainless steel in accordance with AWWA C219.

2.5 SERVICE SADDLES

A. Double strap design rated for 250 psi minimum working pressure.

2.6 SLAB, FLOOR, WALL, AND ROOF PENETRATIONS

A. Modular Mechanical Seal:

1. Type: Interconnected synthetic rubber links shaped and sized to continuously fill annular space between pipe and wall sleeve opening.
2. Assemble interconnected rubber links with Type 316 stainless steel bolts, nuts, and pressure plates.
3. Size modular mechanical seals according to manufacturer's instructions for the size of pipes shown to provide a watertight seal between pipe and wall sleeve opening.
4. Manufacturers and Products:
   a. Thunderline/LinkSeal, Div. of PSI, Houston, TX; Link Seal.
   b. Calpico, Inc., South San Francisco, California; Sealing Linx.
   c. Advance Products and Systems, Lafayette, Louisiana; Innerlynx.
   d. Or equal.

B. Wall Sleeves:

1. Diameter, ends, and length shall be as shown on Drawings.
2. Shall include integral seep ring to minimize seepage between metal sleeve and concrete.

C. Wall Couplings:

1. Diameter, ends, and length shall be as shown on Drawings.
2. Wall couplings shall provide flexible mechanical joint.
3. Body and end rings shall be coated with fusion bonded epoxy.
4. Body shall include integral seep ring.
5. Shall comply with AWWA C219.

2.7 FLANGES, FLANGE GASKETS, AND BOLTING MATERIALS

A. As specified in individual specifications following this section.

B. Flanges, bolting materials, and flange gaskets for steel flanges shall conform to AWWA C207.

C. Flanges, bolting materials, and flange gaskets for ductile iron flanges shall conform to AWWA C110 and AWWA C115.

D. Type 316 Stainless steel bolting material shall conform to ASTM F593.

E. If the flanges are coated, provide two washers for each bolt on each side of the flange to minimize damage to the coating as the nuts are tightened. Provide bolts of the proper length to accommodate the washers.

2.8 FLANGE INSULATION KITS AND INSULATING COUPLINGS

A. Reference the Cathodic Protection Details on the Drawings.

2.9 CONCRETE FOR THRUST BLOCKS

A. Thrust Block Concrete: As specified in Section 03 30 00, Cast-in-Place Concrete.

B. Reinforcing Steel: ASTM A615/A615M, Grade 60 deformed bars.

C. Welded Wire Fabric: ASTM A497/A497M.

D. Formwork: Plywood earth cuts may be used as approved by Engineer**.**

E. Mix: ASTM C94/C94M, Option A.

1. Cement: ASTM C150/C150M, Type III.
2. Coarse Aggregate Size: 3/4 inches.
3. Design for Minimum Compressive Strength at 28 Days: 3,000 psi.

2.10 PIPE LOCATING TAPE

A. As specified in Section 31 23 23.15, Trench Backfill.

2.11 PIPE BEDDING AND PIPE ZONE MATERIAL

A. Granular material as specified in Section 31 23 23.15, Trench Backfill.

2.12 TRENCH STABILIZATION MATERIAL

A. As specified in Section 31 23 23.15, Trench Backfill.

PART 3 EXECUTION

3.1 GENERAL

A. Notify Engineer at least 2 weeks prior to field fabrication of pipe or fittings.

B. Furnish feeler gauges of proper size, type, and shape for use during installation for each type of pipe furnished.

C. Distributing Materials: Place materials along trench only as will be used each day, unless otherwise approved by Engineer. Placement of materials shall not be hazardous to traffic or to general public, obstruct access to adjacent property, or obstruct others working in area.

3.2 EXAMINATION

A. Verify size, material, joint types, elevation, and horizontal location of existing pipeline to be connected to new pipeline or new equipment.

B. Inspect size and location of structure penetrations to verify adequacy of wall pipes, sleeves, and other openings.

C. Damaged Coatings and Linings: Repair using coating and lining materials in accordance with manufacturer's instructions.

3.3 PREPARATION OF TRENCH

A. Prepare trench as specified in Section 31 23 16, Excavation.

B. Unless otherwise permitted by Engineer, maximum length of open trench shall not exceed what is indicated in the City's encroachment permit.

3.4 INSTALLATION

A. General:

1. Join pipe and fittings in accordance with manufacturer's instructions, unless otherwise shown or specified.
2. Install individual pipe lengths in accordance with approved lay diagram. Misplaced pipe shall be removed and replaced.
3. Inspect pipe and fittings before installation, clean ends thoroughly, remove foreign matter and dirt from inside.
4. Flanged Joints:
    a. Install perpendicular to pipe centerline.
    b. Bolt Holes: Straddle vertical centerline, aligned with connecting equipment flanges or as shown on Drawings.
    c. Use torque-limiting wrenches to provide uniform bearing and proper bolt tightness.
    d. Flange Type: Use flat-faced flange when joining with flat-faced ductile or cast iron flange.
5. Couplings:
    a. Install in accordance with manufacturer's written instructions.
    b. Before coupling, clean pipe holdback area of oil, scale, rust, and dirt.
    c. Clean gaskets before installation.
    d. If necessary, lubricate with gasket lubricant for installation on pipe ends.
    e. Tighten coupling bolts progressively, drawing up bolts on opposite sides gradually until bolts have uniform tightness.

B. Buried Pressure Pipe:

1. Concrete Encased or Embedded Pipe: Do not encase joints in concrete, unless specifically shown on Drawings.
2. Placement:
    a. Keep trench dry until pipe laying and joining is completed.
    b. Exercise care when lowering pipe into trench to prevent twisting or damage to pipe.
    c. Measure for grade at pipe invert, not at top of pipe.
    d. Excavate trench bottom and sides of ample dimensions to permit proper joining, welding, visual inspection, and testing of entire joint.
    e. Prevent foreign material from entering pipe during placement.
    f. Close and block open end of last laid pipe section when placement operations are not in progress and at close of day's work.
    g. In general, lay pipe upgrade with bell ends pointing in direction of laying.
    h. Deflect pipe at joints for pipelines laid on a curve using unsymmetrical closure of spigot into bell. If joint deflection of standard pipe lengths will not accommodate horizontal or vertical curves in alignment, provide:
        1) Shorter pipe lengths.
        2) Special mitered joints.
        3) Standard or special fabricated bends.
    i. Check gasket position with feeler gauge to assure proper seating.
    j. After joint has been made, check pipe alignment and grade.
    k. Place sufficient pipe zone material to secure pipe from movement before next joint is installed.
    l. Prevent uplift and floating of pipe prior to backfilling.
3. Disposal of Excess Excavated Material: As specified in Section 31 23 16, Excavation.

3.5 THRUST RESTRAINT

A. Location: At pipeline tees, plugs, caps, bends, and locations where unbalanced forces exist.

B. Thrust Blocking:

1. Place only where shown on Drawings.
2. Quantity of Concrete: Sufficient to cover bearing area of pipe and provide required soil bearing area as shown on Drawings.
3. Place blocking so pipe and fitting joints are accessible for repairs.
4. Place concrete in accordance with Section 03 30 00, Cast-in-Place Concrete.

3.6 CORROSION PROTECTION

A. Buried Pipe: As specified in the individual specifications following this section.

B. Notify Engineer at least 3 days prior to start of surface preparation, coating application, and corrosion protection work.

3.7 PLACEMENT OF PIPE LOCATING TAPE

A. Place pipe locating tape in accordance with Section 31 23 23.15, Trench Backfill.

3.8 PIPE BEDDING AND ZONE MATERIAL

A. Place pipe bedding and pipe zone material in accordance with Section 31 23 23.15, Trench Backfill.

3.9 FIELD QUALITY CONTROL

A. Pressure Leakage Testing: As specified in the individual specification(s) following this section.

3.10 CLEANING AND DISINFECTION

A. Following assembly and testing, and prior to disinfection and final acceptance, flush pipelines with water at 2.5 fps minimum flushing velocity until foreign matter is removed. Dispose of water and flushed foreign matter.

B. If impractical to flush large diameter pipe at 2.5 fps, clean pipe in-place from inside by brushing and sweeping, then flush or blow line at lower velocity

C. Remove accumulated debris through blow-offs 2 inches and larger or by removing spools and valves from piping.

D. Disinfection: As specified in Section 33 13 00, Disinfection of Water Utility Distribution Facilities.

END OF SECTION

SECTION 33 05 01.09
POLYVINYL CHLORIDE (PVC) PIPE AND FITTINGS

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Water Works Association (AWWA):
   a. C605, Underground Installation of Polyvinyl Chloride (PVC) and Molecularly Oriented Polyvinyl Chloride (PVCO) Pressure Pipe and Fittings.
2. ASTM International (ASTM):
   a. D2241, Standard Specification for Poly Vinyl Chloride (PVC) Pressure-Rated Pipe (SDR Series).
   b. D2321, Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications.
   c. D2466, Standard Specification for Poly Vinyl Chloride (PVC) Plastic Pipe Fittings, Schedule 40.
   d. D2467, Standard Specification for Poly Vinyl Chloride (PVC) Plastic Pipe Fittings, Schedule 80.
   e. D2672, Standard Specification for Joints for IPS PVC Pipe Using Solvent Cement.
   f. D2855, Standard Practice for Making Solvent-Cemented Joints with Poly Vinyl Chloride (PVC) Pipe and Fittings.
   g. D3139, Standard Specification for Joints for Plastic Pressure Pipes Using Flexible Elastomeric Seals.
3. NSF International (NSF).

1.2 SUBMITTALS

A. Action Submittals: Drawings showing pipe diameter, pipe class, dimension ratio (DR) and fitting details. Include detailed information on two-part solvent and proposed detailed method for solvent welding. Include proposed rubber gasket material.

B. Informational Submittals:

1. Manufacturer's Certificate of Compliance, in accordance with Section 01 61 00, Common Product Requirements.
2. Hydrostatic Testing Plan: Submit at least 15 days prior to testing and at minimum, include the following:

a. Testing dates.
b. Piping systems and section(s) to be tested.
c. Method of isolation.
d. Method of conveying water from source to system being tested.
e. Method of disposing of test water.
f. Calculation of maximum allowable leakage for piping section(s) to be tested.

3. Certification of Calibration: Approved testing laboratory certificate if pressure gauge for hydrostatic test has been previously used. If pressure gauge is new, no certificate is required.
4. Test report documentation.

1.3 DELIVERY, STORAGE, AND HANDLING

A. Solvent Cement: Store in accordance with ASTM D2855.

PART 2 PRODUCTS

2.1 MATERIALS

A. Pipe:

1. PVC, conforming to requirements as shown on drawings**.**
2. Pipe to be used for potable water conveyance shall meet the requirements of NSF 61.
3. Buried pipe for this project shall be PVC Schedule 80, unless otherwise indicated on Drawings**.**

B. Joints:

1. Rubber gasketed, push-on for 12-inch PVC Schedule 80 drain pipe. Provide EPDM, peroxide cured rubber gaskets.
2. Solvent welded for schedule 80 PVC, 6 inches diameter and smaller.
3. Conform to ASTM D2774 and ASTM D2672.

C. Fittings: PVC schedule 80, unless otherwise indicated on Drawings.

D. Service Saddles:

1. Double strap type with minimum strap width of 2 inches.
2. Straps: Type 316 stainless steel.
3. Saddles: Ductile iron, epoxy-coated, 10 mils minimum thickness. Minimum Pressure Rating: 150 psi**.**

E. Restrained Joints:

1. Pipe restraint shall be provided through solvent welding for all pressure pipe applications.
2. 12-inch PVC gravity drain pipe shall be unrestrained.

PART 3 EXECUTION

3.1 INSTALLATION

A. In accordance with AWWA C605 and ASTM D2321.

B. Solvent cement used for joints shall be as recommended by pipe manufacturer.

C. Joints:

1. Solvent Cemented: In accordance with ASTM D2855.
2. Rubber Gasketed: In accordance with ASTM D3139.

D. Pipe Bending for Horizontal or Vertical Curves:

1. Bending of pipe barrels larger than 12 inches in diameter is not allowed.
2. Radius of curves shall not exceed 75 percent of manufacturer's recommended values.
3. Use blocks or braces at pipe joints to ensure axial deflection in gasketed or mechanical joints does not exceed allowable deflection.

E. No deflection is allowed at solvent weld joints.

F. For potable, domestic, and utility water piping, disinfect pipe in accordance with AWWA C651.

G. Contractor shall coordinate with City Operations prior to and during connections to existing City utilities. Contractor shall meet City requirements for disinfection, swabbing, time of shutdown, and means/methods of tying into City – owned utilities.

3.2 INSPECTION AND HYDROSTATIC TESTING

A. General:

1. Notify Engineer in writing at least 15 working days in advance of testing. Perform testing in presence of Engineer.
2. Using water as test medium, all newly installed pipelines must successfully pass hydrostatic leakage test prior to acceptance.

3. Conduct field hydrostatic test on buried piping after trench has been completely backfilled and compacted. Testing may, as approved by Engineer, be done prior to placement of asphaltic concrete or roadway structural section.
4. Contractor may, if field conditions permit and as approved by Engineer, partially backfill trench and leave joints open for inspection and conduct an initial informal service leak test. Final field hydrostatic test shall not, however, be conducted until backfilling has been completed as specified above.
5. Supply of Temporary Water: In accordance with Section 01 50 00, Temporary Facilities and Controls.
6. Dispose of water used in testing in accordance with federal, state, and local requirements.
7. Install temporary thrust blocking or other restraint as necessary to prevent movement of pipe and protect adjacent piping or equipment. Make necessary taps in piping prior to testing.
8. Wait a minimum of 7 days after concrete thrust blocking is installed to perform pressure tests. If high-early strength cement is used for thrust blocking, wait may be reduced to 4 days.
9. Prior to test, remove or suitably isolate appurtenant instruments or devices that could be damaged by pressure testing.
10. New Piping Connected to Existing Piping:
    a. Isolate new piping with grooved-end pipe caps, blind flanges, or other means as acceptable to Engineer.
    b. Provide appropriate thrust blocking.

B. Hydrostatic Testing Procedure:

1. Furnish testing equipment, as approved by Engineer, which provides observable and accurate measurements of leakage under specified conditions.
2. Maximum Filling Velocity: one foot per second.
3. Expel air from piping system during filling.
4. Test Pressure: 50 psi above system operating pressure. Contractor shall obtain system operating pressure from Engineer during pipe submittal phase.
5. Apply and maintain specified test pressure with hydraulic force pump. Valve off piping system when test pressure is reached.
6. Maintain hydrostatic test pressure continuously for 2 hours minimum, adding make-up water only as necessary to restore test pressure to within 5 psi of specified hydrostatic test pressure.
7. Determine actual leakage by measuring quantity of water necessary to maintain specified test pressure for duration of test.

C. Maximum Allowable Leakage:

$$L = \frac{ND(P)^{1/2}}{7400}$$

where:

L = Allowable leakage, in gallons per hour.
N = Number of joints in tested line.
D = Nominal diameter of pipe, in inches.
P = Average test pressure during leakage test, in pounds per square inch.

END OF SECTION

SECTION 33 05 10
REINFORCED CONCRETE PIPE (RCP), RUBBER GASKET JOINT WITH PVC LINING

PART 1 GENERAL

1.1 WORK OF THIS SECTION

A. The WORK of this Section includes providing double rubber gasketed reinforced concrete pipe (RCP) with PVC lining intended to be used for the construction of open trench gravity sanitary sewers. RCP for use in trenchless construction shall be provided as identified in the section for Microtunneling.

1.2 RELATED SECTIONS

A. The WORK of the following Sections applies to the WORK of this Section. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this WORK.

1. Section 31 23 19.01 – Dewatering
2. Section 31 23 16 – Excavation
3. Section 31 23 23.15 – Trench Backfill
4. Section 31 71 19 – Microtunneling

1.3 STANDARD SPECIFICATIONS

A. Except as otherwise indicated in this Section of the Specifications, the CONTRACTOR shall comply with the Standard Specifications for Public Works Construction (SSPWC), latest edition.

1.4 SPECIFICATIONS AND STANDARDS

A. Except as otherwise indicated, the current editions of the following apply to the WORK of this Section:

1.	ASTM C 76	Specification for Reinforced Concrete Culvert, Storm Drain, Sewer Pipe
2.	ASTM C 150	Specification for Portland Cement
3.	ASTM C 361	Specification for Reinforced Concrete Low-Head Pressure Pipe

4.	ASTM D 412	Test Methods for Rubber Properties in Tension
5.	ASTM D 2240	Test Method for Rubber Property - Durometer Hardness

1.5 CONTRACTOR SUBMITTALS

A. The following shall be submitted in compliance with Section 01 33 00:

1. Manufacturer's design drawings indicating, at relative scale, concrete covers, reinforcement placements and joint assembly design. Submittals shall also include the design pipe size, D-load, cement type, concrete strength and steel areas, and types and placement of reinforcement.
2. A certified affidavit of compliance for all pipe and other products or materials furnished under this Section, as specified in the reference standards and the following supplemental requirements:
   a. Hydrostatic test reports of rubber gasket joints.
   b. Three-edge-bearing strength (D-load) test reports.
   c. PVC-Liner test reports.

1.6 FACTORY INSPECTION AND TESTING

A. The CONTRACTOR shall be responsible for all costs associated with inspection and testing of materials, products, or equipment at the place of manufacture. This shall include costs for travel, meals, lodging, and car rental for one OWNER-designated inspector for up to 4 days required to complete such inspections or observations exclusive of travel days, if the place of manufacture, fabrication and factory testing is more than fifty (50) miles outside the geographical limit of the City. The CONTRACTOR shall not be responsible for salary or salary-related costs of the inspectors.

B. **Inspection:** All pipe shall be subject to inspection at the place of manufacture in accordance with the provisions of the applicable referenced standards as supplemented by the requirements herein. The CONTRACTOR shall notify the CONSTRUCTION MANAGER in writing of the manufacturing starting date not less than 14 calendar days prior to the start of any phase of pipe manufacture.

C. **Tests:** Unless otherwise indicated, all materials used in the manufacture of the pipe shall be tested in accordance with the requirements of the applicable referenced standards. The CONTRACTOR shall perform said material tests at no additional cost to the OWNER. The CONSTRUCTION MANAGER will witness all testing conducted by the CONTRACTOR; provided, that the CONTRACTOR's schedule is not delayed for the convenience of the

CONSTRUCTION MANAGER. In addition to those tests specifically required, the CONSTRUCTION MANAGER may request additional samples of any material for testing by the OWNER. The additional samples shall be furnished at no additional cost to the OWNER.

D. **Product Testing:** In addition, pipe shall be tested at the factory for D-load bearing strength in compliance with SSPWC Subsection 207-2.9.2.

E. **Hydrostatic Tests:** Pipe shall be subjected to hydrostatic test of the rubber gasket joints in accordance with ASTM C 361 except that test pressure shall be a minimum of 5 psi.

F. **PVC Liner Tests:** PVC liner shall be tested in accordance with Subsection 210-2.3 of SSPWC.

PART 2 PRODUCTS

2.1 GENERAL

A. Reinforced concrete pipe shall conform to the requirements of ASTM C 76 as modified below:

1. In no case shall pipe be less than that specified under ASTM C 76 provisions for Class III, Walls "B", or "C." Wall "A" shall not be accepted.
2. Minimum protective cover of concrete over the inner reinforcement cage shall be 1¼ inches.
3. Pipe shall be fabricated by the vertically cast process which shall be wet cast, vibrated, and steam- or water-cured. Pipe manufactured by the dry cast method is unacceptable. For steam curing, the forms shall not be removed for a minimum of 6 hours. For water curing, the minimum period for removal of forms is 24 hours. Fabrication of vertically-cast pipe shall be in accordance with ASTM C 361 and further, form oils or release agents shall not contain any material or substances as would penetrate or otherwise retard concrete set at the formed surface.

2.2 MATERIALS

A. **General:** Materials shall comply with Section 6 of ASTM C 76 modified below.

B. **Cement:** Cement used in the manufacture of reinforced concrete pipe shall

be Type II in conformance with ASTM C 150.

C. **Admixtures:** No admixture shall be used unless otherwise specified or accepted by the CONSTRUCTION MANAGER.

D. **Rubber Gaskets:** Rubber gaskets shall be neoprene and shall comply with the requirements of ASTM C 361.

E. **PVC-Liner:** PVC-liner shall conform to SSPWC Subsection 207.3 and shall be Amerplate T-Lock as manufactured by Northwest Pipe Company, Brea, California, or equal. The liner shall cover 330 degrees of the pipe interior surface, leaving an open arc of 30 degrees at the bottom of the pipe for observation of cracks that may occur during D- Load tests.

2.3 JOINTS

A. Joint assembly design shall be Carnegie bell and spigot steel joint or reinforced concrete raised or flush bell concrete joint incorporating a fully retained single rubber gasket in accordance with ASTM C 361 and as shown. For locations where pipelines will be installed below the water table, the CONTRACTOR shall provide double rubber gaskets.

PART 3 EXECUTION

3.1 GENERAL

A. Reinforced concrete pipe shall be installed in accordance with the requirements of SSPWC Subsection 306-1.2 and Section 33 05 01.

3.2 PVC-LINER INSTALLATION

A. PVC-liner installation shall conform to SSPWC Subsection 311-1.

1.2 SUBMITTALS

A. Action Submittals:

1. Shop Drawings including details of construction, reinforcing and joints, anchors, lifting, erection inserts, and other items cast into members.
2. Product Data:
   a. Concrete mix design.
   b. Manhole frame to structure seals.
   c. Manhole frame to structure anchor bolt.
   d. Rubber gaskets and sealants.
   e. External joint wrap.

B. Informational Submittals:

1. Experience Record:
   a. Precast concrete production capabilities.
   b. Evidence of current PCI plant certification.
2. Calculations: Proposed details and design calculations for stresses in precast concrete members for loading conditions including earth pressures and transportation, handling, and erection. Calculations shall be stamped by engineer registered in the state of California.
3. Certificate of Compliance: Certify admixtures and concrete do not contain calcium chloride.
4. Test Reports:
   a. Precast manufacturer's concrete test cylinders.
   b. Core compression test.
   c. Absorption test.
5. Manufacturer's recommended installation instructions.
6. Field quality control report.

1.3 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. Precast Concrete and Precast Prestressed Concrete: Product of manufacturer with experience producing precast concrete products of quality specified.
2. Precast Plant: PCI certified plant with current certification.

PART 2 PRODUCTS

2.1 GENERAL

A. Materials of Construction and Service Conditions:

1. Screws, Bolts, or Nuts: Type 304 stainless steel conforming to ASTM F593 and ASTM F594.
2. Gaskets: Internal and external seals shall be made of materials that have been proven to be resistant to the following exposures and conditions:
   a. Sanitary sewage.
   b. Corrosion or rotting under wet or dry conditions.
   c. Gaseous environment in sanitary sewers and at road surfaces including common levels of ozone, carbon monoxide, and other trace gases at installation site.
   d. Biological environment in soils and sanitary sewers.
   e. Chemical attack by road salts, road oil, and common street spillages or solvents used in street construction or maintenance.
   f. Temperature ranges, variations, and gradients in construction area.
   g. Variations in moisture conditions and humidity.
   h. Fatigue failure caused by a minimum of 30 freeze-thaw cycles per year.
   i. Vibrations because of traffic loading.
   j. Fatigue failure because of repeated variations of tensile, compressive and shear stresses, and repeated elongation and compression. Material shall remain flexible allowing repeated movement.
3. Materials shall be compatible with each other and manhole materials.
4. Designed to provide a 20-year service life.

B. Structures shall meet requirements of ASTM C478, this specification and the following:

1. Concrete:
   a. Cement: Meet requirements of ASTM C150/C150M.
   b. Compressive Strength:
      1) Minimum 4,000 psi.
      2) Minimum strength shall be confirmed at 7 days by making two standard cylinders per manhole for testing.

c. Concrete mix design shall include Xypex C-500 or C-1000 based upon mix design at dosage recommended by manufacturer for installation.

2. Reinforcement: Grade 60, unless otherwise specified.
3. Ring: Custom made with openings to meet indicated pipe alignment conditions and invert elevations.
4. Joint:
   a. Form joint contact services with machined castings.
   b. Surfaces shall be parallel with nominal 1/16-inch clearing and tongue equipped with recess for installation of O-ring rubber gasket.
5. Gasket: Meet requirements of ASTM C443.

2.2 PRECAST MANHOLES

A. Riser Sections:

1. Fabricate in accordance with ASTM C478.
2. Diameter: Minimum 60 inches.
3. Wall Thickness: Minimum 4 inches or 1/12 times inside diameter, whichever is greater.
4. Top and bottom surfaces shall be parallel.
5. Joints: confined O-ring with rubber gaskets meeting ASTM C443**.**

B. Cone Sections:

1. Eccentric.
2. Same wall thickness and reinforcement as riser section.
3. Top and bottom surfaces shall be parallel.

C. Base Sections and Base Slab:

1. Base slab integral with sidewalls.
2. Fabricate in accordance with ASTM C478.

D. Manhole Extensions:

1. Concrete grade rings; maximum 6 inches high.
2. Fabricate in accordance with ASTM C478.

E. Joint Seal Manufacturers and Products:

1. Butyl Gaskets:
   a. Hamilton Kent, Sparks, NV; Kent-Seal No. 2.
   b. Henry Company, Houston, TX; Ram-Nek.
   c. Trelleborg Engineered Solutions, Park Hills, MO; NPC Bidco C-56.

d. Or equal.

2. Confined Plastic or Rubber O-Ring:
   a. As recommended by precasting manufacturer.
   b. Meet requirements of ASTM C443.
3. External Wrap:
   a. Sealing Systems, Inc., Loretto, MN; Gator Wrap.
   b. Henry Company, Houston, TX; RU116 Rubr-Nek External Joint Wrap.
   c. Trelleborg Engineered Solutions, Park Hills, MO; NPC External Joint Wrap.
   d. Cretex Specialty Products, Waukesha, WI; Cretex Wrap.
   e. Or equal.

F. CAST-IN-PLACE MANHOLES

G. Concrete: As specified in Section 03 30 00, Cast-in-Place Concrete.

H. Reinforcing Steel: As specified in Section 03 21 00, Reinforcing Steel.

2.3 MANHOLE FRAMES AND COVER

A. Castings:

1. Tough, close-grained gray iron, sound, smooth, clean, free from blisters, blowholes, shrinkage, cold shuts, and defects.
2. Cast Iron: ASTM A48/A48M Class 35B.
3. Ductile Iron: ASTM A536, Grade 60-40-12.
4. Plane or grind bearing surfaces to ensure flat, true surfaces.

B. Cover: Owner's Standard.

2.4 MANHOLE FRAME CONNECTION TO STRUCTURE

A. Butyl Sealant:

1. Conform to ASTM C1311, or AASHTO M198 and ASTM C990.
2. Trowelable or cartridge applied.
3. Manufacturers and Products:
   a. Tremco Commercial Sealants and Waterproofing, Beachwood, OH; Tremco Butyl Sealant.
   b. Bostik, Middleton, MA; Chem-Calk 300.
   c. Press-Seal Gasket Company, Fort Wayne, IN; EZ-Stik #3.
   d. Or equal.

B. External Wrap:

1. Meet requirements of ASTM C923.
2. Construct of high quality rubber that will provide flexible watertight seal around joint.
3. Thickness: Minimum 60 mils.
4. Consist of a top and bottom section and be sealed to structure, frame top, and bottom with mastic as applicable.
5. Length: Extend from manhole frame and extension ring to cone section.
6. Bands: If required, constructed of minimum 16-gauge sheet if channeled, or 5/16-inch diameter if round.
7. Manufacturers and Products:
    a. Sealing Systems, Inc., Loretto, MN; Infi-Shield.
    b. Trelleborg Engineered Systems, Milford, NH; NPC Flexrib Frame-Chimney Seals.
    c. Cretex Specialty Products, Waukesha, WI; X-85 Seal.
    d. Or equal.

C. Internal Wrap or Sealing Membrane:

1. Meet requirements of ASTM C923.
2. Minimum internal thickness of 3/16 inch or as recommended by manufacturer for installation climate.
3. Designed for application and have a demonstrated history of accommodating differential expansion between frame and concrete.
4. Width: Minimum 8 inches.
5. Expansive type wraps shall be fabricated of high quality rubber or urethane.
6. Bands: If required, constructed of minimum 16-gauge sheet if channeled, or 5/16-inch diameter if round.
7. Wrap shall not restrict access to manhole.
8. Manufacturers and Products:
    a. Sealing Systems, Inc., Loretto, MN; Flex-Seal Utility Sealant.
    b. Trelleborg Engineered Systems, Milford, NH; NPC Flexrib Frame-Chimney Seals.
    c. Cretex Specialty Products, Waukesha, WI; Internal Manhole Chimney Seal.
    d. Or equal.

D. Frame to Structure Anchor Bolts:

1. 3/4-inch-diameter HAS stainless steel bolts; minimum 6-5/8-inch embedment.

2. Manufacturer and Product: Hilti; HVA Capsules Adhesive Anchoring System.

2.5 MORTAR

A. Standard premixed in accordance with ASTM C387/C387M, or proportion one part Portland cement to two parts clean, well-graded sand that will pass a 1/8-inch screen.

B. Admixtures: May be included; do not exceed the following percentages of weight of cement:

1. Hydrated Lime: 10 percent.
2. Diatomaceous Earth or Other Inert Material: 5 percent.

C. Mix Consistency:

1. Tongue-and-Groove Type Joint: Such that mortar will readily adhere to pipe.
2. Confined Groove (Keylock) Joint: Such that excess mortar will be forced out of groove and support is not provided for section being placed.

2.6 BACKFILL AROUND AND UNDER MANHOLE

A. Structural fill as specified in Section 31 23 23, Fill and Backfill.

B. One-inch-minus rock or sand free from dirt, clay balls, and organic material.

2.7 FLEXIBLE JOINTS FOR SEALING PIPES IN MANHOLE

A. Manufacturers and Products:

1. NPC, Inc., Milford, New Hampshire; Kor-N-Seal flexible rubber boot with stainless steel accessories.
2. A-LOK Products, Inc., Tullytown, PA; Z-LOK XP or A-LOK flexible connectors.
3. Or equal.

2.8 SOURCE QUALITY CONTROL

A. Prior to delivery of precast manhole sections to Site, yard permeability tests may be required at point of manufacture. Engineer or Owner will select precast sections not to exceed 5 percent of the total project quantity to test from material which is to be supplied to Project. Test specimens shall be mat tested and meet permeability test requirements of ASTM C14.

B. Concrete Testing: Test two concrete test cylinders for each manhole. Compressive strength shall be tested in accordance with ASTM C31/C31M, ASTM C39/C39M, and ASTM C192/C192M.

C. Inspection:

1. Material Quality:
   a. Manufacturing process and finished sections shall be subject to inspection and approval by Owner and Engineer.
      1) Inspections may take place at manufacturer's plant, at Site after delivery, or at both.
      2) Sections not meeting requirements of this Specification or that are determined to have defects which may affect durability of structure are subject to rejection.
      3) Sections rejected after delivery shall be removed and replaced.
      4) Sections damaged after delivery will be rejected and if already installed shall be repaired to satisfaction of Owner and Engineer.
      5) If structure cannot be repaired it shall be removed and replaced entirely at Contractor's expense.
2. At the time of inspection the sections will be carefully examined for compliance with ASTM C478 and with manufacturer's drawings. Sections will be inspected for general appearance, dimensions, scratch strength, blisters, cracks, roughness, and soundness. Surface shall be dense and close textured.
3. Imperfections may be repaired, subject to approval of Engineer, after demonstration by manufacturer that strong and permanent repairs result.

PART 3 EXECUTION

3.1 GENERAL

A. Prior to installation inspect materials:

1. Sections not meeting requirements of this specification or that are determined to have defects which may affect durability of structure are subject to rejection.
2. Sections damaged after delivery will be rejected and if already installed shall be repaired to satisfaction of Owner and Engineer.
3. Remove and replace structure that cannot be repaired.

B. If needed, dewater excavation during construction and testing operations.

3.2 EXCAVATION AND BACKFILL

A. Excavation: As specified in Section 31 23 16, Excavation.

B. Backfill:

1. As specified in Section 31 23 23, Fill and Backfill.
2. Place structural fill under manhole in 6-inch maximum lifts; minimum of 12 inches unless otherwise specified on Drawings. Compact each lift to 98 percent relative compaction as determined in accordance with ASTM D698.
3. Backfill around structure with earth fill to lines and grades shown; allow for topsoil thickness where shown. Place in 8-inch thick maximum lifts. Compact each lift to 92 percent relative compaction as determined in accordance with ASTM D698.

3.3 INSTALLATION OF PRECAST MANHOLES

A. Concrete Base:

1. Precast:
   a. Place on compacted structural fill.
   b. Properly locate, ensure firm bearing throughout, and plumb first section.
2. Cast-in-Place:
   a. Invert: Minimum 8 inches below lowest connecting pipe.
   b. First section of manhole shall be cast in concrete base.

B. Sections:

1. Inspect precast manhole sections to be joined.
2. Clean ends of sections to be joined.
3. Do not use sections with chips or cracks in tongue.

C. Preformed Plastic Gaskets or Rubber O-Ring:

1. Use only pipe primer furnished by gasket manufacturer.
2. Install gasket material in accordance with manufacturer's instructions.
3. Completed Manhole: Rigid and watertight.

D. Mortar Joints:

1. Thoroughly wet joint with water prior to placing mortar.
2. Place mortar on groove of lower section prior to section installation.
3. Fill joint completely with mortar of proper consistency.
4. Trowel interior and exterior surfaces smooth on standard tongue-and-groove joint.
5. Prevent mortar from drying out and cure by applying approved curing compound or comparable approved method.
6. Do not use mortar mixed for longer than 30 minutes.

7. Chip out and replace cracked or defective mortar.
8. Completed Manhole: Rigid and watertight.

E. External Joint Wraps: Install in accordance with manufacturer's instructions.

F. Extensions:

1. Provide on manholes in streets or other locations where change in existing grade may be likely.
2. Install to height not exceeding 12 inches.
3. Lay grade rings in mortar with sides plumb and tops level.
4. Seal joints with mortar as specified for sections and make watertight.

3.4 MANHOLE INVERT

A. Construct with smooth transitions to ensure unobstructed flow through manhole. Remove sharp edges or rough sections that tend to obstruct flow.

B. Where full section of pipe is laid through manhole, break out top section and cover exposed edge of pipe completely with mortar. Trowel mortar surfaces smooth.

3.5 MANHOLE FRAMES AND COVERS

A. Install concrete grade rings as required to set covers flush with surface of adjoining pavement or ground surface, unless otherwise shown or directed.

B. Set frames in three equally spaced beads of butyl sealant that run full circumference of frame.

C. Anchor frame to manhole with specified bolts.

D. Install exterior manhole frame to structure seals in accordance with manufacturer's instructions. Seal shall cover grade rings.

3.6 WATERTIGHT MANHOLES

A. Unless otherwise noted, manholes covers shall be bolted down with sealing gasket.

3.7 CAST-IN-PLACE MANHOLE

A. Concrete: As specified in Section 03 30 00, Cast-in-Place Concrete.

B. Reinforcing Steel: As specified in Section 03 21 00, Reinforcing Steel.

3.8 MANHOLE PIPING

A. Drop Assembly: See Drawings for detail of installation requirements.

B. Flexible Joints:

1. Provide in pipe not more than 1-1/2 feet from manhole walls.
2. Where last joint of pipe is between 1-1/2 feet and 6 feet from manhole wall, provide flexible joint in manhole wall.

C. Stubouts for Future Connections:

1. Provide same type and class of pipe as specified for use in service connection, lateral, main, or trunk sewer construction. Where there are two different classes of pipe at manhole use higher strength pipe.
2. Grout pipe in precast walls or manhole base to provide watertight seal or use flexible joints as specified herein.
3. Maximum Length: 1-1/2 feet outside manhole wall.
4. Construct invert channels as shown.
5. Test Plugs:
   a. Install rubber-gasketed plugs in end of stubouts with gasket joints similar to sewer pipe being used.
   b. Plugs shall withstand internal or external pressures without leakage.
   c. Adequately brace plugs against hydrostatic or air test pressures.

D. Permanent Plugs: Clean interior contact surfaces of pipes to be cut off or abandoned as shown, and construct plug as follows:

1. Pipe 18 Inches or Less in Diameter: Concrete plug in end, minimum 2 feet long.
2. Pipe 20 Inches and Larger: Concrete plug in end, minimum 4 feet long.
3. Plugs shall be watertight and capable of withstanding internal and external pressures without leakage.

3.9 MANHOLES OVER EXISTING PIPING

A. Maintain flow through existing pipelines at all times.

B. Concrete Pipe: Apply bonding agent on surfaces in contact with concrete.

C. Construct base under existing piping.

D. Construct manhole as detailed in Drawings.

E. Apply minimum of two complete wraps of hydrophilic waterstop centered on pipe in wall.

F. Place a minimum of 24 inches of concrete around each pipe penetration outside manhole against undisturbed soil or compacted aggregate unless otherwise detailed.

G. Grout channel through manhole.

H. Saw cut out or demolish existing pipe within new manhole using method approved by Engineer.

I. Protect new concrete or grout for 7 days after placing concrete.

3.10 CONNECTIONS TO EXISTING MANHOLES

A. Core manhole bases and grouting as necessary.

B. Seal pipe in manhole using flexible connector.

C. Regrout to provide smooth flow into and through manholes.

D. Provide diversion facilities and perform work necessary to maintain flow during connection.

3.11 FIELD QUALITY CONTROL

A. Conduct negative air pressure (vacuum) test on all manholes in accordance with ASTM C1244.

B. Hydrostatic Testing:

1. When, in Engineer's opinion, groundwater table is too low to permit visual detection of infiltration leaks, hydrostatically test all manholes.
2. Procedure: Plug inlets and outlets and fill manhole with water to height determined by Engineer.
3. Manhole may be filled 24 hours prior to time of testing, if desired, to permit normal absorption into pipe walls to take place.
4. Leakage in each manhole shall not exceed 0.1 gallon per hour per foot of head above invert.
5. Repair manholes that do not meet leakage test, or do not meet specified requirements from visual inspection.
6. If more than 25 percent of manholes tested fail the hydrostatic test, test all or as many manholes as Engineer deems necessary.

END OF SECTION

SECTION 33 05 17
COPPER PIPE AND TUBING

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:

1. CONTRACTOR shall provide all labor, materials, equipment, and incidentals as shown, specified and required to furnish copper pipe and fittings.
2. The extent of the piping is shown on the Contract Drawings.

1.2 QUALITY ASSURANCE

A. Requirements of Regulatory Agencies: Comply with the applicable provisions of the following regulatory agencies:

1. Underwriters' Laboratories, Incorporated.
2. National Fire Protection Association.
3. ASME, Boiler and Pressure Vessel Code.
4. State and Local Building Codes and Ordinances.
5. Uniform Plumbing Code.

B. Reference Standards: Comply with applicable provisions and recommendations of the following, except as otherwise shown or specified.

1. ASTM B 32, Specification for Solder Metal.
2. ASTM B 42, Specification for Standard Size Seamless Copper Pipe.
3. ASTM B 68, Specification for Bright Annealed Seamless Copper Tube.
4. ASTM B 75, Specification for Seamless Copper Tube.
5. ASTM B 88, Specification for Seamless Copper Water Tube.
6. ASTM B 280, Specification for Seamless Copper Tube for Air-conditioning and Refrigeration Field Service.
7. ASTM B 302, Specification for Threadless Copper Pipe.
8. ASTM B 306, Specification for Copper Drainage Tube (BWV).
9. Product Handbook of Copper Development Association, Inc.

1.3 SUBMITTALS

A. Shop Drawings: Submit for approval the following:

1. Detailed drawings and data on pipe fittings and appurtenances.

B. Certificates: Submit certificates of compliance with referenced standards.

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Cap ends of pipe to keep interiors free from contaminates.

B. Store fittings in containers so they are not in contact with the ground.

PART 2 PRODUCTS

2.1 SERVICE CONDITIONS

A. Copper pipeline systems shall be specially designed and installed for the service intended and shall be as shown and specified.

B. Copper pipe with soldered joints shall be used for all piping less than 3 inches in diameter for process, potable and non-potable water lines, vacuum signal and pneumatic signal lines, air supply lines, process sampling lines, equipment drains and instrument drains unless specified or shown otherwise.

2.2 MATERIALS

A. Copper Piping and Fittings:

1. Copper piping to be installed in exposed locations shall be Type K (wall thickness) hard temper pipe with wrought solder joint pressure fittings. Type K copper pipe shall conform to ASTM B 88. Fittings shall conform to ANSI B16.22.
2. Copper piping to be installed in buried locations shall be Type K (wall thickness) soft temper pipe with wrought copper pressure fittings. Type K copper pipe shall conform to ASTM B 88. Fittings shall be in conformance with ANSI B16.22 or ANSI B16.29, as applicable.
3. All pipe shall be made of copper free from cupreous oxide, as determined by microscopic examination at a magnification of 75 diameters.
4. Copper pipe, when furnished in coils, shall be annealed after coiling.
5. Copper piping and fitting shall be tape wrapped in areas where hydrogen sulfide is present.

2.3 JOINTING

A. The copper piping systems shall be assembled with soldered joints. The fittings shall conform to ASTM B 61 and ANSI Standards listed in paragraph 1.2.B. The solder used for pipe joints shall be 50-50 standard solder, conforming to ASTM B 32.

B. All joints shall conform to manufacturer's recommendations and shall be made by skilled workmen.

C. Joints shall develop full strength. Strength shall be greater than the pipe joined.

2.4 MARKING

A. All items shall be marked or labeled with the following information:

1. Metal or alloy designation.
2. Temper.
3. Size and wall thickness.
4. ASTM specification number.
5. Name and location of supplier.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install to lines and grades shown.

B. See Section 33 05 01.

3.2 TESTING OF PIPING

A. Refer to Section 33 05 01.

B. Pipeline testing not described in Section 33 05 01 shall be performed in accordance with Section 306-1.4 of the SSPWC (Green Book).

END OF SECTION

SECTION 33 05 19
DUCTILE IRON PIPE AND FITTINGS

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards that may be referenced in this section:

1. American Association of State Highway and Transportation Officials (AASHTO): T99, Standard Method of Test for the Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop.
2. American Society of Mechanical Engineers (ASME):
   a. B16.21, Nonmetallic Flat Gaskets for Pipe Flanges.
   b. B16.42, Ductile Iron Pipe Flanges and Flanged Fittings Classes 150 and 300.
3. American Water Works Association (AWWA):
   a. C104/A21.4, Cement-Mortar Lining for Ductile-Iron Pipe and Fittings.
   b. C105/A21.5, Polyethylene Encasement for Ductile-Iron Pipe Systems.
   c. C110/A21.10, Ductile-Iron and Gray-Iron Fittings.
   d. C111/A21.11, Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
   e. C115/A21.15, Flanged Ductile-Iron Pipe with Ductile-Iron or Gray-Iron Fittings.
   f. C116/A21.16, Protective Fusion-Bonded Epoxy Coatings for the Interior and Exterior Surfaces of Ductile-Iron and Gray-Iron Fittings for Water Supply Service.
   g. C150/A21.50, Thickness Design of Ductile-Iron Pipe.
   h. C151/A21.51, Ductile-Iron Pipe. Centrifugally Cast, for Water.
   i. C153/A21.53, Ductile-Iron Compact Fittings for Water Service.
   j. C600, Installation of Ductile-Iron Water Mains and Their Appurtenances.
   k. C606, Grooved and Shouldered Joints.
4. ASTM International (ASTM):

f. D2000, Standard Classification System for Rubber Products in Automotive Applications.
g. D4976, Standard Specification for Polyethylene Plastics Molding and Extrusion Materials.

5. International Organization for Standardization (ISO): 9001, Quality Management Systems – Requirements.

1.2 SUBMITTALS

A. Action Submittals:

1. Shop Drawings: Marking plan and details of standard pipe section showing dimensions, pipe joints, fitting and special fitting pressure rating and thickness, size, coating and lining data.

B. Informational Submittals:

1. Manufacturer's Certificate of Compliance, in accordance with Section 01 61 00, Common Product Requirements, stating that inspections and specified tests have been made and that results thereby comply with requirements of Article Source Quality Control.]
2. Field Hydrostatic Testing Plan: Submit at least 15 days prior to testing and at minimum, include the following:
   a. Testing dates.
   b. Piping systems and section(s) to be tested.
   c. Method of isolation.
   d. Method of conveying water from source to system being tested.
   e. Calculation of maximum allowable leakage for piping section(s) to be tested.
3. Certifications of Calibration: Approved testing laboratory certificate if pressure gauge for hydrostatic test has been previously used. If pressure gauge is new, no certificate is required.
4. Test documentation form and results.

1.3 QUALITY ASSURANCE

A. Pipe manufacturer shall be ISO 9001 registered or provide the services of an independent inspection agency.

B. Prior to start of manufacturing, manufacturer not meeting or having ISO registration requirements shall submit name of at least two independent inspection agencies for approval.

1. Independent inspection agency shall be responsible, on a daily basis, for sample monitoring of chemical and mechanical tests, sample visual inspection of quality assurance tests performed on in-process pipe and

fittings, and sample visual and dimensional inspection on finished products.

PART 2 PRODUCTS

2.1 MATERIALS

A. General:

1. Ductile iron pipe shall be manufactured, lined, coated, and tested domestically in the United States of America.
2. Pipe manufacturer shall certify source manufacturing facility has been producing ductile iron pipe of the specified diameters, pressure, dimensions and standards.
3. Ductile iron pipe and fitting shall be supplied by a single manufacturer.
   a. Mixing of components and sources is not permitted.
   b. Fitting from outside the United States of America shall be produced in a facility with documented experience manufacturing, coating, testing, and delivery of size and type specified to projects in the United States of America.

B. Pipe:

1. General:
   a. Pipe shall be new and recently manufactured. Refurbished pipe shall not be provided.
   b. Lined and coated as specified.
2. Meet requirements of AWWA C150/A21.50, AWWA C151/A21.51, and AWWA C111/A21.11.
3. Centrifugally cast, grade 60-42-10 iron.
4. Pressure rating of pipe from 4 inches to 16 inches in diameter shall be 300 psi.
5. Grooved end pipe shall be minimum Special Class 53.

C. Joints:

1. Push-On Joint: Rated at minimum working pressure equal to pipe material design.
2. Restrained Joint:
   a. Manufactured proprietary joint that mechanically restrains pipe to adjoining pipe.
   b. Manufacturers and Products:
      1) American Cast Iron Pipe; Flex-Ring, Field Flex-Ring, and Lok-Ring.
      2) Pacific States Pipe; Thrust-Lock.
      3) U.S. Pipe; TR Flex and HP Lok
      4) Or equal.

3. Mechanical Wedge Action Type Joint:
    a. Use only in areas where adjoining to fixed points where laying length is determined in field.
    b. Prior to purchase and installation, type and application of this joint shall be approved by Engineer.
4. Use of set screws for restraint or field-lock gaskets shall not be allowed.
5. Grooved Joint:
    a. Rigid type radius cut grooved, conforming to AWWA C606.
    b. Manufacturer: Victaulic Company of America.
6. Ball Joint:
    a. Meet requirements of AWWA C151/A21.51.
    b. Minimum Working Pressure:
        1) 4-inch through 12-inch Diameter: 350 psi.
        2) Larger than 12-inch Diameter: 250 psi.
    c. Manufacturers and Products:
        1) American Cast Iron Pipe; Flex-Lock.
        2) U.S. Pipe; USIFLEX.

D. Fittings:

1. Fittings shall be new and recently manufactured. Refurbished fittings will not be accepted.
2. Mechanical, Push-On, Flanged, or Restrained Joint: In accordance with the following table:

Minimum Pressure Ratings for AWWA C110/A21.10 and C115/A21.15 Ductile Iron Fittings		
Diameter (inches)	Rubber Gasket Joints (Push-on, Mechanical, Restrained) (psi)	Flanged Joints (psi)
3 to 24	300	300
30 to 48	250	250
Minimum Pressure Ratings for AWWA C153/A21.53 Ductile Iron Fittings		
Diameter (inches)	Rubber Gasket Joints (Push-on, Mechanical, Restrained) (psi)	Flanged Joints
3 to 24	300	Not included in C153/A21.53 (refer to the C110/A21.10 Standard)
30 to 48	250	Not included in C153/A21.53 (refer to the C110/A21.10 Standard)
54 to 64	150	150 psi

3. Rubber Gasket Joints Including Mechanical Joints, Push-On Joints, and Flanged Joints: In accordance with AWWA C111/A21.11.
4. Mechanical Joint Fittings: In accordance with AWWA C110/A21.10 and AWWA C153/A21.53.
5. Grooved End Fittings:
   a. Radius cut grooved, rigid type conforming to AWWA C110/A21.10 and AWWA C153/A21.53.
   b. Manufacturers:
      1) Victaulic Company of America.
      2) Gustin-Bacon.

E. Welded Outlet: Only weld to pipe in manufacturer's shop.

F. Lining:

1. Pipe and fittings for clean water applications shall be cement mortar-lined and asphaltic seal coated in accordance with AWWA C104/A21.
2. Pipe and fittings shall be lined with 40-mil ceramic epoxy, as manufactured by Induron or equal.

G. Bolting:

1. Flanged Connection Bolts: Carbon steel, ASTM A307, Grade A hex bolts and ASTM A563, Grade A hex head nuts.
2. Grooved End Connections Bolts: Manufacturer's standard.

H. Gaskets:

1. Flat Faced Flange Gaskets:
   a. Pipe Smaller Than 54 Inches: Rated for working pressure 150 psi to 250 psi, 1/8 inch thick, red rubber (SBR), hardness 80 (Shore A), rated to 200 degrees F, conforming to ASME B16.21, AWWA C207, and ASTM D1330, Grade 1 and Grade 2.
   b. Pipe 54 Inches and Larger: Rated for working pressure greater than 250 psi; shall be Toruseal gaskets as manufactured by American Ductile Iron Pipe or Flange-Tyte gaskets as manufactured by U.S. Pipe.
2. Grooved End Joint Gaskets: Halogenated butyl, conforming to ASTM D2000 and AWWA C606.

2.2 SOURCE QUALITY CONTROL

A. Factory Tests:

1. General:
   a. Tests shall be performed on pipe with metal thickness equal to that specified.
   b. Only pipe that passes leak test shall be shipped.
2. Hydrostatic Proof Test:
   a. All Pipe: Perform at 500 psi for a minimum duration of 10 seconds.
   b. Pipe 30 Inches and Larger: Additionally test to 75 percent of minimum yield strength during test duration which shall not be less than 15 seconds.
   c. Record each test cycle on a strip chart.
   d. Each test cycle for 30-inch and larger pipe shall be marked by pipe number.
   e. Inspect each pipe during testing for leaks.
   f. Pipe which shows evidence of leaks shall be scrapped.
   g. Repair welding of leaks is not permitted.
3. Perform a 15-psi air test on welded-on outlet pipe.
4. Pipe ends (spigot end, bell and socket) shall be gauged with suitable gauges at sufficiently frequent intervals to ensure compliance to standard dimensions of AWWA C151/A21.51.

a. In addition, each socket and spigot shall be inspected in a well-lighted area for injurious defects which could affect the joint performance.
b. Remove defects by cutting of pipe ends.
c. Pipe with injurious defects in the bell shall be scrapped.
d. Manufacturer shall have a recommended ovality tolerance for pipes 18 inches inch and larger.
e. Each end of each 18-inch and larger pipe shall be measured and approved by manufacturer's quality assurance inspector to meet tolerances.

5. Submit a certified inspection report from the independent agency of witnessed tests within 10 days of the inspection.
   a. Test results shall show restrained joints in the sizes specified have been successfully tested to at least twice the specified pressure rating of the joint without leakage or failure.
6. In accordance with AWWA C104, C110, C153, and C606.

PART 3 EXECUTION

3.1 EXAMINATION

A. Inspect pipe and fittings to ensure no cracked, broken, or otherwise defective materials are being used.

3.2 PREPARATION

A. Trench Grade:

1. When specified, grade bottom of trench by hand to specified line and grade with proper allowance for pipe thickness and pipe base. Trench bottom shall form a continuous and uniform bearing and support for pipe between bell holes.
2. Before laying each section of pipe, check grade and correct irregularities found. Grade may be disturbed for removal of lifting tackle.

B. Pipe Bedding: Place and compact pipe bedding material as follows:

1. Install to full width of trench, 4 inches to 6 inches bedding below bottom to springline of pipe:
   a. Pipe 12-Inch Diameter: 4 inches to 6 inches.
   b. Pipe Larger than 12-Inch Diameter: 6 inches to 8 inches.
2. Compact to at least 95 percent of its maximum density as determined by D: AASHTO T99.
3. Ensure that no unfilled or uncompacted areas occur beneath pipe.

C. Bell (Joint) Holes: At each joint, dig bell holes of ample dimensions in bottom of trench, and at sides where necessary, to permit joint to be made properly and to permit easy visual inspection of entire joint.

3.3 INSTALLATION

A. General:

1. Provide and use proper implements, tools, and facilities for safe and proper prosecution of the Work.
2. Lower pipe, fittings, and appurtenances into trench, piece by piece, by means of a crane, slings, or other suitable tools and equipment, in such a manner as to prevent damage to pipe materials, protective coatings and linings.
3. Do not drop or dump pipe materials into trench.

B. Cleaning Pipe and Fittings:

1. Remove lumps, blisters, and excess coal tar coating from bell and spigot ends of each pipe. Wire brush outside of spigot and inside of bell and wipe clean, dry, and free from oil and grease before pipe is laid.
2. Wipe ends of mechanical joint pipe and fittings and of rubber gasket joint pipe and fittings clean of dirt, grease, and foreign matter.

C. Laying Pipe:

1. Direction of Laying: Lay pipe with bell end facing in direction of laying. For lines on an appreciable slope, face bells upgrade at discretion of Engineer.
2. Mechanical Joint, Push-On Joint, and Restrained Joint Pipe: After first length of pipe is installed in trench, secure pipe in place with approved backfill material tamped under and along sides to prevent movement. Keep ends clear of backfill. After each section is jointed, place backfill as specified to prevent movement.
3. Take precautions necessary to prevent floating of pipe prior to completion of backfill operation.
4. When using movable trench shield, take necessary precautions to prevent pipe joints from pulling apart when moving shield ahead.
5. Do not allow foreign material to enter pipe while it is being placed in trench.
6. Close and block open end of last laid section of pipe to prevent entry of foreign material or creep of gasketed joints when laying operations are not in progress, at close of day's work, or whenever workers are absent from job.

D. Joining Push-On Joint Pipe and Mechanical Joint Fittings:

1. Join pipe with push-on joints and mechanical joint fittings in accordance with manufacturer's recommendations.
2. Provide special tools and devices, such as, special jacks, chokers, and similar items required for installation.
3. Lubricate pipe gaskets using lubricant furnished by pipe manufacturer. No substitutes will be permitted.
4. Clean ends of fittings of dirt, mud, and foreign matter by washing with water and scrubbing with a wire brush, after which, slip gland and gasket on plain end of pipe. If necessary, lubricate end of pipe to facilitate sliding gasket in place, then guide fitting onto spigot of pipe previously laid.

E. Ball Joint Pipe:

1. Assemble and install in accordance with manufacturer's recommendations.
2. Hydrostatic Test:
   a. Conduct on ball joint pipe independent of other pipe systems/type being installed.
   b. Conduct test in accordance with requirements of these Specifications and manufacturer's recommendations.

F. Cutting Pipe:

1. General: Cut pipe for inserting valves, fittings, or closure pieces in a neat and workmanlike manner without damaging pipe or lining and so as to leave a smooth end, at right angles to axis of pipe.
2. Pipe: Cut pipe with milling type cutter or saw. Do not flame cut.
3. Dressing Cut Ends: Dress cut end of mechanical joint pipe to remove sharp edges or projections, which may damage rubber gasket. Dress cut ends of push-on joint pipe by beveling, as recommended by manufacturer.

G. Field Welding:

1. Use of field welded outlets will not be allowed. Welding for outlets shall be performed only in pipe manufacturer's shop.
2. Field installed outlets may be installed with saddle approved by Engineer. Opening in pipe shall be machined cut and not with cutting torch.
3. Field welding of bars for restrained joint systems will not be allowed unless approved by Engineer. Welding shall be performed in pipe manufacturer's shop.

H. Line and Grade:

1. Minimum Pipe Cover: 3 feet, unless otherwise indicated.

2. No high points will be allowed between air valves.
3. Maintain pipe grade between invert elevations to provide minimum clearance at air valve locations of 4 feet from existing ground surface to top of pipe.
4. Install air valves as shown and field verify intervening low points. When field conditions warrant, exceptions may be made upon approval of Engineer.
5. Deviations exceeding 6 inches from specified line or 1 inch from specified grade will not be allowed without express approval of Engineer.
6. Pipeline sections that are not installed to elevations shown or installed as approved by Engineer shall be reinstalled to proper elevation.

I. Thrust Restraint:

1. Primary method of restraint shall be through use of restrained joint pipe. Thrust blocking shall be used where detailed on Drawings and as approved by Engineer.

3.4 HYDROSTATIC TESTING

A. Pipeline Hydrostatic Test:

1. General:
   a. Notify Engineer in writing 5 days in advance of testing. Perform testing in presence of Engineer.
   b. Test newly installed pipelines. Using water as test medium, pipes shall successfully pass a leakage test prior to acceptance.
   c. Furnish testing equipment and perform tests in manner satisfactory to Engineer. Testing equipment shall provide observable and accurate measurements of leakage under specified conditions.
   d. Isolate new pipelines that are connected to existing pipelines.
   e. Conduct tests on entire pipeline after trench has been backfilled. Testing may be done prior to placement of asphaltic concrete or roadway structural section.
   f. Contractor may, if field conditions permit and as determined by Engineer, partially backfill trench and leave joints open for inspection and conduct an initial service leak test. Hydrostatic test shall not, however, be conducted until backfilling has been completed.
   g. Dispose of water used in testing.
2. Procedure:
   a. Maximum filling velocity shall not exceed 0.25 foot per second calculated based on the full area of pipe.

b. Expel air from pipe system during filling. Expel air through air release valve or through corporation stop installed at high points and other strategic points.
c. Test pressure shall be 125 percent of system operating pressure based on pressure as measured at pipeline lowpoint.
d. Apply and maintain specified test pressure with hydraulic force pump. Valve off piping system when test pressure is reached.
e. Maintain hydrostatic test pressure continuously for 2 hours minimum, adding additional make-up water only as necessary to restore test pressure.
f. Determine actual leakage by measuring quantity of water necessary to maintain specified test pressure for duration of test.
g. If measured leakage exceeds allowable leakage or if leaks are visible, repair defective pipe section and repeat hydrostatic test.

3. Allowable Leakage: Allowable leakage is zero.

END OF SECTION

SECTION 33 05 24
STEEL PIPE

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section describes materials and fabrication of welded steel pipe, with fittings and pipe specials, in accordance with AWWA C200, as modified herein.

B. Uncollapsed welded steel liners are considered to be welded steel pipe.

C. A special is defined as any piece of pipe other than a normal full length of straight section pipe. This includes elbows, manhole sections, short pieces, reducers, adapter sections with special ends, sections with outlets, etc.

D. Except where otherwise specified or shown, steel pipelines shall be cement mortar lined.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 09 97 52 Cold-Applied Wax Tape Coating

B. Section 26 42 00 Galvanic Anode Cathodic Protection System

1.3 WORK SHALL COMPLY WITH THE FOLLOWING SPECIFICATIONS, CODES, AND STANDARDS;

A. American National Standards Institute

B16.1 Cast Iron Pipe Flanges and Flanged Fittings.

B16.5 Pipe Flanges and Flanges Hinges.

B36.10 Welded and Seamless Wrought Steel Pipe.

B. American Society for Testing and Materials

A36 Specification for Structural Steel.

A53 Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated Welded and Seamless.

A105 Specification for Forgings, Carbon Steel, for Piping Components.

A106 Specification for Seamless Carbon Steel Pipe for High-Temperature Service.

A181 Specification for Forgings, Carbon Steel, for General-Purpose Piping.

A216 Specification for Steel Castings, Carbon, Suitable for Fusion Welding, for High Temperature Service.

A234 Specification for Piping Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and Elevated Temperatures.

A283 Specification for Low and Intermediate Tensile Strength Carbon Steel Plates.

A370 Standard Test Methods and Definitions for Mechanical Testing of Steel Products.

A516 Specification for Pressure Vessel Plates, Heat-Treated Carbon-Manganese- Silicon Steel.

A572 Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel.

A1011 Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.

A1018 Specification for Steel, Sheet and Strip, Heavy-Thickness Coils, Hot-Rolled, Carbon, Commercial, Drawing, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.

1.4 QUALIFICATIONS OF MANUFACTURERS

A. Qualification Requirements:

1. Continuous experience in the manufacture of completed lined and coated welded steel pipe, sized 48 inches in diameter or larger, for domestic water service.

2. Experience in design and fabrication of 48-inch diameter and larger welded steel pipe fittings and pipe specials, in accordance with the specification requirements.

3. Experience of the pipe manufacturer, or specialty lining subcontractor under the direct supervision of the same pipe manufacturer, in the application of cement mortar lining.

B. Experience information to be submitted shall be organized and labeled as attachments to the welded steel pipe manufacturer qualifications as specified below:

1. A list of steel liner or single plate circumference welded steel pipe projects completed or in current fabrication within the past six years, sized 30 inches or larger, minimum 0.375 inch plate thickness. Label this item as Attachment A. List shall include the following minimum information for each project:

    a. Project Name

    b. Project Owner

    c. Year completed

    d. Owner's current contact information: Include contact name, address, telephone number, fax number, and email address.

    e. Project Size: Include pipe diameter, plate thickness, pipe length or tons of steel

    f. Type of service

    g. Type of lining

    h. Lining manufacturer name and contact information if subcontracted

2. Copies of owner approved shop drawing submittals for each of the projects listed. Label this item as Attachment B. Shop drawing submittals shall include the following minimum information:

    a. Fabrication details for steel liner or one plate circumference welded steel pipe and steel pipe fittings and specials

    b. Pipe lining system application details

3. Written statement from the pipe manufacturer showing that the pipe manufacturer or proposed plant-applied specialty lining subcontractor under the direct supervision of the pipe manufacturer, has experience in the application of the specified lining system on steel pipes sized 30 inches in diameter or larger. Label this item as Attachment C.

4. For cement mortar lining, a list of projects completed or in fabrication within the past six years, sized 30 inches in diameter or larger with a cement mortar lining. Label this item as Attachment D. List shall include the following minimum information for each project:

    a. Project Name

    b. Project Owner

    c. Year completed

    d. Owner's current contact information: Include contact name, address, telephone number, fax number, and email address.

1.5 SUBMITTALS

A. Prepare Shop Drawings consistent with the pipeline alignment and grade shown on the Plans, and with the size, location, elevation and slope information of existing utilities, pipelines and encasements obtained by the Contractor. The pipeline Shop Drawings shall include:

1. The location, length, plate thickness, and designation by number of each steel pipe section and fabrication.

2. The invert station and elevation to which the spigot end of each pipe, within the limits of horizontal or vertical curve, will be laid.

3. The elements of curves and bends, both in horizontal and vertical alignment, including elements of the resultant true angular deflections in cases of combined curvature.

4. The limits of each reach of each type of field-welded joint and of concrete encasement.

5. Locations of longitudinal and circumferential joints in the pipe, fabricated fittings, and outlets.

6. Details, locations and calculations for bulkheads, pipe restraint and all methods required to prevent excessive pipe wall stresses for hydrostatic testing of pipeline.

7. Details and locations of closures for length adjustment and for construction convenience.

8. Details of specials and fittings.

9. Details of all valves, meters, pumps and other equipment determining pipe dimensions.

10. Details of butt straps which are to be shipped separately.

B. Certified copies of mill test reports on each heat from which steel is rolled. Tests shall include physical and chemical properties. Submit certified copies of mill test reports for flanges including details of stress relief used.

C. Weld procedure specifications, procedure qualification records including all destructive and non-destructive test results and welding bead profiles as required along with individual welder qualification certificates. The Engineer shall be present during qualification of weld procedure.

D. Certificates of welding rods used for shop and field welding. Submit welding procedure specifications including drawings of bevel surfaces to be automatically welded and procedure qualification records.

E. Test reports on physical properties of rubber used in the gaskets.

F. Points of access and schedule for placement of mortar lining and removal of test bulkheads.

G. Affidavits of compliance with referenced standards (for example AWWA C200, C207) with each required submittal.

H. Within 30 days following the Notice to Proceed and before submittal of any shop drawing for pipe, pipe coating or pipe lining, the pipe manufacturer shall submit a detailed Pipe Fabrication Plan and Quality Control Program Manual for each pipe fabrication plant, as described below. Failure to submit, implement, and adhere to the submitted Pipe Fabrication Plan and the Quality Control Program Manual will be reason to reject delivery of steel pipe. Do not manufacture any pipe until the Pipe Fabrication Plan and Quality Control Program Manual have been reviewed and accepted by the Engineer.

    1. Pipe Fabrication Plan providing a description of the actual steel pipe fabrication process covering all phases of fabrication to finish pipe. The Pipe Fabrication Plan shall include, as a minimum, the following:

        a. Qualifications of plant staff directly involved in this Contract, including qualifications of welders.

        b. Current and anticipated workload of the plant. State how other work will affect the fabrication schedule for this Contract.

c. Plant quality control recordkeeping and means for transmittal to the Engineer's in-plant inspectors.

d. Shop drawing submittal process.

e. Sources of materials, and plant quality control procedures regarding these materials.

f. Schedule of material delivery to the plant.

g. Fabrication schedule.

h. Material, pipe handling and storage at the plant.

i. Steel fabrication process.

j. Welding procedures.

k. Physical testing methods and procedures for the steel pipe and welds.

l. Coating and lining materials and procedures.

m. Curing methods.

n. Repair methods and limits of repairs.

o. Bracing Plan.

p. Shipping and transportation methods from the plant to the job site.

q. Storage and handling of pipe at the job site.

2. Quality Control Program Manual providing hold points, documentation, staffing, and appropriate sign-off regarding adherence to the Contract Documents. Include a system for documenting the pertinent information for each pipe section. Complete documentation as each pipe section is fabricated, and a copy shall accompany the pipe section to the job site. Include certification of Compliance with the Contract requirements as part of the Quality Control Program Manual.

I. Provide 30 day written notice to start of pipe fabrication.

J. Within 30 days following completion of pipe fabrication, submit mill test reports on each heat, dimensional check report, shop hydrostatic test report, and results of production weld test for each pipe section by mark number. Certify each report. Include a summary list cross referencing heat numbers and pipe shop numbers with pipe mark numbers.

PART 2 - PRODUCTS

2.1 DESIGN CRITERIA

A. Obtain the following information from the Plans:

1. Elevation of the pipe invert and of the final ground surface.

2. Alignment of the pipeline.

3. Nominal internal diameter, after lining.

4. Pipe wall thickness and welded steel pipe cylinder internal diameter.

5. Locations of double-welded and butt-welded joints.

6. Design Hydraulic Grade Line.

B. The proportioning and detailing of fabricated fittings, manholes, outlets, and pass holes, and the fabrication thereof, shall be performed in accordance with the requirements of the latest edition of the ASME Boiler and Pressure Vessel Code, Section VIII, Pressure Vessels; provided, that if the details shown on the Plans are better suited for the work, in the opinion of the Engineer, such details shall be controlling. Where not detailed on the Plans, the design of wyes, tees and fitting reinforcement shall be in accordance with the applicable procedures of AWWA Manual M11.

2.2 SHEET STEEL OR PLATE AND MINIMUM YIELD POINT

A. Fabricate steel pipe, appurtenances and fittings from steel sheet, plate, or coil that conforms to ASTM A36, Grade 40. Steel plates or coils shall be fine grained, fully kilned, and manufactured using a continuous casting process. The maximum carbon content shall not exceed 0.25 percent. The maximum sulfur content shall not exceed 0.015 percent. The steel shall also meet a maximum carbon equivalent of 0.45, calculated as follows:

$$CE = C + \frac{(Mn + Si)}{6} + \frac{(Cr + Mo + V)}{5} + \frac{(Ni + Cu)}{15}$$

B. Arrange the fabricated pipe sections such that adjoining pipe sections have a yield strength variation of no greater than five ksi.

C. Order the steel plate and sheet by thickness such that the maximum allowable thickness variation for steel sheet, plate, or coil shall have a zero negative thickness tolerance from

nominal calculated, specified, or shown. Do not substitute thicker plate without the Engineer's approval. Tests performed on two-inch tension specimens shall show elongations not less than 22 percent.

D. Test steel 3/8 inch and greater in thickness for notch toughness using the Charpy V-Notch test. The steel shall withstand a minimum impact of 25 ft lb at a temperature of 30 degrees F. Test each heat of steel by taking one specimen from any two coils per heat number and test in accordance with ASTM A370.

E. The cold working of steel plate to obtain the specified tensile requirements will not be permitted. Any laminations or other defects will be cause for rejection.

2.3 STRUCTURAL STEEL FOR OUTLET REINFORCEMENT

A. Conform to the requirements of ASTM A36.

2.4 MILL-MANUFACTURED STEEL PIPE

A. Size range for mill manufactured pipe is two inch through 36 inch.

B. Fabrication of mill manufactured steel pipe shall conform to the requirements of AWWA C200. Pipe shall be fabricated from steel sheet, plate, or coil that conforms to ASTM A36 Grade 36 modified to have minimum yield strength of 40,000 psi, or equivalent.

C. Alternatively, pipe shall conform to the requirements of ASTM A53, Type E or S, Grade B, or ASTM A106, Grade B. Pipe shall be standard weight in accordance with ANSI B36.10, unless otherwise shown on the Plans, and shall meet dimensional requirements of ASTM A53 for diameters up to 26 inches and ANSI B36.10 for diameters larger than 26 inches.

2.5 FLANGES

A. For design pressures up to and including 275 psi, use AWWA Class E steel flanges, or use ANSI B16.5, Class 150 steel flanges.

B. For design pressures exceeding 275 psi, use ANSI B16.5, Class 300 steel flanges for pipe diameters up to and including 24 inches. Use ASME B16.47, Class 300 steel flanges for pipe diameters 26 through 36 inches.

C. Cast iron flanges shall conform to ANSI B16.1, Class 125 or Class 300.

D. Flanges fabricated from steel plate shall meet the requirements of ASTM A516, Grade 70. Forgings shall meet the requirements of ASTM A105. Castings shall meet the requirements of ASTM A216 WCB.

E. Flange bolts, nuts, gaskets, flange insulation kits and unions, shall be in accordance with standard provisions.

F. For flanges where an insulating kit will be installed, the pipe flange and valve flange bolt holes shall be oversized an additional 1/8 inch per AWWA C207, Section 4.2.3 to accommodate the insulating sleeves according to the following schedule:

1. Pipe diameters less than 36 inches: Oversized flange boltholes are not required. Holes shall be drilled the normal 1/8-inch larger than the nominal bolt diameters.
2. Pipe diameters between 36 inches and 84 inches: The flange boltholes diameters shall be 1/4 inch larger than the nominal bolt diameters.
3. Pipe diameters larger than 84 inches: The flange boltholes diameters shall be 5/16-inch larger than the nominal bolt diameters.

2.6 JOINTS

A. Provide bell and spigot pipe ends for field welded joints, except where butt-strap joints, butt-welded joints, or flanged joints are used.

B. Where piping connects to wall pipes, meters, valves, or other equipment, match the pipe ends to the ends of the wall pipes, meters, valves, or equipment.

C. Joints for buried blow-off outlet piping fabricated as epoxy lined and coated steel pipe shall be field welded, bell and spigot joint. Provide a threaded opening at each welded joint for repairing of the epoxy lining.

2.7 FITTINGS

A. Except where detailed on the Plans, fabricated steel fittings shall be in accordance with AWWA C208. Reinforcement of fittings shall be in accordance with AWWA M11.

2.8 WELDING FITTINGS

A. Provide butt-welded wrought carbon steel fittings conforming to ASTM A234, Grade WPB. Minimum thickness shall equal the thickest matching pipe.

2.9 PIPE JOINT COMPOUND

A. Use American National Taper pipe threads on all threaded joints. Apply joint compound to the male threads only. Pipe Joint compound shall be Teflon thread sealant Bakerseal by Radiator Specialty Company, La-Co SlicTite by Lake Chemical Company, or equal.

2.10 THREADED OPENINGS

A. Provide threaded openings not less than two inches, nor more than four inches in nominal size. Threaded openings shall be a standard weight, flat-bottom, threaded welding outlet. Where the mounting surface is curved to a diameter of 36 inches or less, the mounting diameter shall be the same as that of the surface upon which it is to be mounted.

B. Provide threaded outlet and its plug forged from steel conforming to ASTM A105 or ASTM A181, Class 70. Provide weldolet outlets.

2.11 WELDING OUTLETS

A. Provide welding-type outlets with a mounting diameter the same as that of the surface upon which they are to be mounted. Where the mounting surface is curved to a diameter of 36 inches or more, the outlet bottom may be flat. Provide welding-type outlets forged from steel conforming to the requirements specified for threaded outlets. Provide weldolet outlets.

2.12 STULLING (STRUTTING)

A. Materials:

1. Shop-Lined Pipe: Wood stulls and wedges.
2. Unlined Pipe: Steel or wood.

B. Install stulling for pipe and fittings in accordance with approved submittal and as soon as practical after pipe is fabricated or, for shop-lined pipe, after lining has been applied.

C. Install stulling in a manner that will not harm lining.

2.13 TAPECOAT ROCKSHEILD SYSTEM

A. General:

1. Provide 25 mil. polyethylene backing and 375 mil foam
2. Provide perforations 1 ¼" on center
3. Manufacturer: Chase Tapecoat or equal

2.14 CEMENT-MORTAR COATING

A. General:

1. Notify Engineer at least 10 days prior to application of coating products.
2. Holdback of and coating from field-welded joints shall be as follows:
   a. For lap welded joints and flex couplings, 8 inches.
   b. For butt weld and butt strap joints, 6 inches.

3. Unless otherwise indicated, coat exterior surfaces of pipe and fittings passing through structure walls from center of wall or from wall flange to end of underground portion.

B. Shop-Applied:

1. Cement-mortar coating shall conform to AWWA C205. Thickness shall conform to AWWA C205 and shall be 3/4 inch, minimum.
2. Steel wire or ribbon mesh reinforcement shall be in accordance with AWWA C205.
3. For cement-mortar coatings applied over dielectric coated pipe, ensure reinforcing metals in coating do not electrically contact pipe.
4. Coating system for field joints shall be cement mortar in accordance with AWWA C205. Mortar shall be retained with suitable water-impermeable bands or heavy-duty diapers of sufficient strength to hold fresh mortar and resist rodding.

2.15 CEMENT-MORTAR LINING

A. General:

1. Notify Engineer at least 10 days prior to application of lining products.
2. Holdback of lining from field-welded joints shall be as follows:
   a. For lap-welded joints and flex couplings, 8 inches
   b. For butt-weld and butt-strap joints, 6 inches.

B. Shop-Applied:

1. Applied centrifugally in conformance with AWWA C205. Thickness shall be in accordance with AWWA C205, unless otherwise noted on the drawings.
2. Lining machine type that has been used successfully for similar work and approved by Engineer.
3. Maintain pipe in round condition during lining operation and thereafter by suitable bracing or strutting.
4. Provide polyethylene or other suitable bulkhead on ends of pipe and on special openings to prevent drying out of lining. Bulkheads shall be substantial enough to remain intact during shipping and storage until pipe is installed.
5. Pipe shall be left bare where field joints occur.
6. Ends of lining shall be left square and uniform. Feathered or uneven edges will not be permitted.

C. Field-Applied:

1. Materials conforming to AWWA C602.

2. Do not use pozzolanic material in mortar mix.
3. Admixtures shall contain no calcium chloride.
4. Wire mesh conforming to AWWA C205.

PART 3 - EXECUTION

3.1 DIAMETER AND LENGTH OF PIPE SECTIONS

A. The nominal diameter or inside diameter of the pipe and other fabricated steel sections as shown on the Plans is the clear diameter of the lined pipe after the application of interior mortar lining. For epoxy lined pipe, the diameter shown on the Plans shall be considered the minimum inside diameter of the pipe.

B. The length of standard sections of pipe shall be from 30 to 40 feet, except within tunnels where standard sections may be up to 50 feet in length.

C. The minimum length of closure and correction pieces shall be four feet.

D. Do not locate closure lap joints, field joints, or field closure assemblies within four feet of the end of a concrete encased section of pipe. Do not locate closure lap joints or field closure assemblies within a concrete encased section of pipe. Concrete encased pipe sections are located around manholes, outlets, and at other locations as shown on the Plans.

3.2 PIPE CYLINDER FABRICATION

A. Longitudinal and Girth Seams: Fabricate the pipe cylinder by butt welding, spiral seam, or straight seam. When using straight seams, fabricate pipe with either a single longitudinal seam and multiple courses of, from seven feet six inches to ten feet, or else with a single course having not more than the number of longitudinal seams shown in the table listed below. Where more than one longitudinal seam is used, the plates shall be of equal widths. Equally stagger the longitudinal joints of adjacent courses. When using spiral seams, coil splices shall be a minimum of two feet away from the ends of the pipe cylinder.

Pipe Nominal Diameter (in.)	No. of Seams
36 to 60	2
61 to 90	3
91 to 120	4

B. Preparation of Edges

1. Machine or face the ends and edges of plates for butt welds. Inspect sheared edges of plates or sheets over 1/4 inch in thickness for cracks. Do not use plates or sheets with edges containing cracks. If the ends are faced with a cutting torch, remove irregularities and scale due to burning by grinding or chipping. The dimensions and shape of the edges of the plates to be joined by welding and the gap between the plates shall be such as to allow thorough fusion and complete penetration, and the edges of plates shall be properly formed to accommodate the various welding conditions. Limit the maximum gap between the edges of plates prior to welding to not more than 1/16 inch.

2. Remove projecting burrs. Do not use hammering to shape the edges preparatory to welding. Cut plates true to line so that the edges, when in position for welding, are straight, parallel, and in contact on longitudinal seams.

C. Forming Steel Plate or Sheet

1. Before rolling or forming longitudinal edges, lap break the plate edges by a continuous rolling operation or forming in a press having dies that are machined to the proper radius. Exert pressure during the lap breaking operation to obtain a true and uniform curve at the edges of the plate. Roll or press form plates to the specified diameter. Continually remove scale and other foreign matter accumulating on the plate during the rolling and forming operation by an air blast so that it will not be rolled or pressed into the surface of the plate.

2. Keep the surfaces of breaker dies and rolls clear of bits of metal or other accumulated materials during forming operations. Form each section of pipe to a true circle of the specified diameter throughout its entire length so as to produce a finished pipe truly round and free from dents, kinks, and abrupt changes in curvature.

3. The outside circumference of the finished pipe shall not be less than its design value and shall not exceed its design value by more than 0.4 percent. Complete rolling and forming prior to making butt welds. Do not heat or hammer for the necessary forming of angles.

4. Do not use any forming process in which the plates are bent or otherwise formed during any stage of the process to a curvature of appreciably smaller radius than the radius of curvature corresponding to the specified diameter of the pipe.

D. Forming Bells

1. Shape the bells to accommodate the spigot penetration shown on the Plans or specified herein. Form the bell on an expanding press or by being thrust axially over a die in such a manner as to stretch the steel plate beyond its elastic limit to a round bell of required diameter and shape, avoiding injurious reduction in plate thickness at any point, and

avoiding impairment of the physical properties of any part of the plate. Do not use any process in which the bell is formed by rolling.

2. Bells for mitered pipe shall be normal to the axis of the adjacent course of the adjoining pipe, and the axis of any such bell shall be parallel to the axis of such adjacent course. The interior circumferential length of the bell shall be greater than the exterior circumferential length of the spigot, and the difference between circumferential lengths shall not exceed 1/4 inch.

E. Preparation for Welding

1. Take special care in the layout of joints in which fillet welds are to be used in order to ensure the fusion of the weld material at the bottom of the fillet. Prior to welding, fit the plates closely; and during welding, hold them firmly together. Tack weld or clamp in place the edges of butt joints in proper alignment and so hold throughout the welding process. Do not use dogs, clips, lugs, or equivalent devices welded to the steel plate for the purpose of forcing it into position.

2. Prior to welding, clean the surfaces of plates and members to be welded by an automatic process of all scale and rust for a distance of not less than one inch and of all oil or grease for a distance of not less than three inches from the welding edge and on both sides of the plates in the case of butt joints. Remove grease or oil with lye or other solvent. Do not use kerosene or any heavier petroleum solvent.

3. Blasting and other cleaning shall preferably be done prior to any tack welding of the plates. Should inspection indicate a greater amount of porosity at the tack welds than in the remainder of the welds, sandblast the tack welds prior to automatic welding.

4. When it is necessary to deposit metal over a previously welded surface, remove any scale, slag, or welding flux thereon by a roughing tool, chisel, air chipping hammer, or other means to prevent inclusion of impurities in the weld metal.

5. Where butt-welded joints are used, take particular care in aligning the edges to be joined so that complete penetration and fusion at the bottom of the joint is accomplished. The offset in abutting edges shall not exceed 1/16 inch at circumferential and spiral seams and shall not exceed 1/32 inch at longitudinal seams.

6. For plates over 1/2 inch thickness, if thickness of the two adjacent plates are different by more than 1/8 inch, the thicker plate shall be trimmed to a smooth taper extending for a distance of at least four times the offset between abutting surfaces so that the adjoining edges will be approximately the same thickness. The length of the required taper may include the width of the weld.

F. Welding

1. Perform all welding in accordance with AWS Standards, and as provided herein.

2. Perform welding by an unvarying arc-welding process, which excludes the atmosphere during the process of deposition and while the metal is in a molten state. The size and type of electrode used, the current and voltage required, and the type of wire and flux to be used for automatic processes shall be subject to review by the Engineer. Do not use rusted or damaged electrodes. Sift used flux from automatic welders free of fines and coarse pieces and remove mill scale before reusing.

3. Welds shall be of uniform composition, neat, smooth, full strength, and ductile. Make welds with a technique which will ensure uniform distribution of load throughout the welded section with a minimum tendency to produce eccentric stress or distortion in the weld or in the adjacent metal.

4. Make all welds in such manner and on such time schedule as to avoid residual internal stresses in the welded joints and stresses due to temperature changes in the completed pipelines. Weld longitudinal seams before girth seams.

G. Longitudinal Joints

1. Double butt weld by a fully automatic welding process longitudinal joints using welding heads which permit visual investigation of the deepest point of penetration of the first pass and which permit backfilling of extensive repair cuts by the automatic process. Use starter and runoff plates for longitudinal welds. The first pass on longitudinal welds shall be on the inside of the pipe and accomplish at least 75 percent of the land. Land is defined as the non-beveled portion of the pipe face along the edge of pipe. Do not use runoff plates for weld test coupons.

2. Joint welds shall be continuous for the full length of the seam, and shall be built up uniformly at the center of the weld to form reinforcement on both sides of the plate. The weld on the outside of the pipe shall have a reinforcement of a minimum of 1/16 inch and a maximum of 1/8 inch and a minimum width of at least the thickness of the plate; provided that in any case the weld and penetration shall be of width so that both edges to be joined shall be entirely consumed in the weld, regardless of a possible inaccuracy in the line of travel of the automatic electrode. Where the welding method permits a considerable deviation in the line of travel of the welding head, place a scribed line parallel to and at a fixed distance from the edges of the plates before welding so that the location of the welding bead with regard to the plate joints may be readily checked.

3. Where welding is done from one side only, remove the bead on the inside of the pipe by chipping so that the finished weld on the inside of the pipe will be practically flush with the plates. The inside bead will in no case be required to be larger than the outside bead but shall be of size so that upon its removal, the inside fusion lines and any defects near the under surface of the weld metal will be exposed.

4. If complete penetration and reinforcement on both sides of butt-welded joints are not satisfactorily accomplished, when the welding is done from one side, then chip out the reverse side to the extent necessary to secure a clean surface of the originally deposited weld metal and make an automatic welding pass on the reverse side. The bead on the inside of the pipe shall be not more than 3/32 inch in height and the width of the bead shall be not less than 3/8 inch with smoothly tapered edges. Before making the second weld, chip out the under-side of the first weld with a round-nosed tool until entirely solid and clean metal is reached.

5. Welding shall be subject to the requirement that there shall be no valley, groove, or undercut along the edge of or in the center of the weld, and that the deposited metal shall be fused smoothly and uniformly into the plate surface at the edges of the joint.

6. If the normal welding process is interrupted for any reason, take special care when welding is resumed, to get full penetration and thorough fusion between the weld metal and the plates and the weld metal previously deposited. Where welding is interrupted by faulty machine operation, chip back the weld to where the presence of solid, clean metal indicates correct machine operation before resuming welding operations.

H. Shop Circumferential Joints and Spiral Seam Joints

1. Double butt weld shop circumferential and spiral seam joints. The details of shop circumferential and spiral seam joints shall conform to the requirements for longitudinal joints as given above. Circumferential joints in bends and welded fabricated fittings need not be made by automatic welding methods.

I. Quality of Welds

1. There shall be no greater evidence of oxidation in the metal of the weld than in the metal of the unwelded plate. Welded joints shall be of a type that will produce complete fusion of the plates and shall be free from unsound metal, pinholes, and cracks.

2. The finish of welded joints shall be reasonably smooth and free from grooves, depressions, burrs, and other irregularities. There shall be no valley or undercut in the center or edges of any weld.

3. Any pipe section which shows irregularities in shape after welding may be rerolled to make it cylindrical, but in no case shall it be reformed by hammering, and in no event shall reforming be permitted of pipe sections which after welding are found to have abrupt changes in curvature at longitudinal seams, unless such welds are subsequently removed and rewelded following the reforming operation.

4. Back chipping on both automatic and hand welding, whether for repairs or preparation of the groove for the original weld, are subject to inspection by the Engineer before

being filled with weld metal. Do not make butt welds prior to the completion of the rolling and forming. Grind butt welds for both hand and automatic welding to sound metal before welding the reverse side.

J. Defects

1. Completely remove porosity and cracks, trapped welding flux, or other defects in the welds in a manner which shall permit proper and complete repair by welding. After removing the defect, the area shall be inspected by the Engineer using liquid penetrant or magnetic particle test method. Repair defective welds by hand welding. Where the defect is so extensive as to make a hand repair undesirable, use automatic welds. If the percent of the weld defect repair area exceeds 10 percent for longitudinal or circumferential seams in pipe and fittings or five percent of spiral seams the pipe section shall be rejected and removed from the job rather than repaired.

2. Map all weld defect locations and dimensions to verify acceptable weld defect repair percentages and record on as-built drawings. A weld defect is defined as any interruption in the weld continuity that exceeds the acceptable tolerances of the governing code or as stated in the Contract Documents.

3. Gouging or pits greater than 1/16 inch in depth that occur during fabrication shall be repaired by welding and ground flush. Inspect the repaired area using the liquid penetrant method in the presence of the Engineer.

4. Repair of off-sets exceeding specification tolerances shall be repaired as follows:

   a. Repair of out of tolerance pipe may be made on localized areas for a length of eight inches by adding weld metal to provide a 4:1 transition; and

   b. All other areas out of tolerance may be repaired by removing weld metal, realigning the material and rewelding in accordance with approved weld procedures. The manufacturer shall take all reasonable precautions to minimize reoccurring imperfections, damage and discontinuities.

K. Equipment

1. In welding by an automatic process, both the rate of deposition of weld metal and the rate of travel of the electrode shall be automatically controlled. Use the submerged melt process for automatic welding.

3.3 JOINTS

A. When plate flanges are made from butt-welded segments, do not place the joints between segments adjacent to longitudinal joints in adjoining steel plate sections. Stress-relieve flanges made from butt-welded segments.

B. Furnish forged steel slip-on flanges or welding neck flanges for companion flanges and connections. Blind flanges, reducing flanges, special flanges, and flanges which are greater in diameter than 24-inch nominal pipe size may be made of plate.

C. For drilling of bolt holes of insulating flanges not dimensioned on the Plans, prepare flange bolting as recommended by the insulating sleeve manufacturer.

3.4 SHOP TESTING

A. After completion of fabrication and welding in the shop, and before the application of any lining or coating, test each component according to the following requirements.

1. Test each section of steel pipe in the shop where it is manufactured by the hydrostatic test method. Additionally, perform partial testing of each pipe section in the shop where it is manufactured by the radiographic test method or radiation imagining system in accordance with AWS D1.1 Section 6.15.2 requirements. A minimum of three areas shall be selected by the Engineer and tested utilizing 4.5 inch x 17.5 inch film.

2. Except as otherwise shown or specified, test each completed section of fabricated bend or reducer using the hydrostatic test method. If the bend or reducer is fabricated from steel pipe previously tested, retest the completed bend or reducer by hydrostatic test method or use the radiographic or ultrasonic test methods on all non-hydrostatically tested welds. Sections requiring mitering on the ends may be tested by hydrostatic test method before mitering. Pipe special sections not subject to the above requirements shall be tested by non-destructive testing methods in accordance with the AWWA C200 Section 5.2.2.1. In the event the bell is formed subsequent to hydrostatic test, perform a magnetic particle examination two inches beyond either side of that portion of welded longitudinal joint which is within the longitudinal limits of the area of plate subjected to deformation in forming the bell; provided, that a minimum of 10 percent of the longitudinal welds described above shall be examined by the radiographic method.

3. After completion of the shop hydrostatic test, test each section of pipe with manholes and outlets attached as follows:

    a. Except as specifically shown on the plans, or except as specifically noted below, for d/D greater than 0.35, where d is the nominal diameter of the outlet and D is the nominal diameter of the main pipeline, test each section by the hydrostatic test method plus soap and compressed air method at the collar. Pipe special sections not subject to the above requirements shall be tested by non-destructive testing methods in accordance with AWWA C200 Section 5.2.2.1.

    b. For d/D less than 0.35, test the collar by the soap and compressed air method.

4. Perform tests of production welds in accordance with AWWA C200 for each heat of steel used. Guided-bend tests shall be performed utilizing 1-1/2 inch width specimens. Perform impact tests on weldments in accordance with AWS D1.1 on each heat of steel used. Do not use runoff plates for weld test coupons. A guided-bend test specimen shall be considered as having passed only if no crack or other open defect exceeding 1/8 inch measured in any direction is present in the weld metal or heat affected zone of the base material after the bending. A tension test specimen shall be considered as having passed only if failure occurs in the base metal at a stress in excess of the minimum specified tensile strength. Report both yield and ultimate strength of each test specimen. Impact test values shall equal those required for the base materials. There shall be at least one impact test and one set of welding tests as described in AWWA C200, for each 1,000 lineal feet of spiral seam weld in addition to tests specified in Section 3.3.6 of the same standard.

5. Test each slip-on type flange by the soap and compressed air method.

6. Test backgouge and completed weld of all manual process groove welds by the liquid penetrant method. Test completed fillet welds by the liquid penetrant method.

B. Test Methods

1. Shop Hydrostatic Test: Vent air from the pipe before the test pressure is applied. Hold the test pressure on each section for a length of time to permit inspection of all joints. Use the following hydrostatic test pressures for testing pipes without outlets:

$$P = \frac{1.6 \times f_y \times T}{D}$$

Where: P = test pressure in psi.
f_y = yield stress of the steel used, in psi.
T = minimum thickness of the steel pipe section tested in inches.
D = internal diameter of the steel pipe or cylinder, in inches.

2. The hydrostatic test pressure for fabricated bends and pipes with outlets shall be in accordance with AWWA M-11.

3. When subjected to the above hydrostatic test pressure, the pipe shall show no leaks, distortion, or other defects. Repair any leaks or other defects which develop during the hydrostatic test by chipping out and rewelding, after which the repaired section shall again be tested until it shows no leaks or other defects.

4. Test Bulkheads: Furnish and attach suitable dished heads and blind flanges for making the hydrostatic tests, and after completion of the tests, remove the heads and properly restore the ends of the sections.

5. Radiographic Test: Make the radiographs in accordance with the requirements of the AWS D1.1. Repair defects in the welds disclosed by the radiographs. Submit all radiographs and the notation of areas for repair to the Engineer for review. Welds in which indications are characterized as cracks, incomplete fusion, or incomplete penetration are unacceptable regardless of length.

6. Ultrasonic Test: Make the ultrasonic tests in accordance with the requirements of the AWS D1.1. Repair defects in the welds disclosed by ultrasonic testing. Prepare a report of the ultrasonic testing and submit to the Engineer for review. Welds in which indications are characterized as cracks, incomplete fusion, or incomplete penetration are unacceptable regardless of length.

7. Soap and Compressed Air Test: Use compressed air at maximum 40 psi pressure into the joint, and while the joint is under pressure, swab every portion of every welded seam forming a part of the joint with a heavy soap solution or a commercial bubble-producing leak test fluid. Examine for leakage. Repair any defects disclosed by the test by chipping out, rewelding the chipped section, and retesting. Drill and tap the necessary test holes, and plug weld the holes after testing.

8. Liquid Penetrant Test: Conform to the requirements in ASTM E165. Provide materials either water washable or nonflammable. Products: "Spotcheck" by the Magnaflux Corporation or "Met-L-Check Flaw-Findr" by the Met-L-Check Company. Chip out all defects, reweld, and retest the section affected until it shows no leaks or other defects.

9. Magnetic Particle Test: Conform to the requirements in ASTM E709, using the dry powder technique. Chip out defects, reweld, and retest the section affected until it shows no leaks or other defects.

3.5 CURVES, ANGLES, CLOSURES, AND SHORT SECTIONS

A. Furnish closing courses and short sections of pipe to ensure the correct location of outlets, angles, and other pipeline features and to accommodate the pipeline installation, lining, and field testing programs. Closing courses and short sections of steel pipe shall be not less than four feet in length. Accurately form the inside diameter of butt-straps to match the largest outside diameter of the adjacent steel cylinders to which they are to join.

B. The angular deflection at any field joint in square-ended pipe shall not exceed a pull of 3/4-inch, and the penetration of the spigot into the bell at all points of the circumference shall be at least equal to the required penetration shown on the Plans. Do not use angular deflections at butt-strap joints.

C. Use pipe sections having beveled bell ends for curves and angles in the alignment which cannot be accomplished using the maximum allowable deflection at square-ended pipe joints. Beveled pipe sections used in curved alignment shall be of standard length except when shorter sections are required to limit the radius of curvature in which case all sections

shall be of equal length. Do not bevel spigot ends. The beveled end of a pipe shall not have a deflection from a plane perpendicular to the pipe axis exceeding 3.0 degrees.

D. Fabricated Bends

1. Do not use fabricated bends to accomplish angles in the alignment unless shown on the Plans or permitted by the Engineer. Deflection between the centerline of adjacent courses shall not exceed 15 degrees. Double-butt weld girth seams in the shop.

2. The radius of curvature (R) for the axis of fabricated bends shall be 2.5 times the inside pipe diameter (D). The design shown on the Plans is based on such radius. However, a radius of curvature smaller than 2.5 times the inside pipe diameter can be used provided the following hoop stress intensification factor (SI) is used to determine wall thickness. Allowable hoop stress shall be 0.6 times the yield stress of the steel.

$$SI = \frac{R-0.167D}{R-0.5D}$$

3.6 MANHOLES, OUTLETS, AND PASS HOLES

A. Install manholes and outlets vertically unless otherwise shown on the Plans. Install at the stations shown for street-type installations and install closures where required to conform to the designated locations. The manhole stations for right of way installations may be shifted a maximum of six feet with written approval of the Engineer, provided that the outlet is no closer than eight feet to the end of the pipe section.

B. The Contractor may provide, at his own expense, additional flanged outlets in the steel pipe for use in passing hose, lead wires, equipment, or materials into the pipe.

C. The Contractor may also provide, at his own expense, forged steel threaded outlets for use in passing hose or lead wires into the pipe. Tap the outlets for standard pipe thread, weld to the pipe, and close after use with solid forged steel plugs. The plugs shall not project beyond the inner surface of the pipe shell. Retap the pipe thread in the outlet to correct any distortion caused by welding. Apply a seal weld made by at least two passes around the inside or outside of the plug after it has been inserted in final position in the field.

D. Coat outlets, plugs, and closures inside and outside to match the adjacent coated surfaces in the same manner as specified for outlets and as required at field joints in the pipe.

3.7 PIPELINE LININGS AND COATINGS

A. Apply cement mortar lining to welded steel pipe, pipe fittings and specials except where the limits of epoxy or polyurethane lined pipe is shown on the Plans. Apply pipeline coatings to welded steel pipe, pipe fittings and specials according to the limits for the type of coating system as shown on the Plans, or as specified herein. Apply pipeline

linings and coatings in accordance with the specifications for the type of lining and coating indicated.

B. Coat the interior metal surfaces of the blind and reducing flanges of manholes and outlets with System No. 7 per Section 09900, Painting and Coating.

C. Coat the exposed pipe ends at insulating joints and other couplings with solid epoxy. Do not coat over insulating gasket.

D. Coat exposed pipe in vaults and structures in accordance with Section 09900, Painting and Coating, System Nos. 4, 5, or 6 depending on the location of piping.

E. Apply external tape coatings for buried steel pipe and fittings per AWWA C-209 and AWWA C-214

3.8 BLIND FLANGES

A. At outlets not indicated to be connected to valves or to other pipes, provide blind flanges with bolts, nuts, and gaskets. Provide blind flange thickness at least equal to thickness of mating flange or in accordance with AWWA C207, whichever is greater.

3.9 PRODUCT MARKING

A. Prior to shipment, plainly and permanently mark the inside of each length of straight pipe at the bell end and each pipe special and fitting to identify the design pressure or head, the steel wall thickness, the date of manufacture, the mark number, the field top designating position of the pipe by reference to the layout schedule and the designation "Bell End". For beveled pipe, show the degree of bevel and field top. Show the mark number in four inch tall letters at springline ofpipe.

B. Mark on the inside of the pipe a continuous, circumferential line, 1/16 inch wide, and 12 inches from the end of each bell section. For plant cement mortar lined pipe, place the mark on the lining. The circumferential line will be used to evaluate fit up during installation.

C. Mark a continuous line, two inches wide, along the outside of each pipe section at the point on the circumference to laid uppermost (field top). Along this line, three feet from each end of the pipe section, permanently mark the pipe number in four-inch tall letters.

D. Punch mark the spigot end of pipe sections at the field top.

E. Mark the following chart on the inside of the liner, at the spring line of the spigot side. Chart size shall be 24 inches by 24 inches, and use 1/2 inch tall lettering.

	LONGIT	CIRC	GP
FIT UP OK			

WELDER			
VT			
PT			
UT			
QA			

3.10 PIPE BRACING

A. Adequate pipe bracing shall be provided on all specials, fittings, and straight pipe to avoid damage to the pipe and fittings during handling, storage, and hauling. Pipe cylinders shall not be stacked and shall be stored in a manner to prevent damage. The following requirements shall apply:

1. The pipe bracing shall be placed as soon as practical and shall remain in place while the pipe is loaded, transported, and unloaded at the jobsite. If shop application of the cement mortar lining is selected, bracing shall be installed as soon as practical after the application of the cement mortar lining.

2. Piping shall be transported with vertical and horizontal bracing per manufacturer's plan. Any pipe damaged during handling, hauling, or storage due to improper bracing shall be repaired or replaced.

3. Pipe bracing may be reused, provided all damaged ends are redressed to provide square and uniform bearing and all previously used fasteners are removed.

3.11 REPAIR OF TAPE COATING

A. For field repair of tape coating, power tool clean the bare pipe surface to be coated to a bright, shiny metal surface (to remove rust, mill scale, weld splatter or sharp edges). Cut and apply a patch with at least 2 inches of overlap over all adjacent unaffected tape coating. Cut a second piece of tape to cover the patch completely and wrap around the pipe at least 1.25 times the pipe circumference.

3.12 COATING AND LINING OF FIELD-WELDED JOINTS

A. Using Cement Mortar: Applied to joints in accordance with AWWA C205.

B. For Field-Applied Tape Coating: Prior to applying tape coating to field welded joints, power tool clean the bare surface pipe to remove rust, mill scale, weld splatter, and sharp edges. The wrapping process shall start at a minimum of 4 inches beyond the cutback edge of the existing coating and start on the downside of the pipe. A minimum of two (2) layers of joint wrap tape coating shall be applied over the field joint. The joint coating system shall be applied under taught hand or machine tension that will result in a smooth, wrinkle free coating. Apply joint coating system in a spiral configuration. Perform holiday testing of all field joints.

C. Cement-Mortar Lining at Joints: For pipe with shop-applied cement-mortar lining, place lining at joints in accordance with AWWA C205.

END OF SECTION

SECTION 33 05 81
WALL PIPES, FLOOR PIPES AND PIPE SLEEVES

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:

1. CONTRACTOR shall provide all labor, materials, equipment, services and incidentals as shown, specified and required to furnish and install all wall and floor pipe fittings, pipe sleeves, other wall pieces, and escutcheons.

B. Coordination:

1. Review installation procedures under other Sections and coordinate the Work that must be installed with or attached to the wall pipe, floor pipe and pipe sleeves Work.
2. Manufacturers and suppliers of the equipment and materials specified herein shall be required to review and satisfy all relevant requirements of other sections of the Contract Documents and the requirements of the Contract Drawings. The CONTRACTOR, manufacturer, supplier, fabricator and/or subcontractors furnishing and/or installing equipment, materials, services and specialties associated with this Section shall fully coordinate their efforts to avoid potential claims that are based on failure to review relevant Contract Documents, including the Contract Drawings.
3. The CONTRACTOR shall furnish and install all equipment, labor, materials, appurtenances, specialty items and services not provided by the CONTRACTOR'S manufacturers, suppliers, fabricators and/or subcontractors but required for complete and operable systems.

C. Related work specified elsewhere that shall apply to all equipment, materials, labor and services furnished under this Section shall include, but not be limited to, the following:

1. Division 1, General Requirements:
   a. Section 01 33 00, Submittal Procedures
2. Division 3, Concrete
3. Division 5, Metals - all anchoring hardware shall be Type 316 stainless steel
4. Division 33, Utilities
   a. Section 33 05 01, Conveyance Piping
   b. Section 33 05 19, Ductile-Iron Pipe

5. Division 40, Process Integration
    a. Section 40 27 00, Process Piping – General

1.2 QUALITY ASSURANCE

A. Reference Standards: Comply with applicable provisions and recommendations of the following except as otherwise shown or specified.

1. ANSI B16.1, Cast-Iron Pipe Flanges and Flanged Fittings
2. ANSI B16.4, Cast-Iron Threaded Fittings
3. AWWA C205, Cement-Mortar Protective Lining and Coating for Steel Pipe – 4in. and Larger – Shop Applied
4. AWWA C110 (ANSI A21.10), Ductile-Iron and Gray-Iron Fittings, 3-in. Through 48-in., for Water and Other Liquids
5. AWWA C111 (ANSI A21.11), Rubber-Gasket Joints for Ductile-Iron and Gray-Iron Pressure Pipe and Fittings
6. AWWA C115 (ANSI A21.15), Flanged Ductile-Iron and Gray-Iron Pipe with Threaded Flanges
7. AWWA C151 (ANSI A21.51), Ductile-Iron Pipe, Centrifugally Cast in Metal Molds or Sand-Lined Molds, for Water or Other Liquids
8. AWWA C200, Steel Water Pipe 6 Inches and Larger

1.3 SUBMITTALS

A. Shop Drawings: Submit for approval the following:

1. Detailed drawings and data on all wall and floor pipes and pipe sleeves

PART 2 PRODUCTS

2.01 MATERIALS

A. Wall and Floor Pipe:

1. Material: Carbon Steel.
2. End Connections: As shown on Contract Drawings.
3. Pressure Ratings:
    a. Sizes 4 - 24 inches: 350 psi.
    b. Sizes 30 - 54 inches: 150 psi.
4. Fittings may be cast or fabricated.
5. Water Stop: Water Stops shall be provided on all wall and floor pipe.
6. Fittings ends shall be flush with wall face unless otherwise shown.
7. Flanges and mechanical joint bells shall be drilled and tapped for studs.
8. Coatings: Wall and floor pipe shall be exterior coated with epoxy coating.

9. Linings: Fittings shall be interior lined same as specified for the piping connected to the fitting. Refer to AWWA C205.
10. Manufacturer: Provide wall and floor pipe as manufactured by one of the following:
    a. Thompson Pipe Group.
    b. Northwest Pipe Company.
    c. Or equal.

B. Pipe Sleeves Through Walls or Floor Slabs (New Concrete Below Grade): Sleeves shall be cast into the wall as shown on the Contract Drawings.

1. Material: Steel with welded-on waterstop.
2. Dimensions: As recommended by manufacturer and link-seal manufacturer. Length as required.
3. Pipe Sizes: Greater than 22-inch diameters.
4. Product and Manufacturer: Provide one of the following:
    a. Steel Wall Sleeve, Model WS, Thunderline Corporation.
    b. Or equal.

C. Link Seals: Provide link type mechanical seals suitable for 20 psi working pressure, accessible from one side.

1. Sizes: As recommended by manufacturer and pipe sleeve manufacturer.
2. Seal Element: EPDM black.
3. Pressure Plates: Composites.
4. Bolts and Nuts:
    a. 316 stainless steel for all applications.
5. Product and Manufacturer: Provide one of the following:
    a. Link-Seal, Model C, Thunderline Corporation, for above grade applications.
    b. Link-Seal, Model S. Thunderline Corporation for below grade applications.
    c. Or equal.

D. Escutcheon Plates:

1. Bare pipes passing through walls and ceilings in finished rooms: Provide escutcheon plates of cast brass or cast iron nickel plated, clevis or split ring and hinged with set screws.
2. Insulated pipes passing through walls and ceilings in finished rooms: Provide plated escutcheon plates of 18 gage steel.

PART 3 EXECUTION

3.01 INSTALLATION

A. Wall and Floor Pipe: Install as shown and in accordance with approved shop drawings.

B. Pipe Sleeves: Install as shown and in accordance with approved shop drawings.

1. All sleeves through floor slabs shall extend a minimum of 2 inches above finished floor.
2. Sleeves through walls shall be flush with wall face.
3. All annular spaces in exterior walls or walls subjected to hydrostatic pressure shall be completely watertight.
4. Size sleeves to provide annular space required to suit link type mechanical seals that are used.
5. Do not install sleeves and pipes through structural members unless specifically shown and approved by ENGINEER.

C. Install escutcheon plates in accordance with the manufacturer's recommendations and the approved shop drawings.

END OF SECTION

SECTION 33 12 16.29
AIR AND VACUUM RELEASE VALVE ASSEMBLIES

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Society of Mechanical Engineers (ASME):
   a. B16.1, Gray Iron Pipe Flanges and Flanged Fittings (Classes 25, 125, and 250).
   b. B36.10M, Welded and Seamless Wrought Steel Pipe.
   c. B36.19M, Stainless Steel Pipe.
   d. Boiler and Pressure Vessel Code.
2. American Water Works Association (AWWA):
   a. C209, Cold-Applied Tape Coatings for the Exterior of Special Sections, Connections, and Fittings for Steel Water Pipelines.
   b. C214, Tape Coating Systems for the Exterior of Steel Water Pipelines.
   c. C220, Stainless Steel Pipe, 4 In. (100 mm) and Larger.
   d. C500, Metal-Seated Gate Valves for Water Supply Service.
   e. C504, Rubber-Seated Butterfly Valves.
   f. C507, Ball Valves, 6 In. Through 48 In. (150 mm Through 1200 mm).
   g. C509, Resilient-Seated Gate Valves for Water Supply Service.
   h. C512, Air-Release, Air/Vacuum, and Combination Air Valves for Waterworks Service.
   i. C550, Protective Interior Coatings for Valves and Hydrants.
   j. C800, Underground Service Line Valves and Fittings.
3. ASTM International (ASTM):
   a. A53/A53M, Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
   b. B43, Standard Specification for Seamless Red Brass Pipe, Standard Sizes.
   c. C478, Standard Specification for Precast Reinforced Concrete Manhole Sections.
   d. D1785, Standard Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120.
4. Environmental Protection Agency (EPA): Safe Drinking Water Act.
5. NSF International (NSF):
   a. NSF/ANSI 61, Drinking Water System Components - Health Effects.

b. NSF/ANSI 372, Drinking Water System Components - Lead Content.

1.2 SUBMITTALS

A. Action Submittals:

1. Product data sheets for make and model.
2. Complete catalog information, descriptive literature, specifications, and identification of materials of construction.
3. Maximum recommended test pressure; maximum and minimum recommended working pressures of air valves, isolation valves, flanges, connecting piping, and fittings.
4. Recommended seating materials for specified operating pressures.

B. Informational Submittals:

1. Manufacturers' Instructions:
   a. Installation and testing of products specified.
   b. Pipeline tapping and service saddle installation.
2. Operation and maintenance data.
3. Affidavit of Compliance in accordance with AWWA C512 stating valve and all materials used conform to applicable requirements of AWWA C512 and these Specifications, and tests specified have been performed and all requirements have been met.

PART 2 PRODUCTS

2.1 GENERAL

A. Components and Materials in Contact with Water for Human Consumption: Comply with the requirements of the Safe Drinking Water Act and other applicable federal, state, and local requirements. Provide certification by manufacturer or an accredited certification organization recognized by the Authority Having Jurisdiction that components and materials comply with the maximum lead content standard in accordance with NSF/ANSI 61 and NSF/ANSI 372.

1. Use or reuse of components and materials without a traceable certification is prohibited.

2.2 AIR VALVES

A. General:

1. Air release, air/vacuum, and combination air valves shall conform to AWWA C512.
2. Exterior of air valves shall be coated in accordance with Section 09 90 00, Painting and Coating.
3. Interior of air valves shall be coated in accordance with AWWA C550.
4. Air valves shall be factory tested in accordance with AWWA C512. Suitable for operating pressures between 300 and 350 psi.

B. Air and Vacuum Valve, Water Service, 1/2 Inch to 16 Inches:

1. Suitable for water service; automatically exhausts air during system filling and allows air to re-enter during draining or when vacuum occurs.
2. 1/2-inch through 3-inch NPT inlets and outlets, 4-inch and larger ASME B16.1 Class 125 flanged inlet with plain outlet and protective hood.
3. Rated 150 psi working pressure, cast-iron or ductile iron body and cover, stainless steel float and trim, built and tested to AWWA C512.
4. Equip 4 inch and larger with antislam device to throttle flow of water into air valve and prevent damage caused by rapid closure.
5. Manufacturers and Products:
   a. Val-Matic Valve; Series 100.

C. Air Release Valve, Water Service, 1/2 Inch to 6 Inches:

1. Suitable for water service, automatically exhaust small amounts of entrained air that accumulates in a system. In CLOSED position, seat against resilient seat to prevent water leakage.
2. Rated 150 psi working pressure, cast-iron or ductile iron body and cover, stainless steel float and trim, NPT threaded inlet and outlet, built and tested to AWWA C512.
3. Equip 4 inch and larger with antislam device to throttle flow of water into air valve and prevent damage caused by rapid closure.
4. Manufacturers and Products:
   a. Val-Matic Valve; Series 15A to 45.6.

D. Combination Air Valve, Water Service, 1 Inch to 16 Inches:

1. Suitable for water service, combines operating features of air and vacuum valve and air release valve. Air and vacuum portion to automatically exhaust air during filling of system and allow air to re-

enter during draining or when vacuum occurs. Air release portion to automatically exhaust entrained air that accumulates in system.

2. Valve single body or dual body, air release valve mounted on air and vacuum valve, isolation valve mounted between the dual valves. 1-inch through 3-inch valves with NPT threaded inlet and outlet, 4-inch and larger valves with ASME B16.1 Class 250 flanged inlet and cover outlet.
3. Rated 150 psi working pressure, cast-iron or ductile iron body and cover, stainless steel float and trim, built and tested to AWWA C512.
4. Equip 4 inch and larger with antislam device to throttle flow of water into air valve and prevent damage caused by rapid closure.
5. Manufacturers and Products:
    a. Val-Matic Valve; Series 201C to 203C or 104/22 to 116/38.

E. Sewage Air and Vacuum Valve 2 Inches to 14 Inches:

1. Suitable for sewage service; automatically exhausts air during system filling and allows air to re-enter during draining or when vacuum occurs.
2. Rated working pressure of 300 psi, 1-inch through 3-inch valves with NPT threaded inlet and outlet, 4-inch and larger valves with ASME B16.1 Class 125 flanged inlet and threaded cover outlet, built and tested to AWWA C512.
3. Materials: Cast-iron or ductile iron body and cover, concave or skirted stainless steel float and trim, Buna-N seat.
4. Sewage air and vacuum valve fitted with blowoff valve, flushing valve with quick disconnect couplings, and a minimum 5 feet of hose with quick disconnect couplings to permit backflushing after installation without dismantling valve.
5. Manufacturers and Products:
    a. Val-Matic Valve; Series 301 to 306.

F. Sewage Air Release Valve 2 Inches to 4 Inches:

1. Suitable for sewage service; automatically exhausts entrained air that accumulates in a system.
2. Rated working pressure of 300 psi, operating pressure, built and tested to AWWA C512.
3. Materials: Cast-iron or ductile iron body and cover with NPT threaded inlet and 1-inch NPT threaded outlet, concave or skirted stainless steel float and trim; Buna-N resilient seat.
4. Sewage air release valve fitted with blowoff valve, flushing valve with quick disconnect couplings, and a minimum 5 feet of hose with quick

disconnect couplings to permit backflushing after installation without dismantling valve.

5. Manufacturers and Products:
   a. APCO Valve and Primer Corp.; Series 400 SARV or 450 SARV.
   b. Val-Matic Valve; Series 48 or 49.

G. Sewage Combination Air Valve 2 Inches to 6 Inches:

1. Suitable for sewage service; combines operating functions of air and vacuum valve and an air release valve. Air and vacuum portion shall automatically exhaust air during filling of a system and allow air to re-enter during draining or when a vacuum occurs. Air release portion to automatically exhaust entrained air that accumulates in system. Single body unit with air and vacuum valve and an air release valve in a single housing.
2. Rated working pressure of 300 psi, built and tested to AWWA C512.
3. Materials: Cast-iron or ductile iron body and covers, NTP threaded inlet and outlet, with concave or skirted stainless steel float and trim.
4. Sewage air release valve fitted with blowoff valve, flushing valve with quick disconnect couplings, and a minimum 5 feet of hose with quick disconnect couplings to permit backflushing after installation without dismantling valve.
5. Provide air-vac orifice and auto orifice.
6. Twin-chamber unit with adjustable surge protection orifice.
7. Manufacturer and Product: Val-Matic Valve.

H. Sewage Combination Air Valve 6 Inches to 14 Inches:

1. Suitable for sewage service; combines operating functions of air and vacuum valve and an air release valve using separate valves connected together. Air and vacuum valve shall automatically exhaust large quantities of air during system filling and allow air to re-enter during draining or when a vacuum occurs. Air release valve to automatically exhaust small quantities of entrained air that accumulates in system.
2. Rated working pressure of 300 psi.
3. Materials: Cast-Iron or Ductile Iron Body:
   a. Air and Vacuum Valve:
      1) Upper and lower concave or skirted stainless steel float and trim.
      2) Inlet Flanges: ASME B16.1 Class 250 pound.
      3) Outlet**:** Flanged.
      4) Seat: Buna-N.
   b. Air Release Valve: 2-inch NPT threaded inlet and 1/2-inch NPT threaded outlet; Buna-N seat.

4. Provide with all-bronze blow-off and flushing gate valves for each valve, all-bronze isolation gate valve between air and vacuum valve and air release valve; 5-foot rubber hose with quick disconnect couplings.
5. Manufacturer and Product: Val-Matic Valve

2.3 CONNECTION TO MAINLINE

A. Flanged Outlet or Fitting: Flange shall be Class 300 to match drilling pattern of adjoining valve and suitable for test pressure and working pressure**.**

B. Service Saddle:

1. Stainless steel double straps.
2. Body: Ductile iron, nylon, or epoxy coated.
3. Bolts and Nuts: Type 304 stainless steel.
4. Comply with applicable portions of AWWA C800.
5. Manufacturers and Products:
   a. Mueller; Series DR2S.
   b. Romac; Style 202S or 202N.

C. For steel pipe, connection to mainline will be flanged.

2.4 ISOLATION VALVES

A. Gate Valve 3 Inches and Larger:

1. Iron body, flanged joint ends, nonrising stem, O-ring sealed stuffing box, rated for minimum pressure of 300 psi.
2. Provide handwheel operator**.**

B. Globe Valve 2 Inches and Smaller:

1. All-bronze, screwed ends, union bonnet, inside screw, rising stem.
2. Rated for minimum pressure of 300 psi.

C. Corporation Stop:

1. AWWA C800 type, with ends suitable for adjoining pipe.
2. Rated for minimum pressure of 300 psi.

D. Butterfly Valve for Water Only:

1. AWWA C504, flanged ends.
2. Rated for minimum pressure of 150 psi.
3. Provide handwheel operator**.**

E. Ball Valve for Water Only:

1. AWWA C507, flanged ends.
2. Rated for minimum pressure of 150 psi.
3. Provide handwheel operator**.**

F. Ball Valve:

1. Threaded ends.
2. Rated for minimum pressure of 150 psi.
3. Provide handwheel operator**.**

2.5 ACCESSORIES

A. Insulation:

1. Cellular polystyrene**,** 2 inch(es) thick.
2. Manufacturer and Product: Dow Chemical Co.; Styrofoam, or equal.

B. Carbon Filter:

1. Granulated activated impregnated carbon, PVC housing.
2. Manufacturer and Product: Orenco Systems Inc.; Model CF, or equal.

C. Abovegrade Enclosures**:** As shown on Drawings.

D. Inflow Prevention Device on Vent Pipe:

1. Used to provide backflow prevention and prevent nonpotable water from entering the air vent piping.
2. Inflow preventer shall be designed, manufactured and tested in accordance with ASSE 1063 and rated lead-free in accordance with NSF/ANSI 61, Annex G.
3. Shall be rated for submergence to 25 psi.
4. Float checks and trim shall be Type 316 stainless steel. Resilient seats shall be EPDM with fiberglass reinforcement. The upper and lower chambers shall be constructed of ASTM A536, Grade 65-45-12 ductile iron.
5. Provide Type 304 stainless steel basket screen on device to minimize entrance of debris.
6. Manufacturer and Product: Val-Matic; FloodSafe, or equal.
7. Provide field test kit to confirm drip-tight closure of backflow prevention device.
8. Provide all necessary brackets and mounting hardware required and recommended by the manufacturer.

PART 3 EXECUTION

3.1 INSTALLATION

A. Valves:

1. In accordance with manufacturer's printed instructions.
2. Orient valve in vault with easy access to operator.
3. Replace valves that drip or do not function properly.

B. Service Saddle:

1. Tap and install in accordance with manufacturer's printed instructions.
2. Use adapters for size of line being tapped.

C. Insulation:

1. Install within vault, above and around designated valve assemblies as required to protect valve from freezing.
2. Provide space for air passage to allow proper functioning of air valves.
3. Support insulation with clips anchored to manhole or vault wall.

D. Carbon Filter: Install in accordance with manufacturer's recommendations.

E. Pipe Support: Install in accordance with Section 40 05 15, Piping Support Systems**.**

3.2 TESTING AND INSPECTION

A. Air Valve:

1. Shall be tested with pipeline.
2. Isolation valves shall be in open position during pipeline test.

B. Isolation Valves: Test that valves open and close smoothly with operating pressure on one side and atmospheric pressure on the other.

C. Air and Vacuum Valves: Inspect valves as pipe is being filled to verify venting and seating is fully functional.

D. Verify leak-free performance during testing.

E. Using the test kit provided by the manufacturer of the inflow prevention device, perform inflow prevention test as recommended by the manufacturer.

END OF SECTION

SECTION 33 13 00
DISINFECTION OF WATER UTILITY DISTRIBUTION FACILITIES

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Water Works Association (AWWA):
   a. B300, Hypochlorites.
   b. B301, Liquid Chlorine.
   c. B302, Ammonium Sulfate.
   d. B303, Sodium Chlorite.
   e. C651, Disinfecting Water Mains.
   f. C652, Disinfection of Water Storage Facilities.
   g. C653, Disinfection of Water Treatment Plants.
2. NSF International (NSF):
   a. NSF/ANSI 61, Drinking Water System Components - Health Effects.
   b. NSF/ANSI 372, Drinking Water System Components - Lead Content.
3. Standard Methods for the Examination of Water and Wastewater, as published by American Public Health Association, American Water Works Association, and the Water Environment Federation.

1.2 SUBMITTALS

A. Informational Submittals:

1. Plan describing and illustrating conformance to appropriate AWWA standards and this Specification.
2. Procedure and plan for cleaning system.
3. Procedures and plans for disinfection and testing.
4. Proposed locations within system where Samples will be taken.
5. Type of disinfecting solution and method of preparation.
6. Certification that employees working with concentrated chlorine solutions or gas have received appropriate safety training.
7. Method of disposal for highly chlorinated disinfecting water.
8. Independent Testing Agency: Certification that testing agency is qualified to perform bacteriological testing in accordance with AWWA standards, agency requirements, and this Specification.
9. Certified Bacteriological Test Results:
   a. Facility tested is free from coliform bacteria contamination.

b. Forward results directly to the Owner's representative

1.3 QUALITY ASSURANCE

A. Independent Testing Agency Certified in the State of California with experience in field of water sampling and testing. Agency shall use calibrated testing instruments and equipment, and documented standard procedures for performing specified testing.

1.4 SEQUENCING

A. Commence initial disinfection after completion of following:

1. Completion and acceptance of internal painting of system(s).
2. Hydrostatic and pneumatic testing, pressure testing, functional and performance testing and acceptance of pipelines, pumping systems, structures, and equipment.
3. Disinfection of:
   a. Pumps and associated system piping.
   b. Treatment plant basins and processes used to supply water to system.

PART 2 PRODUCTS

2.1 GENERAL

A. Components and Materials in Contact with Water for Human Consumption: Comply with the requirements of the Safe Drinking Water Act and other applicable federal, state, and local requirements. Provide certification by manufacturer or an accredited certification organization recognized by the Authority Having Jurisdiction that components and materials comply with the maximum lead content standard in accordance with NSF/ANSI 61 and NSF/ANSI 372.

1. Use or reuse of components and materials without a traceable certification is prohibited.

2.2 WATER FOR DISINFECTION AND TESTING

A. Clean, uncontaminated, and potable.

B. Make arrangements for water supply and convey water in disinfected pipelines or containers.

PART 3 EXECUTION

3.1 GENERAL

A. Conform to AWWA C651 for pipes and pipelines**,** except as modified in these Specifications.

B. Contractor's Equipment:

1. Furnish chemicals and equipment, such as pumps and hoses, to accomplish disinfection.
2. Water used to fill pipeline may be supplied using a temporary connection to existing distribution system. Provide protection against cross-connections as required by AWWA C651.

C. Disinfect the following items installed or modified under this Project, intended to hold, transport, or otherwise contact potable water:

1. Pipelines: Disinfect new pipelines that connect to existing pipelines up to point of connection.
2. Disinfect surfaces of materials that will contact finished water, both during and following construction, using one of the methods described in AWWA C652 and AWWA C653. Disinfect prior to contact with finished water. Take care to avoid recontamination following disinfection.

D. Prior to application of disinfectants, clean pipelines of loose and suspended material.

E. Allow freshwater and disinfectant solution to flow into pipe or vessel at a measured rate so chlorine-water solution is at specified strength. Do not place concentrated liquid commercial disinfectant in pipeline or other facilities to be disinfected before it is filled with water.

3.2 TURBIDITY

A. Cleaning of equipment and facilities shall include removal of materials that result in a turbidity exceeding limits stated in Article Testing.

3.3 PIPING AND PIPELINES

A. Cleaning:

1. Before disinfecting, clean foreign matter from pipe in accordance with AWWA C651.

2. If continuous feed method or slug method of disinfection, as described in AWWA C651, are used flush pipelines with potable water until clear of suspended solids and color. Provide hoses, temporary pipes, ditches, and other conduits as needed to dispose of flushing water without damage to adjacent properties.

B. Disinfecting Procedure: In accordance with AWWA C651, unless herein modified.

3.4 DISPOSAL OF CHLORINATED WATER

A. Do not allow flow into a waterway without neutralizing disinfectant residual.

B. See appendix of AWWA C651 for acceptable neutralization methods.

3.5 TESTING

A. Collection of Samples:

1. Coordinate activities to allow Samples to be taken in accordance with this Specification.
2. Provide valves at sampling points.
3. Provide access to sampling points.

B. Test Equipment:

1. Clean containers and equipment used in sampling and make sure they are free of contamination.
2. Obtain sampling bottles with instructions for handling from [Owner's] [an independent testing] laboratory.

C. Chlorine Concentration Sampling and Analysis:

1. Analysis to be performed by an independent test laboratory. Samples will be analyzed using amperometric titration method for free chlorine as described in latest edition of Standard Methods for Examination of Water and Wastewater.

D. After pipelines have been cleaned, disinfected, and refilled with potable water, an independent laboratory will take water Samples and have them analyzed for conformance to bacterial limitations for public drinking water supplies.

1. Collect Samples in accordance with applicable AWWA Standard.

2. Analyze Samples for coliform concentrations in accordance with latest edition of Standard Methods for the Examination of Water and Wastewater.
3. Obtain and analyze a minimum of two Samples on each of 2 consecutive days from each separable structure every 1,000 feet of pipeline by standard procedures outlined by state and local regulatory agencies.
4. Sampling points shall be representative and accepted by Engineer.

E. Turbidity Sampling and Analysis:

1. After pipeline**s** have been cleaned, disinfected, and refilled with potable water, an independent laboratory will take water Samples and have them analyzed for conformance to turbidity limitations for public drinking water supplies. Turbidity shall not exceed 0.3 NTU.
2. If turbidity is in excess of the limit, dispose of the water in accordance with this Specification and applicable regulations, take action to remove source of turbidity, refill system, and retest.

F. If minimum Samples required above are bacterially positive, disinfecting procedures and bacteriological testing shall be repeated until bacterial limits are met.

END OF SECTION

SECTION 33 44 13.13
CATCH BASINS

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards that may be referenced in this section:

1. American Welding Society (AWS): Code for Welding in Building Construction.
2. ASTM International (ASTM):
   a. A36/A36M, Standard Specification for Carbon Structural Steel.
   b. A48, Standard Specification for Gray Iron Castings.
   c. A615/A615M, Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement.
   d. C94/C94M, Standard Specification for Ready-Mixed Concrete.
   e. C387, Standard Specification for Packaged, Dry, Combined Materials for Mortar and Concrete.
   f. C478, Standard Specification for Precast Reinforced Concrete Manhole Sections.

PART 2 PRODUCTS

2.1 CONCRETE

A. Concrete shall be ready-mixed, conforming to ASTM C94/C94M, Alternate 2. Compressive field strength shall be not less than 2,500 psi at 28 days. Maximum size of aggregate shall be 1-1/2 inch. Slump shall be between 2 and 4 inches. Field strength shall be assumed as equal to 85 percent of strength of laboratory-cured cylinders.

2.2 FORMS

A. Exposed surfaces shall be plywood. Others shall be steel, matched boards, plywood, or other acceptable material. Form vertical surfaces. Provide fillets on re-entrant angles. Trench walls, large rock, or earth will not be acceptable form material.

2.3 REINFORCING STEEL

A. Reinforcing steel shall conform to ASTM A615/A615M, Grade 60, deformed bars.

2.4 PRECAST UNITS

A. Use precast units where indicated on the Drawings. Precast units shall conform to ASTM C478 except dimensions shall be as shown and specified. Submit details of proposed units to Engineer for review. Concrete risers for extensions shall be a maximum of 6 inches high and of same quality as sections. Risers shall be reviewed by Engineer before installation.

2.5 MORTAR

A. Standard premixed mortar conforming to ASTM C387, Type S, or proportion 1 part portland cement to 2 parts clean, well-graded sand which will pass a 1/8-inch screen. Admixtures may be used not exceeding the following percentages of weight of cement: Hydrated lime, 10 percent; diatomaceous earth or other inert materials, 5 percent. Consistency of mortar shall be such that it will readily adhere to concrete.

2.6 FRAMES AND GRATES

A. Frames and grates for catch basins and storm drain inlets shall be fabricated of steel conforming to ASTM A36/A36M in accordance with details shown. Connections shall be welded. Welding shall conform to requirements of current Code for Welding in Building Construction of the American Welding Society. Frames and grates shall be properly cleaned and hot-dip galvanized after fabrication.

2.7 FRAMES AND GRATINGS

A. Cast iron frames and gratings for catch basins and storm drain inlets shall be as indicated. Bearing surfaces shall be clean and shall provide uniform contact. Castings shall be tough, close-grained gray iron, sound, smooth, clean, free from blisters, blowholes, shrinkage, cold shuts, and defects, and shall conform to ASTM A48, Class 30.

2.8 CONFORMANCE TO CODES AND STANDARDS

A. Conform to all applicable requirements of the San Diego Regional Standard Drawings, where those standards are referenced on the Drawings.

PART 3 EXECUTION

3.1 EXCAVATION AND BACKFILL

A. Excavate as required to accomplish construction. Backfill shall be as specified for adjoining pipe trench.

3.2 CONSTRUCTION OF CATCH BASINS AND INLETS

A. Construct inlets and catch basins at locations shown and in accordance with Drawings. Construct forms to dimensions and elevations required. Forms shall be tight and well braced. Chamfer corners of forms.

B. Prior to placing concrete, remove water and debris from forms. Moisten forms just prior to placing concrete. Handle concrete from transporting vehicle to forms in a continuous manner as rapidly as practical without segregation or loss of ingredients. Immediately after placing, compact concrete with mechanical vibrator. Limit duration of vibration to time necessary to produce satisfactory consolidation without causing segregation.

C. Screed top surface of exposed slabs and walls. When initial water has been absorbed, float surfaces with wood float and lightly trowel with steel trowel to smooth finish free from marks or irregularities. Finish exposed edges with steel edging tool. Remove forms and patch defects in concrete with mortar mixed in same proportions as original concrete mix.

D. Cure concrete by preventing loss of moisture for a period of 7 days. Accomplish with a membrane-forming curing compound. Apply curing compound immediately after removal of forms or finishing of slabs. Protect concrete from damage during 7-day curing period.

3.3 PLACING PRECAST UNITS

A. If material in bottom of trench is unsuitable for supporting unit, excavate and backfill to required grade with 3-inch minus, clean, pit-run material. Set units to grade at locations shown.

3.4 EXTENSIONS

A. Install extensions as shown and specified, or if not shown and specified, to a height determined by Engineer. Lay risers in mortar with sides plumb and tops to grade. Joints shall be sealed with mortar, with interior and exterior troweled smooth. Prevent mortar from drying out and cure by applying a curing compound. Extensions shall be watertight.

3.5 INSTALLATION OF FRAMES AND GRATES

A. Set frames and grates at elevations indicated or as determined in field and in conformance with Drawings.

B. Frames may be cast in, or shall be set in mortar.

3.6 CLEANING

A. Upon completion, clean each structure of all silt, debris, and foreign matter.

END OF SECTION

SECTION 35 20 16.25
FABRICATED SLIDE AND CONTROL GATES

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Water Works Association (AWWA): C513, Open-Channel, Fabricated-Metal Slide Gates.
2. ASTM International (ASTM):
   a. A193/A193M, Alloy-Steel and Stainless Steel Bolting Materials for High Temperature or High Pressure Service and Other Special Purpose Applications.
   b. A240/A240M, Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and General Applications.
   c. A276, Standard Specification for Stainless Steel Bars and Shapes.
   d. B209, Standard Specification for Aluminum and Aluminum Alloy Sheet and Plate.
   e. B308/B308M, Standard Specification for Aluminum-Alloy 6061-T6 Standard Structural Profiles.
3. National Electrical Manufacturers Association (NEMA): 250, Enclosures for Electrical Equipment (1,000 Volts Maximum).
4. NSF International (NSF):
   a. NSF/ANSI 61, Drinking Water System Components - Health Effects.
   b. NSF/ANSI 372, Drinking Water System Components - Lead Content.

1.2 DEFINITIONS

A. Submersible: The ability to exclude water when submerged under a 20-foot head of fresh water for 24 hours and still maintain electrical integrity.

B. Slenderness Ratio: The ratio of the maximum unsupported stem and cylinder rod length to the stem cross-section radius of gyration.

C. Self-Contained: The arrangement of gate operator, supported by gate frame, such that operating thrust loads are not applied external to the assembly.

1.3 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Make, model, weight, and horsepower of each equipment assembly.
   b. Manufacturer's catalog information, descriptive literature, specifications, and identification of materials of construction.

c. Detailed structural, mechanical, and electrical drawings showing the equipment fabrications and interface with other items. Include dimensions, size, and locations of connections to other work, and weights of associated equipment associated therewith.
d. Gate operator and stem calculations for each gate and service condition.
e. Gate opening and closing thrust forces that will be transmitted to the support structure with operator at extreme positions and load.
f. External utility requirements such as air, water, power, drain, etc., for each component.
g. Functional description of internal and external instrumentation and controls to be supplied including list of parameters monitored, controlled, or alarmed.
h. Power and control wiring diagrams, including terminals and numbers.
i. Performance Test Procedures.
j. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:

1. Seismic anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.
2. Manufacturer's Certificate of Compliance.
3. Special shipping, storage and protection, and handling instructions.
4. Manufacturer's written/printed installation instructions.
5. Routine maintenance requirements prior to plant startup.
6. Operation and Maintenance Data: As specified in Section 01 78 23, Operation and Maintenance Data.
7. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers' Field Services.

1.4 SYSTEM DESCRIPTION

A. Coordinate such that electric motor operators are fully assembled and tested, including motor, at the factory.

1.5 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage the following spare parts and special tools:

Item	Quantity
Stem collars for all gate stems	One of each different size
lift nuts	One of each different size
Indicator lights	One dozen
Special tools required to maintain or dismantle	One complete set

B. Delivery: In accordance with Section 01 61 00, Common Product Requirements.

PART 2 PRODUCTS

2.1 GENERAL

A. Components and Materials in Contact with Water for Human Consumption: Comply with the requirements of the Safe Drinking Water Act and other applicable federal, state, and local requirements. Provide certification by manufacturer or an accredited certification organization recognized by the Authority Having Jurisdiction that components and materials comply with the maximum lead content standard in accordance with NSF/ANSI 61 and NSF/ANSI 372.

1. Use or reuse of components and materials without a traceable certification is prohibited.

2.2 SUPPLEMENTS

A. See supplements to this section for additional product information.

2.3 MATERIALS

A. Stainless Steel:

1. Plate, Sheet, and Strip: ASTM A240/A240M, Type 316L.
2. Bars and Shapes: ASTM A276, Type 316L.

2.4 PERFORMANCE REQUIREMENTS

A. Leakage shall not exceed 0.1 gallon per minute per foot of gate periphery under either seating or unseating head conditions.

2.5 SLIDE GATES

A. Rising or non-rising stem type as indicated on Gate Schedule, with assembly styles designated as follows:

1. Style A: Upward acting type for wall surface mounting on the concrete structures.
2. Style B: Upward acting type for mounting in channels with concrete embedded frame and invert.
3. Style C: Downward acting weir gate type with P-type invert seal for wall surface mounting on the concrete structures.
4. Style D: Downward acting weir gate type with invert “P” seal for embedded side frame mounting in concrete structures.

Gate Schedule

Description	Location	Qty.	Nom Pipe Dia.	Width	Height	Material	Max Seating Head Above Invert	Max Unseating Head Above Invert	Notes
Slide Gate – Rising Stem	Diversion Structures 1, 2, 3	3	48”	4 ft	4 ft	316 Stainless Steel	10’	20’	Modulating electric actuator (Type 4)
Slide Gate – Rising Stem	60-inch Influent Pipe to Screening Facility	1	60”	5’	5’	316 Stainless Steel	10’	20’	Electric actuator Type 4 open-close)
Stop Plates	Screening Facility Screens Channels	4	-	8 ft	10 ft	Fiberglass Reinforced Plastic	10’	10’	Manual/ Slotted fir Removal
Stop Plates	Screening Facility Bypass Channel	2	-	3.5 ft	10 ft	Fiberglass Reinforced Plastic	10’	10’	Manual / Slotted for Removal
Slide Gate – Rising Stem	Screening Facility Screens Channels	4	-	8 ft	6 ft	316 Stainless Steel	10’	10’	Electric actuator (Type 4 open-close)
Slide Gate – Rising Stem	Screening Facility Bypass Channel	2	-	3.5 ft	6 ft	316 Stainless Steel	10’	10’	Electric actuator (Type 4open-close)
Weir Gate – Non-Rising Stem	Diversion Structure 3	1	78”	6.5 ft	Solid Slide height 54 in; total slide height 91 in	316 Stainless Steel	15’	25’	Modulating electric actuator – cut out 72 in width x 24 in height
Weir Gate – Non-Rising Stem	Diversion Structure 2	1	72”	6 ft	Solid Slide height 36 in; total slide height 81 in	316 Stainless steel	15’	25’	Modulating electric actuator – cut out 66 in width x 36 in height
Weir Gate – Non-rising Stem	Diversion Structure 1	1	60”	5 ft	Solid Slide height 30 in; total slide height 72 in	316 stainless steel	15’	25’	Modulating electric actuator – cut out 54 in width x 30 in height

B. Guide Frames:

1. Stainless steel.
2. Vertical Guides: Design for maximum rigidity, and extend in one continuous piece from the gate invert to form posts for support of gate operators of self-contained gates. When guides extended above the operating floor, they shall be sufficiently strong so that no further reinforcements are required.
    a. Weight: Not less than 9 pounds per linear foot for stainless steel.
    b. Incorporate a replaceable UHMW polyethylene bearing strip in a retainer slot on the downstream side (unseating head side) of the gate.
3. Frame Invert: For flush bottom gate, furnish a neoprene insert to function as a seating surface for the gate disc.
    a. Weight: Not less than 9 pounds per linear foot for stainless steel.
4. Join vertical guide frames and invert with factory welded corners.
5. Size guided slot to provide a minimum disc engagement of 1 inch on each side.
6. Provide face-mounted or channel-mounted frames as shown on the Drawings.

C. Disc:

1. Disc Plate (Sliding Member): One-piece stainless steel plate. Reinforce as required so that the disc will not deflect more than 1/360 of the gate span, when the upstream liquid depth (seating head side) is as shown on the schedule and the downstream liquid depth is less than 1/2 inch.
2. Reinforce gate disc with one-piece stainless steel angles or channels welded to the disc plate. Bolted reinforcements will not be permitted.
3. For downward-opening weir gates, provide cut-out and slide height dimensions shown on Gate Schedule.

D. Operator Support Yoke:

1. For self-contained gate operators, attached to the vertical extensions of the guide frames.
2. Constructed from at least two stainless steel angles, or two other suitable shapes, and bolt in place to provide a rigid assembly.
3. Maximum Deflection: Not to exceed 1/4 inch under full operator applied loading.

E. Stems:

1. 1-1/2-inch minimum diameter, ASTM A276, Type 316 stainless steel.
2. Threads: Acme type with RMS surface roughness of 63 microinches or less on the flanks for manually operated gates and 32 microinches or less on the flanks for electrically operated gates. Extend threaded portion of stem 2 inches above operator when gate is in CLOSED position. Provide 4 threads per inch.
3. Ratio of the unsupported stem length to the radius of gyration, both in inches, shall not exceed 200.
4. Stems to withstand in compression, without damage, the thrust equal to at least 2-1/2 times the rated output of the hoisting mechanism, with a 40-pound effort applied to the handwheel or crank.
5. Design electric motor-driven floor stands to withstand at least 1.25 times the output thrust of the motor in the stalled condition.
6. Equip operating stems with cast iron, bushed stem guides, mounted on cast iron brackets; adjustable in two directions and spaced so that the L/r ratio does not exceed 200.
7. Adjustable stop collar for the CLOSED position.
8. Connect the stems to the disc plate with a yoke, bolted to the stem and welded to the disc.
9. Slide gates having a width greater than twice the height or width greater than 84 inches shall have dual stems. For downward opening weir type gates, locate stems near outside edges of gate.

F. Stem Covers:

1. Transparent plastic, vented pipe stem cover and cap.
2. Provide with OPEN/CLOSED designators with 1-inch graduations on clear mylar pressure sensitive, adhesive tape, suitable for outdoor application.

G. Manufacturers:

1. Stainless Steel:
   a. Whipps, Inc.
   b. Hydro Gate Corp.
   c. Rodney Hunt Co.
   d. H. Fontaine, Ltd.
   e. Waterman
   f. Or equal

2.6 GATE OPERATORS

A. General:

1. Components: Withstand a minimum of 250 percent of design torque or thrust at extreme operator positions without damage.
2. Mount at walkway level, 36 inches above floor, unless otherwise indicated. Electric motor actuators for diversion structures shall be mounted below grating as shown on the Drawings.

3. Gear train and gate stem sections shall produce a self-locking drive train.
4. Lift Nuts: Internally threaded with cut or cold-rolled Acme threads corresponding to stem threading.
5. Roller Bearings: Ball-thrust or tapered above and below lift nut to support both opening and closing thrusts.
    a. Grease lubrication fittings for bearings.
    b. Input pinions with needle or ball bearings.
6. Lubrication: Furnish rising stem gates with an insert lubricator flange in lift, with grease fitting for greasing stem threads below stem nut.
7. Manual Operator Limit Switches:
    a. Mounted on an angle adjacent to stem and actuated through limit switch wands by stop collar.
    b. Single-pole, double-throw type, with contacts rated 5 amps at 120V ac.
    c. Provide two switches, one for gate full OPEN, and one for gate full CLOSED, where indicated.

B. Dual-Stem Gate Operators:

1. Enclosed, geared floor stands.
2. Interconnect so operators will work as a unit from single point with interconnecting electric operator.
3. Interconnecting Shafts:
    a. Stainless steel with flexible couplings at ends.
    b. Diameter sufficient to prevent sagging.
    c. Include flanged coupling to allow precision weir leveling.

C. Type 1, Handwheel-Operated Bench Stands:

1. Direct drive.
2. Sealed, ball thrust, roller or needle bearing type and equipped with bronze lift nut, internally threaded with Acme threads.
3. Furnish mechanical seals at housing penetrations.
4. Handwheel and Baseplate: Cast Aluminum.
5. Manual Effort: Not to exceed 40 pounds.

D. Type 2, Crank-Operated Bench Stands:

1. Weatherproof housings, mounted on cast aluminum to the top horizontal member of the slide gate frame as described under paragraph Operator Support Yoke.
2. Solid Bronze Lift Nut: Integrally threaded with Acme threads.
3. Ball Thrust or Tapered Roller Bearings:
    a. Locate above and below operating nut flange to support opening and closing thrusts.
    b. Include grease lubrication fittings and input pinions.
4. Manual Crank Effort: Not to exceed 40 pounds.
5. Suitable for portable electric drill operation after removal of handcrank.

E. Type 3, Geared Floor Stands:

1. Crank-operated, with weatherproof housings with solid bronze lift nut.
2. Mount on high-strength cast-iron pedestal or base.
3. Maximum manual crank effort to operate gate shall not exceed 40 pounds.
4. Lift Nut: Internally threaded with Acme threads.
5. Furnish ball thrust or tapered roller bearings above and below the lift nut to support both opening and closing thrusts.
    a. Grease lubrication fittings for bearings.
    b. Input pinions with needle or ball bearings.
    c. Mechanical seals at housing penetrations.

F. Type 4, Electric Motor Operators:

1. 28-inch-high steel pedestal or direct yoke-mounted, totally enclosed weatherproof electric drive unit, and a totally enclosed gear box that operates a two-piece, bronze stem nut, which lifts the gate stem.
2. Gears: Heat treated alloy steel, supported throughout by antifriction ball or roller bearings and grease lubricated.
3. Automatic double-acting geared limit switches and double-acting torque switches.
    a. Gear directly to the operating gear train and shall be “in step” at all times, whether in motor or manual operation.
    b. Wire geared limit switches internally to stop the motor at the fully OPEN and fully CLOSED positions.
    c. Wire torque switches internally so that, in the event of a mechanical overload in either direction, the motor will be stopped.
4. Equip with side mounted handwheel for manual operation.
    a. Include an automatic clutch to positively disengage the handwheel at any time the drive motor control is energized.
    b. Design handwheel operator so that failure of the motorized gearing will not prevent hand operation of the gate.
5. Drive Unit:
    a. TENV, 480-volt, three-phase electric motor as specified in Section 26 20 00, Low-Voltage AC Induction Motors, with integral OPEN/STOP/CLOSE weatherproof pushbuttons, reversing controller, 480/120 volt control power transformer, space heaters in the limit switches and in the control compartments, mechanical dial type position indicator, and transparent plastic pipe stem cover and cap unless otherwise specifically noted on the Drawings.
    b. Furnish motor enclosure with drainage and breathing holes.
    c. Self-locking, with approximately 12 inches per minute gate travel speed, and a rated running torque equal to 20 percent of the motor starting torque at a rated running time of 5 minutes, without exceeding the allowable NEMA temperature rise for the insulation class used.
6. Operation: Drive the gate to its fully OPEN or CLOSED position when the OPEN or CLOSED pushbutton is depressed momentarily. Motor shall stop in mid-travel when the STOP button is depressed.

7. Controls: Furnish the following in accordance with operator control styles listed below and specified in Slide Gate Schedule:

2.7 GATE CONTROLS

A. Control Features

Feature	Description
A	Local OPEN/STOP/CLOSE pushbutton station
B	End position limit switches; OPEN and CLOSED position switches shall be normally open contacts that close at the end position; contacts shall be dry and rated for 5 amps, 120V ac
C	Continuous position output; provide transmitter to generate a 4 to 20 mA dc signal to an external loop in direct proportion to gate position; the transmitter shall be factory mounted in a NEMA 250, Type 4 enclosure. Transmitter shall be capable of driving an external load impedance of 350 ohms minimum.
D	LOCAL/REMOTE weatherproof selector switch and provisions for remote OPEN/STOP/CLOSE operation; remote commands will be by way of a four-wire circuit, as shown; motor operator shall impress the voltage required to read these contacts and shall go to the commanded position or stop when in the REMOTE mode. Provide auxiliary contact which closes when LOCAL/REMOTE switch is in REMOTE position.

a. Operator Control Styles:
   1) Provide Control Features A, B, C, and D for modulating gates and Control Features A, B, and D for all other electrically actuated gates.

2. Provide remote-mounted control units for all electric actuators shown on the Drawings installed below top grating of diversion structures.
3. All electric actuators and connecting electrical/control devices shall be rated for the NFPA hazard classifications shown on the Electrical Drawings.
4. Contractor coordinate actuator rotation with the Owner Representative to ensure that handwheel is facing upward.

5. Manufacturers and Products:
   a. Rotork Controls
   b. Flowserve Limitorque
   c. EIM
   d. AUMA
   e. Or equal.

B. Identification Tagging Requirements:

1. For each gate operator, 1-1/2-inch minimum diameter heavy brass tag, bearing the gate tag number shown in the schedule.
2. Attach the tags to the operator by soldered split key rings to that ring and tag cannot be removed. Use block type numbers and letters with 1/4-inch minimum high numbers and letters stamped on and filled with black enamel.

2.8 FRP STOP PLATES

A. Composition of the stop gate laminate shall be in accordance with the recommendations shown in the Quality Assurance Report for Reinforced Thermoset Plastic (RTP) Corrosion Resistant Equipment prepared under the sponsorship of the Society of the Plastics Industry, Inc. (SPI), and the Material Technology Institute (MTI) of the Chemical Process Industry for "Hand Lay-up Laminates," and shall meet the specifications for Type I, Grade 10 laminates shown in Appendix M-1 of said report.

B. Manufacturers shall be experienced in the design and manufacture of specific gates and accessories.

C. Composition of the gate laminate shall be in accordance with the recommendations shown in the Quality Assurance Report for Reinforced Thermostat Plastic (RTP) Corrosion Resistant Equipment prepared under the sponsorship the Society of the Plastics Industry, Inc. (SPI) and the Material Technology Institute of the Chemical Process Industries, Inc. (MTI) for "Hand Lay-up Laminates" and shall meet the specifications for Type 1, Grade 10 laminates shown in Appendix M-1 of said report.

1. Visual inspection for defects shall be made without the aid of magnification and defects shall be classified as to type and level as shown in Table 1 of ANSI/ASTM D2563-0, approved 1977, (or any subsequent revision). Allowable surface tolerances are as follows:

DEFECTS	ALLOWABLE TOLERANCE
Cracks Crazing Blisters Chips Pits Dry Spots Fish Eyes Burned Areas Entrapped Air	None
Wrinkles and solid blisters, not to exceed 1/8"	Maximum Deviation: 10% of thickness

Surface porosity (pinholes or pores in the laminate surface)	None
Exposed Glass Exposure of cut edges	None
Scratches	None more than .002" (0.05mm) deep
Foreign Matter	None

D. Maximum Fiber Stress

1. Ultimate or yield, whichever applies, does not exceed 2.5 times the working stress.

E. Deflection

1. Deflection across the plate width shall be limited to: L/360 or ¼" (6mm), whichever is less, at the maximum operating head.

F. Head Pressure

1. Plate shall be designed for a maximum head pressure as shown on plans or gate schedule.

G. Plate Size as shown on the contact drawings and/or gate schedule.

H. Surface Conditions

1. All plates shall be flat and level.
2. Warpage throughout the entire plate shall not produce a crown of more than 1/16" (1.6mm) in any direction.

I. Plate Disc

1. Plate disc shall be manufactured of fiberglass reinforced polyester totally encapsulating an internal reinforcing structure.
2. Each plate shall be molded individually to the exact dimensions specified. Seams and joints in and on the disc are not acceptable.
3. Plates shall be manufactured of reinforced thermoset plastic.
4. Plate shall have UV Stabilizing pigment in the Resin to provide long-term protection from UV.
5. The surface shall be resin rich to a depth of 0.01 inches (0.3mm) to 0.02 inches (0.5mm) and reinforced with C-glass or polymeric fiber surfacing material.
6. The surface shall be free of exposed reinforcing fibers.
7. The composition of these layers shall be approximately 95% (by weight) resin. The remaining laminate shall be made up of copolymer composite and reinforcing fibers in a form, orientation and position to meet the mechanical requirements.

8. Structural reinforcing shall be utilized to attain the necessary stiffness to meet deflection requirements, and shall be well encapsulated with a laminate not less than 1/8" (3mm) thick on each side to ensure against any permeation by water to the core areas.
9. Core material must be 100% resistant to decay and attack by fungus and bacteria and be resistant to hydrocarbons.

J. Frames and Guides

1. Guides shall be styled for embedment as shown on the contract drawings and/or gate schedule.
2. Guides shall be fabricated from FRP and shall have a slot suitable for mating with the plate body.

K. Structural characteristics for a 1/8" (3mm) glass mat laminate shall meet the following minimum physical properties.

Tensile strength	15,000 psi (1034 ksc)
Flexural Modulus	1,000,000 psi (70307 ksc)
Flexural Strength	20,000 psi (1406 ksc)
Compressive Strength	22,000 psi (1547 ksc)
Impact Strength	9.0 ft-lbs/in. (1.24 kgf.m/25mm)
Water absorption	0.13% (in 24 hours)

L. All bolts and concrete anchors shall be manufactured of AISI 316 stainless steel.

M. In-channel frames shall be fabricated of FRP.

N. Manufacturer

1. PlastiFab, Inc.
2. Or equal

PART 3 EXECUTION

3.1 INSTALLATION

A. In accordance with the manufacturer's written instructions.

B. Disassemble factory assembled gate components before installation.

C. Field mount operators after installing gates.

D. Brace thimbles internally during concrete placement.

E. Accurately place anchor bolts using templates furnished by the manufacturer and as specified in Section 05 50 00, Metal Fabrications.

F. Lubricate stems before operating.

3.2 FIELD QUALITY CONTROL

A. Functional Tests: Conduct on each slide gate.

B. Performance Test:

1. Conduct on each slide gate.
2. Perform under actual or approved simulated operating conditions.
3. Test for a continuous 3-hour period without malfunction.
4. Adjust, realign, or modify units and retest if necessary.

3.3 MANUFACTURER'S SERVICES

A. Manufacturer's Representative: Present at Site or classroom designated by Owner for minimum person-days listed below, travel time excluded:

1. Two person-days for installation assistance and inspection.
2. Two person-days for functional and performance testing and completion of Manufacturer's Certificate of Proper Installation.
3. Two person-days for prestartup classroom or Site training.
4. Two person-days for facility startup.
5. Two person-days for post-startup training of Owner's personnel. Training shall not commence until an accepted detailed lesson plan for each training activity has been reviewed by Owner.

B. See Section 01 43 33, Manufacturers' Field Services and Section 01 91 14, Testing, Integration, and Startup.

C. Provide manufacturer's representative at Site in accordance with Section 01 43 33, Manufacturers' Field Services, for installation assistance, inspection and certification of proper installation, equipment testing, startup assistance, and training of Owner's personnel for specified component, subsystem, equipment, or system.

END OF SECTION

SECTION 40 05 15
PIPING SUPPORT SYSTEMS

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Society of Civil Engineers (ASCE): 7, Minimum Design Loads for Buildings and Other Structures.
2. American Society of Mechanical Engineers (ASME): B31.1, Power Piping.
3. ASTM International (ASTM):
   a. A123/A123M, Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
   b. A653/A653M, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvanealed) by the Hot-Dip Process.
   c. E84, Standard Test Method for Surface Burning Characteristics of Building Materials.
4. International Code Council (ICC):
5. California Building Code (CBC).
6. International Mechanical Code (IMC).
7. Manufacturers' Standardization Society (MSS):
   a. SP 58, Pipe Hangers and Supports—Materials, Design and Manufacture.
   b. SP 127, Bracing for Piping Systems Seismic-Wind-Dynamic Design, Selection, and Application.

1.2 DEFINITIONS

A. Wetted or Submerged: Submerged, less than 1 foot above liquid surface, below top of channel wall, under cover or slab of channel or tank, or in other damp locations.

1.3 SUBMITTALS

A. Action Submittals:

1. Catalog information and drawings of piping support system, locating each support, sway brace, seismic brace, hanger, guide, component, and anchor for piping. Identify support, hanger, guide, and anchor type by catalog number and Shop Drawing detail number.
2. Calculations for each type of pipe support, attachment and anchor.

3. Revisions to support systems resulting from changes in related piping system layout or addition of flexible joints.
4. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:

1. Seismic anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.
2. Maintenance information on piping support system.

1.4 QUALIFICATIONS

A. Piping support systems shall be designed and Shop Drawings prepared and sealed by a Registered Professional Engineer in the state where the Work is to be installed.

1.5 DESIGN REQUIREMENTS

A. General:

1. Design, size, and locate piping support systems throughout facility, whether shown or not.
2. Piping Smaller than 30 Inches: Supports are shown only where specific types and locations are required; additional pipe supports may be required.
3. Piping 30 Inches and Larger: Support systems have been designed for piping shown.
4. Meet requirements of MSS SP 58 and ASME B31.1 or as modified by this section.

B. Pipe Support Systems:

1. Design pipe support systems for gravity and thrust loads imposed by weight of pipes or internal pressures, including insulation and weight of fluid in pipes.
2. Seismic loads in accordance with governing codes and as shown on Structural General Drawings**.**
3. Wind loads in accordance with governing codes and as shown on Structural General Drawings**.**
4. Maximum Support Spacing and Minimum Rod Size: In accordance MSS SP 58 Table 3 and Table 4.
    a. Ductile-iron Pipe 8 Inches and Under: Maximum span limited to that for standard weight steel pipe for water service.
    b. Ductile-iron Pipe 10 Inches and Larger: Maximum span limited to 20 feet.

5. Electrical Conduit Support: Include in design of framing support system.

C. Anchoring Devices: Design, size, and space support anchoring devices, including anchor bolts, inserts, and other devices used to anchor support, to withstand shear and pullout loads imposed by loading and spacing on each particular support.

D. Vertical Sway Bracing: 10-foot maximum centers or as shown.

E. Existing Support Systems: Use existing supports systems to support new piping only if Contractor can show they are adequate for additional load, or if they are strengthened to support additional load.

PART 2 PRODUCTS

2.1 GENERAL

A. When specified items are not available, fabricate pipe supports of correct material and to general configuration indicated.

B. Special support and hanger details may be required for cases where standard catalog supports are not applicable.

C. Materials: In accordance with Table 1 and Table 2, attached as Supplements at end of section.

2.2 HANGERS

A. Clevis: MSS SP 58, Type 1:

1. Anvil; Figure 260 for steel pipe and Figure 590 for ductile-iron pipe, sizes 1/2 inch through 30 inches.
2. Insulated Steel Pipe: Anvil; Figure 260 with insulated saddle system (ISS), sizes 1/2 inch through 16 inches.
3. B-Line; Figure B3100, sizes 1/2 inch through 30 inches.

B. Adjustable Swivel Split-Ring Pipe Clamp: MSS SP 58, Type 6:

1. Anvil; Figure 104, sizes 3/4 inch through 8 inches.
2. B-Line; Figure B3171, sizes 3/4 inch through 8 inches.

C. Steel Yoke Pipe Rolls and Roller Supports: MSS SP 58, Type 41 or Type 43:

1. Anvil; Figure 181 for sizes 2-1/2 inches through 24 inches, and Figure 171 for sizes 1 inch through 30 inches.

2. B-Line; Figure B3110 for sizes 2 inches through 24 inches and Figure B3114 for 30 inches.

D. Pipe Rollers and Supports: MSS SP 58, Type 44:

1. Anvil; Figure 175, sizes 2 inches through 30 inches.
2. B-Line; Figure B3120, sizes 2 inches through 24 inches.

2.3 WALL BRACKETS, SUPPORTS, AND GUIDES

A. Welded Steel Wall Bracket: MSS SP 58, Type 33 (heavy-duty):

1. Anvil; Figure 199, 3,000-pound rating.
2. B-Line; Figure B3067, 3,000-pound rating.

B. Adjustable "J" hanger MSS SP 58, Type 5:

1. Anvil; Figure 67, sizes 1/2 inch through 8 inches.
2. B-Line; Figure B3690, sizes 1/2 inch through 8 inches.

C. Offset Pipe Clamp: Anvil; Figure 103, sizes 3/4 inch through 8 inches.

D. Channel Type:

1. Unistrut.
2. Anvil; Power-Strut.
3. B-Line; Strut System.
4. Aickinstrut (FRP).

2.4 PIPE SADDLES

A. Provide 90-degree to120-degree pipe saddle for pipe 6 inches and larger with baseplates drilled for anchors bolts.

1. In accordance with Standard Detail 4005-515.
2. Sizes 20 inches though 60 inches, Piping Technology & Products, Inc.; Fig. 2000.

B. Saddle Supports, Pedestal Type:

1. Minimum standard weight pipe stanchion, saddle, and anchoring flange.
2. Nonadjustable Saddle: MSS SP , Type 37 with U-bolt.
   a. Anvil; Figure 259, sizes 4 inches through 36 inches with Figure 63C base.
   b. B-Line; Figure B3095, sizes 1 inch through 36 inches with B3088S base.
3. Adjustable Saddle: MSS SP 58, Type 38 without clamp.

a. Anvil; Figure 264, sizes 2-1/2 inches through 36 inches with Figure 62C base.
b. B-Line; Figure B3092, sizes 3/4 inch through 36 inches with Figure B3088S base.

2.5 CHANNEL TYPE SUPPORT SYSTEMS

A. Channel Size: 12-gauge, 1-5/8-inch wide minimum steel, or 1-1/2-inch wide, minimum FRP.

B. Members and Connections: Design for loads using one-half of manufacturer's allowable loads.

C. Fasteners: Vinyl ester fiber, polyurethane base composite nuts and bolts, or encapsulated steel fasteners.

D. Manufacturers and Products:

1. B-Line; Strut System.
2. Unistrut.
3. Anvil; Power-Strut.
4. Aickinstrut (FRP System).
5. Enduro-Durostrut (FRP Systems).

2.6 FRP PIPE SUPPORTS SYSTEMS

A. General:

1. FRP with UV additive, protective veil, and vinyl ester resins resistance to chemicals listed in Supplement at end of section.
2. Fire Retardant: ASTM E84.
3. Include hangers, rods, attachments, and fasteners.

B. Clevis Hangers:

1. Factor of Safety: 3 to 1.
2. Minimum Design Load: 200 pounds.

C. Design:

1. Design pipe supports spacing, hanger rod sizing based upon manufacturer's recommendations.
2. Identify and highlight nonFRP fasteners or components in Shop Drawing.

D. Manufacturers:

1. Aickinstrut.
2. Enduro.
3. Century Composite.

2.7 PIPE CLAMPS

A. Riser Clamp: MSS SP 58, Type 8.

1. Anvil; Figure 261, sizes 3/4 inch through 24 inches.
2. B-Line; Figure B3373, sizes 1/2 inch through 30 inches.

2.8 ELBOW AND FLANGE SUPPORTS

A. Elbow with Adjustable Stanchion: Sizes 2 inches through 18 inches, Anvil; Figure 62C base.

B. Elbow with Nonadjustable Stanchion: Sizes 2-1/2 inches through 42 inches, Anvil; Figure 63A or Figure 63B base.

C. Flange Support with Adjustable Base: Sizes 2 inches through 24 inches, Standon; Model S89.

2.9 INTERMEDIATE PIPE GUIDES

A. Type: Hold down pipe guide.

1. Manufacturer and Product: B-Line; Figure B3552, 1-1/2 inches through 30 inches.

B. Type: U-bolts with double nuts to provide nominal 1/8-inch to 1/4-inch clearance around pipe; MSS SP 58, Type 24.

1. Anvil; Figure 137 and Figure 137S.
2. B-Line; Figure B3188 and Figure B3188NS.

2.10 PIPE ALIGNMENT GUIDES

A. Type: Spider.

B. Manufacturers and Products:

1. Anvil; Figure 255, sizes 1/2 inch through 24 inches.
2. B-Line; Figure B3281 through Figure B3287, sizes 1/2 inch through 24 inches.

2.11 PIPE ANCHORS

A. Type: Anchor chair with U-bolt strap.

B. Manufacturer and Product: B-Line; Figure B3147A or Figure B3147B.

2.12 SEISMIC RESTRAINTS

A. Solid pipe bracing attachment to pipe clevis with clevis cross brace and angle rod reinforcement.

B. Manufacturers:

1. Mason Industries.
2. B-Line.
3. Anvil.

2.13 ACCESSORIES

A. Anchor Bolts:

1. Size and Material: Sized by Contractor for required loads, 1/2-inch minimum diameter, and as specified in Section 05 50 00, Metal Fabrications.
2. Bolt Length (Extension Above Top of Nut):
   a. Minimum Length: Flush with top of nut preferred. If not flush, shall be no more than one thread recessed below top of nut.
   b. Maximum Length: No more than a full nut depth above top of nut.

B. Dielectric Barriers:

1. Plastic coated hangers, isolation cushion, or tape.
2. Manufacturer and Products:
   a. B-Line; B1999 Vibra Cushion.
   b. B-Line; Iso Pipe, Isolation Tape.

C. Insulation Shields:

1. Type: Galvanized steel or stainless steel, MSS SP 58, Type 40.
2. Manufacturers and Products:
   a. Anvil; Figure 167, sizes 1/2 inch through 24 inches.
   b. B-Line; Figure B3151, sizes 1/2 inch through 24 inches.

D. Welding Insulation Saddles:

1. Type: MSS SP 58, Type 39.
2. Manufacturers and Products:

a. Anvil; Figure Series 160, sizes 1 inch through 36 inches.
b. B-Line; Figure Series B3160, sizes 1/2 inch through 24 inches.

E. Plastic Pipe Support Channel:

1. Type: Continuous support for plastic pipe and to increase support spacing.
2. Manufacturer and Product: B-Line; Figure Series B3106V, sizes 1/2 inch through 6 inches with Figure B3106 Vee bottom hanger.

F. Hanger Rods, Clevises, Nuts, Sockets, and Turnbuckles: In accordance with MSS SP 58.

G. Attachments:

1. I-Beam Clamp: Concentric loading type, MSS SP 58, Type 21, Type 28, Type 29, or Type 30, which engage both sides of flange.
2. Concrete Insert: MSS SP 58, Type 18, continuous channel insert with load rating not less than that of hanger rod it supports.
3. Welded Beam Attachment: MSS SP 58, Type 22.
   a. Anvil; Figure 66.
   b. B-Line; Figure B3083.
4. U-Channel Concrete Inserts: As specified in Section 05 50 00, Metal Fabrications.
5. Concrete Attachment Plates:
   a. Anvil; Figure 47, Figure 49, or Figure 52.
   b. B-Line; Figure B3084, Figure B3085, or Figure B3086.

PART 3 EXECUTION

3.1 INSTALLATION

A. General:

1. Install support systems in accordance with MSS SP 58, unless shown otherwise.
2. Install pipe hanger rods plumb, within 4 degrees of vertical during shut down, start up or operations.
3. Support piping connections to equipment by pipe support and not by equipment.
4. Support large or heavy valves, fittings, and appurtenances independently of connected piping.
5. Support no pipe from pipe above it.
6. Support pipe at changes in direction or in elevation, adjacent to flexible joints and couplings, and where shown.

7. Do not use adhesive anchors for attachment of supports to ceiling or walls.
8. Do not install pipe supports and hangers in equipment access areas or bridge crane runs.
9. Brace hanging pipes against horizontal movement by both longitudinal and lateral sway bracing and to reduce movement after startup.
10. Install lateral supports for seismic loads at changes in direction.
11. Install pipe anchors where required to withstand expansion thrust loads and to direct and control thermal expansion.
12. Repair mounting surfaces to original condition after attachments are completed.

B. Standard Pipe Supports:

1. Horizontal Suspended Piping:
    a. Single Pipes: Clevis hangers or adjustable swivel split-ring.
    b. Grouped Pipes: Trapeze hanger system.
2. Horizontal Piping Supported from Walls:
    a. Single Pipes: Wall brackets, or attached to wall, or to wall mounted framing with anchors.
    b. Stacked Piping: Wall mounted framing system and "J" hangers acceptable for pipe smaller than 3-inch.
    c. Pipe clamp that resists axial movement of pipe through support is not acceptable. Use pipe rollers supported from wall bracket.
3. Horizontal Piping Supported from Floors:
    a. Saddle Supports:
        1) Pedestal Type, elbow and flange.
        2) Provide minimum 1-1/2-inch grout beneath baseplate.
    b. Floor Mounted Channel Supports:
        1) Use for pipe smaller than 3-inch running along floors and in trenches at pipe elevations lower than can be accommodated using pedestal pipe supports.
        2) Attach channel framing to floors with baseplate on minimum 1-1/2-inch nonshrink grout and with anchor bolts.
        3) Attach pipe to channel with clips or pipe clamps.
    c. Concrete Cradles: Use for pipe larger than 3 inches along floor and in trenches at pipe elevations lower than can be accommodated using stanchion type.
4. Insulated Pipe:
    a. Pipe hanger and support shall be on outside of insulation. Do not enclose within insulation.
    b. Provide precut 120-degree sections of rigid insulation (minimum length same as shield), shields and oversized hangers or insulated saddle system (ISS).
    c. Wall-mounted pipe clips not acceptable for insulated piping.

5. Vertical Pipe: Support with wall bracket and elbow support, or riser clamp on floor penetration.

C. Standard Attachments:

1. New Concrete Ceilings: Concrete inserts, concrete attachment plates, or concrete anchors as limited below:
   a. Single point attachment to ceiling allowed only for 3/4-inch rod and smaller (8 inches and smaller pipe).
   b. Where there is vibration or bending considerations, do not connect a single pipe support hanger rod directly to a drilled concrete anchor (single point attachment) regardless of size.
2. Existing Concrete Ceilings: Channel type support with minimum of two anchor points, concrete attachment plates or concrete anchors as limited below:
   a. Single point attachment to ceiling is allowed only for 3/4-inch rod and smaller (8 inches and smaller pipe).
   b. Where there is vibration or bending considerations do not connect a single pipe support hanger rod directly to a drilled concrete anchor (single point attachment) regardless of size.
3. Steel Beams: I-beam clamp or welded attachments.
4. Wooden Beams: Lag screws and angle clips to members not less than 2-1/2 inches thick.
5. Concrete Walls: Concrete inserts or brackets or clip angles with concrete anchors.
6. Concrete Beams: Concrete inserts, or if inserts are not used attach to vertical surface similar to concrete wall. Do not drill into beam bottom.

D. Saddles for Steel or Concrete Pipe: Provide 90-degree to 120-degree pipe saddle for pipe sizes 6 inches and larger when installed on top of steel or concrete beam or structure, pipe rack, trapeze, or where similar concentrated point supports would be encountered.

E. Intermediate and Pipe Alignment Guides:

1. Provide pipe alignment guides, or pipe supports that provide same function, at expansion joints and loops.
2. Guide pipe on each side of expansion joint or loop at 4 pipe and 14 pipe diameters from each joint or loop.
3. Install intermediate guides on metal framing support systems not carrying pipe anchor or alignment guide.

F. Accessories:

1. Insulation Shield: Install on insulated piping with oversize rollers and supports.

2. Welding Insulation Saddle: Install on insulated steel pipe with oversize rollers and supports.
3. Dielectric Barrier:
    a. Provide between painted or galvanized carbon steel members and copper or stainless steel pipe or between stainless steel supports and non stainless steel ferrous metal piping.
    b. Install rubber wrap between submerged metal pipe and oversized clamps.

3.2 FIELD FINISHING

A. Paint atmospheric exposed surfaces hot-dip galvanized steel components as specified in Section 09 90 00, Painting and Coating.

3.3 SUPPLEMENTS

A. The supplements listed below, following "End of Section," are a part of this specification:

1. Table 1: Nonchemical Areas.

END OF SECTION

Table 1 Nonchemical Areas	
Exposure Conditions	**Support Material**
Office Areas	Galvanized steel or precoated steel, plastic coated hangers for uninsulated copper or stainless steel piping
Shops and Warehouse Areas	Galvanized steel or precoated steel, plastic coated hangers for uninsulated copper or stainless steel piping
Pump Station and Screenings Facilities	Stainless steel or FRP
Process Areas: High Humidity or Hydrogen sulfide	Stainless steel or FRP
Process Areas: Wetted or Submerged	Stainless steel or FRP

SECTION 40 27 00
PROCESS PIPING—GENERAL

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section and any supplemental Data Sheets:

1. Air Force: A-A-58092, Tape, Antiseize, Polytetrafluorethylene.

qqq. F441/F441M, Standard Specification for Chlorinated Poly(Vinyl Chloride) (CPVC) Plastic Pipe, Schedules 40 and 80.
rrr. F493, Standard Specification for Solvent Cements for Chlorinated Poly(Vinyl Chloride) (CPVC) Plastic Pipe and Fittings.
sss. F593, Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
ttt. F656, Standard Specification for Primers for Use in Solvent Cement Joints of Poly(Vinyl Chloride) (PVC) Plastic Pipe and Fittings.

9. FM Global (FM).

10. Manufacturers Standardization Society of the Valve and Fittings Industry, Inc. (MSS): SP-43, Wrought and Fabricated Butt-Welding Fittings for Low-Pressure, Corrosion Resistant Applications.

11. NSF International (NSF):
    a. ANSI 61: Drinking Water System Components - Health Effects.
    b. ANSI 372: Drinking Water System Components - Lead Content.
12. National Electrical Manufacturers Association (NEMA): LI 1, Industrial Laminating Thermosetting Products.
13. National Fire Protection Association (NFPA): 24, Standard for the Installation of Private Fire Service Mains and Their Appurtenances.

1.2 DEFINITIONS

A. Submerged or Wetted:

1. Zone below elevation of liquid surface or within 1 foot above top of liquid service.

1.3 DESIGN REQUIREMENTS

A. Where pipe diameter, thickness, pressure class, pressure rating, or thrust restraint is not shown or specified, design piping system in accordance with the following:

1. Process Piping: ASME B31.3, normal fluid service unless otherwise specified.
2. Building Service Piping: ASME B31.9, as applicable.
3. Sanitary Building Drainage and Vent Systems: California plumbing code.
4. Buried Piping: H20-S16 traffic load with 1.5 impact factor, AASHTO HB-17, as applicable.
5. Thrust Restraints:
    a. Design for test pressure.
    b. Allowable Soil Pressure: 1,000 pounds per square foot or higher when approved by Project Geotechnical Engineer.
    c. Low Pressure Pipelines:
        1) When bearing surface of the fitting against soil provides an area equal to or greater than area required for thrust restraint, concrete thrust blocks will not be required.
        2) Determine bearing area for fittings without thrust blocks by projected area of 70 percent of internal diameter multiplied by chord length for fitting centerline curve.

1.4 SUBMITTALS

A. Action Submittals:

1. Shop Fabricated Piping:
    a. Detailed pipe fabrication or spool drawings showing special fittings and bends, dimensions, coatings, and other pertinent information.

b. Layout drawing showing location of each pipe section and each special length; number or otherwise designate laying sequence on each piece.

2. Pipe Wall Thickness: Identify wall thickness and rational method or standard applied to determine wall thickness for each size of each different service including exposed, submerged, buried, and concrete-encased installations for Contractor-designed piping.
3. Hydraulic Thrust Restraint for Restrained Joints: Details including materials, sizes, assembly ratings, and pipe attachment methods.
4. Thrust Blocks: Concrete quantity, bearing area on pipe, and fitting joint locations.
5. Dissimilar Buried Pipe Joints: Joint types and assembly drawings.
6. Pipe Corrosion Protection: Product data.
7. Anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:

1. Manufacturer's Certification of Compliance, in accordance with Section 01 61 00, Common Product Requirements.
   a. Pipe and fittings.
   b. Factory applied resins and coatings.
2. Anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.
3. Flanged Pipe and Fittings: Manufacturer's product data sheets for gaskets including torqueing requirements and bolt tightening procedures.
4. Qualifications:
   a. Nondestructive Testing Personnel: SNT-TC-1A Level II certification and qualifications.
   b. AWS QC1 Certified Welding Inspector: Submit evidence of current certification prior to commencement of welding activities.
   c. Welders:
      1) Continuity log for welders and welding operators.
      2) Welder qualification test records conducted by Contractor or manufacturer.
5. Welding Procedures: Qualified in accordance with ASME Boiler and Pressure Vessel Code, Section IX for weld type(s) and base metal(s).
6. Nondestructive inspection and testing procedures.
7. Test logs.
8. Pipe coating applicator certification.
9. Laboratory Testing Equipment: Certified calibrations, manufacturer's product data, and test procedures.
10. CWI inspection records and NDE test records.

1.5 QUALITY ASSURANCE

A. Qualifications:

1. Independent Inspection and Testing Agency:
    a. Experience in field of welding and welded pipe and fittings' testing required for this Project.
    b. Calibrated instruments and equipment, and documented standard procedures for performing specified testing.
    c. Certified in accordance with ASNT SNT-TC-1A for testing procedures required for this Project.
    d. Testing Agency: Personnel performing tests shall be NDT Level II certified in accordance with ASNT SNT-TC-1A.
    e. Verification Welding Inspector: AWS QC1 Certified.
2. Welding Procedures: In accordance with ASME BPVC SEC IX (Forms QW-482 and QW-483) or AWS D1.1/D1.1M (Annex N Forms).
3. Welder Qualifications: In accordance ASME BPVC SEC IX (Form QW-484) or AWS D1.1/D1.1M (Annex N Forms).
4. Contractor's CWI: Certified in accordance with AWS QC1, and having prior experience with specified welding codes. Alternate welding inspector qualifications require approval by Engineer.
5. Solvent Welder for Double Wall Containment Piping: Qualified in accordance with Chapter VII of the ASME B31.3 Code, Part 9, Paragraph A328.

B. Quality Assurance: Special inspection to be provided by Owner and performed by independent inspection and testing agency for welding operations.

1. Note, the presence of Owner's Special Inspector or Verification CWI does not relieve Contractor from performing own quality control, including 100 percent visual inspection of welds.

1.6 DELIVERY, STORAGE, AND HANDLING

A. In accordance with Section 01 61 00, Common Product Requirements, and:

1. Flanges: Securely attach metal, hardboard, or wood protectors over entire gasket surface.
2. Threaded or Socket Welding Ends: Fit with metal, wood, or plastic plugs or caps.
3. Linings and Coatings: Prevent excessive drying.
4. Cold Weather Storage: Locate products to prevent coating from freezing to ground.
5. Handling: Use heavy canvas or nylon slings to lift pipe and fittings.

PART 2 PRODUCTS

2.1 GENERAL

A. Components and Materials in Contact with Water for Human Consumption: Comply with the requirements of the Safe Drinking Water Act and other applicable federal, state, and local requirements. Provide certification by manufacturer or an accredited certification organization recognized by the Authority Having Jurisdiction that components and materials comply with the maximum lead content standard in accordance with NSF/ANSI 61 and NSF/ANSI 372.

1. Use or reuse of components and materials without a traceable certification is prohibited.

2.2 PIPING

A. Provide material and size as shown on Drawings.

B. Diameters Shown:

1. Standardized Products: Nominal size.
2. Fabricated Steel Piping (Except Cement-Lined): Outside diameter, ASME B36.10M.
3. Cement-Lined Steel Pipe: Lining inside diameter.

2.3 JOINTS

A. Grooved End System:

1. Rigid type.
2. Use of flexible grooved joints allowed where shown on Drawings or with prior approval by Engineer.
3. Flanges: When required, furnish with grooved type flange adapters of same manufacturer as grooved end couplings.

B. Flanged Joints:

1. Flat-faced, carbon steel, or alloy flanges when mating with flat-faced cast or ductile iron flanges.
2. Higher pressure rated flanges as required to mate with equipment when equipment flange is of higher pressure rating than required for piping.

C. Threaded Joints: NPT taper pipe threads in accordance with ASME B1.20.1.

D. Mechanical Joint Anchor Gland Follower:

1. Ductile iron anchor type, wedge action, with break-off tightening bolts.
2. Thrust rated to 250 psi minimum.
3. Rated operating deflection not less than:

a. 3 degrees for sizes through 12 inches.
b. 2 degrees for sizes 14 inches through 16 inches.
c. 1.5 degrees for sizes 18 inches through 24 inches.
d. 1 degree for sizes 30 inches through 48 inches.

4. UL and FM approved.

E. Flexible Mechanical Compression Joint Coupling:

1. Stainless steel, ASTM A276, Type 305 bands.
2. Manufacturers:

a. Pipeline Products Corp.
b. Fernco Joint Sealer Co.

F. Mechanical connections of high-density polyethylene pipe to auxiliary equipment such as valves, pumps, tanks, and other piping systems shall be through-flanged connections consisting of the following:

1. Polyethylene stub end thermally butt-fused to end of pipe.
2. ASTM A240/A240M, Type 304 stainless steel backing flange, 125-pound, ASME B16.1 standard. Use insulating flanges where shown.
3. Bolts and nuts of sufficient length to show a minimum of three complete threads when joint is made and tightened to manufacturer's standard. Retorque nuts after 4 hours.
4. Gaskets as specified on Data Sheet.

2.4 GASKET LUBRICANT

A. Lubricant shall be supplied by pipe manufacturer and no substitute or "or-equal" will be allowed.

2.5 DOUBLE WALL CONTAINMENT PIPING SYSTEM

A. System components shall be pre-engineered, factory fabricated, tested, and assembled such that field assembly is minimized to primarily that of straight joints.

2.6 PIPE CORROSION PROTECTION

A. Coatings: See Section 09 90 00, Painting and Coating, for details of coating requirements.

B. Heat Shrink Wrap:

1. Type: Cross-linked polyolefin wrap or sleeve with mastic sealant.
2. Manufacturer and Product: Raychem; or approved equal.

C. Polyethylene Encasement (Bagging):

1. Encasement Tube: Black polyethylene encasement tube, 8 mils minimum thickness, conforming to AWWA C105/A21.5, free of gels, streaks, pinholes, foreign matter, undispersed raw materials, and visible defects such as tears, blisters, and thinning at folds.
2. Securing Tape: Thermoplastic tape, 8 mils minimum thickness, 1 inch wide, pressure sensitive adhesive face capable of bonding to metal, bituminous coating, and polyethylene encasement tube.

D. Insulating Flanges, Couplings, and Unions:

1. Materials:
   a. In accordance with applicable piping material specified in Pipe Data Sheet. Complete assembly shall have ASME B31.9 working pressure rating equal to or higher than that of joint and pipeline.
   b. Galvanically compatible with piping.
   c. Resistant for intended exposure, operating temperatures, and products in pipeline.
2. Union Type, 2 Inches and Smaller:
   a. Screwed or solder-joint.
   b. O-ring sealed with molded and bonded insulation to body.
3. Flange Type, 2-1/2 Inches and Larger:
   a. Flanged, complete with bolt insulators, dielectric gasket, bolts, and nuts.
   b. Bolt insulating sleeves shall be provided full length between insulating washers.
   c. Ensure fit-up of components of insulated flange assembly to provide a complete functioning installation.
   d. AWWA C207 steel flanges may be drilled oversize up to 1/8-inch to accommodate insulating sleeves.
   e. No less than minimum thread engagement in accordance with specified bolting standards will be permitted to accommodate thicknesses of required washers, flanges, and gasket.
4. Flange Insulating Kits and Couplings: Meet requirements of Spec Section 26 42 00.

2.7 STAINLESS-STEEL PIPING

A. Potable-water piping and components shall comply with NSF 61.

B. Stainless-Steel Pipe: ASTM A 312/A 312M, Schedule 40.

C. Stainless-Steel Pipe Fittings: ASTM A 815/A 815M.

D. Appurtenances for Grooved-End, Stainless-Steel Pipe:
   1. Basis-of-Design Product: Subject to compliance with requirements, provide comparable product by one of the following:
      a. Anvil International.
      b. Grinnell Mechanical Products; Tyco Fire Products LP.
      c. Shurjoint Piping Products.
      d. Victaulic Company.

E. Fittings for Grooved-End, Stainless-Steel Pipe: Stainless-steel casting with dimensions matching stainless-steel pipe.

F. Mechanical Couplings for Grooved-End, Stainless-Steel Pipe:
   1. AWWA C606 for stainless-steel-pipe dimensions.
   2. Stainless-steel housing sections.
   3. Stainless-steel bolts and nuts.
   4. EPDM-rubber gaskets suitable for hot and cold water.
   5. Minimum Pressure Rating: 200 PSI

2.8 THRUST TIES

A. Steel Pipe: Fabricated lugs and rods in accordance with details shown on Drawings.

B. Buried Ductile Iron Pipe and Fittings: Unless restraint is otherwise specified or shown, conform to NFPA 24. Tie-rod attachments relying on clamp friction with pipe barrel to restrain thrust are unacceptable.

2.9 VENT AND DRAIN VALVES

A. Pipeline 2-Inch Diameter and Smaller: 1/2-inch vent, 1-inch drain, unless shown otherwise.

B. Pipelines 2-1/2-Inch Diameter and Larger: 3/4-inch vent, 1-inch drain, unless shown otherwise.

2.10 FABRICATION

A. Mark each pipe length on outside with the following:

   1. Size or diameter and class.

2. Manufacturer's identification and pipe serial number.
3. Location number on laying drawing.
4. Date of manufacture.

B. Code markings according to approved Shop Drawings.

C. Shop fabricate flanged pipe in shop, not in field, and delivered to Site with flanges in place and properly faced. Threaded flanges shall be individually fitted and machine tightened on matching threaded pipe by manufacturer.

2.11 FINISHES

A. Factory prepare, prime, and finish coat in accordance with Pipe Data Sheet(s) and Piping Schedule.

B. Galvanizing:

1. Hot-dip applied, meeting requirements of ASTM A153/A153M.
2. Electroplated zinc or cadmium plating is unacceptable.
3. Stainless steel components may be substituted where galvanizing is specified only when approved by Engineer.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify size, material, joint types, elevation, horizontal location, and pipe service of existing pipelines to be connected to new pipelines or new equipment.

B. Inspect size and location of structure penetrations to verify adequacy of wall pipes, sleeves, and other openings.

3.2 PREPARATION

A. See Piping Schedule and Section 09 90 00, Painting and Coating, for additional requirements.

B. Notify Engineer at least 2 weeks prior to field fabrication of pipe or fittings.

C. Inspect pipe and fittings before installation, clean ends thoroughly, and remove foreign matter and dirt from inside.

D. Damaged Coatings and Linings: Repair using original coating and lining materials in accordance with manufacturer's instructions except for damaged glass-lined pipe or PVDF-lined pipe that is to be promptly removed from Site.

3.3 WELDING

A. Perform in accordance with Section IX, ASME Boiler and Pressure Vessel Code and ASME B31.9 for Pressure Piping, as may be specified on Piping

Data Sheets, and if recommended by piping or fitting manufacturer.

B. Weld Identification: Keep paper record of which welder welded each joint.

C. Pipe End Preparation:

1. Machine Shaping: Preferred.
2. Oxygen or Arc Cutting: Smooth to touch, true, and slag removal by chipping or grinding.
3. Beveled Ends for Butt Welding: ASME B16.25.

D. Surfaces:

1. Clean and free of paint, oil, rust, scale, slag, or other material detrimental to welding.
2. Clean stainless steel joints with stainless steel wire brushes or stainless steel wool prior to welding.
3. Thoroughly clean each layer of deposited weld metal, including final pass, prior to deposition of each additional layer of weld metal with a power-driven wire brush.

E. Alignment and Spacing:

1. Align ends to be joined within existing commercial tolerances on diameters, wall thicknesses, and out-of-roundness.
2. Root Opening of Joint: As stated in qualified welding procedure.
3. Minimum Spacing of Circumferential Butt Welds: Minimum four times pipe wall thickness or 1 inch, whichever is greater.

F. Climatic Conditions:

1. Do not perform welding if there is impingement of any rain, snow, sleet, or wind exceeding 5 mph on the weld area, or if ambient temperature is below 32 degrees F.
2. If ambient is less than 32 degrees F, local preheating to a temperature warm to the hand is required.

G. Tack Welds: Performed by qualified welder using same procedure as for completed weld, made with electrode similar or equivalent to electrode to be used for first weld pass, and not defective. Remove those not meeting requirements prior to commencing welding procedures.

H. Surface Defects: Chip or grind out those affecting soundness of weld.

I. Weld Quality: Meet requirements of governing welding codes.

3.4 INSTALLATION—GENERAL

A. Join pipe and fittings in accordance with manufacturer's instructions, unless otherwise shown or specified.

B. Remove foreign objects prior to assembly and installation.

C. Flanged Joints:

1. Install perpendicular to pipe centerline.
2. Bolt Holes: Straddle vertical centerlines, aligned with connecting equipment flanges or as shown.
3. Use torque-limiting wrenches to ensure uniform bearing and proper bolt tightness.
4. Plastic Flanges: Install annular ring filler gasket at joints of raised-face flange.
5. Grooved Joint Flange Adapters: Include stainless steel washer plates as required for mating to serrated faces and lined valves and equipment.
6. Raised-Face Flanges: Use flat-face flange when joining with flat-faced ductile or cast iron flange.
7. Verify compatibility of mating flange to adapter flange gasket prior to selecting grooved adapter flanging.
8. Flange fillers are to be avoided, but if necessary, may be used to make up for small angles up to 6 degrees and for filling gaps up to 2 inches between flanges. Stacked flange fillers shall not be used.
9. Threaded flanged joints shall be shop fabricated and delivered to Site with flanges in-place and properly faced.
10. Manufacturer: Same as pipe manufacturer or grooved joint flange adapter manufacturer.

D. Threaded and Coupled Joints:

1. Conform to ASME B1.20.1.
2. Produce sufficient thread length to ensure full engagement when screwed home in fittings.
3. Countersink pipe ends, ream and clean chips and burrs after threading.
4. Make connections with not more than three threads exposed.
5. Lubricate male threads only with thread lubricant or tape as specified on Piping Data Sheets.

E. Grooved-End Joints:

1. Piping shall be grooved in accordance with manufacturer's latest published instructions and shall be accurately cut with tools conforming to coupling manufacturer's standards and to AWWA C606.
2. Install grooved joint couplings and gaskets in accordance with manufacturer's latest published installation instructions.

A. Threaded and Coupled Joints:

1. Conform to ASME B1.20.1.
2. Produce sufficient thread length to ensure full engagement when screwed home in fittings.
3. Countersink pipe ends, ream and clean chips and burrs after threading.
4. Make connections with not more than three threads exposed.
5. Lubricate male threads only with thread lubricant or tape as specified on Piping Data Sheets.

B. Grooved-End Joints:

1. Piping shall be grooved in accordance with manufacturer's latest published instructions and shall be accurately cut with tools conforming to coupling manufacturer's standards and to AWWA C606.
2. Install grooved joint couplings and gaskets in accordance with manufacturer's latest published installation instructions.

C. Soldered Joints:

1. Use only solder specified for particular service.
2. Cut pipe ends square and remove fins and burrs.
3. After thoroughly cleaning pipe and fitting of oil and grease using solvent and emery cloth, apply noncorrosive flux to the male end only.
4. Wipe excess solder from exterior of joint before hardened.
5. Before soldering, remove stems and washers from solder joint valves.

D. Brazed Joints for Refrigerant Piping:

1. Braze copper piping with silver solder complying with AWS A5.8/A5.8M

2. Construct joints according to AWS Brazing Handbook, Chapter Pipe and Tube.
3. Inside of tubing and fittings shall be free of flux.
4. Clean parts to be joined with emery cloth and keep hot until solder has penetrated the full depth of the fitting and extra flux has been expelled.
5. Cool joints in air and remove flame marks and traces of flux.
6. During brazing operation, prevent an oxide film from forming on inside of tubing by slowly flowing dry nitrogen to expel the air.
7. When brazing, remove solenoid-valve coils and sight glasses; also remove valve stems, seats, and packing, and accessible internal parts of refrigerant specialties. Do not apply heat near expansion valve bulb.

.

E. PVC Piping:

1. Provide Schedule 80 threaded nipple where necessary to connect to threaded valve or fitting.
2. Use strap wrench for tightening threaded plastic joints. Do not overtighten fittings.
3. Do not thread Schedule 40 pipe.

F. Ductile Iron Piping:

1. Cutting Pipe: Cut pipe with milling type cutter, rolling pipe cutter, or abrasive blade cutter. Do not flame cut.
2. Dressing Cut Ends:
   a. General: As required for the type of joint to be made.
   b. Rubber Gasketed Joints: Remove sharp edges or projections.
   c. Push-On Joints: Bevel, as recommended by pipe manufacturer.
   d. Flexible Couplings, Flanged Coupling Adapters, and Grooved End Pipe Couplings: As recommended by the coupling or adapter manufacturer.
3. Special Precautions at Flanges: Polyethylene pipe connected to heavy fittings, manholes, and rigid structures shall be supported in such a manner that no subsequent relative movement between polyethylene pipe at flanged joint and rigid structures is possible.

3.2 INSTALLATION—EXPOSED PIPING

A. Piping Runs:

1. Parallel to building or column lines and perpendicular to floor, unless shown otherwise.
2. Piping upstream and downstream of flow measuring devices shall provide straight lengths as required for accurate flow measurement.

B. Supports: As specified in Section 40 05 15, Piping Support Systems.

C. Group piping wherever practical at common elevations; install to conserve building space and not interfere with use of space and other work.

D. Unions or Flanges: Provide at each piping connection to equipment or instrumentation on equipment side of each block valve to facilitate installation and removal.

E. Install piping so that no load or movement in excess of that stipulated by equipment manufacturer will be imposed upon equipment connection; install to allow for contraction and expansion without stressing pipe, joints, or connected equipment.

F. Piping clearance, unless otherwise shown:

1. Over Walkway and Stairs: Minimum of 7 feet 6 inches, measured from walking surface or stair tread to lowest extremity of piping system including flanges, valve bodies or mechanisms, insulation, or hanger/support systems.
2. Between Equipment or Equipment Piping and Adjacent Piping: Minimum 3 feet, measured from equipment extremity and extremity of piping system including flanges, valve bodies or mechanisms, insulation, or hanger/support systems.
3. From Adjacent Work: Minimum 2 inches from nearest extremity of completed piping system including flanges, valve bodies or mechanisms, insulation, or hanger/support systems.
4. Do not route piping in front of or to interfere with access ways, ladders, stairs, platforms, walkways, openings, doors, or windows.
5. Headroom in front of openings, doors, and windows shall not be less than the top of the opening.
6. Do not install piping containing liquids or liquid vapors in transformer vaults or electrical equipment rooms.
7. Do not route piping over, around, in front of, in back of, or below electrical equipment including controls, panels, switches, terminals, boxes, or other similar electrical work.

3.3 INSTALLATION—BURIED PIPE

A. Joints:

1. Dissimilar Buried Pipes:
   a. Provide flexible mechanical compression joints for pressure pipe.
   b. Provide concrete closure collar for gravity piping or as shown.
2. Concrete Encased or Embedded Pipe: Do not encase joints in concrete, unless specifically shown.

B. Placement:

1. Keep trench dry until pipe laying and joining are completed.
2. Pipe Base and Pipe Zone: As specified in Section 31 23 23.15, Trench Backfill.
3. Exercise care when lowering pipe into trench to prevent twisting or damage to pipe.
4. Measure for grade at pipe invert, not at top of pipe.
5. Excavate trench bottom and sides of ample dimensions to permit visual inspection and testing of entire flange, valve, or connection.
6. Prevent foreign material from entering pipe during placement.
7. Close and block open end of last laid pipe section when placement operations are not in progress and at close of day's work.
8. Lay pipe upgrade with bell ends pointing in direction of laying.
9. Install closure sections and adapters for gravity piping at locations where pipe laying changes direction.
10. Deflect pipe at joints for pipelines laid on a curve using unsymmetrical closure of spigot into bell. If joint deflection of standard pipe lengths will not accommodate horizontal or vertical curves in alignment, provide:
    a. Shorter pipe lengths.
    b. Special mitered joints.
    c. Standard or special fabricated bends.
11. After joint has been made, check pipe alignment and grade.
12. Place sufficient pipe zone material to secure pipe from movement before next joint is installed.
13. Prevent uplift and floating of pipe prior to backfilling.

C. PVC Pipe Placement:

1. Lay pipe snaking from one side of trench to other.
2. Offset: As recommended by manufacturer for maximum temperature variation between time of solvent welding and during operation.
3. Do not lay pipe when temperature is below 40 degrees F, or above 90 degrees F when exposed to direct sunlight.
4. Shield ends to be joined from direct sunlight prior to and during the laying operation.

D. Tolerances:

1. Deflection from Horizontal Line 2 inches.
2. Deflection from Vertical Grade: Maximum 1/4 inch.
3. Joint Deflection: Maximum of 75 percent of manufacturer's recommendation.

4. Horizontal position of pipe centerline on alignment around curves maximum variation of 1.75 feet from position shown.
5. Pipe Cover: Minimum 4 feet, unless otherwise shown.

3.4 INSTALLATION—CONCRETE ENCASED

A. Provide reinforced concrete pipe encasement where shown on Drawings and where otherwise required. Some piping may be required to be concrete encased for pipe strength requirements that are included in the Specifications. Piping under and within the influence of buildings, utility trenches, vaults, slabs, and other structures shall be concrete encased. See details on Drawings for encasement requirements.

B. Where concrete encased piping crosses structure construction and expansion joints, provide flexible piping joints to coincide with structure joints to prevent excessive pipe stress and breakage.

3.5 PIPE CORROSION PROTECTION

A. Ductile Iron Pipe:

1. Reference Spec Sections 33 05 19 and 09 90 00.

B. Carbon Steel Pipe:

1. Reference Spec Sections 33 05 01.01 and 09 90 00.

C. Copper Pipe:

1. Reference Spec Section 33 05 17.

D. PVC Pipe, Exposed: As specified in Section 09 90 00, Painting and Coating.

E. Piping Accessories:

1. Exposed:
   a. Field paint black and galvanized steel, brass, copper, and bronze piping components as specified in Section 09 90 00, Painting and Coating, as applicable to base metal material.
   b. Accessories include, but are not limited to, pipe hangers, supports, expansion joints, pipe guides, flexible couplings, vent and drain valves, and fasteners.
2. Buried:
   a. Ferrous Metal and Stainless Steel Components: Coat with coal-tar epoxy as specified in Section 09 90 00, Painting and Coating.
   b. Bolts, Nuts, and Similar Items: Coat with bituminous paint.

c. Flexible Couplings Grooved Couplings, and Similar Items: Fusion-banded epoxy.
d. Buried Valves and Similar Elements on Wrapped Pipelines: Coat with bituminous paint and wrap entire valve in polyethylene encasement.
e. Cement-Coated Pipelines: Cement coat appurtenances same as pipe.

F. Polyethylene Encasement: Install in accordance with AWWA C105/A21.5 and manufacturer's instructions.

G. Tape Coating System: As specified in Section 09 90 00, Painting and Coating and Section 33 05 01.01, Carbon Steel Pipe and Fittings.

H. Heat Shrink Wrap: Apply in accordance with manufacturer's instructions to surfaces that are cleaned, prepared, and primed.

I. Insulating Flanges, Couplings, and Unions:

1. Applications:
   a. Dissimilar metal piping connections.
   b. Cathodically protected piping penetration to buildings and watertight structures**.**
   c. Submerged to unsubmerged metallic piping connections.
   d. Connections to existing metallic pipe**.**
   e. Where required for electrically insulated connection.
2. Pipe Installation:
   a. Insulating joints connecting immersed piping to non-immersed piping shall be installed above maximum water surface elevation.
   b. Submerged carbon steel, ductile iron, or galvanized piping in reinforced concrete shall be isolated from the concrete reinforcement steel.
   c. Align and install insulating joints as shown on the Drawings and according to manufacturer's recommendations. Bolt lubricants that contain graphite or other metallic or electrically conductive components that can interfere with the insulating capabilities of the completed flange shall not be used.

J. Pipe Bonding for Buried Piping: As specified in Section 26 42 00.

K. Cathodic Protection for Buried Piping: As specified in Section 26 42 00.

3.6 THRUST RESTRAINT

A. Location:

1. Buried Piping: Where shown and where required to restrain force developed at pipeline tees, plugs, caps, bends, and other locations where unbalanced forces exist because of hydrostatic testing and normal operating pressure.
2. Exposed Piping: At all joints in piping.

B. Thrust Ties:

1. Steel Pipe: Attach with lugs or joint harnesses fabricated in accordance with details shown on Drawings.
2. Ductile Iron Pipe: Attach with socket clamps anchored against grooved joint coupling or flange.
3. Flanged Coupling Adapters: For exposed installations, install manufacturer's anchor studs through coupling sleeve or use dismantling joints.

C. Mechanical Joint Valve Restraint in Proprietary Restrained Joint Piping: Install pipe joint manufacturer's adapter gland follower and pipe end retainer, or mechanical joint anchor gland follower.

D. Thrust Blocking:

1. Place between undisturbed ground and fitting to be anchored.
2. Quantity of Concrete: Sufficient to cover bearing area on pipe and provide required soil bearing area as shown.
3. Place blocking so that pipe and fitting joints will be accessible for repairs.

3.7 BRANCH CONNECTIONS

A. Do not install branch connections smaller than 1/2-inch nominal pipe size, including instrument connections, unless shown otherwise.

B. When line of lower pressure connects to a line of higher pressure, requirements of Piping Data Sheet for higher pressure rating prevails up to and including first block valve in the line carrying the lower pressure, unless otherwise shown.

C. Threaded Pipe Tap Connections:

1. Ductile Iron Piping: Connect only with service saddle or at tapping boss of a fitting, valve body, or equipment casting.

2. Welded Steel or Alloy Piping: Connect only with welded threadolet or half-coupling as specified on Piping Data Sheet.
3. Limitations: Threaded taps in pipe barrel are unacceptable.

3.8 VENTS AND DRAINS

A. Vents and drains at high and low points in piping required for completed system may or may not be shown. Install vents on high points and drains on low points of pipelines at all low and high point locations.

3.9 INSULATION

A. As shown on the Drawings.

3.10 DISINFECTION

A. See Section 33 13 00, Disinfecting of Water Utility Distribution.

3.11 FIELD FINISHING

A. Notify Engineer at least 3 days prior to start of surface preparation or coating application work.

B. As specified in Section 09 90 00, Painting and Coating.

3.12 PIPE IDENTIFICATION

A. As specified in Section 10 14 00, Signage.

3.13 FIELD QUALITY CONTROL

A. Minimum Duties of Welding Inspector:

1. Job material verification and storage.
2. Qualification of welders.
3. Certify conformance with approved welding procedures.
4. Maintenance of records and preparation of reports in a timely manner.
5. Notification to Engineer of unsatisfactory weld performance within 24 hours of weld test failure.

B. Required Weld Examinations:

1. Perform examinations in accordance with Piping Code ASME B31.3.
2. Perform examinations for every pipe thickness and for each welding procedure, progressively, for piping covered by this section.
3. Examine at least one of each type and position of weld made by each welder or welding operator.

4. For each weld found to be defective under the acceptance standards or limitations on imperfections contained in the applicable Piping Code, examine two additional welds made by the same welder that produced the defective weld. Such additional examinations are in addition to the minimum required above. Examine, progressively, two additional welds for each tracer examination found to be unsatisfactory.

C. Test containment piping leak detection system in accordance with system manufacturer's instructions and recommendations to verify proper operation.

3.14 MANUFACTURER'S SERVICES

A. Provide manufacturer's representative at Site in accordance with Section 01 43 33, Manufacturers' Field Services, to assist with unloading of the double wall containment piping system, system tests, containment pipe joint closure, installation and testing of leak detection system, and training of Owner's personnel in operation and maintenance of leak detection system. Manufacturer's representative shall complete a Manufacturer's Certificate of Proper Installation. Inspection and examination practices shall be according to ASME B31.3 for Normal Fluid Service.

3.15 CLEANING

A. Following assembly and testing, and prior to disinfection and final acceptance, flush pipelines, except as stated below, with water at 2.5 fps minimum flushing velocity until foreign matter is removed.

3.16 DESIGNATION OF PIPE MATERIAL, SCHEDULE, AND LINING/COATING

A. Pipe material, schedule, pressure class, lining/coating designation shall be as shown on the Drawings and as designated in the Specifications. There is no common pipe schedule for the project. Hydrostatic test pressure shall be 120% of max rated working pressure as designated by Engineer during construction. Test with air or perform water-based gravity test, in lieu of hydrostatic testing, only where shown on the Drawings or Specifications.

1.2 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
    a. Product data sheets for each make and model. Indicate valve Type Number, applicable Tag Number, and facility name/number or service where used.
    b. Complete catalog information, descriptive literature, specifications, and identification of materials of construction.
    c. Certification for compliance to NSF/ANSI 61 for valves used for drinking water service.
    d. Power and control wiring diagrams, including terminals and numbers.
    e. For each power actuator provided, manufacturer's standard data sheet, with application specific features and options clearly identified.
    f. Sizing calculations for open-close/throttle and modulating valves.
    g. Anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:

1. Anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.
2. Manufacturer's Certificate of Compliance, in accordance with Section 01 61 00, Common Product Requirements, for:
    a. Electric actuators; full compliance with AWWA C542.
    b. Butterfly valves; full compliance with AWWA C504.
3. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection and Testing.
4. Tests and inspection data.
5. Operation and Maintenance Data as specified in Section 01 78 23, Operation and Maintenance Data.
6. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers' Field Services.

PART 2 PRODUCTS

2.1 GENERAL

A. Valves to include operator, actuator, handwheel, chain wheel, extension stem, floor stand, operating nut, chain, wrench, and accessories to allow a complete operation from the intended operating level.

B. Valve to be suitable for intended service. Renewable parts not to be of a lower quality than specified.

C. Valve same size as adjoining pipe, unless otherwise called out on Drawings or in Supplements.

D. Valve ends to suit adjacent piping.

E. Resilient seated valves shall have no leakage (drip-tight) in either direction at valve rated design pressure. All other valves shall have no leakage (drip-tight) in either direction at valve rated design pressure, unless otherwise allowed for in this section or in stated valve standard.

F. Size operators and actuators to operate valve for full range of pressures and velocities.

G. Valve to open by turning counterclockwise, unless otherwise specified.

H. Factory mount operator, actuator, and accessories.

I. Components and Materials in Contact with Water for Human Consumption: Comply with the requirements of the Safe Drinking Water Act and other applicable federal, state, and local requirements. Provide certification by manufacturer or an accredited certification organization recognized by the Authority Having Jurisdiction that components and materials comply with the maximum lead content standard in accordance with NSF/ANSI 61 and NSF/ANSI 372.

1. Use or reuse of components and materials without a traceable certification is prohibited.

2.2 MATERIALS

A. Bronze and brass valve components and accessories that have surfaces in contact with water to be alloys containing less than 16 percent zinc and 2 percent aluminum.

1. Approved alloys are of the following ASTM designations: B61, B62, B98/B98M (Alloy UNS No. C65100, C65500, or C66100), B139/B139M (Alloy UNS No. C51000), B584 (Alloy UNS No. C90300 or C94700), B164, B194, and B127.
2. Stainless steel Alloy 18-8 may be substituted for bronze.

B. Valve materials in contact with or intended for drinking water service to meet the following requirements:

1. Materials to comply with requirements of the Safe Drinking Water Act and other applicable federal, state, and local requirements.
2. Coatings materials to be formulated from materials deemed acceptable to NSF/ANSI 61.
3. Supply certification product is certified as suitable for contact with drinking water by an accredited certification organization in accordance with NSF/ANSI 61. Provide certification for each valve type used for drinking water service.

2.3 FACTORY FINISHING

A. General:

1. Interior coatings for valves and hydrants shall be in accordance with AWWA C550, unless otherwise specified.
2. Exterior coating for valves and hydrants shall be in accordance with Section 09 90 00, Painting and Coating.
3. Material in contact with potable water shall conform to NSF/ANSI 61.
4. Exposed safety isolation valves and lockout valves with handles, handwheels, or chain wheels shall be “safety yellow.”

B. Where epoxy lining and coating are specified, factory finishing shall be as follows:

1. In accordance with AWWA C550.
2. Either two-part liquid material or heat-activated (fusion) material except only heat-activated material if specified as “fusion” or “fusion bonded” epoxy.
3. Minimum 7-mil dry film thickness except where limited by valve operating tolerances.

2.4 VALVES

A. Ball Valves:

1. Type V300 Ball Valve 3 Inches and Smaller for General Water and Air Service:

a. Two-piece, standard port, NPT threaded ends, bronze body and end piece, hard chrome-plated solid bronze or brass ball, RTFE seats and packing, blowout-proof stem, adjustable packing gland, zinc-coated steel hand lever operator with vinyl grip, rated 600-pound WOG, 150-pound SWP, complies with MSS SP-110.
b. Manufacturers and Products:
1) Threaded:
a) Conbraco Apollo; 70-100.
b) Nibco; T-580-70.
c) Or equal.
2) Soldered:
a) Conbraco Apollo; 70-200.
b) Nibco; S-580-70.
c) Or equal.

2. Type V301 Ball Valve 2 Inches and Smaller for General Water and Air Service:
a. Two-piece, full port, NPT threaded ends, bronze body and end piece, hard chrome-plated solid bronze or brass ball, RTFE seats and packing, blowout-proof stem, adjustable packing gland, zinc-coated steel hand lever operator with vinyl grip, rated 600-pound WOG, 150-pound SWP, complies with MSS SP-110.
Manufacturers and Products:
1) Threaded:
a) Conbraco Apollo; 77-100.
b) Nibco; T-585-70.
c) Or equal.
2) Soldered:
a) Conbraco Apollo; 77-200.
b) Nibco; S-585-70.
c) Or equal.

3. Type V306 Stainless Steel Ball Valve 2 Inches and Smaller:
a. Two-piece, full port, ASTM A276 GR 316 or ASTM A351/A351M GR CF8M stainless steel body and end piece, NPT threaded ends, ASTM A276 Type 316 stainless steel ball, reinforced PTFE seats, seals, and packing, adjustable packing gland, blowout proof stainless steel stem, stainless steel lever operator with vinyl grip, rated 1,000 psig CWP, complies with MSS SP-110.
b. Manufacturers and Products:
1) Conbraco Apollo; 76F-100 Series.
2) Nibco; T-585-S6-R-66-LL.
3) Or equal.

B. Plug Valves:

1. Type V407 Eccentric Plug Valve 24 Inches to 48 Inches:
    a. 100% Port, nonlubricated type rated 250 psig CWP, drip-tight shutoff with pressure from either direction, ductile-iron body, exposed service flanged ends with drilling per ANSI/ASME B16.1 Class 125 and flange rating of 250 psi flanged joints ends unless otherwise shown, eccentric plug, ductile iron plug material plug coated with NBR, seats welded nickel, stem bearings lubricated stainless steel or bronze, stem seal multiple V-rings or U-cups with O-rings of nitrile rubber, grit seals on both upper and lower bearings.
    b. Provide quarter-turn electric motor actuator with backup handwheel per requirements of this spec section.
    c. Manufacturers and Products:
        1) APCO DeZurik; Style PEF.
        2) Pratt.
        3) Milliken.
        4) Or equal.

C. Check and Flap Valves:

1. Type V608 Swing Check Valve 2 Inches to 24 Inches:
    a. AWWA C508, flange drilling confirming to ANSI/ASME B16.1, Class 125, with flange rating of 125 psi, ductile-iron body and ductile iron cover, NBR rubber disc sent, 316 stainless steel sent.
    b. Ductile-iron disc and disc arm.
    c. PTFE Packing.
    d. Type 316 stainless steel pivot shaft.
    e. Type 316 stainless steel bushings.
    f. Ductile-iron counterweight assembly.
    g. Provide air cushion cylinder with speed control assembly
    h. Valve shall have a working pressure rating of 250 psi.
    i. Manufacturers and Products:
        1) Dezurik, APCO CVS-250.
        2) Or equal.

D. Stainless Steel Check Valve (Scum Pumps)

1. Swing Check Valve 2 Inches to 24 Inches:
    a. Flange drilling confirming to ANSI/ASME B16.1, Class 125, with flange rating of 125 psi, stainless steel body and cover, NBR rubber disc sent, 316 stainless steel sent.
    b. Stainless Steel disc and disc arm.
    c. PTFE Packing.
    d. Type 316 stainless steel pivot shaft.
    e. Type 316 stainless steel bushings.

f. Stainless steel hing assembly.
g. Valve shall have a working pressure rating of 150 psi.
h. Manufacturers and Products:
    1) FNW 471A Steel Flanged Check Valve.
    2) Or equal.

E. Sewage Pressure Relief Valve

1. 4 Inches to 48 Inches:
    a. Valve body shall be constructed of gray iron casting that confirms to ASTM Specifications A 126 Class B. Internal stainless steel Components shall confirm to ASTM Specification A-743 Grade CF-8 or CF-8M. The threaded assembly shall confirm to ANSI standards.
    b. Type 316 stainless steel seat ring.
    c. Type 316 stainless steel bushings and fasteners
    d. Type 316 stainless steel seat support assembly
    e. The control assembly shall be rigid red brass no less than 0.5" in diameter.
    f. Valve shall have a working pressure rating of 250 psi.
    g. The valve shall be coated with NSF Certified Epoxy (Tenemec Series FC20 or approved equal). Coating shall be in accordance with ANSI/NSF Std. 61 and confirming to AWWA D102 Inside System No. 1
    h. Manufacturers and Products:
        1) Ross Series 70SWR-E
        2) Or equal.

F. Knife Gate Valves at Pump Station:

1. Body material: 316 stainless steel.
2. PTFE braided packing.
3. 304 stainless steel yoke.
4. 316 stainless steel gate.
5. Painted cast iron handwheel.
6. 420 stainless steel roll pin.
7. 316 stainless steel gland.
8. NBR seat ring
9. 304 stainless steel stem.
10. Pressure rating 150 psi.
11. Wafer-style flanges.
12. Provide multi-turn electric actuators.
13. Manufacturer: Dezurik/APCO or equal.

2.5 OPERATORS AND ACTUATORS

A. Manual Operators:

1. General:
   a. For AWWA valves, operator force not to exceed requirements of applicable valve standard. Provide gear reduction operator when force exceeds requirements.
   b. For non-AWWA valves, operator force not to exceed applicable industry standard or 80 pounds, whichever is less, under operating condition, including initial breakaway. Provide gear reduction operator when force exceeds requirements.
   c. Operator self-locking type or equipped with self-locking device.
   d. Position indicator on quarter-turn valves.
   e. Worm and gear operators one-piece design, worm-gears of gear bronze material. Worm of hardened alloy steel with thread ground and polished. Traveling nut type operator's threaded steel reach rod with internally threaded bronze or ductile iron nut.
2. Exposed Operator:
   a. Galvanized and painted handwheel.
   b. Cranks on gear type operator.
   c. Chain wheel operator with tieback, extension stem, floor stand, and other accessories to permit operation from normal operation level.
   d. Valve handles to take a padlock and wheels a chain and padlock.
3. Buried Operator:
   a. Buried service operators on valves larger than 2-1/2 inches shall have a 2-inch AWWA operating nut. Buried operators on valves 2 inches and smaller shall have cross handle for operation by forked key. Enclose moving parts of valve and operator in housing to prevent contact with the soil.
   b. Buried service operators to be grease packed and gasketed to withstand submersion in water to 20 feet minimum.
   c. Buried valves shall have extension stems, bonnets, and valve boxes.

B. Electric Motor Actuators, 480 Volts:

1. General:
   a. Comply with latest version of AWWA C542.
   b. Size to 1-1/2 times required operating torque. Motor stall torque not to exceed torque capacity of valve.

c. Controls integral with actuator and fully equipped as specified in AWWA C542.
d. Stem protection for rising stem valves.

2. Actuator Operation—General:
   a. Suitable for full 90-degree rotation of quarter-turn valves or for use on multiturn valves, as applicable.
   b. Manual override handwheel.
   c. Valve position indication.
   d. Operate from FULL CLOSED to FULL OPEN positions or the reverse in the number of seconds given in Electric Actuated Valve Schedule.
   e. Nonintrusive Electronic Control: Local controls, diagnostics, and calibration, including limit and torque settings, shall be accomplished non-intrusively. Electronic valve position display with capability to show continuous torque output.
3. Open-Close(O/C)/Throttling(T) Service:
   a. Size motors for one complete OPEN-CLOSE-OPEN cycle no less than once every 10 minutes.
   b. Actuator suitable for throttling operation of valve at intermediate positions.
   c. LOCAL-OFF-REMOTE Selector Switch, padlockable in each position:
      1) Integral OPEN-STOP-CLOSE momentary pushbuttons with seal-in circuits to control valve in LOCAL position.
      2) Remote OPEN-STOP-CLOSE momentary control dry contact inputs in REMOTE position. Integral seal-in circuits for remote OPEN and CLOSE commands; valve travel stops when remote STOP contact opens.
      3) Auxiliary contact that closes in REMOTE position.
   d. OPEN and CLOSED indicating lights.
   e. Integral reversing motor starter with built-in overload protection.
4. Limit Switch:
   a. Single-pole, double-throw (SPDT) type, field adjustable, with contacts rated for 5 amps at 120 volts ac.
   b. Each valve actuator to have a minimum of two auxiliary transfer contacts at end position, one for valve FULL OPEN and one for valve FULL CLOSED.
   c. Housed in actuator control enclosure.
5. Control Features: Electric motor actuators with features as noted above, and as modified/supplemented in Electric Actuated Valve Schedule.
6. Manufacturers and Products:
   a. Rotork Controls.
   b. Flowserve Limitorque.
   c. EIM.
   d. AUMA.

e. Or equal.

2.6 ACCESSORIES

A. Tagging: 1-1/2-inch diameter stainless steel tag attached with No. 16 solid brass or stainless steel jack chain for each valve operator, and valves 6-inch and larger.

B. Limit Switch:

1. Factory installed NEMA 4X limit switch by actuator manufacturer.

C. T-Handled Operating Wrench where shown on Drawings:

1. Each galvanized operating wrenches, 4 feet long.
2. Manufacturers and Products:
   a. Mueller; No. A-24610.
   b. Clow No.; F-2520.

D. Extension Bonnet for Valve Operator where shown on Drawings: Complete with enclosed stem, extension, support brackets, and accessories for valve and operator.

1. Manufacturers and Products:
   a. Pratt.
   b. DeZurik.

E. Floor Stand where shown on Drawings:

1. Nonrising, heavy pattern, indicating type.
2. Complete with solid extension stem, coupling, handwheel, stem guide brackets, and yoke attachment. Stem length as required to connect valve operating nut and floor stand.
3. Stem Guide: Space such that stem L/R ratio does not exceed 200.
4. Anchor Bolts: Type 304 stainless steel.
5. Manufacturers and Products:
   a. Clow; Figure F-5515.
   b. Mueller, Figure A-26426.

F. Floor Box where shown on Drawings:

1. Plain type, for support of nonrising type stem.
2. Complete with solid extension stem, operating nut, and stem guide brackets. Stem length as required to extend valve operating nut to within 3 inches of finish floor.
3. Stem Guide: Space such that stem L/R ratio does not exceed 200.

4. Anchor Bolts: Type 304 stainless steel.
5. Manufacturers and Products:
    a. Neenah Foundry; R 7506.
    b. Clow; No. F5690.

G. Chain Wheel and Guide where shown on Drawings:

1. Handwheel direct-mount type.
2. Complete with chain.
3. Galvanized or cadmium-plated.
4. Manufacturers and Products:
    a. Clow Corp.; Figure F-5680.
    b. Walworth Co.; Figure 804.
    c. DeZurik Corp.; Series W or LWG.

H. Cast-Iron Valve Box where shown on Drawings: Designed for traffic loads, sliding type, with minimum of 5-1/4-inch ID shaft.

1. Box: Cast iron with minimum depth of 9 inches.
2. Lid: Cast iron, minimum depth 3 inches locking type, marked WATER, or SEWER.
3. Extensions: Cast iron.
4. Two-piece box and lid for valves 4 inches through 12 inches, three-piece box and lid for valves larger than 12 inches with base sized for valve.
5. Valve extension stem for valves with operating nuts 3 feet or greater below finish grade.
6. Manufacturers and Products:
    a. East Jordan Iron Works; Cast-Iron Valve Boxes.
    b. Bingham & Taylor; Cast-Iron Valve Boxes.

I. Concrete Valve Box: Designed for traffic loads, sliding type, with minimum of 10-inch ID shaft.

1. Box: High-density, reinforced concrete, minimum depth 12 inches, cast-iron ring seat.
2. Lid: Cast iron, minimum depth 3 inches, marked WATER or SEWER.
3. Extensions: Concrete.
4. Manufacturers and Products:
    a. Christy Concrete Products; G Series.
    b. BES Concrete Products; G Series.

J. Indicator Post Assembly:

1. Cast or ductile iron post head, bell, and wrench with cast or ductile iron or steel barrel.

2. Plexiglas or equal protected window to indicate OPEN and CLOSED position.
3. Padlockable eye bolt for wrench.
4. Adjustable bury depth. Bury depth as required for valve installation.
5. UL Listed and FM Approved.
6. Manufacturers and Products:
    a. Clow; Style 2945.
    b. Mueller; A-20806.

PART 3 EXECUTION

3.1 INSTALLATION

A. Flange Ends:

1. Flanged valve bolt holes shall straddle vertical centerline of pipe.
2. Clean flanged faces, insert gasket and bolts, and tighten nuts progressively and uniformly.

B. Screwed Ends:

1. Clean threads by wire brushing or swabbing.
2. Apply joint compound.

C. PVC Valves: Install using solvents approved for valve service conditions.

D. Valve Installation and Orientation:

1. General:
    a. Install valves so handles operate from fully open to fully closed without encountering obstructions.
    b. Install valves in location for easy access for routine operation and maintenance.
    c. Install valves per manufacturer's recommendations.
2. Gate, Globe, and Ball Valves:
    a. Install operating stem vertical when valve is installed in horizontal runs of pipe having centerline elevations 4 feet 6 inches or less above finished floor, unless otherwise shown.
    b. Install operating stem horizontal in horizontal runs of pipe having centerline elevations greater than 4 feet 6 inches above finish floor, unless otherwise shown.
3. Eccentric Plug Valves:
    a. Unless otherwise restricted or shown on Drawings, install valve as follows:
        1) Liquids with suspended solids service with horizontal flow: Install valve with stem in horizontal position with plug up

when valve is open. Install valve with seat end upstream (flow to produce unseating pressure).

2) Liquids with suspended solids service with vertical flow: Install valve with seat in highest portion of valve (seat up).

3) Clean Liquids and Gas Service: Install valve with seat end downstream of higher pressure when valve is closed (higher pressure forces plug into seat).

4. Butterfly Valves:
   a. Unless otherwise restricted or shown on Drawings, install valve a minimum of 8 diameters downstream of a horizontal elbow or branch tee with shaft in horizontal position.
   b. For vertical elbow or branch tee immediately upstream of valve, install valve with shaft in vertical position.
   c. For horizontal elbow or branch tee immediately upstream of valve, install valve with shaft in horizontal position.
   d. When installed immediately downstream of swing check, install valve with shaft perpendicular to swing check shaft.
   e. For free inlet or discharge into basins and tanks, install valve with shaft in vertical position.
5. Check Valves:
   a. Install valve in accordance with manufacturer's instructions and provide required distance from immediate upstream fitting.
   b. Install valve in vertical flow (up) piping only for gas services.
   c. Install swing check valve with shaft in horizontal position.
   d. Install double disc swing check valve to be perpendicular to flow pattern when discs are open.
6. Solenoid Valves: Install in accordance with manufacturer's instructions.

E. Install line size ball valve and union upstream of each solenoid valve, in-line flow switch, or other in-line electrical device, excluding magnetic flowmeters, for isolation during maintenance.

F. Locate valve to provide accessibility for control and maintenance. Install access doors in finished walls and plaster ceilings for valve access.

G. Extension Stem for Operator: Where depth of valve operating nut is 3 feet or greater below finish grade, furnish operating extension stem with 2-inch operating nut to bring operating nut to a point within 6 inches of finish grade.

H. Torque Tube: Where operator for quarter-turn valve is located on floor stand, furnish extension stem torque tube of a type properly sized for maximum torque capacity of valve.

I. Floor Box and Stem: Steel extension stem length shall locate operating nut in floor box.

3.2 TESTS AND INSPECTION

A. Valve may be either tested while testing pipelines, or as a separate step.

B. Test that valves open and close smoothly under operating pressure conditions. Test that two-way valves open and close smoothly under operating pressure conditions from both directions.

C. Inspect air and vacuum valves as pipe is being filled to verify venting and seating is fully functional.

D. Count and record number of turns to open and close valve; account for discrepancies with manufacturer's data.

E. Set, verify, and record set pressures for relief and regulating valves.

F. Automatic valves to be tested in conjunction with control system testing. Set opening and closing speeds, limit switches, as required or recommended by Engineer.

G. Test hydrostatic relief valve seating; record leakage. Adjust and retest to maximum leakage of 0.1 gpm per foot of seat periphery.

3.3 MANUFACTURER'S SERVICES

A. All valves in this project require manufacturer's field services:

B. Manufacturer's Representative: Present at Site for minimum person-days listed below, travel time excluded:

1. Five person-days for installation assistance and inspection.
2. Three person-days for functional and performance testing and completion of Manufacturer's Certificate of Proper Installation.

END OF SECTION

SECTION 40 80 01
PROCESS PIPING LEAKAGE TESTING

PART 1 GENERAL

1.1 SUBMITTALS

A. Informational Submittals:

1. Testing Plan:
   a. Submit prior to testing and include at least the information that follows.
      1) Testing dates.
      2) Piping systems and section(s) to be tested.
      3) Test type.
      4) Method of isolation.
      5) Calculation of maximum allowable leakage for piping section(s) to be tested.
2. Certifications of Calibration: Testing equipment.
3. Certified Test Report.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 PREPARATION

A. Notify Engineer in writing **10** days in advance of testing. Perform testing in presence of Engineer.

B. Pressure Piping:

1. Install temporary thrust blocking or other restraint as necessary to protect adjacent piping or equipment and make taps in piping prior to testing.
2. Wait seven days minimum after concrete thrust blocking is installed to perform pressure tests. If high-early strength cement is used for thrust blocking, wait may be reduced to 3 days.
3. Prior to test, remove or suitably isolate appurtenant instruments or devices that could be damaged by pressure testing.
4. New Piping Connected to Existing Piping:
   a. Isolate new piping with grooved-end pipe caps, spectacle blinds, blind flanges, or as acceptable to Engineer.

C. Test section may be filled with water and allowed to stand under low pressure prior to testing.

D. Gravity Piping:

1. Perform testing after service connections, manholes, and backfilling have been completed between stations to be tested.
2. Pipe 42 Inches Diameter and Larger: Joint testing device may be used to isolate and test individual joints.

3.2 HYDROSTATIC TEST FOR PRESSURE PIPING

A. Fluid: Clean water of such quality to prevent corrosion of materials in piping system.

B. Exposed Piping:

1. Perform testing on installed piping prior to application of insulation.
2. Maximum Filling Velocity: 0.25 foot per second, applied over full area of pipe.
3. Vent piping during filling. Open vents at high points of piping system or loosen flanges, using at least four bolts, or use equipment vents to purge air pockets.
4. Maintain hydrostatic test pressure continuously for 120 minutes, minimum, and for such additional time as necessary to conduct examinations for leakage.
5. Examine joints and connections for leakage.
6. Correct visible leakage and retest as specified.
7. Empty pipe of water prior to final cleaning or disinfection.

C. Buried Piping:

1. Test after backfilling has been completed.
2. Expel air from piping system during filling.
3. Apply and maintain specified test pressure with hydraulic force pump. Valve off piping system when test pressure is reached.
4. Maintain hydrostatic test pressure continuously for four (4) hours minimum, reopening isolation valve only as necessary to restore test pressure.
5. Determine actual leakage by measuring quantity of water necessary to maintain specified test pressure for duration of test.
6. Maximum Allowable Leakage:

$$L = \frac{SD(P)^{1/2}}{148{,}000}$$

where:

L = Allowable leakage, in gallons per hour.
S = Length of pipe tested, in feet.
D = Nominal diameter of pipe, in inches.
P = Test pressure during leakage test, in pounds per square inch.

7. Correct leakage greater than allowable, and retest as specified.

3.3 PNEUMATIC TEST FOR PRESSURE PIPING

A. Do not perform on:

1. PVC pipe.
2. Piping larger than 24 inches.
3. Buried and other non-exposed piping.

B. Fluid: Oil-free, dry air.

C. Procedure:

1. Apply preliminary pneumatic test pressure of 25 psig maximum to piping system prior to final leak testing, to locate visible leaks. Apply soap bubble mixture to joints and connections; examine for leakage.
2. Correct visible leaks and repeat preliminary test until visible leaks are corrected.
3. Gradually increase pressure in system to half of specified test pressure. Thereafter, increase pressure in steps of approximately one-tenth of specified test pressure until required test pressure is reached.
4. Maintain pneumatic test pressure continuously for minimum of 10 minutes and for such additional time as necessary to conduct soap bubble examination for leakage.
5. Correct visible leakage and retest as specified.

D. Allowable Leakage: Piping system, exclusive of possible localized instances at pump or valve packing, shall show no visual evidence of leakage.

E. After testing and final cleaning, purge with nitrogen those lines that will carry flammable gases to assure no explosive mixtures will be present in system during filling process.

3.4 HYDROSTATIC TEST FOR GRAVITY PIPING

A. Testing Equipment Accuracy: Plus or minus ½ gallon water leakage under specified conditions.

B. Maximum Allowable Leakage: 0.16 gallon(s) per hour per inch diameter per 100 feet. Include service connection footage in test section, subjected to minimum head specified.

C. Gravity Sanitary and Roof Drain Piping: Test with 15 feet of water to include highest horizontal vent in filled piping. Where vertical drain and vent systems exceed 15 feet in height, test systems in 15-foot vertical sections as piping is installed.

D. Exfiltration Test:

1. Hydrostatic Head:
   a. At least 6 feet above maximum estimated groundwater level in section being tested.
   b. No less than 6 feet above inside top of highest section of pipe in test section, including service connections.
2. Length of Pipe Tested: Limit length such that pressure on invert of lower end of section does not exceed 30 feet of water column.

E. Infiltration Test:

1. Groundwater Level: At least 6 feet above inside top of highest section of pipe in test section, including service connections.

F. Piping with groundwater infiltration rate greater than allowable leakage rate for exfiltration will be considered defective even if pipe previously passed a pressure test.

G. Defective Piping Sections: Replace**,** and retest as specified.

3.5 PNEUMATIC TEST FOR GRAVITY PIPING

A. Equipment:

1. Calibrate gauges with standardized test gauge provided by Engineer at start of each testing day. Engineer will witness calibration.
2. Install gauges, air piping manifolds, and valves at ground surface.
3. Provide pressure release device, such as rupture disc or pressure relief valve, to relieve pressure at 6 psi or less.
4. Restrain plugs used to close sewer lines to prevent blowoff.

B. Procedure:

1. Require that no person enter manhole where pipe is under pressure.
2. Slowly introduce air into pipe section until internal air pressure reaches 4 psi greater than average back pressure of groundwater submerging pipe.
3. Allow 2 minutes minimum for air temperature to stabilize.

C. Allowable Leakage: Test section will be considered defective when time required for pressure to decrease from 3.5 psi to 2.5 psi greater than average back pressure of groundwater submerging pipe is less than that computed using values from following table:

Table 1*

A Pipe Diameter (Inches)	B Time per Foot up to Length in Col C (Seconds)	C Test Length (Feet)	D Test Time for any Length Between Col C & E (Min:Sec)	E Length at Which Time in Col F Applies (Feet)	F Time per Foot for Total Length (Seconds)
4	0.18	636	1:54	1,114	0.10
6	0.40	424	2:50	743	0.23
8	0.71	318	3:47	557	0.41
10	1.11	255	4:43	446	0.63
12	1.60	212	5:40	371	0.91
15	2.50	170	7:05	297	1.42
18	3.62	141	8:30	248	2.06
21	4.92	121	9:55	212	2.81
24	6.42	106	11:20	187	3.67

Example: 15-inch diameter pipe:
For 150 feet, T = 2.50 sec (Col B) x 150 ft = 375 sec = 6:15
For 250 feet, T = 7:05 (Col D)
For 500 feet, T = 1.42 sec (Col F) x 500 ft = 710 sec = 11:50

*Based on 0.003 cfm per square foot with a minimum significant loss of 2 cfm and a maximum loss of 3.5 cfm.

D. Piping with groundwater infiltration rate greater than allowable leakage rate for exfiltration will be considered defective even if pipe previously passed a pressure test.

E. Defective Piping Sections: Replace and retest as specified.

3.6 FIELD QUALITY CONTROL

A. Test Report Documentation:

1. Test date.
2. Description and identification of piping tested.
3. Test fluid.
4. Test pressure.
5. Remarks, including:
   a. Leaks (type, location).
   b. Repair/replacement performed to remedy excessive leakage.
6. Signed by Contractor and Engineer to represent that test has been satisfactorily completed.

END OF SECTION

SECTION 40 90 00
INSTRUMENTATION AND CONTROL

PART 1 GENERAL

1.1 WORK OF THIS SECTION

A. The Work of the following Divisions and Sections applies to the Work of this Section. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this Work.

1. Section 01 33 00, Submittal Procedures.
2. Division 26, Electrical.
3. Division 40, Process Integration.

B. The Work of this Section includes the general specification and requirements for the Instrumentation and Control (I&C) Work under this, and other applicable Specifications, including providing instrumentation and all related wiring as shown in these Contract Documents and Drawings. Detailed scope, and quantities are shown in Section 40 90 03, General Requirements, and Section 40 90 07, Scope of Work.

C. The Contractor shall be responsible for the design, procurement, installation, testing, training, and documentation for I&C systems provided under this Contract in accordance with this Section and Section 40 90 07, Scope of Work. A Distributed Control System (DCS), when applicable, as specified in Section 40 90 03, General Requirements, will be provided by the City's DCS provider, Emerson Process Management (EPM). The Contractor shall be responsible for terminating and integrating all I&C equipment with the EPM DCS systems.

1.2 SCOPE

A. The intent of this Section is that the Contractor will provide a complete and operational, turn-key, integrated I&C system, including all instrumentation and equipment as shown on Drawings and as specified herein.

B. The Contractor shall furnish all materials, tools, equipment, consumables and supplies and shall perform all labor required to complete the work in this Section.

1.3 REFERENCE, CODES AND STANDARDS

A. Except as otherwise indicated, the current editions of the following apply to the Work of this Section:

1. ANSI/ASME B16.5, Pipe Flanges and Flanged Fittings.
2. API RP-550, Manual on Installation of Refinery Instruments and Control Systems, Part 1 - Process Instrumentation and Control Sections 1 through 13.
3. ASTM A105, Specification for Forgings, Carbon Steel for Piping Components.
4. ASTM A193, Specification for Alloy Steel and Stainless Steel Bolting Materials for High Temperature Service.
5. ASTM A194, Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure and High Temperature Service.
6. ASTM A283, Specification for Low and Intermediate Tensile Strength Carbon Steel Plates, Shapes, and Bars.
7. ASTM A312, Stainless Steel Piping.
8. ISA-RP60.6, Nameplates, Labels, and Tags for Control Centers.
9. ISA-RP7.1, Pneumatic Control Circuit Pressure Test.
10. ISA-RP12.6, Installation of Intrinsically Safe Systems for Hazardous (Classified) Locations.
11. ISA-S5.1, Instrument Symbols and Identification.
12. ISA-S5.4, Instrument Loop Diagrams.
13. ISA-S12.4, Instrument Purging for Reduction of Hazardous Area Classification.
14. ISA-S20, Specification Forms for Process Measurement and Control Instrumentation; Primary Elements and Control Valves.
15. ANSI B16.1, Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250, and 800.
16. ANSI/AWWA C207, Steel Pipe Flanges for Waterworks Service - Sizes 4 In Through 144 In.
17. ANSI/AWWA C701, Cold-Water Meters - Turbine Type for Customer Service.
18. ANSI/AWWA C702, Cold-Water Meters - Compound Type.
19. AWWA C704, Cold-Water Meters - Propeller Type for Main Line Applications.
20. ASTM A126, Specification for Gray Iron Castings for Valves, Flanges and Pipe Fittings.
21. ASTM B61, Specification for Steam or Valve Bronze Castings.
22. ANSI/AWWA, Ductile-Iron and Gray-Iron Fittings, 3-In Through C110/A21.10 48-In for Water and Other Liquids.
23. ASME REPORT Fluid Meters, Sixth Edition, 1971.

B. Work of this Section shall comply with the current editions of the following codes as adopted by the City of San Diego Municipal Code:

1. Uniform Fire Code.
2. National Electrical Code: NFPA 70
3. National Fire Protection Association: NFPA 70E.

C. UL: All I&C and instrument equipment furnished in this Section shall be listed by and shall bear the label of UL or of an independent testing laboratory acceptable to the City of San Diego (City).

D. No exposed voltage that would require PPE or work permits will be allowed.

1.4 SUBMITTALS

A. General:

1. All submittals shall be provided in accordance with Section 01 33 00, Submittal Procedures, as a minimum, and in accordance with specialty submittal requirements below.
2. All submittal of this section shall be provided with six hard copy and one soft copy [CD].
3. Submittals of this section shall be in Adobe Acrobat PDF format, unless otherwise specified. Vendor and Contractor shop drawings developed under this section shall be in Bentley Microstation (.dgn) format, utilizing monochrome.
    a. Documents not available in electronic format shall be scanned at 600 dpi, black and white) for documents without graphics, or color for documents with graphics and converted to Adobe Acrobat (PDF).
4. Operations and Maintenance (O&M) Submittal Requirements of this Section:
    a. Preliminary Submittal: Where required by Specification, two hard copies, and one PDF of the preliminary submittals shall be provided to the City's representative for review.
    b. Final Submittal: All Submittal documents in this section, including design and O&M documents, shall be provided on two CD's; One CD shall provide documents in native format (e.g. Microstation, MS Word, MS Excel, etc.), and the other CD shall provide documents in PDF format. Both CD shall use the same file naming convention, except that the suffixes shall be different (e.g. PDF, XLS, etc.).
    c. Each document shall be indexed, and a database table in Excel shall be provided, which includes the following data for each document:
        1) Document file name.
        2) Document description.
        3) Hard Copy Catalog No. (used by facility document coordinator).
        4) Document Type:
            a) Shop Drawings:
                (1) P&IDs.

(2) Loop Drawings.
(3) Instrument Data Sheets.
(4) Other.

b) Manufacturer's data.
c) Maintenance instructions.
d) Training.

5) Facility Name.
6) Specification Number.
7) Process Name.
8) Unit Process Number.

d. Provide a 4 set of CDs/USB drive containing PCM software, HMI screens and all Emerson provided files to maintain and update DCS.

e.

B. Presubmittal Conference:

1. The Contractor shall arrange and conduct a Presubmittal Conference within 60 days after award of the Contract. The purpose of the Presubmittal Conference is to review and approve the manner in which the Contractor intends to carry out Contractor's responsibilities for shop drawing submittal on the Work to be provided under this Section. The Contractor and the City Representative shall attend. Both the Contractor and the City Representative may invite additional parties at their discretion.
2. The Contractor shall allot a minimum of two 8-hour days for the Conference.
3. The Contractor shall prepare the following for discussion at the Conference:
   a. List of equipment and materials for the instrumentation and I&C systems, including proposed manufacturer names and model numbers.
   b. List of proposed clarifications to the indicated requirements plus a brief written explanation of each exception. Review and acceptance of proposed clarifications will be according to Section 01 33 00, Submittal Procedures.
   c. One complete example of each type of submittal proposed.
   d. A flow chart showing the steps the Contractor will take in preparing and coordinating each submittal to the City's Representative.
   e. A Gant-Chart type schedule for the Work provided under this Section, covering the time period beginning with the conference and ending after startup and acceptance. Dates for the beginning and ending of submittal preparation, submittal review periods, design, fabrication, programming, factory testing, delivery to the site, installation, field testing, and training shall be scheduled. The

schedule shall be subdivided into major items or groups of items which are on the same schedule.

4. The Contractor shall take formal minutes of the Presubmittal Conference, including all events, questions, and resolutions. Minutes shall be distributed to the City's Representative within 48 hours after the meeting.
5. The Contractor shall prepare a formal 'sign-in sheet for the pre-submittal meeting that captures the name, telephone number, affiliation/title and email address for each participant. Contractor shall deliver a copy of the sign-n sheet with the 'Minutes' as required above.

C. Informational Submittals:

1. Submittal List: The Contractor shall develop and deliver a detailed list of all submittals required by the specification, as well as all additional Submittal he/she envisions. This should be inclusive of Instruments and I&C hardware, software, reports, plans, status of schedules, testing documents and relevant maintenance documentation and forms.
2. I&C Schedule: Within 60 days of Contract NTP the Contractor shall develop and deliver a detailed base-line schedule for the Instrumentation and I&C disciplines of the Project. The base-line schedule shall reference each submittal shown on the 'Submittal List', as well as all design, engineering, fabrication, delivery, installation, testing and acceptance elements related to Instrumentation and I&C Work.
    a. The base-line schedule shall be prepared utilizing Primavera P6, or other project controls software standards that the city may direct.
    b. The base-line schedule shall ensure that each activity is tied to all appropriate predecessor(s) and successor(s) activities.
    c. 'Float' contained within the schedule shall be 'owned' by the City. Contractor utilization of schedule float is at the discretion of the City and the City may, at its sole discretion, require 'schedule recovery' efforts to regain float, to maintain Project delivery, if the City deems Contractor use of the float as deleterious to the Project.
    d. Contractor shall allocate a minimum of 1 day to present and explain the base-line schedule to the City's representative.
    e. The City will review, and approve, the Contractor's base- line schedule, and Contractor shall not proceed with any of the Work of this section until he has obtained Instrumentation and I&C schedule approval.
    f. The 'approved' base-line schedule shall be 'statused' and submitted to the City, no later than the fifth workday of each month, following the Work status period.

3. Shop Drawings: The Contractor shall submit a sample of each ‘type’ of Shop Drawing that Contractor anticipates for the Project.
4. Loop Drawings: The Contractor shall submit a sample for each ‘type’, Analog, Discrete and Foreign Device Interface (Data link), Loop Drawings.
    a. The Sample Loop Drawings will utilize a City Standard format which will be provided to the Contractor after Contract NTP. The loop drawing and DCS standards are available on the City’s website under the Clean Water Operations Management Network (COMNET) Project Standards and Procedures Manual webpage. The purpose of this is to prove that the Contractor understands the various steps necessary to deliver a final, as- constructed, set of Loop Drawings to the City.
5. Training Submittal: The Contractor shall submit a sample of a training syllabus, and his training Plan for each piece of Instrumentation and I&C and DCS system components and software.

D. Action Submittals:

1. General: The Contractor shall be responsible for providing instrument and I&C Submittals to be used in the generation of control-panel wiring diagrams and Loop Drawings which depict the interconnection between instruments, panels, valve actuators, MCCs, and the DCS.
2. Shop Drawings:
    a. Preparation of Shop Drawings shall not commence until completion of the Presubmittal Conference.
    b. Preliminary Shop Drawings shall be submitted as a single package at one time not later than 90 days after NTP.
    c. All systems, meters, instruments, and other elements shall be represented by symbology derived from the latest version of ANSI/ISA S5.1 and in accordance with Contract Documents and Drawings. The ISA nomenclature and numbers indicated herein shall be used exclusively in all Shop Drawings. No manufacturer's standard symbology or nomenclature shall replace those indicated in the Contract Documents.
    d. During Shop Drawing development, the Contractor shall maintain a direct, informal liaison with the City’s Representative, identified at the presubmittal conference, for exchange of technical information. As a result, certain minor refinements and revisions to the indicated systems may be authorized informally by the City’s Representative. However, these shall not alter the Work of this section and shall not cause increase or decrease in the Contract Price. No statement or direction by the City’s Representative shall be construed as approval of any component or method, or exception to, or deviation from these Contract Documents.

e. All Shop Drawings shall include the letterhead or title block of the Contractor. The title block shall include, as a minimum, the Contractor registered business name and address, project name, drawing name, revision level, and personnel responsible for drawing development and the name of the QA/QC reviewer.
    1) Shop drawing copies shall be submitted as standard size 3-ring, loose-leaf, vinyl plastic binders suitable for bookshelf storage.
    2) A complete index shall be placed at the front of each binder. All sections indexed shall be separated by Alpha-Numeric Tabs that match the index.
    3) A separate technical brochure or bulletin shall be included for each instrument, meter system, and other element. The brochures shall be indexed by systems or loops. If, within a single system or loop, a single item is employed more than once, one brochure may cover all identical uses of that item in the system. Each brochure shall include a list of tag numbers to which it applies. System groups shall be separated by labeled tags.

3. Loop Drawings:
    a. Contractor is responsible for the overall development, coordination efforts and final delivery of Loop Drawings. Special requirements are outlined below.
    b. Loop Diagrams: Loop diagrams shall be submitted in accordance with Section 01 33 00, Submittal Procedures, and the special requirements of this section. All Loop Drawings will conform to ISA 5.4 to verify DCS interface with all instrumentation and devices provided or installed under the project. The loop diagrams shall also define all interfaces with equipment provided by skid-mounted for Foreign Device interfaces.
    c. Loop Drawings shall be developed utilizing a three-sheet format. A sample of the City's Standard three-sheet format will be provided to the Contractor after NTP. The following three- sheet format is required:
        1) Sheet 1: Provide a device schedule developed from an electronic spreadsheet or database file, which will be submitted with the loop diagrams. The table will show the following:
            a) Device tag number, with Prefix, Unit Process, ISA Tag Prefix, Tag No. (a three or four-digit number based on the loop number) and Tag suffix.
            b) Equipment Service.
            c) Device Type.
            d) Location.
            e) Device Manufacturer.

f) Model No.
g) Spec. No.
h) Area Contractor (if applicable.
i) Submittal No.
j) Calibrated Range/Remarks.
k) Data Sheet No.
l) I/O Signal type (AI, AO, DI, or DO).
m) Signal Level.
n) Device Range (full available instrument range).
o) Engineering Units.
p) Process Set Point.
q) Loop Diagram No., reflecting the field instrument tag number.
r) Loop Drawing File Name.
s) Interconnect Drawing File Name.

2) Sheet 2: Loop Drawing meeting the Requirements of ANSI/ISA S5.4, except that intermediate terminal junction boxes may be omitted, and shall be shown on Page 3 for clarity. Butt splices and wire nuts shall be shown on as-builts, with the corresponding termination housing (JB, LB, etc. shown on Sheet 3. Datalinks, third-party I/O, and bus connections shall also be shown.
3) Sheet 3: (Expansion sheet - required if the number of intermediate devices or terminal junction boxes exceeds what can be legibly shown on Sheet 2). Abbreviated diagram showing instrument, wire and cable numbers, intermediate terminal junction boxes, and PCM terminations. Wire identification numbers will reflect the field instrument tag number, and not the DCS I/O number.
4) DCS I/O tag numbers will generally reflect the device tag number. Each I/O tag number will be unique. The tag prefix will be based on ISA-5.4, with the following additional special acronyms:

Acronym	Signal Use
YL	Ready Signals/ Status
ZL	In Computer status
ZSO	Device Open
ZSC	Device Closed
YL	Motor Run
HS	Equipment Start/Stop

d. The Contractor in concert with his I&C subcontractor shall be responsible for the preliminary development of all Loop

Drawings, in the format specified. The Contractor will develop a 'draft' of each loop drawing.

e. The Contractor will then coordinate with the DCS Controls Programmer (DCSCP), delivering draft loop drawings to the DCSP, who shall be responsible to filling out all the DCS-related addressing, software level Information, DCS termination numbering, etc.

f. The Contractor will then receive the draft loop drawings from the DCSP, and the Contractor shall finalize all Loop Drawings in Microstation. Contractor shall ensure that all 'as- constructed' information (such as I/O wiring being re-addressed at the DCS) has been incorporated onto the finalized loop drawings.

g. The Contractor shall deliver the finalized loop drawings to the project Design Engineer. The Design Engineer is responsible for Quality Assurance/Quality Control of the final loop drawings, and shall check all loop drawings against design P&IDs, electrical design, and Contractor's field as-constructed drawings. Contractor is responsible for all co-ordination with the Design Engineers and shall incorporate all changes and corrections required by the Design Engineer.

h. Contractor shall prepare and deliver all loop drawing packages in accordance with these specifications. Note: All Loop Drawings shall be submitted to the City's representative, prior to the start of any DCS cutover.

i. The City's representative will review and approve the Loop Drawing Submittal in accordance with Section 01 33 00, Submittal Procedures. The Contractor is responsible for making all changes and annotation to the final loop drawings, as may be dictated during the various testing procedures. Red-line mark-up of all annotated loop drawings shall be delivered to the City's representative at the conclusion of DCS testing activities.

4. Instruments and I&C Devices: For all Instruments and I&C devices provided under this section Contractor shall submit Technical brochures, bulletins and data sheets containing:

   a. Fully completed ISA S20 data sheets.
   b. Component functional descriptions.
   c. Locations or assembly at which component is to be installed.
   d. Materials of a component's parts which will be in contact with process fluids or gases.
   e. Instrument Factory Calibration Sheets: Where an instrument is of necessity, precalibrated at the factory, the Contractor shall submit all Factory Calibration Sheets to the City's representative immediately upon arrival.
   f. Instrument Bench Calibration Sheets: Contractor shall submit the calibration plan for bench calibration of each type of instruments.

Upon approval of the Bench Calibration Plant by the City, Contractor shall coordinate and commence Bench Calibration of all instruments, other than those containing Factory Calibration. Bench Calibration of Instruments will be witnessed by the City's representative, who may at his sole discretion, provide Contractor a waiver of witnessing. Upon completion of bench calibration Contractor shall submit Calibration Sheet documentation and shall affix calibration stickers to each instrument, indicating date of calibration and initials of person performing calibration.

5. Panels, Local Control Panels. Contractor shall supply:
   a. Schematic and wiring diagrams for control circuits shall be submitted in two stages. Initially, schematic control diagrams shall show complete details on the circuit interrelationships of all devices within and outside each Control Panel. Subsequent to acceptance of all schematic control diagrams, by the City's representative, piping and wiring diagrams shall be submitted. The diagrams shall consist of component layout drawings to scale, showing numbered terminals on components together with the unique number of the wire to be connected to each terminal.
   b. Piping and wiring diagrams shall show terminal assignments from all primary measurement devices, such as flow meters, and to all final control devices, such as pumps, valves, chemical feeders and local control panels. Wiring diagrams shall include MCC Panel, circuit, and breaker number for each power feed.
   c. Assembly and construction drawings for each Panel and Local Control Panel type. These drawings shall include dimensions, identification of all components, surface preparation and finish data, and nameplates. These drawings also shall include enough other details, including prototype photographs, to define exactly the style and overall appearance of the assembly; a finish treatment sample shall be included.
   d. Installation, mounting, and anchoring details for all components and assemblies to be field-mounted, including conduit connection or entry details. Where applicable and required by Code, Contractor shall include seismic calculations for the panel assembly and mounting, which shall be stamped by a California registered structural engineer.
   e. Complete control panel layouts, all drawn to a 1-1/2 inch equals 1 foot scale showing.
      1) Physical arrangements which define and quantify the physical groupings of annunciators, hand-stations, recorders, indicators, pilot lights and all other instrumentation devices associated with control panel sections, auxiliary panels, subpanels and racks.
      2) All cutout locations fully dimensioned. All outside panel dimensions shall be shown.

3) Locations of back-of-panel stiffeners.
4) Terminal point locations for all panel and back-of-panel piping and wiring connections. Terminations shall be coded with identifiers for wiring and piping connections for all electric, hydraulic and pneumatic terminations.

f. Contractor shall submit a complete Nameplate engraving list, annotating the size of each engraved plate, the material, font size, color and attaching methodology. [Note: Adhesive-backed mount is to be avoided, except in those cases where screw mounting is not possible.

g. A complete and detailed bill of material list shall be submitted for each field mounted device or assembly as well as cabinet assemblies and subassemblies. Bills of material shall include all items within an enclosure. An incomplete submittal shall be rejected and no further evaluation performed until a complete and detailed bill of material is submitted.

1.5 OWNER'S MANUAL

A. The Owner's Manual shall be submitted in both paper and electronic format. Electronic format shall conform to the Electronic Document Submittal Requirements for Shop Drawings.

B. Information included in the Owner's Manual shall comply with the requirements of Section 01 33 00, Submittal Procedures, with the following exceptions:

1. Two copies of the Owner's Manual shall be submitted after acceptance of all submittals. One set will be returned to the Contractor with comments.
2. Final copies of the Owner's Manual, after revision, shall be submitted to the City's representative 15 days prior to startup.

C. The following shall be included in the Owner's Manual in accordance with Section 01 33 00, Submittal Procedures.

1. Installation, connection, operating, troubleshooting, maintenance, and overhaul instructions from the manufacturer.
2. Exploded or details views of all instruments, assemblies, and accessory components.
3. Parts lists and ordering instructions.
4. Wiring diagrams.
5. A list of spare parts for 1 year operation recommended by the manufacturers of all DCS and analog equipment.
6. As-Built Drawings.

1.6 AS-BUILT DRAWINGS

A. As-built drawings shall be prepared in accordance with Section 01 33 00, Submittal Procedures, with the following exceptions and changes:

1. The Contractor shall keep current an approved set of complete loop diagrams and schematic diagrams which shall include all field and panel wiring, all piping and tubing runs, all routing, all mounting details, all point-to-point diagrams with cable, wire, tube and termination numbers. These drawings shall include all instruments and all instrument elements for the complete instrument loop as provided under equipment and electrical requirements of this Contract.
2. Two copies of each as-built drawing under this Section shall be submitted to the City's representative after completion of field checkout but before placing the systems in service for the Owner's use.
3. Drawings shall also be submitted in electronic format (Microstation) and in PDF.

1.7 SERVICES OF MANUFACTURER

A. Calibration, Testing and Startup: A technical service representative of the manufacturer shall visit the site and perform the following on all flow meters and analyzers.

1. Inspection, checking and calibrating the equipment.
2. Startup and field testing for proper operation.
3. Performing field adjustments to ensure that installation and operation comply with the Specifications.

B. Instruction of Owner's Personnel: The manufacturer's technical service representative shall instruct the Owner's personnel as indicated in Article Installation, Calibration, Testing, Precommissioning, Startup and Instruction.

1.8 SPECIAL GUARANTEE

A. The Contractor shall guarantee the Work of this section for 2 years following final acceptance of the Work. In making any warranty repairs, the Contractor shall utilize technical service personnel designated by the manufacturer of the failed device. Repairs shall be completed within 5 days after written notification by the Owner.

1.9 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Delivery of Materials: Products delivered to the site for incorporation into the Work of this Section shall be delivered in original, unbroken packages, containers, or bundles bearing the name of the manufacturer.

B. Storage: Products shall be carefully stored in a manner that will prevent damage and in an area that is protected from the elements.

1.10 ENVIRONMENTAL CONDITIONS

A. General: All instrumentation and control system components and associated wiring shall be suitable for use in a treatment facility environment where there may be high energy ac fields, dc control pulses, and varying ground potentials between transducers and system components. The system design shall be adequate to provide proper protection against interferences from all such possible situations.

B. Field Situated Equipment: All devices shall be designed to exist in environments rated (G2)(G3)(GX) per ISA S71.04. The system design shall be adequate to provide proper protection the environment typically associated with these facilities. As a minimum, the instrumentation and control systems shall be designed and constructed for satisfactory operation and low maintenance requirements under the following environmental conditions:

1. Temperature Range: 0 through 50 degrees C (32 through 122 degrees F).
2. Thermal Shock: 0.55 degrees C per minute (1.0 degrees F per minute).
3. Relative Humidity: 20 percent through 95 percent (noncondensing).

C. Control Room Situated Equipment: Control rooms shall be air conditioned to achieve the environmental noted in item B herein. (No positive control of relative humidity is provided.) In the event of a failure of the air conditioning system, all components of the instrumentation and control system shall be rated to operate in an environment where the ambient temperature is 15 degrees C through 35 degrees C (59 degrees F through 95 degrees F) and the relative humidity is 20 percent to 95 percent (noncondensing).

D. Noise Tolerance: The instrumentation and control system components shall not exceed a dB level of 55 when monitored 3 feet away from the devices. If upon testing it is found that this limit is exceeded at the option of the City's representative and at no additional cost to the Owner, devices shall be replaced in order to achieve a maximum level of 55 dB or sound absorption materials shall be added.

1.11 CABLE NUMBERING

A. The first two characters denote the facility or area number.

B. The second group of characters identifies the device being served (field device).

C. The third section uses one of the four suffixes in the table below. Where multiple circuits of the same type are routed to the same endpoint, the suffix will be P1, P2, as required.

D. At each device or termination point, the circuit identification number is appended with the individual wire number. For Direct-Current (DC) circuits only, wire polarity is shown in parentheses as (+) or (-).

E. Spaces are not allowed, and letters are case-sensitive, written in upper case.

Suffix	Circuit Type	Example
(A)	24V dc analog (4 to 20 mA)	01FIT022(A)-1(+)
(C)	120V ac control	05P320(C)-2
(D)	24V dc digital status or control	55LSH201(D)-1(+)
(P)	Power (120-volt, 480V, 5 kV, 15 kV, etc.)	01MCC6101(P)-2

PART 2 PRODUCTS

2.1 GENERAL

A. All meters, all instruments, and all other components shall be of the most recent field- proven models marketed by their manufacturers at the time of submittal of the shop drawings unless otherwise indicated.

B. Panel mounted instruments shall have matching style and general appearance. Instruments performing similar functions shall be of the same type, model, or class, and shall be of one manufacturer.

C. Outdoor instrumentation shall be suitable for operation in the ambient conditions at the equipment installation locations. Heating, cooling, and dehumidifying devices shall be incorporated with the outdoor instrumentation in order to maintain it within its rated environmental operating ranges. The Contractor shall provide all power wiring for these devices. Outdoor enclosures suitable for the environment shall be provided.

D. All instrumentation in hazardous areas shall be intrinsically safe or be approved for use in the particular hazardous classification in which it is to be installed.

E. Mercury switches and components containing liquid mercury shall not be used.

F. Analog measurements and control signals shall be electrical and shall vary in direct linear proportion to the measured variable, except as indicated.

G. Electrical signals outside control board(s) shall be 4 mA dc to 20 mA dc except as noted. Analog instruments shall be provided with Highway Addressable Remote Transducer (HART) Protocol.

H. The accuracy of each instrumentation system or loop shall be expressed as a probable maximum error; this shall be the square-root of the sum of the squares of certified "accuracies" of the designated components in each system, expressed as a percentage of the actual span or value of the measured variable. Each individual instrument shall have a minimum accuracy of plus or minus 0.5 percent of full scale and a minimum repeatability of plus or minus 0.25 percent of full scale unless otherwise indicated. Instruments which do not conform to or improve upon these criteria are not acceptable.

I. Control panels shall be provided with redundant power supplies which are configured in a fault-tolerant manner to prevent interruption of service upon failure and interruption of service necessitated by the replacement of a power supply. All power supplies shall have an excess rated capacity of 40 percent. The failure of a power supply shall be annunciated locally and shall generate an alarm to the DCS.

2.2 CONTROL PANELS

A. General: Control Panels shall minimize the use of PLC's as it is the intent of the City to maximize the use of the DCS as the primary control system. PLC's may be used where 'package system' vendors require PLC use to provide warranty and support of their system. Where PLC's are utilized, they shall conform to the Allen Bradley ControlLogix or CompacLogix standards of the City.

1. When PLCs are utilized the Contractor shall interface the 'Package system' PLC to the DCS via TCP/IP using the Ethernet I/P protocol or Modbus protocol.

B. Control Panels shall be provided in accordance with Section 40 95 13 – Field Cabinetry.

2.3 GENERAL INSTRUMENTATION ENCLOSURE COMPONENTS

A. Signal Isolators, Converters, and Power Supplies: Signal isolators shall be provided in each measurement and control loop, wherever required, to match adjacent component impedances, or where feedback paths may be generated or to maintain loop integrity when the removal of a component of a loop is required. Signal converters shall be provided where required to resolve any signal incompatibilities. Signal power supplies shall be provided to supply sufficient power to each loop component.

B. General Purpose Relays: General purpose relays in the Control Panels shall be plug-in type with contacts rated 10 amperes at 120V ac; quantity and type of contacts shall be as indicated. Each relay shall be enclosed in a clear plastic heat and shock resistant dust cover. Sockets for relays shall have screw type terminals.

C. Time Delay Relays: Time delay relays shall be electronic on-delay or off-delay type with contacts rated 10 amperes at 120V ac. Units shall include adjustable dials with graduated scales covering the indicated time range.

D. Slave Relays: Slave relays shall be provided when the number or type of contacts indicated exceed the contact capacity of the indicated relays and timers.

E. Circuit Breakers: Circuit breakers shall be single pole, 120-volt, 15-ampere rating or as required to protect wiring and equipment. Circuit breakers shall be mounted inside the panels as shown.

2.4 FIELD INSTRUMENTATION

A. Provide components that are listed in the Instrument List in Article Supplements at the end of this Section. Specific component requirements are defined in the Instrument Data Sheets at the end of this Section.

B. First Named Manufacturer: I&C design is based on the listed first names manufacturers of equipment, materials, and software.

1. If an item is proposed from other than first named manufacturer, obtain approval from Engineer for such changes.
2. If proposed item requires, but not limited to, different installation, wiring, raceway, enclosure, intrinsically safe barriers, and accessories, provide such equipment and work.

2.5 CONTROL PANEL INSTRUMENTATION

A. Digital Indicators:

1. Digital indicators shall be self-contained instruments that display process signals directly in engineering units. The unit shall be suitable for panel mounting and shall utilize an LED display where numerals are no less than 0.5 inch height.
2. The input signal to the digital process indicator shall be 4 mA to 20 mA dc or 1 to 5V dc. The input sample rate of the unit shall be a minimum of 2 per second. The unit shall have an auto-zeroing feature and shall have provisions for field adjustable scaling and offset. Accuracy shall be plus or minus 1 least significant digit. Input power to the digital indicator shall be 120V ac, 60-Hz.

B. Current Alarm Trip Switches: Current alarm trips shall be single or dual type as indicated. Units shall accept voltage or current input signals. Dead bands shall be factory set at 1.0 percent of full span for dual trips and adjustable over 100 percent of span for single trips. Alarm trips shall be equipped with 10A DPDT contacts. Alarm trips shall include setpoint dials calibrated 0 percent to 100 percent for each trip point. Single alarm trips shall include a dead band adjustment dial calibrated 0 percent to 100 percent.

C. Selector and Pushbutton Switches: Selector and pushbutton switches shall be rated 10A at 600 volts, shall be heavy-duty, oil-tight, and shall have the number of positions and poles indicated. Operators shall be corrosion resistant.

D. Indicating Lights: Indication lights shall be incandescent push-to-test type and shall be heavy-duty, oil-tight. Each light shall have a screwed-on glass prismatic lens approximately 1-inch in diameter. Each light shall have a factory-engraved legend plate as indicated. Indicating lights shall be 120V ac type with transformers for use with 6.3-volt lamps.

2.6 PROGRAMMABLE LOGIC CONTROLLER (PLC)

A. Where required, the Contractor shall furnish, install, program, test, calibrate, fully configure and place into operation Programmable Logic Controllers (PLCs) as specified herein. These requirements also pertain to all PLCs provided under package system specifications and within the electrical specifications.

B. The PLC's shall be in compliance with Specification Section 40 94 43 – Programmable Logic Controllers.

C. General: The Contractor shall furnish all necessary interconnecting cables, all accessories, and all appurtenances as indicated herein or as required for proper operation of the system. All major PLC components of the system shall be of the same manufacturer and PLC family product line. All equipment shall be housed in an enclosure or control panel suitable for the intended operation and location. The PLC system shall be capable of tolerating and capable of riding through a power interruption of 8 milliseconds or less without interruption of normal operation. The PLC system shall be Allen Bradley Controllogix or Compactlogix to match existing.

PART 3 EXECUTION

3.1 INSTALLATION

A. The Contractor shall employ installers who are skilled and experienced in the installation and connection of all elements, all instruments, all accessories, and all assemblies provided under this Contract.

B. The Contractor shall install all instruments according to the manufacturer's installation instructions and the following:

1. Perform field engineering as required for mounting and supporting all field mounted components.
2. Prepare any additional schematic and interconnection diagrams required for installation.
3. Assemble and interconnect instrument components disconnected for shipping purposes.
4. Remove all temporary supports, bracing, and padding inserted in instrument control panels and other equipment to prevent damage during shipping, storage, or installation.
5. All piping shall be field measured prior to fabrication and erection. Any significant discrepancies between drawings and field conditions shall be reported to the City's representative. The Owner will not be responsible for any costs to the Contractor for rework because of Contractor failure to take measurements prior to fabrication.
6. Adequately support and protect capillary tubing. All extra tubing shall be carefully coiled, tied, and protected at the instrument location.
7.

C. It is the intent of the Contract Documents that all wiring external to Control Panels be provided under the requirements of Division 26, Electrical. Further, it is the general intent that all 4 mA to 20 mA signal circuits, process equipment control wiring, signal wiring to field instruments, and Control Panel input and output wiring, be provided under Division 26, Electrical and be terminated and identified under Division 40, Process Integration.

D. The Contractor's attention is directed to the electrical and mechanical schematics and details of this project. Referral to these portions of the Contract Documents shall be required in order to understand the full intent and scope of work required.

E. Monitoring and control system configurations are diagrammatic only. Locations of equipment are approximate unless dimensioned on Drawings. Exact locations and routing of wiring and cables shall be governed by structural conditions, physical interferences, and locations of electrical terminations on equipment.

F. Where job conditions require minor changes in approximated locations and arrangements, the Contractor shall make such changes without additional cost to the Owner.

G. All instruments shall be located and installed for ready access by the Owner's operation and maintenance staff. The Owner reserves the right to require minor changes in location of equipment prior to roughing without any additional cost to the Owner.

H. Meters shall be installed in easily accessible locations and orientated for ease of reading and maintenance, and where shown, for balancing flow. Wherever possible, meters shall be inserted in such a way to comply with the manufacturer's recommendations. Meters, shut-off and balancing valves shall be properly supported. In-line meters shall be installed to ensure full-line flow and not less than the manufacturer's recommended head at all times.

3.2 CONTROL PANEL SIGNAL AND CONTROL CIRCUIT WIRING

A. Wiring Installation: All wires shall be in plastic wireways except (1) field wiring, (2) wiring between mating blocks in adjacent sections, (3) wiring from components on a swing-out panel to components on the fixed structure, and (4) wiring to panel-mounted components. Wiring from components on a swing-out panel to other components on fixed panels shall be tied into bundles with nylon wire ties, and shall be secured to panels at both sides of the "hinge loop" so that conductors are not strained at the terminals.

B. Wiring to control devices on the front panels shall be tied together at short intervals with nylon wire ties and secured to the inside face of the panel using adhesive mounts.

C. Wiring to rear terminals on panel-mount instruments shall be in plastic wireways secured to horizontal brackets above or below the instruments in about the same plane as the rear of the instruments.

D. Wire Marking: Each signal, control, alarm, and indicating circuit conductor connected to a given electrical point shall be designated by a single unique number which shall be shown on all shop drawings. These numbers shall be marked on all conductors at every terminal using white numbered wire markers which shall be permanently marked heat-shrink plastic. See the sample loop diagrams for details of wire marking.

3.3 INSTRUMENT CABLE TESTS

A. General: The following tests shall be performed on each instrumentation and control system cable. All tests shall be end-to-end tests of installed cables with the ends supported in free air, not adjacent to any grounded object. All test

data shall be recorded on forms which are available from the City's representative. Complete records of all tests shall be made and delivered to the City's representative. Each form shall be signed by the City's representative who witnessed the testing.

B. Continuity tests shall be performed by measuring wire/shield loop resistance of each signal cable as the wires, taken one at a time, are shorted to the channel shield. No loop resistance measurement shall vary by more than plus or minus 2 ohms from the calculated average loop resistance value.

C. Insulation resistance tests shall be performed by using a 500-volt megometer to measure the insulation resistance between each channel wire, between each channel wire and the channel shield, between individual channel shields in a multichannel cable, between each individual channel shield and the overall cable shield in a multi-channel cable, between each wire and ground, and between each shield and ground. Values of resistance less than 1 megohms shall be unacceptable.

3.4 INSTALLATION, CALIBRATION, TESTING, PRECOMMISSIONING, STARTUP AND INSTRUCTION

A. Installation and Connection: The Contractor shall install and connect all field-mounted components and assemblies under the following criteria:

1. Process sensing lines and air signal tubing shall be installed to the installation of conduit indicated under Section 26 05 33, Raceways and Boxes. Individual tubes shall be run parallel and near the surfaces from which they are supported. Supports shall be used at intervals not longer than 3 feet of tubing.
2. Bends shall be formed with the proper tool and to uniform radii and shall be made without deforming or thinning the walls of the tubing. Plastic clips shall be used to hold individual plastic tubes parallel. Ends of tubing shall be square-cut and cleaned before insertion into fittings. Bulkhead fittings shall be provided at all panels requiring pipe or tubing entries.
3. All flexible cables and all capillary tubing shall be provided in flexible conduits. Lengths shall be sufficient to withdraw the cables and tubing for periodic maintenance.
4. Thermocouple lead wire shall be provided in dedicated conduit or wireway from the thermocouple to the control panel. Conduit or wireway shall be sized in accordance with the capacity of the instrument.
5. All power and all signal wires shall be terminated with spade type lugs.
6. All connectors shall be, as a minimum, watertight.
7. After all installation and connections have been completed, a technical field representative of the Contractor shall check the Work for polarity

of electric power and signal connections, leaks at all process connections, and conformance with requirements. The technical field representative shall certify in writing to the Contractor that each loop and system meets requirements.

8. All wire and all cable shall be connected from terminal to terminal without splices, arranged in a neat manner and securely supported in cable groups. All wiring shall be protected from sharp edges and corners.

B. Calibration: All analog instrumentation and all control system equipment shall be calibrated and tested after installation to verify that requirements are satisfied. The Contractor shall provide all necessary labor, tools, and equipment to calibrate and test each instrument in accordance with the manufacturer's instructions. Each instrument shall be calibrated at a minimum of three points using test equipment to simulate inputs and read outputs. All test equipment and all instruments used to simulate inputs and read outputs shall be suitable for the purpose intended and shall have an accuracy better than the required accuracy of the instrument being calibrated. Test equipment shall have accuracies traceable to the NIST as applicable. All analog instruments shall be calibrated and tested in place without removal. Test data, applicable accuracy requirements, all instrument manufacturer published performance specifications and all permissible tolerances at each point of calibration shall be entered on test forms available from the City's representative. These test forms shall verify compliance with all. A report shall be delivered to the City's representative for each instrument, certifying that the instrument has been calibrated in the presence of the [City's representative and meets contract and system requirements.

C. Analog Loop Tests: The Contractor shall be responsible for loop checking and testing all instrumentation loops with this project. The Contractor shall coordinate all loop check functions with the CSP to ensure that a single total loop check is conducted for each device. The intent of the loop checks is to confirm and document each loop's component specification conformance up to and including all field-situated CSP devices. The CSP will have all control room personnel present to witness and confirm loop check results at the CRT level. The Contractor shall provide all necessary labor, tools, and equipment to field test, inspect and adjust each instrument to its indicated performance requirement in accordance with manufacturer's specifications and instructions. Any instrument which fails to meet any Contract requirement, or any published manufacturer performance specification for functional and operational parameters, whether or not indicated in the Contract Documents, shall be repaired or replaced, at the discretion of the City's representative at no additional cost to the Owner.

1. At least 15 working days before installation testing begins, the Contractor shall submit to the City's representative a detailed description, in duplicate, of the installation tests to be conducted to demonstrate correct installation of the instrumentation and control system and the anticipated dates the testing will occur.
2. Controllers and electronic function modules, shall be tested and exercised by the Contractor to demonstrate correct operation, first individually and then collectively as functional analog networks. Each hardwired analog control network shall be tested to verify proper performance within indicated accuracy tolerances. Accuracy tolerances for each analog network are defined as the root-mean-square-summation of individual component accuracy tolerances. Individual component accuracy tolerances shall be as indicated by contract requirements, or by published manufacturer accuracy specifications, whenever contract accuracy tolerances are not indicated.
3. Each analog network shall be tested by applying simulated inputs to the first element(s). Simulated sensor inputs corresponding to 10 percent, 50 percent, and 90 percent of span shall be applied, and the resulting outputs read to verify compliance to network accuracy tolerance requirements. All analog test equipment used to simulate or measure current/voltage signals shall be certified accurate within the previous 6 months by a recognized/certified testing facility. Actual equipment listed as customer spares or test equipment may not be used for these tests. Continuously variable analog inputs shall be applied to verify the proper operation of discrete devices. Temporary settings shall be made on controllers, alarms, etc., during analog loop tests. All analog loop test data shall be recorded on test forms, which include calculated root-mean-square-summation system accuracy tolerance requirements for each output.
4. Air systems shall be tested for leaks in compliance with ISA RP7.1.
5. When installation tests have been successfully completed for all individual instruments and all separate analog control networks, a certified copy of all test forms signed by the [City's representative as a witness, with test data entered, shall be submitted together with a clear and unequivocal statement that all instrumentation has been success fully calibrated, fully inspected, and fully tested.

D. Functional Testing: During the DCS Operational Readiness Testing (ORT), the Contractor shall be responsible for demonstrating the operability of all systems provided under this specification. The City will assist and coordinate the operability assessment with the Contractor. Functional Testing shall commence after acceptance of all wire, all calibrating and loop tests, all inspections have been conducted, and DCS ORT has been started. Functional Testing shall demonstrate proper operation of all systems with process equipment operating over full operating ranges under actual operating conditions.

1. The Contractor shall develop and submit to the City's representative for approval a Functional Testing Plan which describes detailed test procedures, checklists, blank forms and data to be recorded, test equipment to be used and calculated tolerance limits.
2. Functional Testing activities shall include the use of water to establish service conditions that simulate, to the greatest extent possible, normal final control element operating conditions in terms of applied process loads, operating ranges and environmental conditions. Final control elements, control panels, and ancillary equipment shall be tested under start-up and steady-state operating conditions to verify that proper and stable control is achieved using motor control center and local field mounted control circuits. All hardwired and software control circuit interlocks and alarms shall be operational. The control of final control elements and ancillary equipment shall be tested using both manual and automatic (where provided) control circuits. The stable steady-state operation of final control elements running under the control of field mounted automatic analog controllers or software based controllers shall be assured by adjusting the controllers, as required, to eliminate oscillatory final control element operation. The transient stability of final control elements operating under the control of field mounted, and software based automatic analog controllers shall be verified by applying control signal disturbances, monitoring the amplitude and decay rate of control parameter oscillations (if any) and making necessary controller adjustments, as required, to eliminate excessive oscillatory amplitudes and decay rates.
3. All control stations incorporating proportional, integral and/or differential (P&ID) control circuits shall be initially tuned using mathematical methods such as Ziegler-Nichols or Tyreus-Luyben rules in order to establish the initial parameters for closed loop control. The tuning parameters shall be refined experimentally, by applying control signal disturbances and adjusting the gain, reset and/or rate setting(s) as required to achieve a proper response. Measured final control element variable position/speed set-point settings shall be compared to measured final control element position/speed values at 10 percent, 50 percent and 90 percent of span and the results checked against specified accuracy tolerances. Specified accuracy tolerances are defined as the root-mean-square-summation of individual component accuracy requirements. Individual component accuracy requirements shall be as specified in the contract or as specified by published manufacturer accuracy specifications whenever contract accuracy requirements are not specified.
4. Individual component accuracy tolerances shall be as indicated in the Contract Documents or as specified by published manufacturer accuracy specifications whenever not indicated.

5. The Contractor shall submit an instrumentation and control system Functional Testing completion report which shall state that all Contract requirements have been met and which shall include a listing of all instrumentation and all control system maintenance and repair activities conducted during the pre-commissioning testing. The City's representative must accept the instrumentation and control system functional testing before the 30-day operational testing may begin. Final acceptance of the control system shall coincide with final acceptance of the Work.

E. 30-Day Operational Testing: The Contractor shall furnish his own personnel, electrical personnel, and any instrument manufacturers' representatives as required during the testing period required in Section 01 91 14, Equipment Testing and Facility Startup, to produce a fully operational system.

F. Instruction: The Contractor shall train the Owner's maintenance personnel in the maintenance, calibration and repair of all instruments provided under this Contract.

1. The training shall be scheduled a minimum of 3weeks in advance of the first session. The training shall be performed concurrent with the precommissioning in Subparagraph D.
2. The training shall be performed by qualified representatives of the instrument manufacturers and shall be specific to each instrument model provided. Instructors shall have training experience.
3. Each training class shall be a minimum of 8 hours in duration and shall cover Operational Theory, Maintenance, Trouble Shooting/Repair, and Calibration of the instrument.
4. Proposed training material, including resumes for the proposed instructors and a detailed outline of each lesson shall be submitted to the City's representative at least 30 days in advance of when the lesson is to be given. The City's representative shall review the submitted data for suitability and provide comments which shall be incorporated into the course.
5. Within 10 days after the completion of each lesson the Contractor shall present to the City's representative the following:
    a. A list of all Owner personnel that attended the lesson.
    b. An evaluation of Owner personnel knowledge through written testing or equivalent.
    c. A copy of text utilized during the lesson with all notes, diagrams, and comments.

3.5 PROCESS CONTROL STRATEGIES

A. The control strategies, shown in Appendix A, complement of the Process and Instrumentation Diagrams (P&IDs). All materials and components shall be

furnished, whether explicitly indicated or not, to effect the functional requirements defined on the P&IDs and in the process control strategy descriptions. The Contractor shall utilize the control strategies as a resource in generating control narratives to be included in the analog hardware submittal.

B. Common functions that are generally applicable to all strategies or to similar strategies are described under the heading "General Functions". These functions are not repeated in the descriptions for each strategy.

C. Each strategy is described as follows:

1. Overview: A brief description of the mission of the related strategy including the roles of logic, monitoring and control stations located/associated with MCCs, field situated, and DCS -based.
2. Detailed Strategy Functions: A detailed description of each and every monitoring and control function associated with the associated strategy. This description addresses the strategies reaction to sensor failures, process equipment failures, control device failures, DCS malfunctions, and power interruptions. All control modes (MCC, local hand station, local control panel, DCS keyboard) are fully described. These descriptions are augmented by a listing of all instruments, valves, control devices, process equipment, and DCS equipment associated with the noted strategy. All control sequences associated with equipment activation, deactivation, process startup and process shutdown are defined along with all required time delays.
3. Preface to Control Strategy Section:
    a. Tag numbering system definitions and terms.
    b. Controls and control functions provided for all equipment, unless otherwise noted Local control station at equipment.
    c. Local/DCS switch.
    d. Alarms Logic: Open contact for alarms (fail-safe).
4. Format for Each Strategy:
    a. General Description:
        1) An overall description of the process.
        2) Major control components (PCM, PLC, annunciator, panels).
        3) General function of each major control component.
        4) P&ID references for this strategy.
        5) Reference to I/O listing.
    b. Related equipment.
    c. Overview of strategy.
    d. Non-DCS Control:
        1) Local Manual Control: Description of monitoring and control from each equipment item. If this is covered by the general statement in the Preface, describe any deviations.

Example: “Because of inaccessibility location of this valve in the sump, a local control station is not provided.”

2) Remote Manual Control: Description of control from any local or area control panels. Other Control: Package system, PLC, etc.

e. DCS Alarm, Monitoring and Control Functions:
   1) DCS Manual Control.
   2) DCS Automatic Control.
   3) Alarms - define alarms and alarm priorities. Define level (1, 2, 3, or 4) for each alarm.

f. Failure modes.

g. Communications interfaces. Third party devices and connections to DCS, including any details that may not be present on Loop Drawings or other sources of documentation.

h. In-Service/Out of Service Algorithm: Description of devices which determine in/out of service status for each piece of equipment. (In- service (I/S)/out of service (OOS) algorithms mask or block out all or selected alarms associated with the OOS device (i.e., if a wet well is declared OSS, low level alarms shall be inhibited). Additionally, if a device has been designated OOS, all control routines shall declare the equipment as being unavailable for service.

i. See Appendix A for detailed descriptions of the process control strategies.

3.6 INSTRUMENT SUMMARY

A. General: The Instrument Summary (IS) shown in Appendix C itemizes the instrumentation devices, including control panels, to be furnished under this contract. Specific device requirements for the instrumentation referenced in Part 2 shall be included in the instrument summary such as meter size, ranges, scales, set points, NEMA ratings, flange sizes, pipe connection sizes, material types, probe types, etc.

B. Each column on the Instrument Summary is defined as follows:

1. Tag Number: The identifier assigned to a device which performs a function in the control system. The Contractor shall use this identifier in tagging devices in the field.
2. Loop Number: The number assigned to the control loop associated with the device.
3. Description: A process-oriented functional description which defines the measured/monitored/controlled parameter and the associated process/process equipment.
4. P&ID Drawing Number: The Process and Instrumentation drawing upon which the device appears.

5. Technical Specification Number: The number associated with the technical specification which describes the requirements associated with the device.
6. Specification Section Number: The specification section under which the device shall be provided.
7. Control Panel Number: The designation of the control panel where the device resides.
8. Control Panel Reference Number: The drawing or schedule number associated with the control panel's face-plate representation.
9. Mechanical Drawing Number: The mechanical drawing upon which the device appears.
10. Electrical Drawing Number: The electrical drawing upon which the device appears.
11. Installation Detail Number: The designation of the installation detail defining the installation requirements associated with the device.

3.7 INSTRUMENT DATA SHEETS

A. General: The Instrument Data Sheets shown in Appendix D provides specific device requirements for the instrumentation referenced in Appendix C, Instrument Summary such as meter size, ranges, scales, set points, NEMA ratings, flange sizes, pipe connection sizes, material types, probe types, etc.

3.8 DCS INPUT/OUTPUT (I/O) SUMMARY

A. General: The I/O list contained in Section 40 94 24, Process Inputs/Outputs (I/O), Supplements, itemizes all inputs and outputs to and from the DCS, both hardwired and data linked, which are furnished by the Contractor.

B. Each column on the I/O List is defined as follows:

1. Tag Number: The ISA identifier assigned to a device which performs a function in the control system. The Contractor shall use this identifier in tagging devices in the DCS.
2. Loop Number: The number assigned to the control loop associated with the I/O.
3. Description: A 30-character process-oriented functional description which defines the measured/monitored/controlled parameter and the associated process/process equipment.
4. Alarm Priority: A 1-4 designation that determines the severity of the alarm triggered with 1 being the highest (most severe) and 4 the lowest.
5. Scale: The top value and bottom value of the analog process variable to be displayed or controlled by the DCS.
6. Set: The status to be displayed on the alarm summary when a digital point is not activated or returns to its normal state

7. Reset: The status to be displayed on the alarm summary when a digital point is activated.
8. P&ID Drawing Number: The Process and Instrumentation drawing upon which the device appears.
9. I/O Type: The type of I/O required for current and future monitoring and control activities (spare I/O is not included).
    a. Analog Input (AI): If the tag number generates an AI, the quantity of AIs are listed in Section 40 94 24, Process Inputs/Outputs (I/O), Supplements.
    b. Analog Output (AO): If the tag number generates an AO, the quantity of AOs are listed in Section 40 94 24, Process Inputs/Outputs (I/O), Supplements.
    c. Discrete Input (DI): If the tag number generates a DI, the quantity of DIs are listed in Section 40 94 24, Process Inputs/Outputs (I/O), Supplements.
    d. Discrete Output (DO): If the tag number generates a DO, the quantity of DOs are listed in Section 40 94 24, Process Inputs/Outputs (I/O), Supplements.
10. Data link No.: The name of the data link the soft I/O point is associated with.
11. PCM /RIO/PLC/RTU Number: The designation of the PCM, RIO, PLC or RTU where the I/O resides.
12. Fail-safe: (Yes or No): For digital inputs, whether the field device is to be wired as “open contact on alarm”.
13. Remarks: Any clarifying remarks are made in this area such as pulse inputs, cross references to mechanical and electrical drawings on which the PCM appears.
14. Totals: A summary row shown at the bottom of the I/O list which indicates the total amount of each type of I/O associated with a PCM. I/O associated with future shall be separately tabulated.

3.9 SUPPLEMENT

A. The supplement listed below, following “End of Section,” is part of this Specification.

    1. Appendix A – Control Strategies.

END OF SECTION

APPENDIX A - CONTROL STRATEGIES

LEGEND

A. PCM: Process Control Module (All DCS components inside a common cabinet, consisting of the Controller, IO, Network Switches, etc.).

B. DCS: Distributed Control System (Plant Computer Control System).

C. UPS: Uninterruptable Power System (Provides battery back-up power to the PCM).

D. DH: Data Highway (Plant process network where all DCS components, such as the controllers, servers, workstations, historians, etc., communications take place).

E. DIN: District Information Network (Fiber Optic Transmission that connects all COMNET sites to one another.)

F. LCP: Local Control Panels.

G. PID: Proportional-Integral-Derivative.

H. PLC – Programmable Logic Controller.

I. RTU - Remote Terminal Unit.

PROJECT OVERALL CONTROL SYSTEM STRATEGY OVERVIEW

A. Provide a brief overall project control strategy overview.

B. See Appendix A to Section 40 90 07, Scope of Work.

GENERAL CONTROL AND MONITORING

A. These control strategies are not intended to be all-inclusive operational procedures for the operation of the complete facility. In general, control and monitoring functionality is as follows:

1. Alarm monitoring and generation, process sequencing, automatic control of auxiliary systems and equipment interlocking control strategies are resident within the DCS.
2. Fault tolerant controllers communicate with the DH and contain enhanced DCS automatic control algorithms for process sequencing control based on level, pressure, flow, or other conditions.

3. The DCS workstations shall serve as the operation staff's "window" into the process, enabling operations to locally monitor, interrogate, and manipulate plant processes.
4. The DCS shall provide reporting, historian, diagnostic, client access and other file server functions.
5. The DCS provides information to the District Information Network (DIN) via the communication link between DCS and DIN
6. All hardwired alarms shall be fail safe and activate upon loss of power.

COMMON CONTROLLER/PLC FUNCTIONS

A. Common functions and terms for basic monitoring and control operations are provided as a standard of implementation for the control system. These terms and functions address items that are typical for process control loops and most operator initiated actions. These functions are not necessarily repeated in each individual control strategy. Unless otherwise stated they are considered a part of each implemented control strategy.

B. Provision shall be made to include certain control functions that apply to all analog inputs, virtual variables, analog controllers and discrete control whether or not shown on the P&IDs, even though one or more of the functions may be disabled by the user for a given data base point:

1. Verification of Digital Outputs: In Semi-Auto and Auto mode each command will be monitored for the desired results before proceeding to the next step and if the sired results are not achieved in a certain predetermined time an alarm will be generated. The operator will have the ability to override and move to the next stage.
2. Analog Data Scaling: This control function shall scale all analog inputs to a common span and shall normalize the digital representation of each analog input to a percent of the operating span. The processed value shall be expressed as a binary number that specifies the analog input's position on a straight line lying between zero and full scale as defined for a given input by the zero span values in the data base.
3. Amplitude Limit Check: This control function shall perform dual level, high/low amplitude limit checking and shall identify a limit violation every time a measured or virtual variable goes out-of-limits and returns back into limits. The control function shall determine the time at which each limit excursion occurred. A dead-band shall be provided on each limit and shall be expressed as a percentage of span or in engineering units.

4. Engineering Unit Conversion: This control function shall convert scaled analog data to engineering units by means of the following equation:

$$Y = (H - L)\,(D/DH) + L$$

where:

Y = value in engineering units

H = high value of span, expressed in engineering units

L = low value of span, expressed in engineering units

D = digitized scale input value in counts

5. Discrete Event Monitor: This control function shall monitor an alarm (where appropriate) all discrete status changes.
6. Manual Control: It shall be possible for the operator or plant engineer to interrupt any sequence, loop or automatic operation and operate the same manually from remote.

C. The following terms are used in the descriptions of DCS/PLC functions:

1. Operator Settings (Set points): Operator set or entered values that are adjustable or set from operator displays. Examples of operator set or entered values are controller set points, batch set points, timers, counters, mode selection, etc. Specific values that are required to be operator settable are noted (bracketed [ ]) in the process control strategy descriptions. Unless otherwise stated to be tunable or fixed, a set point value is operator settable.
2. Tunable Values: Tunable values are set points that are adjustable at password protected engineer level displays without requiring any PLC or DCS software reconfiguration. Examples of tunable values are tunable time settings, tunable alarm set points, PID tuning constants, etc. These values are not adjustable from operator level displays. Tunable values are also identified and their preliminary values are shown in brackets [xxx].
3. Fixed Values: Fixed values are constants that are contained within the PLC or DCS control logic normally inaccessible by the DCS system. Modification of fixed values requires a modification to the control logic via the PLC or DCS programming, configuration and diagnostics software package.

4. Displayed Values: The term “displayed” means that the value, or information referred to, is displayed in an easily read and understood format on the DCS workstation. Values are identified by their device tag reference and associated equipment number. For analog variables the value is tagged and its associated engineering units are displayed.
5. Hardware Interlocks: Hardware interlocks refer to interlocks directly wired within the electrical control circuits of equipment that, when activated, shall cause the equipment to shutdown or otherwise prevent operation of the equipment. Hardware interlocks do not necessarily pass through or depend on the PLC or DCS to be operable. Status of hardwired interlocks shall be provided to the PLC/DCS.
    a. Hardware interlocks may also be derived by local control panels or switches wired directly to the PLC or DCS to provide direct hardwired alarm status to the PLC or DCS for processing.
6. Software Interlocks: Software interlocks refer to interlocks that are generated by the PLC or DCS logic or otherwise pass through the PLC or DCS. Software interlocks are not operable when the PLC is not operable or if for some reason equipment is operated while by-passing the PLC logic.
7. Hardware Generated Alarms: Hardware generated alarms are alarms that are generated external to the PLC by equipment such as local control panels, analytical devices and process switches.
    a. Direct wired alarms that do not depend on the PLC or DCS to be operable. An example would be a High H2S level signal from the H2S monitor and wired directly to an alarm light or horn.
    b. Direct PLC or DCS wired alarms such as a High-High pressure switch that interfaces directly with the PLC or DCS.
8. Software Generated Alarms: Alarms that are processed or generated by PLC or DCS logic are referred as software generated. Software generated alarms are displayed on the DCS workstation alarm screens and are available for archiving.
9. Local Automatic Control Mode: Local automatic control refers to control logic performed in a local control panel independent of the DCS. An example is a standalone blower package that, when in the local automatic control mode, automatically controls the blower to maintained air pressure within a fixed dead band.
10. Local Manual Control Mode: Local manual control refers to the mode where operators control equipment from the equipment location. Examples are hoist and trolley that may be stopped or started from the compressor’s local control panel (LCP), or a gate that may be opened or closed from the gate operator.

11. DCS Automatic Control Mode: In DCS automatic mode equipment is controlled automatically per predetermined control schemes residing in the DCS usually without operator intervention. However, in some cases the operators may be required to initiate certain automatic functions, or enter set points.
12. DCS Manual Control Mode: DCS manual control refers to the manual control of equipment from the DCS workstation. In this mode, the operators override the DCS automatic control logic but, usually, DCS safety interlock logic remains in effect.
13. DCS Override Control: DCS override control refers to the ability to override specific software interlocks and initiate control actions. Software interlocks or permissives that can be overridden are identified within the individual control strategies. Override control is an abnormal control operation and a "SAFETY INTERLOCK OVERRIDE ALARM" shall be initiated for the specific override condition whenever an override command is in effect.

D. COMMON DCS/PLC SOFTWARE FUNCTIONS

1. To provide for a standard of implementation, various software control and monitoring functions are defined. The standard functions may not be fully delineated within each control strategy, however, unless otherwise stated the standard function shall be utilized to provide the defined alarm, action, display or control action.
2. DCS is configured as the primary control system for all alarm monitoring, start/stop sequencing, shutdown and interlock and basic process control functions.
3. When delineated within individual control strategies as DCS controlled or DCS logic, the control program is resident within the DCS. Complex control algorithms and historical data calculations are normally performed by the DCS.
4. The following provides for common DCS software functions:
    a. All equipment status items monitored by the DCS and generated within the DCS control strategies are displayed by the DCS. Unless otherwise specified the following is displayed for each equipment item:
    b. Equipment READY status.
    c. Equipment RUNNING or ON status.
    d. Equipment OFF status.
    e. Equipment FAILURE alarm.
    f. Equipment FAIL-TO-OPERATE alarm.
    g. Equipment OUT-OF-SERVICE.

5. All analog inputs transmitted to the DCS shall have instrument bad/failure indications or alarms when the input is below 0 percent or above 100 percent.
6. All discrete alarm and failure inputs are alarmed by the DCS application software and displayed at the DCS. Each discrete alarm input shall have an associated alarm delay that prevents nuisance tripping.
7. Where alarms are specified in the control strategy descriptions, those alarms are initiated by the DCS control logic based on the applicable analog input signals. User tunable trip points shall be provided for each analog input to establish High-High, High, Low, Low- Low, and Rate-Of-Change events. Each trip point shall be provided with a user tunable dead band for set and reset operations. Individual signal trip points shall be provided with a tunable delay to alarm activation.
8. DCS alarm activation and annunciation shall adhere to a priority hierarchy that is established and maintained at the DCS system. Each alarm shall have an associated priority level defined as:
    a. Level 1: Life Threatening or Danger Conditions.
    b. Level 2: Critical process alarms that shall create a plant shutdown condition, cause a critical process failure or severely hinder plant operation.
    c. Level 3: Minor process alarms associated with warning conditions and minor equipment failures.
    d. Level 4: Informational alarms shall not hinder operation or cause equipment failure.
9. All process related analog inputs may be trended at the discretion of the operator.
10. All flow inputs and equipment run times are totalized, recorded and displayed at the DCS. Totalizers are resettable at the engineer level only.
11. Displays: DCS system shall have adequate number of displays for each system to enable the operator to effectively monitor and control the system. Displays are grouped functionally for ease of operation. Both analog and discrete functions associated with an item of equipment or a group of equipment shall be provided on the same display. Displays shall show process graphics, alarms, equipment status, system mode of operation, control strategy implementation, etc.
12. Most interlocks, permissives and start sequences are provided at the DCS level. Unless otherwise stated or shown, all discrete outputs shall be provided as follows:
    a. For equipment START functions, the PLC or DCS shall issue a maintained START command until a RUNNING state is detected or the START command is removed.

b. When a momentary command is required, the PLC or DCS shall issue the command for the minimum time required for the process to react to the command.

13. For equipment that the DCS/PLC is allowed to control, the DCS/PLC shall provide a FAIL-TO-OPERATE alarm if the equipment fails to comply with a DCS/PLC command signal. The (START, STOP, OPEN, CLOSE) shall has been present for more than a tunable time period. In this event, the command shall be removed subsequent to the expiration of the tunable time period and must be reset by the Operator before the logic will attempt to operate the device from the DCS.
14. In the event of a DCS system failure the system shall retain the last command from the DCS system for all equipment that is in service. All interlocks are enabled during a DCS communications or systems failure.
15. All PID control functions (P, PI, and PID) are provided with standard analog controller functions and operator interfaces including, but not limited to, the following:
    a. AUTO/MANUAL mode selection: In AUTO, the output of controller shall be based on the PID control calculation. In MANUAL, the output of the controller shall be operator adjustable from the DCS. Transfer between operational modes shall be bumpless.
    b. LOCAL/REMOTE set point selection: In LOCAL, the set point shall be operator adjustable from the equipment. In REMOTE, the set point shall be adjustable from a REMOTE set point input.
    c. Set point, process variable, and controller output shall be displayed. Provisions shall be included to prevent reset windup.
    d. Dead band limits shall be placed on PID control algorithms to avoid hunting and continuous change actions. Dead band limits shall maintain a constant control until the process variable exceeds the dead band boundaries. A dead band value of zero shall disable the dead band.
    e. Bumpless transition shall be provided when PID is invoked after a transition from manual to PID control or when pump start logic utilizes minimum speed controls for starting applications. The transition from current speed to calculated speed shall be provided as a user tunable set point percentage per second value.
    f. When main equipment is tagged OUT-OF-SERVICE, a DCS function, all associated equipment and devices are automatically placed in OUT-OF-SERVICE status and their alarms inhibited until the tagged equipment is tagged IN SERVICE. Associated equipment for each piece of main equipment shall be determined on a case by case basis.
16. Verification of Result: Whenever a command is issued, DCS/PLC shall verify that its command is implemented before proceeding to the next

step, e.g., a valve open command is issued, the DCS/PLC software shall verify that the valve open limit switch is activated after a preset time, before proceeding to the next step in the program. If no verification is received an alarm will be generated and operator intervention will be necessary to resume the automatic operation.

SECTION 40 90 03
GENERAL REQUIREMENTS

PART 1 – GENERAL

1.1 THE REQUIREMENT

A. GENERAL

The DISTRIBUTED CONTROL SYSTEM PROVIDER (DCSP) shall furnish all equipment and provide all applicable engineering for a fully functional distributed control system, that complies with the technical requirements of the contract documents including, but not limited to, project management, design assistance, coordinate with on-site area contractors, detailed system design and integration, conducting graphic design workshops, equipment supply and shipment, storage, job site delivery, programming and configuration, installation oversight, testing, commissioning and start up, integration with the existing Cleanwater Operation and Management Network (COMNET), and training.

1. The DCS Work shall be as defined within Division 01 and these Specifications.
2. The Work covered by this specification and all of its sub parts shall include, but not limited to, field verification of all existing conditions, engineering and design of system and components, manufacture and/or procurement of all necessary equipment, components, material, transportation, labor, special tools, factory testing, application programming, shipment, storage, and jobsite delivery, operational readiness testing, installation of equipment, system integration, startup operation, site testing, training and documentation, support, maintenance/warranty of a complete, integrated and operational Distributed Control System (DCS) for the City of San Diego.
3. The statements of Work contained herein are necessarily general in nature and should not be construed as an all-inclusive list of devices, equipment, software and services necessary for successful completion of the Work.
4. It shall be the responsibilities of the DCSP to coordinate and project manage the Work, as set forth in this section of the Specifications, with work and equipment specified under other sections of the Specifications, in order to provide a complete and satisfactory installation.
5. To ensure that the distributed control system shall be a standard system of Emerson Process Management, Ovation family. With a complete repertoire of pre-existing software modules running in a familiar hardware environment and free from hardware/software incompatibilities.
6. This specification is generic to all Facilities and applicable sections shall be delivered for each process segment of the Work as defined in these Specifications and project Contract Documents.
7. The DCSP shall be responsible for coordination, installation and testing of DCS. The Prime Contractor is responsible for termination of I/O signals,

power and ground utilities for all DCS equipment. The DCSP shall review and inspect all current designs and all Contract Documents to assess space allocations, power allotments and available grounds. If the DCSP's requirements for power, grounding or spatial requirements differ from that shown within the Contract Documents, the DCSP shall include all required engineering, design and construction details to the Prime Contractor and City's representative immediately.

8. The DCSP shall be responsible for providing all equipment, installation supervision, engineering, programming, configuration, management and services associated with integrating all instrumentation and control devices, and special systems, including Foreign Device Interfaces (FDI), into the DCS in a transparent and seamless manner. The use of a third party, system house, or system integrators for the above service is not acceptable.
9. DCSP shall be fully responsible for the implementation, installation, and integration of the DCS as outlined in this specification.
10. The provisions of this Section shall apply to all items specified in the various Sections of Division 40 and all other Divisions.
11. DCSP shall be responsible for interfacing to all existing instrumentation and all other Input/Output (I/O)devices.
12. During field functional testing the DCSP shall verify the operation of all instruments and field devices and associated wiring (from instrument/device to DCS) and notify the City's representative and Prime Contractor of any deficiencies that exist.

B. SCOPE OF WORK

1. The Work generally consists of the supply of all labor, tools, services and provision of all products required, for a complete, integrated, operational DCS control system in accordance with the Contract Specification and Drawings.
2. Identify other on-going projects/systems development that are not part of this contract. Ensure other ongoing activities, in close proximity or otherwise, do not disturb or interrupt the operation of the existing systems or the work already commissioned or placed into operation. Should any such activity pose a risk to this work or to the system operation, advise the City immediately.
3. In general, the work involves the supply, installation and commissioning of the DCS control system as indicated on the drawings and specification sheets, and as defined in the Matrix of Responsibilities in D. The following is a summary of the major works:
    a. Engineer to provide a high-level description of the project specific work including provision of all instruments, hardware, software,

network, cabling, and services such as testing, commissioning, training, documentation.

b. Following the instructions in D, Provide, test and commission all field instrumentation including field wiring, instrument control panels, and control system hardware including all lightning & surge protection, and all peripheral devices necessary.

c. Conduits and Wires:

1) All conduits, including those for the district information network (DIN), plant information network (PIN) and facility information network (FIN), will be furnished and installed by the Prime Contractor. All conductors, including power and grounding for DCSP furnished equipment will be furnished and installed by the Prime Contractor. DCS grounding will use a special triad grounding system; specifications for this system are provided in the contract documents in accordance with the DCSP requirements. All signal conductors, except for PIN, and FIN fiber optic and coaxial cables, will be provided and installed by the Prime Contractor.

2) The PIN and FIN fiber optic and coaxial cables will be furnished, installed and terminated by the Prime Contractor. DIN fiber optic cable will be furnished by the Prime Contractor up to the first termination point within a facility.

3) Cables and conduits for non-DCS communications systems, such as the telephone system, will be furnished and installed by the Prime Contractor.

d. Provide all programming and microprocessor-based instrument configuration.

e. Provide all required testing, commissioning and start up services. Allow in the Contract Price, for any additional time deemed necessary to meet the testing and commission requirements.

f. Provide Factory Acceptance Testing (FAT) to demonstrate the operational functionality of hardware and communications per specifications.

g. Provide Operational Readiness Testing (ORT) to demonstrate the correct operation of the control system with both hardware and software in place per specifications.

h. Provide Performance Acceptance Test to ensure entire system functions properly per specifications.

i. Provide all required training per specifications.

j. Provide warranty services per contract requirements.

4. Interfacing and Responsibilities of Prime Contractor and DCSP:
The following Table 1 shows the procurement, installation, and labor responsibilities of the DCSP and the GC. All field instrumentation

devices and final control elements which are needed to support DCS functionality will be wired to process control modules (PCMs). Tables 2 and Table 3 define in greater detail of the responsibilities assigned to the Prime Contractor and the DCSP.

Table 1: Matrix of Responsibilities - Equipment/Devices/Materials

Product	Supply	Install
DCS Process Control Modules (PCMs)	DCSP	GC
DCS Workstations (WSs)	DCSP	DCSP
DCS Historian System (HS)	DCSP	DCSP
DCS PIN/FIN Hubs and network equipment	DCSP	DCSP
DCS Printers and Stands	DCSP	DCSP
Fiber Optic Network Cables (PIN and FIN cables)	GC	GC
Fiber Optic "DIN Cables"	GC	GC
All Other Communication Cables which Interconnect DCS Equipment	DCSP	DCSP
UPS Systems and Ancillaries for DCSP provided equipment	DCSP	GC
Instrumentation Panels (including PLCs) and racks provided by DCSP	DCSP	GC
Panels (including PLCs) and racks provided by GCs	GC	GC
Instrumentation provided by GCs	GC	GC
Instrumentation provided by DCSP within panels (including specialized communications cables required.)	DCSP	GC
Interposing relays to interface DCS control commands with equipment controls FIE	GC	GC
DCS Isolated (Reference) Grounding Cables and Rods	GC	GC
Large Screen Control Room Video System	DCSP	GC

Table 2: Matrix of Responsibilities - Wire/Conduit/Terminations

Description	Supply	Install	Terminate
Power conduits and wire to GC furnished equipment and devices	GC	GC	GC

Power conduits and wire to DCSP furnished equipment and devices	GC	GC	GC
Signal conduits from DCSP or GC furnished instruments to DCSP or GC furnished equipment and device	GC	GC	---
Signal wire/cable from DCSP or GC furnished instruments to DCSP or GC furnished equipment and devices	GC	GC	GC
All conduits associated with the PIN, FIN, DIN and other communication links	GC	GC	----
PIN and FIN fiber optic, unshielded twisted-pair and coaxial cables	GC	GC	GC
Other communications cables from GC-supplied equipment to the DCS	GC	GC	GC
All cable associated with the DIN	DCSP	GC	DCSP
All conduits associated with the fire alarm, CCTV, page party and security/card reader systems, as required	GC	GC	----
All signal wire/cable associated with the fire alarm, CCTV, page party, and security/card reader systems	GC	GC	GC
All power wire/cable associated with the fire alarm, CCTV, page party and security/card reader systems	GC	GC	GC
Ground conduits and wire/cable from power panel to PCM or any other DCSP furnished equipment	GC	GC	GC

Table 3: Matrix of Responsibilities - Testing and Services

Task	DCSP	GC
Prepare DCS hardware/installation submittals (PCM; WSs; HS; CM; UPS; fire alarm system, if required)	X	
Prepare DCS software submittal	X	
Provide SAMA functional diagrams	X	
Prepare annotated software listings of all GC-furnished PLCs and other programmable equipment		X
Prepare instrument submittal		X
Calibrate instruments		X
Prepare GC panel submittals		X
Prepare loop drawings to support the termination of all DCS I/O and the installation of all instruments		X

Prepare DCS hardware/installation submittals (PCM; WSs; HS; CM; UPS; fire alarm system, if required)	X	
Coordinate all control systems integration (instrumentation, PLCs, DCS, network, communications and data exchange) amongst various subs		X
Perform factory acceptance test (FAT) of DCS	X	
Perform factory acceptance test of GC panels		X
Perform operational readiness test (ORT) of DCS	X	
Perform ORT test of GC panels		X
Perform loop tests	X	X
Participate in plant startup	X	X
Provide DCS information to support GC development of loop drawings	X	

1.2 RELATED SECTIONS

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego.

1.3 SPECIFICATIONS, CODES AND STANDARDS

A. The Work shall comply with the current editions of the publication and codes identified in Section 40 90 04 References and herein.

1.4 DEFINITIONS

A. Definitions of acronyms are identified in Section 40 90 05.

1.5 SUBMITTALS

A. The DCSP shall develop and submit within the first 45 days after NTP, a detailed list of submittals required by all Contract Documents for review and approval. The list shall contain the title of each submittal, detailed description of its contents and the applicable reference Sections. Submittal shall be grouped, organized and sequenced logically such that it facilitates the City's representative's review process. This requirement extends to all Work required by all other Divisions.

B. NOT USED.

C. NOT USED.

D. All Submittals shall be executed in accordance with Specification 01 33 00, Submittal Procedures.

E. The DCSP shall conduct a pre-submittal conference. At a minimum, the following shall be presented at the conference:

1. A list of equipment and materials required for the applicable submittal content.
2. A list of proposed exceptions to the Specifications and Drawings, along with a brief explanation of each.
3. An exact one-to-one sample of each type of document to be submitted.
4. Any implementation and construction documentation associated with the submittal.
5. A schedule or schedule fragment that applies to the submittal.

F. The DCSP shall coordinate the WORK of the DCS with the Contractor and its subcontractor so that a complete DCS package will be provided inclusive of accurate shop drawings and record drawings. The DCSP shall prepare and submit complete and organized shop drawings, as specified herein. Incomplete or partial submittals are not acceptable. All shop drawings and record drawings shall be submitted in accordance with Specification 01 33 00, Submittal Procedures.

1. Plant-wide loop drawing submittal (PLDS) to verify the DCS interfaces with all instrumentation and devices being provided or installed under this project are to be developed by the Contractor or its subcontractor with the assistance of DCSP. The Loop Drawings shall define all interfaces with equipment provided by the DCSP and as such the DCSP is responsible for providing all necessary information to the Contractor on a timely basis. The Loop Drawings shall be developed in accordance with existing City Loop Drawing standards, as follows:

The loop drawing shall be composed of three sections:

Page 1: A device schedule with a table showing the following:

a. Device tag number, with Prefix, Unit Process, ISA Tag Prefix, Tag No, Tag suffix
b. Equipment Service
c. Device Type
d. Location
e. Device Manufacturer
f. Model No.
g. Spec. No.
h. Area Contractor (if applicable
i. Submittal No.
j. Remarks
k. Data Sheet No.
l. I/O Signal (AI, AO, DI, or DO)
m. Signal Level
n. Device Range
o. Engineering Units
p. Process Set Point
q. Loop Diagram No.
r. Loop Drawing File Name
s. Interconnect Drawing File Name
t. For third-party devices, should also include: IP (if applicable), module addresses, data registers, IO Tag Names (AB), protocols etc.

Page 2: Loop drawing meeting the Requirements of ANSI/ISA S5.4, except that intermediate terminal junction boxes may omitted and be shown on Page 3 for clarity.

Page 3: Abbreviated diagram showing instrument, wire and cable numbers, intermediate terminal junction boxes, and PCM terminations.

2. The DCSP shall augment the content of the Loop Drawings by providing all of the requisite data relating to the DCS. For each DCS input/output, the DCSP shall note on the PLDS the following information:

a. PCM number, and physical location
b. Controller Number
c. Type of input.
d. I/O card location and address.

e. All DCS-dependent displayed functions using ISA symbology.
f. Drawing reference for DCS software content.

3. In these Contract Documents all systems, all meters, all instruments, and all other elements are represented schematically, and are designated by symbology as derived from International Society of Automation ISA S5.1 (latest revision). The nomenclature and numbers designated herein and on the Drawings, shall be employed exclusively throughout shop drawings, and similar materials. Any other symbols, designations, and nomenclature unique to any manufacturer's standard methods shall not replace those prescribed above, used herein, and on the Drawings.
4. All shop drawings shall include a City-approved title block. The title block shall include, as a minimum, business name and address, project name, drawing name, revision level, and personnel responsible for the content of the drawing. Loop Drawing Submittals shall be submitted in accordance with Specification 01 33 00, Submittal Procedures.

G. The DCS hardware submittal (DCSHS) shall be singular and all inclusive, submitted in accordance with Specification 01 33 00, Submittal Procedures. The DCS Hardware Submittal shall include, but not be limited to:
1. A complete set of system diagrams which depict:
a. All Process Control Modules (PCMs), Workstations (WSs), video devices, printers, UPS, Foreign Device Interfaces (Data Link) telemetry devices, communication devices, and communication links.
b. A one-line showing the designed conduit and wire required to support the power, ground, Input/Output, and communication requirements of the system.
c. A complete I/O Database showing all I/Os, annotated in ISA format, which depicts all designed I/O, both external and internal hard-wired and data-linked, inclusive of DCS termination locations.
d. A Complete one-line diagram showing all power wiring and ground wiring, including UPS power, Utility (non-UPS) power and any other external D.C. or A.C. sources for each PCM.
2. A complete set of Factory Data sheets for every DCS component. This shall include layout drawings that show enclosure details, including seismic mounting, as well as the location of each component within the DCS PCM enclosure. Drawings shall contain a scaled representation of the

placement of all DCS equipment being provided under this contract and its spatial relationship to all other equipment (both new and existing) located in the abutting and adjoining areas. All acquired access and clearances associated with the DCS equipment and other equipment must be shown with a statement of compliance to DCSP requirements, NEC, NFPA and other applicable codes.

3. Detailed installation, mounting and anchoring details for all components and assemblies to be field mounted, including access requirements, conduit connections or entry details shall be provided.
4. DCSP shall provide Seismic calculations for each DCS PCM enclosure and UPS installation, or other anchored apparatus, based on the proposed mounting arrangement. Installation/Mounting/Anchoring drawings shall be stamped by a Structural Engineer, registered with the State of California. Each individual anchoring drawing, as well as the seismic calculations drawings, shall be stamped by the structural engineer.
5. A complete, and detailed, bill of material (BOM) shall be provided. The BOM shall show the factory model number for each component within the DCS.

H. The DCS Network submittal (DCSNS) shall be singular and all inclusive, submitted in accordance with Specification 01 33 00, Submittal Procedures. The DCS Hardware Submittal shall include, but not be limited to:
   1. A complete set of network diagrams which depict:
      a. All Process Control Modules (PCMs), Workstations (WSs), video devices, printers, UPS, Foreign Device Interfaces (Data Link) telemetry devices, communication devices, and communication links.
      b. A one-line showing the designed conduit and wire required to support the power, ground, Input/Output, and communication requirements of the system.
      c. A complete network design report including IP scheme, traffic planning and control, QoS, configuration of every network equipment including routers, switches and firewalls.
      d. A Complete fiber connection diagrams including fiber routing plans, fiber details, link budget calculations etc.,
      e. A complete, and detailed, bill of material (BOM) shall be provided. The BOM shall show the factory model number for each component within the DCS.

2. A complete set of Factory Data sheets for every network component.

I. The DCS Software Submittal (DCSSS) shall be singular and all inclusive, submitted in accordance with Specification 01 33 00, Submittal Procedures. The DCS Software Submittal shall include, but not be limited to:
   1. A complete set of all available software algorithms.
   2. A complete set of Designer control strategies, with annotations provided by the DCSP depicting engineering details to show how all monitoring and control functions, on a loop by loop basis, will be accomplished. So operators can understand how the process will respond to his actions through DCS interfaces.
   3. An English narrative of each data acquisition or control loop mission and anticipated action. Narratives shall enumerate the signal point name, signal descriptor, associated PCM number, associated system template displays, system functions activated by signal (i.e., interlocks, alarms, logs, etc.).
   4. A complete set of PCM configuration sheets depicting each loop linkage. Each loop shall be on its own 11" x 17" sheet.
   5. A complete listing of the DCS data base listing for each data point's relevant parameters such as range, contact orientation, limits, incremental limits, I/O card type, I/O hardware address and assignment, including ALL Macros used/created for the Software.

J. The DCS Graphic Submittal (DCSGS) shall be singular and all inclusive, submitted in accordance with Specification 01 33 00, Submittal Procedures. The DCS Graphics Submittal shall include, but not be limited to:
   1. One complete set of all WS-accessible displays which are unique to this project (i.e., process global, system global, process regional, systems regional, process group, process loop, process component, integrated tutorials, integrated process tutorials, integrated documentation, user assistance).
   2. The DCSP shall ensure that all graphics development, and graphics submittal, conform to the existing graphics layouts, linkages and formats used throughout the COMNET Enterprise.
   3. The Graphics Submittals shall contain displays in full size color graphic format and replicate the proposed screen contents. All background colors shall be identical to that of the screen content. All displays shall be arranged in a hierarchical order with references to associated WSs.
   4. A system display linkage diagram which defines the hierarchical order and the linkages via page, down, left, right commands.

5. A definition of each displays data fields by tag numbers, utilizing the existing DCS COMNET standard.
6. A definition of each displays dynamic elements which shall blink, change color, rotate or change shape in response to process changes, and conforms to the existing COMNET standard.
7. A listing of all "help" text associated with each display screen, arranges in conformance to the COMNET standard.

K. The DCSP shall prepare and submit plans for the Factory Acceptance Test (FAT) and Operation Readiness Tests (ORT). The FAT and ORT plans shall be submitted in accordance with Specification 01 33 00, Submittal Procedures. The ORT and FAT Plans shall each be a single-source document which shall encompasses means and methods for testing the complete DCS for this Project segment.
   1. The ORT and FAT Plans shall provide testing of all DCS hardware, software, graphics, alarms and network communications.
   2. The FAT Plan shall elaborate on the simulator to be utilized to provide proof of performance testing for the I&C and DCS functions of the project.
   3. The ORT and FAT Plans shall provide sample sheets depicting all I/O, hardware, Data Links, communication Networking and internally generated alarms and I/O points. Once approved conceptually by the City, these forms will be populated and utilized by the DCSP in the submission of each PCM individual FAT and ORT submittal.

L. The DCSP shall prepare a complete Training Plan. The Training Plan shall be submitted in accordance with Specification 01 33 00, Submittal Procedures. The DCS Training Plan will provide the structure and syllabus for training sessions as follows:
   1. Operator Training: Shall provide instruction to Operators already familiar with the operation of the Enterprise DCS, and shall be tailored to the new I/O, process controls, P&ID schemes and specialty consideration for the controls for this Project.
   2. Maintenance Training; Shall provide training to City DCS Staff on all enhancements to the DCS, new-generation components and all other hardware, software or graphics maintenance requirements, not currently covered in the City's existing Enterprise DCS.
   3. The DCSP shall allow for a minimum of four (4) sessions of each class outlined in the Training Plan to ensure staff availability and shift-differential considerations are facilitated.

4. Resumes of all Training Instructors to be utilized in DCS training shall be included in the Training Plan submittal.
5. After approval of the Training Plan, the DCSP is responsible for coordinating with City DCS Staff, or the City's project representative, to schedule training classes at appropriate times in advance of cut-over and start-up.

PART 2 – PRODUCTS

2.1 CURRENT TECHNOLOGY:

A. All hardware and software shall be the product of Emerson Process Management (EPM) and shall be of the Ovation family of DCS.

B. All products shall be the latest available version of a product or module.

C. The DCS should utilize state-of-the-art products in the DCSP's product line. However, the DCSP must ensure that all products used for this Project are compatible, and will fully integrate into the City's existing enterprise wide COMNET DCS.

D. Successful operation and calculation shall be demonstrated during Factory Acceptance Testing (FAT), Operational Readiness Testing (ORT) and Functional Testing phases.

2.2 HARDWARE AND SOFTWARE COMMONALITY:

A. Where there is more than one item of similar equipment being furnished, all such similar equipment shall be the of the same Ovation family series.

B. The DCSP shall submit a plan in case of a discontinued or upgraded product, or other cases where changing technology requires changes in equipment, the DCSP shall submit a Substitute Item Request Form.

C. All equipment shall be of modular design to facilitate interchangeability of parts and to assure ease of servicing. This interchangeability shall apply to the following components, as a minimum, of the DCS.
   1. Processor Modules
   2. Bulk Memory Modules
   3. Communication Interface Modules
   4. Analog and Discrete Signal Modules
   5. Power Supply Modules, and UPS devices
   6. Workstations and operator interface devices
   7. Software licenses

2.3 DCS PRIMARY ARCHITECTURAL COMPONENTS:

A. The DCS supplied by DCSP shall consist of, but not be limited to, the following primary architectural components:
   1. Operator, engineering, instructor, and field workstations.
   2. Copper and fiber optic communications network (at DCS PCMs, etc.)
   3. DCS OS Software for alarms, events, monitoring and control and configuration tools.
   4. Security.
   5. Historian/Historical data recording and reporting.
   6. System Configuration (Application Software) of I/O database, displays, control loops, and human machine interfaces (HMI) graphics.
   7. Process Control Modules (PCM).
   8. Input/output (I/O) cards and devices, I/O racks, I/O units, remote IO, and Termination Cabinets.

B. In addition, components associated with the DCS are:

   1. Control room furniture as shown on drawings and contained in these Specification, peripherals such as large screen displays, alarm printers, etc.)
   2. Services related to DCS (including system maintenance, upgrading, and third party and enterprise integration)
   3. Enclosures, termination panels, power, UPS, and ground termination busses, etc.
   4. PLC's, RTU's, Foreign Device Interface (FDI) modules for PCM's

2.4 SUPPORTING COMPONENTS:

A. The supporting components and associated application software shall consist of the following:
   1. DCSLAN Switches.
   2. DCSLAN/DCSWAN Routers.
   3. Patch Management Server (when specified herein).
   4. Security hardware and software, including Antivirus software and malware detection.

PART 3 – EXECUTION

3.1 PROJECT EXECUTION AND PROJECT MANAGEMENT SERVICES:

A. The DCSP shall prosecute all Work in strict accordance with the sequence and schedule of the Prime Contractor's Master Baseline Schedule.

B. The DCSP'S attention is called to the Contract Documents and Division 40 for specific administrative and commercial requirements of the Work.

C. The DCSP shall provide all project management services required to complete the Work of these documents. At a minimum project management services shall include:
   1. Progress Review Meetings.
   2. Meeting and workshops to develop project requirements and design details.
   3. Regular meetings on scheduling and invoicing.
   4. All required meetings for design and submittal reviews.
   5. Coordination of support and warranty.
   6. Coordination of training.
   7. Development and delivery of DCS project controls and document management that coordinates with that of the Prime Contractor.
   8. Attend coordination meetings with Prime Contractor, City's representative, plant staff and other City entities as they relate to the delivery of DCS Work.
   9. Respond to City representative's requests for information and project documentation.
   10. Respond to RFI reviews, as requested by the Design Engineer through the City's representative.
   11. As defined in Section 40 98 00, project Management Services.

D. The DCSP shall provide all labor, equipment, materials and furniture for the tenant improvements required for the approved staging site at the sole expense of the DCSP.

3.2 ENGINEERING & DESIGN PHASE:

A. The DCSP shall provide all engineering, resources, equipment, and labor required to successfully:
   1. Produce all submittals, in accordance with Specification 01 33 00, Submittal Procedures and Division 40 requirements.
   2. Program, configure, and test of all hardware and software as required by these specifications
   3. Design and specify the enterprise inter-site WAN interface at Project site for communications interface with the existing COMNET DCS.
   4. Develop the classroom and computer-based-training for all system elements.
   5. Execute field verification and documentation of all conditions, and develop installation drawings and accurate as-constructed documents to successfully complete the Work.
   6. Setup, stage and test the Work of each process segment and perform FAT, witnessed by the City's representative at the approved Staging Area prior to any installation.

7. Put into service all system elements by detailed I/O tests, loop checks, and commissioning. Develop and perform functional and performance testing.
8. Document all system elements, software and custom applications
9. Maintain, upgrade and warrant all Work required by the Prime Contract.
10. Design, develop, program, and test Integration of DCS with other systems.
11. The DCSP shall develop and submit a uniform and standardized IO tag name convention, and follow the ISA tagging scheme standardly used by the COMNET DCS.
12. As defined in Section 40 98 01, Engineering and Design Services.

3.3 PROCUREMENT, STAGING, PROGRAMMING, AND TESTING PHASE:

A. The DCSP shall provide all engineering, resources, equipment, and labor required to:
   1. Procure all goods and services required to conform to these specifications.
   2. Perform all shipments required by the Work.
   3. Ship all equipment and software to the approved staging facility, including deliveries from approved Staging Site to Project site.
   4. As defined in Section 40 98 02, Procurement, Staging, Programming

B. Assemble, stage and program each Segment of Work at the approved Staging area and perform FA T prior to delivery for installation. All tests shall be performed in accordance with Division 40 specifications and approved test procedures.

C. The system elements (i.e. WS, PCM, FHS, etc.) may be assembled at the DCSP'S facility and shipped to the approved Staging area for staging, programming and testing. However, the CITY reserves the right to inspect these system elements prior to shipment, and again prior to delivery from the Staging site to the Project site.

3.4 FIELD CONSTRUCTION/ COMMISSIONING PHASE:

A. Provide all engineering, resources, equipment and labor required to:
   1. Oversee the physical install, by others, of all Process Control Modules (PCM) and Remote IO (RIO) enclosures and electronics.
   2. Oversee termination, by others, of all field wiring in 'B' or PCM Cabinets.
   3. Run new wires from Cabinet to DCS IO where required.
   4. Design, install, and test foreign devices including serial or networked I/O.
   5. Oversee supply and termination of power and grounding of all devices, by others.
   6. Test all signal grounding and certify proper installation and function.

7. Deliver U ninterruptible Power Supplies, for installation by others under Division 26.
8. Obtain and manage all required Intra-Plant permits
9. Install and test all DCS-related networking hardware and cabling.
10. Test all workstations, hardened workstations, PCM and RIO cabinetry and enclosures.
11. The DCSP shall support as-built documentation including DCS loop diagram information and P&ID information. As specified.
12. Conduct a functional test, and site acceptance test to verify DCS performance.
13. Update and submit all specified documentation to reflect "as-built" or record conditions.
14. Support the Integration Period Testing as specified.

As defined in Section 40 98 04, Field Construction/Commissioning Services.

3.5 MAINTENANCE AND UPGRADE SERVICES PHASE:

A. The DCSP shall Warrant all parts and services for a period as specified for the Prim Contract, after Final DCS Acceptance.

3.6 ENVIRONMENTAL SUITABILITY:

A. All DCS devices provided under this contract shall be provided with enclosures which are suitable for use in a treatment facility environment where there are typically high energy AC fields, DC control pulses, and varying ground potentials between the transducers or process instrument locations and those occupied by DCS components.

B. The system design shall be adequate to provide proper protection against interferences from all such possible situations.

C. As a minimum, all DCS equipment shall be resistive to airborne contaminants commonly found in wastewater treatment facilities, and be suitable for installation in an environment which conforms to a G2 classification as defined by ISA-S71.04.

D. Field-Situated Equipment:
1. DCS equipment being furnished under this contract shall be suitable for use in wastewater treatment facilities, some of which are in an environment of air with traces of methane and hydrogen purging sulfide. The system design shall be adequate to provide proper protection against such an environment.
2. All field-situated components including PCMs shall be UL-listed or approved by an independent certification agency acceptable to the City of San Diego.
3. All DCS devices shall be housed in an enclosure suitable for its intended service and installation location.

4. All DCS devices to be installed in MCC or other protected areas shall be furnished in NEMA 12 rated enclosure.
5. All DCS devices to be installed in indoor protected areas shall be furnished in NEMA 12 rated enclosures.
6. All DCS devices to be installed in indoor unprotected or areas subject to hose-down conditions, or outdoor areas, shall be furnished in 316SS NEMA 4X rated enclosures.
7. At a minimum, the DCS shall be designed and constructed for satisfactory, long, and low maintenance operation under the following environmental conditions:
    a. Temperature Range: 0 through 50 degrees C (32 through 122 degrees F).
    b. Thermal Shock: 0.55 degrees C (1-degree F per minute maximum).
    c. Relative Humidity: 5 through 95 percent (non-condensing).
8. The mounting of all enclosures shall meet the requirements as specified in Division 26, and shall be seismically braced as required by code for this seismic zone.

END SECTION

SECTION 40 90 04
REFERENCES

PART 1– GENERAL

1.1 GENERAL:

A. Where the requirements set forth in the Contract Documents are greater or more rigid than the mandatory requirements referenced herein the applicable portions of the Contract Documents shall govern.

B. In the case of conflict between any mandatory requirements and the Contract Documents, the mandatory requirement shall be followed in each case, but only after submitting such proposed changes to the City's representative for approval.

C. Nothing contained in the Contract Documents shall be so construed to conflict with any national state, municipal, or local laws or regulations governing the installation of Work specified herein, and all such acts, ordinance, and regulations, including the National Electrical Code, are hereby incorporated and made a part of the Contract Documents. All such requirements shall be satisfied by the DCSP at no additional expense to the City.

1.2 PERMITS:

A. Construction permits are the responsibility of the Contractor. However, The DCSP shall be responsible for obtaining any Plant permits, 'outage requests' etc. imposed by the City and Plant standard operating procedure.

1.3 REFERENCES:

A. The equipment materials, installation, and other work shall conform to all the following applicable regulations, standards, specifications, and codes unless a more current version is applicable:

SECTION 40 90 05
DEFINITIONS

PART 1 – GENERAL

1.1 DEFINITIONS

A. Terms used in this section:

1. ACAD: AutoCAD
2. AP: Access Point. A wireless access point (WAP or AP) is a device that "connects" wireless communication devices together to create a wireless network.
3. API: Application Programming Interface are a set of definitions of the ways in which 1 piece of computer software communicates with another. It is a method of achieving abstraction, usually (but not necessarily) between lower-level and higher-level software.
4. AMS: Asset Management System
5. Authentication: Authentication is the process of verifying an identity claimed by or for a system entity.
6. Authorization: Authorization is a right or a permission that is granted to a system entity to access a system resource.
7. Analog range: An analog range is the minimum to maximum value that a device is expected to have in the field. A/D: Analog to digital conversion.
8. AWG: American wire gauge.
9. CCTV: Closed Circuit Television.
10. CFC: California Fire Code.
11. CMMS: Computerized Maintenance Management System
12. COMNET: Cleanwater Operations Management Network. COMNET is a dedicated term for City's existing enterprise level of wastewater operation systems.
13. COMC: Central Control Room
14. CoSD: City of San Diego
15. COTS: Commercial off-the-shelf.
16. CPU: Central Processing Unit.
17. CSMA/CD: Carrier Sense Multiple Access with Collision Detection.
18. CSU: Channel Service Unit.
19. D/A: Digital to analog conversion.
20. DCS: Distributed Control System
21. DCSP: Distributed Control System Provider
22. DIN: Department Information Network. DIN is a dedicated term for City's COMNET system. The DIN shall provide connectivity between

all Department facilities and resources by virtue of a network which incorporates high-speed fiber, telephone data links and radio technology.

23. DCSLAN: Distributed Control System intra-plant Local Area Network located within the plant to interconnect various controllers, workstations, printers and servers. DCS Tag: Tag assigned to a loop for identification purposes and reference inside DCS and on P&ID's (without plant identifier)
24. DCSWAN: Distributed Control System Wide Area Network, used to connect plant-based DCSs together
25. DHCP: Dynamic Host Configuration Protocol.
26. DIN: Deutsches Institut für Normung eV (German Institute for Standardization; similar to US ANSI)
27. DMZ: Demilitarized Zone. Isolation zone between a protected control network (CN) and external users, such that all production traffic "flowing" between the CN and those external users actually flows through an access control device, such as a firewall.
28. DSU: Data Service Unit.
29. EHWS: Environmentally Hardened Workstation. The EHWS shall have a 316-stainless steel enclosure rated as NEMA 4X. The EHWS shall be configured in the range of 32 to 104 degrees F, and humidity of 95% non-condensing.
30. EMI: electromagnetic interference.
31. ESD: emergency shutdown.
32. Ethernet: Ethernet is a frame-based computer networking technology for local area networks (LANs). It defines wiring and signaling for the physical layer, and frame formats and protocols for the media access control (MAC)/data link layer of the OSI model. Ethernet is mostly standardized as IEEE 802.3.
33. EWS: Engineers Workstation(s)
34. FAT: Factory Acceptance Test. A test conducted at the DCSP or Vendor premise to ensure operability of a system according to specifications.
35. FCC: U.S. Federal Communications Commission
36. FDDI: Fiber Distributed Data Interface, a protocol used in early version of Emerson Ovation systems.
37. FIN: Facility Information Network. FIN is a dedicated term for City's COMNET system. The FIN shall provide connectivity between the DCS and plant facility management systems. The FIN shall specifically have connectivity to WS and HS devices.
38. FWS: Field Workstation(s).
39. GFCI: Ground-fault circuit interrupting receptacle.
40. HART: Highway Addressable Remote Transducer

41. HMI: Human-Machine Interface. A term that refers to the “layer” that separates a human that is operating a machine from the machine itself. One example of a HMI is the computer hardware and software that enables a single operator to monitor and control large machinery remotely.
42. HOR: Hand-Off-Remote
43. HS: Historian Server.
44. HSE: health and safety equipment.
45. IEC: International Electro-technical Commission, is a European standards body which has developed IEC60870-5 series of SCADA protocols. IEC is now working on IEC-62351 a secure protocol envelope for DNP3 and IEC60870-5.
46. IEEE: Institute of Electrical and Electronics Engineers.
47. I/O: Input and Output: I/O is used by the DCS for receiving and sending signals to and from the field to the DCS. I/O types are:
48. AI: Analog Input
49. AO: Analog Output
50. DI: Digital Input
51. DO: Digital Output
52. I/O Card: Input/Output (I/O) cards refer to the devices used by the DCS to communicate with field devices. I/O cards consist of digital-in (DI), for on/off detection, analog-in (AI), to measure a range of a device in the field, digital-out (DO), to send on-off signals, or analog-out (AO) to control field devices. IP: Internet Protocol. A data-oriented protocol used by source and destination hosts for communicating data across a packet-switched inter- network. Data in an IP inter-network are sent in blocks referred to as packets or datagrams (the terms are basically synonymous in IP).
53. ISA: International Society of Automation
54. ISO: International Organization for Standardization. The International Organization for Standardization, also known as ISO, is global network of the national standards bodies of 156 countries dedicated to technical standards development.
55. IWS: Instructor Workstation(s)
56. LAN: Local Area Network.
57. LIMS: Laboratory Information Management System
58. LCP: Local Control Panel
59. LOR: Local-Off-Remote
60. LOS: Lock-Out Stop
61. L/R: Local/Remote
62. Malware: Malware is malicious software designed to infiltrate or damage a computer system, without the owner's consent. Malware is commonly taken to include computer viruses, worms, Trojan horses,

rootkits, spyware and adware.

63. MBC: Metropolitan Biosolids Center
64. MTBF: Mean Time Before Failure
65. MTTR: Mean Time To Repair
66. MOC II: Metropolitan Operations Center
67. MOV: Motor Operated Valve
68. NCWRP: North City Water Reclamation Plant
69. NEC: National Electrical Code
70. NEMA: National Electrical Manufacturers Association
71. NFPA: National Fire Protection Association
72. NIC: Network Interface Card.
73. NMS: Network Management System
74. NIST: National Institute of Standards and Technology
75. NRC: National Research Council
76. NTP: Notice-to-Proceed
77. OPC: Open Connectivity via Open Standards. OPC is open connectivity in industrial automation and the enterprise systems that support industry. Interoperability is assured through the creation and maintenance of open standards specifications. OPC has been termed Object Linking Embedding [OLE] for Process Control or "OLE for Process Control".
78. OPH: Ovation Process Historian. OPH is a dedicated term for City's COMNET system.
79. ORT: Operational Readiness Test. Operational Readiness Testing is completed at the final stage of the DCS installation to verify the installed system is ready for live deployment and Functional Testing of Unit Processes.
80. OS: Operating System
81. OSC: Ovation Security Center.
82. OSI: Open Systems Interconnection Reference Model (OSI) — The Open Systems Interconnection Reference Model is a layered abstract description for communications and computer network protocol design, developed as part of the Open Systems Interconnect initiative.
83. OSHA: Occupational Safety and Health Standards
84. OWS: Operator Workstation(s)
85. PCM: Process Control Module. PCM is a dedicated term for City's COMNET system. A PCM refers a combination of various modules including central processing unit/modules, network modules, I/O modules, and/or other special modules, these modules are normally located in the same enclosure, and function together to accomplish data acquisition, alarming and implementation of control strategies for a designated process area.
86. P&ID: Piping and Instrumentation Diagram

87. PID: Proportional-Integral-Derivative controller. A standard feedback loop component in industrial control applications. It measures an "output" of a process and controls an "input", with a goal of maintaining the output at a target value, which is called the "setpoint".
88. PIN: Process Information Network. PIN is a dedicated term for the existing COMNET system. The PIN provides connectivity between the WSs, PCMs, and the Historian System (HS) to enable the timely update and archiving of process information and timely control response.
89. PLC: Programmable Logic Controller.
90. PLWTP: Point Loma Wastewater Treatment Plant
91. PMS: Power Monitoring System
92. PPS: Penasquitos Pump Station
93. QA: Quality Assurance
94. QC: Quality Control
95. QoS: Quality of Service
96. RAID: Redundant Array of Independent Disks
97. RDT: Remote Desk Top
98. RDS: Remote Data Server
99. RFP: Request for Proposal
100. RSSI: Receive Signal Strength Indicator
101. RTU: Remote Terminal Unit. An RTU, or Remote Terminal Unit is a device which interfaces objects in the physical world to a DCS or SCADA system by transmitting telemetry data to the system and/or altering the state of connected objects based on control messages received from the system.
102. SBWRP: South Bay Water Reclamation Plant
103. SCADA: Supervisory Control and Data Acquisition.
104. SOP: Standard Operating Procedures
105. SS: Selector Switch
106. S/S: Start/Stop
107. SAT: Site Acceptance Testing
108. SNMP: Simple Network Management Protocol
109. TCP: Transmission Control Protocol
110. TCP/IP: Transmission Control Protocol/Internet Protocol
111. TIA: Telecommunications Industry Association
112. Terminal Server: a hardware device or server that provides terminals (PCs, printers, and other devices) with a common connection point to a local or wide area network.
113. UFC: Uniform Fire Code
114. UL: Underwriters Laboratories. Standards to measure performance, environmental health and sustainability.
115. UPS: Uninterruptible Power Supply
116. VLAN: Virtual LAN. A virtual LAN, commonly known as a VLAN, is

a logically segmented network mapped over physical hardware.

117. VFD: Variable Frequency Drive
118. VoIP: Voice over Internet Protocol (also called VoIP, IP Telephony, Internet telephony, and Digital Phone) is the routing of voice conversations over the Internet or any other IP-based network. The voice data flows over a general-purpose packet-switched network, instead of traditional dedicated, circuit-switched voice transmission lines.
119. VPN: Virtual Private Network. A private, encrypted communications network usually used within a company, or by several different companies or organizations, used for communicating in a software tunnel over a public network.
120. WAN: Wide Area Network
121. WDPF II: Westinghouse Distributed Processing Family, 2nd Generation
122. WiFi: Wireless Fidelity. Short for wireless fidelity and is meant to be used generically when referring of any type of 802.11 network, whether 802.11b/a/g dual-band, etc.
123. WiMax: Worldwide Interoperability of Microwave Access. WiMax is the name commonly given to the IEEE 802.16 standard. A wireless protocol designed for distances as far as 30 miles but more commonly 3 – 5 miles.
124. WS: Workstation(s), see also EWS, FWS, IWS, OWS

B. Types of Variables:

1. Calculated Analog Points (CA): Analog variables computed from inputs, manual inputs, calculated discrete points, and other calculated analog points.
2. Calculated Discrete Points (CD): Discrete variables computed from inputs, manual inputs, calculated analog points, and other calculated discrete points.
3. Manual Inputs (MI): Variables whose values are manually entered, e.g., laboratory data.
4. Process Variables (PV): Analog variables from analog inputs and calculated analog points.
5. Report Variables: Variables computed by report generator.

1.2 RELATED SECTIONS

A. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

All required additional or ancillary components and cables shall be provided as required to provide a complete and functional DCS.					

SECTION 40 90 07
SCOPE OF WORK

PART 1 – GENERAL

1.1 THE REQUIREMENT

A. GENERAL

1. The intent of this section is to provide the DCSP direction in the specific and unique tasks of Work related to the Project segment of the delivery. All other requirements of these specifications apply.
2. The Work includes, but is not limited to the design, procurement, installation, staging, testing, warranty maintenance, and documentation, of a distributed control system (DCS) for the Morena Pump Station And Conveyance System, which includes all process area of the Project required by the Contract Documents.
3. The new DCS equipment is being provided under a proprietary sole-source agreement, and must be fully compatible with, and integrate ~~onto~~ into the existing City of San Diego (City) Enterprise wide COMNET DCS.

1.2 RELATED SECTIONS

A. The Work described in the following Sections applies to the Work identified in this Section.
1. Division 01 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

1.3 SPECIFICATIONS, CODES AND STANDARDS

A. The Work shall comply with the current editions of the publication and codes identified in Section 40 90 04, References.

1.4 DEFINITIONS

A. Definitions of acronyms are identified in Section 40 90 05, Definitions.

1.5 SUBMITTALS

A. All DCSP required submittals are referenced through Division 40 of the Project Specifications as well as Division 01. All required DCSP

Submittals shall be submitted in accordance with Section 01 33 00, Submittal Procedures.

PART 2 – PRODUCTS

2.1 REQUIREMENTS

A. The requirements of each product, material or other are contained in the specifications below. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this Work.

1. Division 26 – Electrical
2. Division 40 – Process Integration
3. Other Technical Specifications

PART 3 – EXECUTION

3.1 REQUIREMENTS FOR THE MORENA PUMP STATION AND CONVEYANCE SYSTEM - Project

A. The DCSP shall provide the following I/O and all required control logic, distributed in the PCM's by process area according to the control narratives, exhibits and drawings identified in the Project Contract documents and, in addition, provide spare capacity of 20% I/O in each PCM.
[Design engineer to populate the I/O counts in the table below, on a process-area by process-area basis]

PROCESS AREA	AI	AO	DI	DO	TOTAL
First Process Area	**TBD**	**TBD**	**TBD**	**TBD**	**TBD**
Last Process Area	**TBD**	**TBD**	**TBD**	**TBD**	**TBD**

B. DCSP shall segment all I/O and cards to increase the reliability of all systems and limit any single I/O card failure causing an outage to a process or process area.

C. The DCSP shall perform all necessary drawing reviews and site investigations to provide the specified DCS portions of the Loop Diagrams, which are the

responsibility of the General Contractor to create.

D. DCSP shall provide all DCS furniture, enclosures and associated equipment, where shown on the design drawings.

E. New fiber optic and copper based intra-site LAN communications is being installed and terminated by others under Division 26. However, the DCSP shall witness the installation and testing of fiber optic cabling provided by the Contractor in accordance with the specification 40 95 34 Fiber Optics. The DCSP shall provide oversight of the cable installation and termination to Patch or Termination panels provided by the DCSP under this specification.

F. The exact locations and routing of wiring and cables shall be provided by the Design Engineer on the Drawings. However, the DCSP shall ensure that fiber optic cabling is installed in accordance with manufacturer's recommendations, particularly in regard to pulling methodology and bend radiuses.

G. All equipment shall be located and installed so that it will be readily accessible for operation and maintenance. All code space-clearance requirements of NEC shall be adhered to.

H. Minimum Workstation Requirements

1.
2. DCSP shall provide Operator Workstations (OWS), in accordance with quantities listed on the Appendix and as shown on the Drawings.
3. DCSP shall provide color laser printers, color printer/scanners and black & white laser printers, in accordance with quantities listed on the Appendix and as shown on the Drawings.
4. DCSP shall provide Engineering Workstations (EWS), in accordance with quantities listed on the Appendix and as shown on the Drawings.
5.
6. DCSP shall be responsible to install, in locations shown on Drawings, a suitable network switch with a minimum of two ports to access the DCSLAN with the laptop computers.
7. DCSP shall provide large screen video displays, in accordance with quantities listed on the Appendix and as shown on the Drawings.

3.2 SPECIFIC REQUIREMENTS OF MORENA PUMP STATION AND CONVEYANCE SYSTEM – ENGINEERING & DESIGN PHASE

A. The DCSP shall provide all submittals required by these specifications to provide a complete final design for the new DCS equipment at the Project. The DCSP submittals shall fully detail DCSP'S engineered design, addressing, at a minimum, the following:

1. All administrative submittals
2. Staging Area modifications at approve Staging Site.
3. Configuration/Architecture, equipment locations, programming and testing of all hardware and software required by these specifications.
4. Plant Server Room final design for all servers, including DMZ servers, and communications equipment. DCSP to provide one-line networking and security topography drawings.
5. Review of design and specification of the DCSLAN for communications, including verification of signal loss budgets.
6. DCSWAN interface
7. Design, construction, and commissioning of DMZ between DCSLAN, DCSWAN and City, and Plant, Business Network
8. Classroom and computer based training
9. Pre-installation staging and witnessed Operational Readiness Testing (ORT) Approved Staging Area
10. System commissioning including DCS-end; Loop checks, functional testing, and performance testing. Prime Contractor is responsible for field-end staffing and testing for all referenced testing regimens.
11. Provide DCS-related information (e.g. PCM termination nomenclature, software level addressing, etc.) required to support the General Contractor to produce the as-constructed Loop Diagrams and P&IDs
12. As built documents of all system elements, software and custom applications
13. Warranty services required by Contract documents.

B. When necessary to accomplish the Work of the DCS, the DCSP shall request through the City representative and then facilitate all workshops necessary to gather information, reach consensus and deliver design submittals in accordance with the milestones contained in the Prime Contractors Master Baseline Schedule.

C. The DCSP shall immediately, if needed, on notice-to-proceed design, build and furnish the Approved Staging Area adequately to, support their proposed staff, test all systems and equipment, provide long term maintenance and storage for spare parts for the life of the Project segments.

D. The DCSP shall perform project management, engineering, programming and staging work at the Approved staging area.

E. The DCSP shall design, provide and oversee installation of new Uninterruptible Power Supplies (UPS) for the Work as defined in Division 26.

F. The DCSP shall provide oversight of the DCS Signal Grounding System, as

defined in Section 40 95 15 DCS Equipment Grounding. The DCSP shall be responsible for testing ground resistivity in accordance with the Specifications to ensure proper signal grounding of the PCM, RIO, etc.

3.3 SPECIFIC REQUIREMENTS OF PROJECT PROCUREMENT, STAGING, PROGRAMMING AND TESTING PHASE

A. Procurement and Staging

1. The DCSP shall develop the Approved Staging Area as the basis of their operations where DCSP staff provides all labor for the entire project. The design and build out of the Staging area shall commence with the notice to proceed of the Project , unless DCSP is using a Staging Area previously developed. The DCSP shall be responsible for providing a safe, secure, maintained area for the Staging area, including janitorial service and supplies, security systems, power and sanitary services.
2. DCSP shall procure, pr og r a m a nd stage, all system elements at the Approved Staging Area to build a complete and operable DCS, including DMZ.
3. DCSP shall provide a DMZLAN containing two (2) firewalls for connection to the dual redundant DCSLAN, or as shown on the plans and drawings.
4. All equipment shall be delivered FO B to the DCSP Approved Staging Area. DCSP shall provide all labor and materials including but not limited to, shipping, logistics, material training tracking, and insurance required Bonds and setup/testing costs.

B. Programming and Testing Phase

1. DCSP shall program system elements at the Staging Area to build a complete and operable DCS, including programming and configuration of system elements in the DMZ, using the latest Ovation version as currently employed in other customer locations and successfully operating to the Owner's satisfaction.

2. DCSP shall provide any and all configuration and programming required to create a fully functional DCS for t h e Project, including but not limited to:
   a. DCSP shall create all graphics to operate with the new DCS.
   b. DCSP shall create all trends/trend groups commonly used on the City's DCS to operate with the new DCS.
   c. DCSP shall create all control programming to operate with the new DCS.
   d. DCSP shall create all reports to operate with the new DCS, and integrate with the Enterprise DCS Reports generation system. The existing types and quantities of the reports for Project are as

appropriate to the project, but at a minimum as follows:

1) 10 Plant level reports
2) 5 state/regulatory level reports
3) 5 enterprise level reports

e. In addition, when requested by the City, the DCSP shall facilitate a minimum of five (5) meetings/workshops with the City's representative for the DCSP to design, program, install, and test the following:

1) An additional 5 (design engineer top specify quantity) three-dimensional main graphic process screens as defined by user workshops.
2) An additional 10 (design engineer top specify quantity) Main Graphic process screens as defined by user workshops.
3) An additional 50 (design engineer top specify quantity) sub graphic (windows) process screens as defined by user workshops.
4) An additional eight (design engineer top specify quantity) plant-level reports as defined by user workshops.
5) An additional five (design engineer top specify quantity) state/regulatory reports as defined by user workshops.
6) An additional five (design engineer top specify quantity) enterprise level reports as defined by user workshops.
7) An additional five (design engineer top specify quantity) trend groups as defined by user workshops.

2. DCSP shall provide any and all configuration and programming required to create a fully functional DCS for the Project including, but not limited to, all intermediate or calculated values, I/O database, control and graphic programming, report and historian programming and trending.
3. In addition to all the other requirements of the DCS identified throughout Division 40, the DCSP shall provide an additional 20% of software database I/O of each I/O type for integration to other systems or as directed by the City's representative. These I/O, if needed, will be defined during the course of the delivery by DCSP facilitated workshops with the City's representative.
4. The DCSP shall provide all necessary products, services and materials as required by these specifications for the DCSLAN. All DCSLAN equipment shall be staged and tested during the FAT.
5. DCSP shall conduct all Factory Acceptance Testing (FAT) at the Approved Staging Area.

3.4 SPECIFIC REQUIREMENTS MORENA PUMP STATION AND CONVEYANCE SYSTEM FIELD CONSTRUCTION AND COMMISSIONING PHASE

A. The DCSP shall obtain all required in tr a - pl a nt permits and approvals for the DCS construction.

B. The DCSP shall witness the installation of final termination in PCM, RIO, etc. for all new Uninterruptible Power Supplies for the DCS as defined in Division 26.

C. The DCSP shall perform the Operational Readiness Testing (ORT) in the field, working in conjunction with the General Contractor.

D. DCSP shall perform all testing requirements including but not limited to; complete testing of all DCS – ends of loops, functional testing and other field testing as required .

E. The DCSP shall provide all materials and labor to connect the DCSWAN to the City or Plant Business Network via the DMZ, in concert with City COMNET Network staff.

3.5 SPECIFIC REQUIREMENTS OF PROJECT WARRANTY SERVICES PHASE

A. Work shall be performed pursuant to Prime Contract warranty requirements of Division 01. The City may, at its sole discretion, contract with the DCSP for an extended warranty and maintenance period.

END OF SECTION

SECTION 40 94 00
DISTRIBUTED CONTROL SYSTEM GENERAL REQUIREMENTS

PART 1 GENERAL

1.1 SUMMARY

A. The intent of this section is to provide the Distributed Control System Provider (DCSP) direction in specific and unique tasks of Work related to the Project segment of the delivery. All other requirements of these Specifications apply.

B. The Work includes but is not limited to the design, procurement, installation, staging, testing, warranty maintenance, and documentation of a distributed control system (DCS) for the project, which includes all process areas of the project required by the Contract Documents.

C. The new DCS components is being provided under a proprietary sole-source agreement, and must be fully compatible with and integrated into the existing City of San Diego Enterprise-wide COMNET DCS.

1.2 THE REQUIREMENT

A. Major Work Items: Includes but is not limited to engineering, furnishing, installing, calibrating, adjusting, testing, documenting, starting up, and training for complete PLC.

1. Distributed Control System (DCS)
2. Computers and networks for Human Machine Interface (HMI).
3. Applications Software: Provided by the Distributed Control System
4. Provider (DCSP) for DCS and HMI.
5.

B. GENERAL: The DISTRIBUTED CONTROL SYSTEM PROVIDER (DCSP) shall furnish all equipment and provide all applicable engineering for a fully functional distributed control system, that complies with the technical requirements of the contract documents including, but not limited to, project management, design assistance, coordinate with on-site area contractors, detailed system design and integration, conducting graphic design workshops, equipment supply and shipment, storage, job site delivery, programming and configuration, installation oversight, testing, commissioning and start up, integration with the existing City-wide Operation and Management Network (COMNET), and training.

1. The DCS Work shall be as defined within Division 01 and these Specifications.
2. The Work covered by this specification and all of its sub parts shall include, but not limited to, field verification of all existing conditions, engineering and design of system and components, manufacture and/or procurement of all necessary equipment, components, material, transportation, labor, special tools, factory testing, application programming, shipment, storage, and jobsite delivery, operational readiness testing, installation of equipment, system integration, startup operation, site testing, training and documentation, support, maintenance/warranty of a complete, integrated and operational Distributed Control System (DCS) for the City of San Diego.
3. The statements of Work contained herein are necessarily general in nature and should not be construed as an all-inclusive list of devices, equipment, software and services necessary for successful completion of the Work.
4. It shall be the responsibilities of the DCSP to coordinate and project manage the Work, as set forth in this section of the Specifications, with work and equipment specified under other sections of the Specifications, in order to provide a complete and satisfactory installation.
5. To ensure that the distributed control system shall be a standard system of Emerson Process Management, Ovation family. With a complete repertoire of pre-existing software modules running in a familiar hardware environment and free from hardware/software incompatibilities.
6. This specification is generic to all Facilities and applicable sections shall be delivered for each process segment of the Work as defined in these Specifications and project Contract Documents.
7. The DCSP shall be responsible for coordination, installation and testing of DCS. The Prime Contractor is responsible for termination of I/O signals, power and ground utilities for all DCS equipment. The DCSP shall review and inspect all current designs and all Contract Documents to assess space allocations, power allotments and available grounds. If the DCSP's requirements for power, grounding or spatial requirements differ from that shown within the Contract Documents, the DCSP shall include all required engineering, design and construction details to the Prime Contractor and City's representative immediately.
8. The DCSP shall be responsible for providing all equipment, installation supervision, engineering, programming, configuration, management and services associated with integrating all instrumentation and control devices, and special systems, including Foreign Device Interfaces (FDI), into the DCS in a transparent and seamless manner. The use of a third party, system house, or system integrators for the above service is not acceptable.
9. DCSP shall be fully responsible for the implementation, installation, and integration of the DCS as outlined in this specification.
10. The provisions of this Section shall apply to all items specified in the various Sections of Division 40 and all other Divisions.

11. DCSP shall be responsible for interfacing to all existing instrumentation and all other Input/Output (I/O) devices.
12. During field functional testing the DCSP shall verify the operation of all instruments and field devices and associated wiring (from instrument/device to DCS) and notify the City's representative and Prime Contractor of any deficiencies that exist.

C. Scope of Work:

1. The Work generally consists of the supply of all labor, tools, services and provision of all products required, for a complete, integrated, operational DCS control system in accordance with the Contract Specification and Drawings.
2. Identify other on-going projects/systems development that are not part of this contract. Ensure other ongoing activities, in close proximity or otherwise, do not disturb or interrupt the operation of the existing systems or the work already commissioned or placed into operation. Should any such activity pose a risk to this work or to the system operation, advise the City immediately.
3. In general, the work involves the supply, installation and commissioning of the DCS control system as indicated on the drawings and specification sheets, and as defined in the Matrix of Responsibilities in D. The following is a summary of the major works:
    a. Engineer to provide a high-level description of the project specific work including provision of all instruments, hardware, software, network, cabling, and services such as testing, commissioning, training, documentation.
    b. Following the instructions in D, Provide, test and commission all field instrumentation including field wiring, instrument control panels, and control system hardware including all lightning & surge protection, and all peripheral devices necessary.
    c. Conduits and Wires:
        1) All conduits, including those for the district information network (DIN), plant information network (PIN) and facility information network (FIN), will be furnished and installed by the Contractor. All conductors, including power and grounding for DCSP furnished equipment will be furnished and installed by the Contractor. DCS grounding will use a special triad grounding system; specifications for this system are provided in the contract documents in accordance with the DCSP requirements. All signal conductors, except for PIN, and FIN fiber optic and coaxial cables, will be provided and installed by the General Contractor.

2) The PIN and FIN fiber optic and coaxial cables will be furnished, installed and terminated by the DCSP. DIN fiber optic cable will be furnished by the DCSP and installed by the Contractor up to the first termination point within a facility. All wire termination except for PIN, FIN and DIN cables will be performed by the General Contractor.
3) Cables and conduits for non-DCS communications systems, such as the telephone system, will be furnished and installed by the General Contractor.
    a) Provide all programming and microprocessor-based instrument configuration.
    b) Provide all required testing, commissioning and start up services. Allow in the Contract Price, for any additional time deemed necessary to meet the testing and commission requirements.
    c) Provide Factory Acceptance Testing (FAT) to demonstrate the operational functionality of hardware and communications per specifications.
    d) Provide Operational Readiness Testing (ORT) to demonstrate the correct operation of the control system with both hardware and software in place per specifications.
    e) Provide Performance Acceptance Test to ensure entire system functions properly per specifications.
    f) Provide all required training per specifications.
    g) Provide warranty services per contract requirements.

4. Interfacing and Responsibilities of General Contractor (GC) and DCSP:
    a. The following Table 1 shows the procurement, installation, and labor responsibilities of the DCSP and the GC. All field instrumentation devices and final control elements which are needed to support DCS functionality will be wired to process control modules (PCMs). Table 2 and Table 3 define in greater detail of the responsibilities assigned to the General Contractor and the DCSP.

Table 1: Matrix of Responsibilities - Equipment/Devices/Materials

Product	Supply	Install
DCS Process Control Modules (PCMs)	DCSP	GC
DCS Workstations (WSs)	DCSP	DCSP
DCS Historian System (HS)	DCSP	DCSP
DCS PIN/FIN Hubs and network equipment	DCSP	DCSP
DCS Printers and Stands	DCSP	DCSP

Table 1: Matrix of Responsibilities - Equipment/Devices/Materials		
Product	**Supply**	**Install**
Fiber Optic Network Cables (PIN and FIN cables)	DCSP	DCSP
Fiber Optic "DIN Cables"	DCSP	GC
All Other Communication Cables which Interconnect DCS Equipment	DCSP	DCSP
UPS Systems and Ancillaries for DCSP provided equipment	DCSP	GC
Instrumentation Panels (including PLCs) and racks provided by DCSP	DCSP	GC
Panels (including PLCs) and racks provided by GCs	GC	GC
Instrumentation provided by GCs	GC	GC
Instrumentation provided by DCSP (including specialized communications cables required.)	DCSP	GC
Interposing relays to interface DCS control commands with equipment controls FIE	GC	GC
DCS Isolated (Reference) Grounding Cables and Rods	GC	GC

All power wire/cable associated with the fire alarm, CCTV, page party and security/card reader systems	GC	GC	GC
Ground conduits and wire/cable from power panel to PCM or any other DCSP furnished equipment	GC	GC	GC

Table 3: Matrix of Responsibilities - Testing and Services		
Task	**DCSP**	**GC**
Prepare DCS hardware/installation submittals (PCM; WSs; HS; CM; UPS; fire alarm system, if required)	X	
Prepare DCS software submittal	X	
Provide SAMA functional diagrams	X	
Prepare annotated software listings of all GC-furnished PLCs and other programmable equipment		X
Prepare instrument submittal		X
Calibrate instruments		X
Prepare GC panel submittals		X

Table 3: Matrix of Responsibilities - Testing and Services		
Task	**DCSP**	**GC**
Prepare DCS hardware/installation submittals (PCM; WSs; HS; CM; UPS; fire alarm system, if required)	X	
Prepare loop drawings to support the termination of all DCS I/O and the installation of all instruments		X
Coordinate all control systems integration (instrumentation, PLCs, DCS, network, communications and data exchange) amongst various subs		X
Perform operational readiness test (ORT) of DCS	X	
Perform ORT test of GC panels		X
Perform loop tests	X	X
Participate in plant startup	X	X
Provide DCS information to support GC development of loop drawings	X	

1.3 RELATED SECTIONS

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 01, General Requirements.
2. Section 01 33 00, Submittal Procedures.
3. Division 26, Electrical.
4. Division 40, Process Integration.

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego.

1.4 SPECIFICATIONS, CODES AND STANDARDS

A. The Work shall comply with the current editions of the publication and codes identified in Section 40 90 04 References, and herein.

1.5 DEFINITIONS

A. Definitions of acronyms are identified in Section 40 90 05, Definitions.

1.6 SUBMITTALS

A. The DCSP shall develop and submit within the first 45 days after NTP, a detailed list of submittals required by all Contract Documents for review and approval. The list shall contain the title of each submittal, detailed description of its contents and the applicable reference Sections. Submittal shall be grouped, organized and sequenced logically such that it facilitates the City's representative's review process. This requirement extends to all Work required by all other Divisions.

B. All Submittals shall be executed in accordance with Section 01 33 00, Submittal Procedures.

C. The DCSP shall conduct a pre-submittal conference. At a minimum, the following shall be presented at the conference:

1. A list of equipment and materials required for the applicable submittal content.
2. A list of proposed exceptions to the Specifications and Drawings, along with a brief explanation of each.
3. An exact one-to-one sample of each type of document to be submitted.
4. Any implementation and construction documentation associated with the submittal.
5. A schedule or schedule fragment that applies to the submittal.

D. The DCSP shall coordinate the Work of the DCS with the Contractor and its subcontractor so that a complete DCS package will be provided inclusive of accurate shop drawings and record drawings. The DCSP shall prepare and submit complete and organized shop drawings, as specified herein. Incomplete or partial submittals are not acceptable. All Shop Drawings and Record Drawings shall be submitted in accordance with Section 01 33 00, Submittal Procedures.

1. Plant-wide loop drawing submittal (PLDS) to verify the DCS interfaces with all instrumentation and devices being provided or installed under this project are to be developed by the Contractor or its subcontractor with the assistance of DCSP. The Loop Drawings shall define all interfaces with equipment provided by the DCSP and as such the DCSP is responsible for providing all necessary information to the Contractor on a timely basis. The Loop Drawings shall be developed in accordance with existing City Loop Drawing standards, as follows:
   a. The loop drawing shall be composed of three sections:
   b. Page 1: A device schedule with a table showing the following:

1) Device tag number, with Prefix, Unit Process, ISA Tag Prefix, Tag No, Tag suffix.
2) Equipment Service.
3) Device Type.
4) Location.
5) Device Manufacturer.
6) Model No.
7) Spec. No.
8) Area Contractor (if applicable).
9) Submittal No.
10) Remarks.
11) Data Sheet No.
12) I/O Signal (AI, AO, DI, or DO).
13) Signal Level.
14) Device Range.
15) Engineering Units.
16) Process Set Point.
17) Loop Diagram No.
18) Loop Drawing File Name.
19) Interconnect Drawing File Name.
20) For third-party devices, should also include: IP (if applicable), module addresses, data registers, IO Tag Names (AB), protocols etc.

c. Page 2: Loop drawing meeting the Requirements of ANSI/ISA S5.4, except that intermediate terminal junction boxes may omitted and be shown on Page 3 for clarity.
d. Page 3: Abbreviated diagram showing instrument, wire and cable numbers, intermediate terminal junction boxes, and PCM terminations.

2. The DCSP shall augment the content of the Loop Drawings by providing all of the requisite data relating to the DCS. For each DCS input/output, the DCSP shall note on the PLDS the following information:
   a. PCM number, and physical location.
   b. Controller Number.
   c. Type of input.
   d. I/O card location and address.
   e. All DCS-dependent displayed functions using ISA symbology.
   f. Drawing reference for DCS software content.
3. In these Contract Documents all systems, all meters, all instruments, and all other elements are represented schematically, and are designated by symbology as derived from International Society of Automation ISA S5.1 (latest revision). The nomenclature and numbers designated herein and on the Drawings shall be employed exclusively throughout shop drawings, and

similar materials. Any other symbols, designations, and nomenclature unique to any manufacturer's standard methods shall not replace those prescribed above, used herein, and on the Drawings.

4. All shop drawings shall include a City-approved title block. The title block shall include, as a minimum, business name and address, project name, drawing name, revision level, and personnel responsible for the content of Drawing. Loop Drawing Submittals shall be submitted in accordance with Section 01 33 00, Submittal Procedures.

E. The DCS hardware submittal (DCSHS) shall be singular and all inclusive, submitted in accordance with Section 01 33 00, Submittal Procedures. The DCS Hardware Submittal shall include, but not be limited to:

1. A complete set of system diagrams which depict:

    a. All Process Control Modules (PCMs), Workstations (WSs), video devices, printers, UPS, Foreign Device Interfaces (Data Link) telemetry devices, communication devices, and communication links.
    b. A one-line showing the designed conduit and wire required to support the power, ground, Input/Output, and communication requirements of the system.
    c. A complete I/O Database showing all I/Os, annotated in ISA format, which depicts all designed I/O, both external and internal hard-wired and data-linked, inclusive of DCS termination locations.
    d. A Complete one-line diagram showing all power wiring and ground wiring, including UPS power, Utility (non-UPS) power and any other external D.C. or A.C. sources for each PCM.

2. A complete set of Factory Data sheets for every DCS component. This shall include layout drawings that show enclosure details, including seismic mounting, as well as the location of each component within the DCS PCM enclosure. Drawings shall contain a scaled representation of the placement of all DCS equipment being provided under this contract and its spatial relationship to all other equipment (both new and existing) located in the abutting and adjoining areas. All acquired access and clearances associated with the DCS equipment and other equipment must be shown with a statement of compliance to DCSP requirements, NEC, NFPS and other applicable codes.
3. Detailed installation, mounting and anchoring details for all components and assemblies to be field mounted, including access requirements, conduit connections or entry details shall be provided.
    a. DCSP shall provide Seismic calculations for each DCS PCM enclosure, or other anchored apparatus, based on the proposed mounting arrangement. Installation/Mounting/Anchoring drawings shall be stamped by a Structural Engineer, registered with the State of

California. Each individual anchoring drawing, as well as the seismic calculations drawings, shall be stamped by the structural engineer.

b. A complete, and detailed, bill of material (BOM) shall be provided. The BOM shall show the factory model number for each component within the DCS.

F. The DCS Network submittal (DCSNS) shall be singular and all inclusive, submitted in accordance with Section 01 33 00, Submittal Procedures. The DCS Hardware Submittal shall include, but not be limited to:

1. A complete set of network diagrams which depict:
   a. All Process Control Modules (PCMs), Workstations (WSs), video devices, printers, UPS, Foreign Device Interfaces (Data Link) telemetry devices, communication devices, and communication links.
   b. A one-line showing the designed conduit and wire required to support the power, ground, Input/Output, and communication requirements of the system.
   c. A complete network design report including IP scheme, traffic planning and control, QoS, configuration of every network equipment including routers, switches and firewalls.
   d. A Complete fiber connection diagrams including fiber routing plans, fiber details, link budget calculations etc.,
   e. A complete, and detailed, bill of material (BOM) shall be provided. The BOM shall show the factory model number for each component within the DCS.
2. A complete set of Factory Data sheets for every network component.

G. The DCS Software Submittal (DCSSS) shall be singular and all inclusive, submitted in accordance with Section 01 33 00, Submittal Procedures. The DCS Software Submittal shall include, but not be limited to:

1. A complete set of all available software algorithms.
2. A complete set of Designer control strategies, with annotations provided by the DCSP depicting engineering details to show how all monitoring and control functions, on a loop by loop basis, will be accomplished. So operators can understand how the process will respond to his actions through DCS interfaces.
3. An English narrative of each data acquisition or control loop mission and anticipated action. Narratives shall enumerate the signal point name, signal descriptor, associated PCM number, associated system template displays, system functions activated by signal (i.e., interlocks, alarms, logs, etc.).
4. A complete set of PCM configuration sheets depicting each loop linkage. Each loop shall be on its own 8 1/2-inch by 11-inch sheet.

5. A complete listing of the DCS data base listing for each data point's relevant parameters such as range, contact orientation, limits, incremental limits, I/O card type, I/O hardware address and assignment, including ALL Macros used/created for the Software.

H. The DCS Graphic Submittal (DCSGS) shall be singular and all inclusive, submitted in accordance with Section 01 33 00, Submittal Procedures. The DCS Graphics Submittal shall include, but not be limited to:

1. One complete set of all WS-accessible displays which are unique to this project (i.e., process global, system global, process regional, systems regional, process group, process loop, process component, integrated tutorials, integrated process tutorials, integrated documentation, user assistance).
2. The DCSP shall ensure that all graphics development, and graphics submittal, conform to the existing graphics layouts, linkages and formats used throughout the COMNET Enterprise.
3. The Graphics Submittals shall contain displays in full size color graphic format and replicate the proposed screen contents. All background colors shall be identical to that of the screen content. All displays shall be arranged in a hierarchical order with references to associated WSs.
4. A system display linkage diagram which defines the hierarchical order and the linkages via page, down, left, right commands.
5. A definition of each displays data fields by tag numbers, utilizing the existing DCS COMNET standard.
6. A definition of each displays dynamic elements which shall blink, change color, rotate or change shape in response to process changes, and conforms to the existing COMNET standard.
7. A listing of all "help" text associated with each display screen, arranges in conformance to the COMNET standard.

I. The DCSP shall prepare and submit a Plan for the Operation Readiness Tests (ORT). The ORT plan shall be submitted in accordance with Specification 01 33 00, Submittal Procedures. The ORT Plan shall be a single-source document which shall encompasses means and methods for testing the complete DCS for this Project segment.

1. The ORT Plan shall provide testing of all DCS hardware, software, graphics, alarms and network communications.
2. The ORT Plan shall elaborate on the simulator to be utilized to provide proof of performance testing for the I&C and DCS functions of the project.
3. The ORT Plan shall provide sample sheets depicting all I/O, hardware, Data Links, communication Networking and internally generated alarms and I/O points. Once approved conceptually by the City, these forms will be

populated and utilized by the DCSP in the submission of each PCM individual ORT submittal.

J. The DCSP shall prepare a complete Training Plan. The Training Plan shall be submitted in accordance with Section 01 33 00, Submittal Procedures. The DCS Training Plan will provide the structure and syllabus for training sessions as follows:

1. Operator Training: Shall provide instruction to Operators already familiar with the operation of the Enterprise DCS, and shall be tailored to the new I/O, process controls, P&ID schemes and specialty consideration for the controls for this Project.
2. Maintenance Training; Shall provide training to City DCS Staff on all enhancements to the DCS, new-generation components and all other hardware, software or graphics maintenance requirements, not currently covered in the City's existing Enterprise DCS.
3. The DCSP shall allow for a minimum of four (4) sessions of each class outlined in the Training Plan to ensure staff availability and shift-differential considerations are facilitated.
4. Resumes of all Training Instructors to be utilized in DCS training shall be included in the Training Plan submittal.
5. After approval of the Training Plan, the DCSP is responsible for coordinating with City DCS Staff, or the City's project representative, to schedule training classes at appropriate times in advance of cut-over and start-up.

PART 2 PRODUCTS

2.1 CURRENT TECHNOLOGY

A. All hardware and software shall be the product of Emerson Process Management (EPM) and shall be of the Ovation family of DCS.

B. The DCS should utilize state-of-the-art products in the DCSP's product line. However, the DCSP must ensure that all products used for this Project are compatible, and will fully integrate into the City's existing enterprise wide COMNET DCS.

C. Successful operation and calculation shall be demonstrated during Factory Acceptance Testing (FAT), Operational Readiness Testing (ORT) and Functional Testing phases.

2.2 HARDWARE AND SOFTWARE COMMONALITY

A. Where there is more than one item of similar equipment being furnished, all such similar equipment shall be the of the same Ovation family series.

B. The DCSP shall submit a plan in case of a discontinued or upgraded product, or other cases where changing technology requires changes in equipment, the DCSP shall submit a Substitute Item Request Form.

C. All equipment shall be of modular design to facilitate interchangeability of parts and to assure ease of servicing. This interchangeability shall apply to the following components, as a minimum, of the DCS.

1. Processor Modules.
2. Bulk Memory Modules.
3. Communication Interface Modules.
4. Analog and Discrete Signal Modules.
5. Power Supply Modules, and UPS devices.
6. Workstations and operator interface devices.
7. Software licenses.

2.3 DCS PRIMARY ARCHITECTURAL COMPONENTS

A. The DCS supplied by EPM shall consist of, but not be limited to, the following primary architectural components:

1. Operator, engineering, instructor, and field workstations.
2. Copper and fiber optic communications network (at DCS PCMs, etc).
3. DCS OS Software for alarms, events, monitoring and control and configuration tools.
4. Security.
5. Historian/Historical data recording and reporting.
6. System Configuration (Application Software) of I/O database, displays, control loops, and human machine interfaces (HMI) graphics.
7. Process Control Modules (PCM).
8. Input/output (I/O) cards and devices, I/O racks, I/O units, remote IO, and Termination Cabinets.
9. PLC's, RTU's, Foreign Device Interface (FDI) modules for PCM's

B. In addition, components associated with the DCS are:

1. Control room furniture as shown on drawings and contained in these Specification, peripherals such as large screen displays, alarm printers, etc).
2. Services related to DCS (including system maintenance, upgrading, and third party and enterprise integration).

3. Enclosures, termination panels, power, UPS, and ground termination busses, etc.

2.4 INTEGRATION COMPONENTS

A. The Integration components shall consist of the following:

1. Integration Server (where show on design drawings and specified herein).
2. Integration Adapters.
3. Software Integration Services.
4. Web Services (when required by specifications).

2.5 SUPPORTING COMPONENTS:

A. The supporting components and associated application software shall consist of the following:

1. DCSLAN Switches.
2. DCSLAN/DCSWAN Routers.
3. Patch Management Server (when specified herein).
4. Security hardware and software, including Antivirus software and malware detection.

PART 3 EXECUTION

3.1 PROJECT EXECUTION AND PROJECT MANAGEMENT SERVICES

A. The DCSP shall prosecute all Work in strict accordance with the sequence and schedule of the Prime Contractor's Master Baseline Schedule.

B. The DCSP'S attention is called to the Contract Documents and Division 40 for specific administrative and commercial requirements of the Work.

C. The DCSP shall provide all project management services required to complete the Work of these documents. At a minimum project management services shall include:

1. Progress Review Meetings.
2. Meeting and workshops to develop project requirements and design details.
3. Regular meetings on scheduling and invoicing.
4. All required meetings for design and submittal reviews.
5. Coordination of support and warranty.
6. Coordination of training.

7. Development and delivery of DCS project controls and document management that coordinates with that of the Prime Contractor.
8. Attend coordination meetings with Prime Contractor, City's representative, plant staff and other City entities as they relate to the delivery of DCS Work.
9. Respond to City representative's requests for information and project documentation.
10. Respond to RFI reviews, as requested by the Design Engineer through the City's representative.

D. The DCSP shall provide all labor, equipment, materials and furniture for the tenant improvements required for the approved staging site at the sole expense of the DCSP.

3.2 ENGINEERING & DESIGN PHASE

A. The DCSP shall provide all engineering, resources, equipment, and labor required to successfully:

1. Produce all submittals, in accordance with Section 01 33 00, Submittal Procedures, and Division 40 requirements.
2. Program, configure, and test of all hardware and software as required by these specifications.
3. Design and specify the enterprise inter-site WAN interface at Project site for communications interface with the existing COMNET DCS.
4. Develop the classroom and computer-based-training for all system elements.
5. Execute field verification and documentation of all conditions, and develop installation drawings and accurate as-constructed documents to successfully complete the Work.
6. Setup, stage and test the Work of each process segment and perform ORT, witnessed by the City's representative at the approved Staging Area prior to any installation.
7. Put into service all system elements by detailed I/O tests, loop checks, and commissioning. Develop and perform functional and performance testing.
8. Develop and submit PCM-by-PCM cutover plans for approval by the City's representative.
9. Document all system elements, software and custom applications
10. Maintain, upgrade and warrant all Work required by the Prime Contract.
11. Design, develop, program, test, and commission Integration of DCS with other systems, see Section 40 90 00, Instrumentation and Control..
12. The DCSP shall develop and submit a uniform and standardized IO tag name convention, and follow the ISA tagging scheme standardly used by the COMNET DCS.

3.3 PROCUREMENT, STAGING, PROGRAMMING, AND TESTING PHASE:

A. The DCSP shall provide all engineering, resources, equipment, and labor required to:

1. Procure all goods and services required to conform to these specifications.
2. Perform all shipments required by the Work.
3. Ship all equipment and software to the approved staging facility, including deliveries from approved Staging Site to Project site.

B. Assemble, stage and program each Segment of Work at the approved Staging area and perform ORT prior to delivery for installation. All tests shall be performed in accordance with Division 40 specifications and approved test procedures.

C. The system elements (i.e. WS, PCM, FHS, etc.) may be assembled at the DCSPS facility and shipped to the approved Staging area for staging, programming and testing. However, the CITY reserves the right to inspect these system elements prior to shipment, and again prior to delivery from the Staging site to the Project site.

3.4 FIELD CONSTRUCTION/ COMMISSIONING PHASE

A. Provide all engineering, resources, equipment and labor required to:

1. Oversee the physical install, by others, of all Process Control Modules (PCM) and Remote IO (RIO) enclosures and electronics.
2. Oversee termination, by others, of all field wiring in 'B' or PCM Cabinets.
3. Run new wires from Cabinet to DCS IO where required.
4. Design, install, and test foreign devices including serial or networked I/O.
5. Oversee Supply and termination of power and grounding of all devices, by others.
6. Test all signal grounding and certify proper installation and function.
7. Deliver Uninterruptible Power Supplies, for installation by others under Division 26.
8. Obtain and manage all required Intra-Plant permits.
9. Install and test all DCS-related networking hardware and cabling.
10. Test all workstations, hardened workstations, PCM and RIO cabinetry and enclosures.
11. Manage and deliver as-built documentation including DCS loop diagram information and P&IDs information. As specified.
12. Conduct a functional test, and site acceptance test to verify DCS performance.
13. Update and submit all specified documentation to reflect "as-built" or record conditions.

3.5 MAINTENANCE AND UPGRADE SERVICES PHASE

A. The DCSP shall Warrant all parts and services for a period as specified for the Prim Contract, after Final DCS Acceptance.

3.6 ENVIRONMENTAL SUITABILITY

A. All DCS devices provided under this contract shall be provided with enclosures which are suitable for use in a treatment facility environment where there are typically high energy AC fields, DC control pulses, and varying ground potentials between the transducers or process instrument locations and those occupied by DCS components.

B. The system design shall be adequate to provide proper protection against interferences from all such possible situations.

C. As a minimum, all DCS equipment shall be resistive to airborne contaminants commonly found in wastewater treatment facilities, and be suitable for installation in an environment which conforms to a G2 classification as defined by ISA-S71.04.

D. Field-Situated Equipment:

1. DCS equipment being furnished under this contract shall be suitable for use in wastewater treatment facilities, some of which are in an environment of air with traces of methane and hydrogen purging sulfide. The system design shall be adequate to provide proper protection against such an environment.
2. All field-situated components including PCMs shall be UL-listed or approved LABOS by an independent certification agency acceptable to the City of San Diego.
3. All DCS devices shall be housed in an enclosure suitable for its intended service and installation location.
4. All DCS devices to be installed in MCC or other protected areas shall be furnished in NEMA 12 rated enclosure.
5. All DCS devices to be installed in indoor protected areas shall be furnished in NEMA 12 rated enclosures.
6. All DCS devices to be installed in indoor unprotected or areas subject to hose-down conditions, or outdoor areas, shall be furnished in 316SS NEMA 4X rated enclosures.
7. At a minimum, the DCS shall be designed and constructed for satisfactory, long, and low maintenance operation under the following environmental conditions:
    a. Temperature Range: 0 degree C through 50 degrees C (32 degrees F through 122 degrees F).
    b. Thermal Shock: 0.55 degrees C (1 degree F per minute maximum).
    c. Relative Humidity: 5 through 95 percent (non-condensing).

8. The mounting of all enclosures shall meet the requirements as specified in Division 26, and shall be seismically braced as required by code for this seismic zone.

END SECTION

SECTION 40 94 23
PROCESS CONTROL MODULE (PCM)

PART 1 – GENERAL

1.1 REQUIREMENT

A. This specification section covers furnishing all labor, materials, equipment and programming for the provision of the required Process Control Modules (PCMs) to complete this WORK.

B. Named types:
   1. Process Control Modules (PCM) Type

C. At a minimum, a PCM shall include the redundant controller processors, redundant memory and communication modules, redundant power supplies with arbitration control, redundant I/O communication processors, NEMA enclosure and backplane, all wiring, power and ground distribution, mounting and anchoring hardware. If part of the manufacturer's standard assembly, it shall also include the chassis to facilitate the I/O modules.

D. Fault Tolerant:
   1. Where a system processor or a system is required to be redundant, that unit shall function as a fault tolerant device.
   2. Fault tolerant processing shall consist of two parallel-operation processors (electronics) with separate connections to the system communication network. Both processors shall receive and process information simultaneously, with faults detected by the processors themselves.
   3. A fault tolerant configuration shall provide synchronous read/execute/compare capabilities with no database transfer.
   4. Upon detection of a fault, self-diagnostics shall be run by both processors to determine which processor is defective. The non-defective processor shall then assume communication and control without affecting normal system operation. Upon replacement of the defective processor the system shall automatically - or the operator may initiate – download of the data base to the replaced processor and assume communications via the network without affecting normal system operation. The use of backup, "hot standby", or "automatic and bumpless switch over" configurations are acceptable if the transition from failed device to backup device does not degrade the process monitoring and control system or the system's availability.

1.2 RELATED SECTIONS

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego.

1.3 SUBMITTALS

A. The DCSP shall provide all Submittals in accordance with the requirements of Specification 01 33 00, Submittal Procedures. In addition, the DCSP shall provide PCM Component Data: Manufacturer's standard catalog data, including a description and depiction of all control devices and instruments in sufficient detail to demonstrate complete specification compliance. If standard catalog data does not contain sufficient detail to verify compliance, then the DCSP shall submit supplementary documentation to verify compliance.

B. PCM Design: Layout and shop drawings, including the following:
1. Panel layout, including fully dimensioned and detailed external spatial views and internal layout.
2. Electrical schematics, including, new panel wiring, instrument wiring and power and grounding.
3. Layout of relays, breakers, switches and instrumentation provided, and applicable single line and wiring diagrams.
4. IO Card Placement and layout.
5. Enclosures, including all associated hardware devices.
6. Detailed description and associated diagrams of all software components of the PCM.

1.4 CODES AND REGULATORY REQUIREMENTS

A. Instrument Society of America: ISA S5.1 (ANSI/ISA-5.01.01) Instrument Symbols and Identification.

B. National Electric Manufacturers Association (NEMA):

1. NEMA 250 - Enclosures for Electrical Equipment
2. NEMA ICS 2 - Industrial Control Devices, Controllers, and Assemblies.

C. National Fire Protection Association (NFPA): NFPA 70, National Electrical Code.

1.5 DEFINITIONS

A. Definitions of acronyms are identified in Section 40 90 05, Definitions.

PART 2 - PRODUCTS

2.1 PCM REQUIREMENTS

A. All DCS Controllers shall be manufactured by Emerson Process Management (EPM) and shall be of the OVATION family line. All I/O modules shall match existing and shall be compatible with and seamlessly integrate onto the existing Enterprise wide COMNET DCS

B. DCS Controllers shall be directly or remotely connected to field Input/Output (I/O) modules.

C. All requirements for Process Control Modules (PCM) enclosures shall apply to a RIO enclosure

D. Examples of PLCs provided as a part of a vendor's standard package system are: UV disinfection controls, RO filtration units, HVAC controls and generator controls. This application is distinguished by extensive use of packaged control software and a substantial number of I/O's which are of secondary interest and do not directly affect the major treatment processes (monitoring of lamp status in UV systems, for example). Many of these systems are provided standard with separate operator interfaces. Because of limited space and maintenance requirements, panel-mounted color LCD operator interfaces for these packaged control systems are preferred over desktop personal computers. For these systems, the DCS will be used for supervisory control and monitoring via a communications link, preferably Modbus/TCP, with the PLC operating in the "slave" mode.

All PLCs and local operator interface panels provided for a packaged system project will be of a common manufacturer. Furthermore, the Design Consultant will consult with City prior to the naming of acceptable PLC manufacturers. The PLC programmer will include a heartbeat bit to be exchanged between the PLC and the DCS, and the designer will include this bit in the MODBUS I/O list. The City's standard PLC is Allen Bradley. Designers must carefully select I/Opoints included in PLC to DCS communications. Points transmitted must support the control strategies, necessary alarms, or otherwise be useful to the operator.

Simply specifying that all PLC points will be transmitted to the DCS is not acceptable.

E. All remote I/O (RIO) shall be physically connected to its associated, PCM. Wireless communication is not acceptable.

F. NOT USED

G. NOT USED

H. Each PCM shall contain all of the required IO, inclusive of all attributes, data, alarming, and control strategies required to monitor and control its associated process.

I. PCMs, including remote IO, shall receive power from a dedicated UPS branch circuit and from an additional secondary branch power source (other than the circuit feed to the UPS) to create a redundant bumpless transfer of power to the PCM and/or RIO. UPS and utility power circuits are to be provided to the PCM and RIO by others, under Division 26.

J. PCMs shall be configured, programmed and loaded utilizing engineering functions found in Ovation Developer Studio. The number of user licenses required for each engineering function for each project will be identified in the scope of work.

K. PCMs shall be dual network ported to communicate with other DCS devices over the fault tolerant DCSLAN.

L. PCMs shall communicate with the Workstations (WS) over the DCSLAN.

M. Each PCM shall be able to communicate with every other PCM directly in a peer-to-peer manner using peerprotocol.

N. Each process location shall be provided with dual redundant DCS Controllers (excluding I/O) configured for fault tolerant processing via standard system configuration procedures.

O. Each DCS Controller shall be redundant and provide complete "bumpless" automatic failover to a backup PCM controller in the event of Primary PCM failure.

P. Each PCM enclosure shall be provided with an interior cabinet temperature sensor and security switch to report "real-time temperature" and "door ajar" conditions, respectively.

Q. Each PCM enclosure with additional air purge shall be equipped with a sensor to report air purge system fail

R. NOT USED

S. PCM Interface to Packaged System PLCs

1. PLCs shall interface to the DCS through Foreign Device Interfaces (FDI) which is defined as follows;
    a. The DCS shall be provided with an integrated fault tolerant FDI in the PCM which supports monitoring and control of the PLC.
    b. The FDI shall be fault-tolerant and redundant where indicated.
    c. The DCS shall have an open architecture which shall enable the FDI to provide a means of integration with multiple vendors in a manner which is transparent to the user at the WS level. All of the data associated with the FPI shall appear at the WS –in a similar format and presentation to data derived from PCMs. All WS interaction functions that the operator uses to monitor and control inputs/outputs associated with the PLC(s) shall be similar to those used by the operator to interact with inputs / outputs associated with the PCM(s).
    d. The FDIs provided shall interface with all existing packaged system PLCs that are connected to inputs/outputs on the plant.
    e. All self-documentation features which relate to DCS devices shall also relate to the documentation of PLC configurations made at the DCS. All documentation produced shall be in like format as that for all other DCS components.
    f. The FDI shall support existing field workstations which are part of the existing or packaged system PLC.
    g. DCSP shall include all research, development of drivers (if necessary), I/O maps, I/O register address / protocol maps, configure and startup all FDIs.
    h. As an alternative to the above, if the FDI utilizes custom software drivers to communicate with various manufacturers PLCs/PLC networks, the DCSP shall include all costs associated with providing, licensing, documenting, and revising these software drivers throughout the duration of this contract. If a software driver is used at more than one location, the DCSP shall furnish the additional software driver(s) at no additional cost. A minimum of one (1) set of hardware and all required software shall be furnished to interface with each of the PLCs and PLC communications networks listed below.

i. The DCSP shall provide all hardware, software, to interface to the existing PLCs. FDI network cabling will be supplied and installed by others, under Division 26.

2. The following interface communication protocols and support management shall be provided via the FDI for third-party PLC integration:
   a. Allen Bradley (EIP, TCP and serial DF-1).
   b. Modbus (TCP and serial).
   c. DNP3

T. Process Database:
1. PCMs shall support the following types of Database Points:
   a. I/O Points from I/O resident in PCMs, remote I/O, or OWS.
   b. I/O points from FDIs.
   c. DCS calculated analog and calculated discrete points.
   d. DCS manual inputs.
   e. PLC/RTU registers.
2. The PCM shall store the following configurable/default fields about each Database Point:
   a. DCS Tag Numbers: 16 characters, minimum, assigned as follows:
      1) Characters 1-3 to identify each plant/collection system, e.g. 'DCT'
      2) Characters 4-X pad with zeros (0's)
      3) DCS Point Naming Guidelines: Below are naming guidelines for DCS I/O points and user-created internal DCS points that are visible to Operations (such as derived alarm points that are shown on Alarm Screens, calculated points that are collected by the Historian, or shown on Reports, Graphics, or on Trend screens).
         a) For all such points, the recommended tag structure is:

<Plant> <Plant Area> <ISA Acronym> <Loop Number> <Suffix>, where:
<Plant> = A single letter to designate the Plant or system as follows
"M" for Metropolitan Biosolids Center (MBC),
"N" for North City WRP,
"P" for Point Loma WTP,
"S" for South Bay WRP,
"T" for Pump Stations 1 and 2
"I" for Pump Stations 64 and 65
"E" for East Mission Gorge Pump Station
"Q" for Penasquitos Pump Station
"C" for SCADA
"G" for Grove Avenue Pump Station (GAPS)

"O" for Otay Pump Station

<Plant Area> = Two-digit Plant Area code

For example, "05" is commonly used for the "Headworks" area.

<ISA Acronym> = Two or more Identification Letters chosen based on "ISA-5.4 Appendix B"

If an appropriate ISA Acronym is not readily identifiable, the letter "X" ("Unclassified") may be used.

<Loop Number> = Four Digit Loop Number

For points that are derived from an I/O point or associated with a device for which a loop number is defined, the loop number should be readily identifiable. If an appropriate Loop number is not readily identifiable, the number "0" may be used, or any number in the range 0-999 chosen at the discretion of the programmer (for example unit number, system number).

<Suffix> = A multi alpha-numeric character string that begins with a letter. The string is chosen at the discretion of the programmer to make the point unique and/or to clarify point use.

b) DCS point names should be composed of alpha-numeric characters only (i.e. characters A through Z and 0 through 9). They should not include any special characters such as #, $, &, (, %, -, and so on.

c) For all such user-created points, Engineering Descriptions should be provided. For packed points, where individual bits are used for separate functions, descriptions should be provided for any individual bits that are used.

d) DCS Point names must be unique.

2.2 PCM HARDWARE COMPONENT PLATFORM:

A. Each PCM shall use minimum 32 BIT processor.

B. Redundancy – Fully Redundant Pairs:

1. The PCM cabinet shall be provided with the following redundancy unless specified otherwise:
   a. Dual functional processors.
   b. Dual redundant network interfaces.
   c. Dual processor power supplies.
   d. Dual I/O power supplies.
   e. Dual input power feeds.

f. Dual I/O interfaces not dual I/O.
g. Dual Auxiliary power supplies (loop power).
h. Auto fail over from active PCM to standby PCM for all sites that contain dual PCMs.
i. Hot programming of backup module.

PART 3 – EXECUTION

3.1 GENERAL

A. The DCSP shall furnish all materials, tools, equipment, consumables and supplies, hardware, firmware, software and software licenses, and shall perform all labor required to complete the work in this specification.

B. All I/O tags shall be incorporated as defined elsewhere in these specifications required for the Process Database as defined in these specifications.

C. The International Society of Automation (ISA) Standards will be used if there are no conflicts with existing codes. If there is a conflict between existing Enterprise DCS Facility DCS Tag Codes and the current published ISA table which lists the ISA identifiers, it shall be brought to the attention of the City's representative and the fix coordinated with the City COMNET staff and Project Design Engineers.

D. Spares, Tools, and Test Equipment: General – The DCSP shall furnish all spare parts, tools and test equipment, which may be unique to the Hardware or Software provided under this Contract, which is required to repair and calibrate the DCS and maintain it in good operating condition. In addition, the DCSP shall provide the following spare parts and supplies:

1. One (1) of each type of processor board associated with PCM's, WS's and peripheral devices.
2. One (1) spare I/O card, of each type used, for every PCM provided under this Contract.
3. One (1) of each type of communication board.
4. Three (3) of each type power supplies, utilized in any DCS component of the Contract.

END OF SECTION

SECTION 40 94 24
PROCESS INPUTS/OUTPUTS (I/O)

PART 1 – GENERAL

1.1 REQUIREMENT

A. Process I/O to and from the DCS shall be provided primarily through I/O modules connected to each PCM.

B. I/O Modules shall be modular plug-in components.

C. Analog Input modules shall be available for analog-to digital conversion, including 4-20mA, 1-5 Vdc or RTD input signals.

D. Analog Output modules shall be 24 VDC and generate 4-20mA output signals.

E. Digital and Analog I/O modules shall be 24 VDC.

F. Digital Output modules shall be available with current sinking and relay outputs.

G. Intelligent Device Modules (e.g. Hart, DeviceNet, Fieldbus, etc.) shall be a requirement.

H. Foreign Processor Interface (FPI) referenced in Section 40 94 23 Process Control Modules.

1.2 RELATED SECTIONS

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego

1.3 SUBMITTALS

A. The DCSP shall provide Submittals in accordance with the requirement in Section 01 33 00, Submittal Procedures

1.4 CODES AND REGULATORY REQUIREMENTS

A. The WORK shall comply with the current editions of the publication and codes identified in Section 40 90 04, References.

1.5 DEFINITIONS

A. Definitions of acronyms are identified in Section 40 90 05, Definitions.

PART 2 - PRODUCTS

2.1 GENERAL

A. All I/O products shall be manufactured by Emerson Process Management (EPM) and shall be of the OVATION family line. All I/O modules shall match existing and shall be compatible with and seamlessly integrate onto the existing Enterprise wide COMNET DCS.

B. All process I/O modules shall be located in an enclosure that is proximal or integral to the associated PCM.

C. All I/O modules shall be 24Vdc maximum. Connection to external 120VAC and other foreign voltages shall use interposing relays. Interposing or slave relays shall also be provided in cases where the number, type or rating of the DO module output are incompatible with the electrical circuit to which it is connected. All interposing relays switching 120 VAC shall be isolated from low voltage I/O in accordance with NFPA.

D. Boards or modules shall be provided to interface with process I/O and intelligent transmitters as follows:
   1. Analog Inputs HART (AI):
      a. Maximum 8 AI per Analog Input Module
      b. Four wire transmitters shall provide an isolated 4 to 20 mA signal.
      c. Two wire transmitters shall provide an isolated 4 to 20 mA signal powered from DC power supplies internal or external to the DCS.
      d. Sink/source selection shall be available by hard jumper or software configuration on a point-by-point basis.
      e. All AI's shall be HART protocol compatible
      f. DCS analog inputs shall have a load of 250 ohms.

g. Each analog input shall have a minimum of 12-bit resolution, accuracy of 0.25 percent, and a dedicated A/D converter.

2. Thermocouple Inputs and RTD Modules
   a. Maximum 8 RTD per RTD input module.
   b. Thermocouple input cards shall be able to receive signals from type J, K, and T thermocouples.
   c. Thermocouple type shall be selectable on a point-by-point basis.
   d. Each RTD or thermocouple input shall have a minimum of 12-bit resolution, accuracy of 0.25 percent, and a dedicated D/A converter.
3. Analog Outputs (AO):
   a. Maximum 8 AO per Analog Output Module
   b. Analog output boards shall provide isolated 4 to 20 mA output signals.
   c. Signals shall be capable of driving a loop impedance of at least six hundred (600) ohms.
   d. Each analog output shall have a minimum of 12-bit resolution, accuracy of 0.25 percent, and a dedicated D/A converter.
4. Discrete Inputs (DI)
   a. Maximum 16 DI per Digital Input Module
   b. Discrete inputs shall be powered by the DCS
   c. 24 VDC signals shall be available
   d. Field contacts shall be dry isolated inputs to the DCS
   e. Field contacts that are used for alarms or control purposes shall be wired in a fail-safe manner; i.e. an open wire will result in an alarm and/or in the DCS controlling the system to a safe state.
5. Discrete Outputs (DO)
   a. Maximum 12 DO per Digital Output Module
   b. Discrete outputs shall be dry, isolated relay contacts capable of switching a minimum of 2 Amps, at 24 VDC, or bussed 24VDC current sinking output (maximum 0.5-amp per channel and 6- amp per module), depending on the application.
   c. Power for sensing ("wetting") discrete outputs shall be provided external to the DCS.
   d. Output signal shall use interposing or slave relays.
6. Intelligent Transmitters
   a. Intelligent Transmitter Modules (ITM) that provides bi-directional communications with smart transmitters shall be available.
   b. The PCM shall allow remote transmitter configuration that simultaneously updates the DCS database, excluding DeviceNet.
   c. All digital communication with the intelligent process instrumentation from the DCS WS shall be in engineering units and shall be received a minimum of ten times per second.
   d. ITMs shall be available that communicate using Foundation Fieldbus, Profibus, etc.

e. Each message shall contain the following information with analog values specified in standard IEEE 754 32-bit floating-point:
    1) Primary measurement information such as flow, pressure, level, etc.
    2) Transmitter temperature readings.
    3) Data security information.
    4) Diagnostic information.
    5) Message checking.

7. Configuration and status information shall be accessible at any DCS workstation, and shall include:
    a. The assignment of configurable parameters such as tag number, location, address, tag name, upper and lower range values, zero elevation or suppression, linear or square root output for d/p cells, and damping time
    b. I/O card diagnostics graphic display
    c. Display of the process value in terms of percent of span, engineering units, or current level.
    d. Diagnostics, card faults, and communications errors.
    e. DCS sites that contain AMS shall be up dated with new HART I/O when added by contract.

PART 3 – EXECUTION

3.1 GENERAL

A. The DCSP shall furnish and install all I/O Boards and related equipment as shown on the Contract Drawings and called for in the Project Specifications.

B. Modules will be configures using:
    1. Established format of the Fully Qualified Module Record Point Names with full English Descriptions
    2. AC Line Frequency set at 60 Hz.
    3. Suppress Point Fault Module Alarm Active
    4. Blown Fuse Detection Enabled

3.2 SUPPLEMENTS

A. The supplements listed below, following “End of Section,” are part of this Specification.
    1. DCS Input/Output List

SECTION 40 94 33
WORKSTATIONS (WS) - PRODUCTS

PART 1 GENERAL

1.1 REQUIREMENT

A. The DCSP is responsible for furnishing several types of workstations that will be used in the operation of the Distributed Control System (DCS).

B. The categories of acceptable workstations include the following:

1. Workstation (WS), generic workstation type that includes all workstations.
2. Operator Workstation (OWS), desktop type.

C. The DCSP is responsible for meeting the requirements for each type of workstation, which are specified in this section. Workstations shall be the standard product of the DCSP and shall be fully compatible with, and integrate onto the existing Enterprise wide COMNET DCS.

1.2 RELATED SECTIONS

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego.

1.3 SUBMITTALS

A. The DCSP shall submit technical submittals in accordance with Section 01 33 00, Submittal Procedures.

B. The DCSP shall submit a detailed listing of each type, quantity, and location of the workstations required to complete the Work, as shown on the drawings and specified within this section.

1.4 CODES AND REGULATORY REQUIREMENTS

A. Workstations shall conform to the following standards:

1. Military Standards (Military Standard 810E).
2. American National Standards Institute (ANSI).
3. IEEE-754, Standard for Floating Point Arithmetic.
4. IEEE-802.3, Carrier Sense Multiple Access with Collision Detection (CSMA/CD) (Ethernet).
5. IEEE 802.3z, Gigabit/s Ethernet Operation.
6. IEEE 802.3ae, 10 Gigabit/s Ethernet Operation.
7. IEEE 802.3af, Data Terminal Equipment (DTE) Power via MDI.
8. RFC 791 (1981), Internet Protocol (IP).
9. RFC 793 (1981), Transmission Control Protocol (TCP).

1.5 DEFINITIONS

A. Definitions of acronyms are identified in Section 40 90 05, Definitions.

PART 2 PRODUCTS

2.1 WORKSTATIONS (WS)

A. All workstations shall be the standard offering of Emerson Process Management (EPM) and shall be fully compatible with the Ovation DCS family line. All Workstations shall match existing, or the current City COMNET standard in place at the time of this Project. All Workstations shall be compatible with and seamlessly integrate onto the existing Enterprise wide COMNET DCS.

B. All workstations shall be the most current product that is compatible with the City's Ovation DCS.

C. Minimum General Requirements:

1. The standard WS dictionary shall be U.S. English.
2. Each WS platform shall feature graphics, multitasking with preemptive priority scheduling, virtual memory to enable concurrent processing without degradation of response times required for critical tasks, and networking capabilities that enable the workstations to run sophisticated applications and bridge the gap between various MIS functions and the process.
3. Workstations shall function as a process monitoring/control and system configuration device.
4. Workstations shall present a windowed, high resolution, color-graphic interface to the operator in the depiction of present and past values of process.

5. Workstations shall be configured for multiple concurrent displays.
6. Workstation-devices shall be dual ported to the DCSLAN to provide the operations staff with an object oriented advanced Graphical User Interface (GUI) used to monitor and intervene in the control of process areas.
7. All WS shall be standard Microsoft Windows workstation devices
8. All Desktop Workstations shall be the same hardware family and contain the same software revisions.
9. All non-portable WS shall be provided with UPS power. UPS power circuits shall be provided by others, under Division 26.

D. Operator Workstations (OWS):

1. OWS General Requirements:
   a. All WS shall be designed to function as a workstation for operations, maintenance, and other staff. The WS interface shall operate in both fill-in-the blanks wizard like mode wherein the user interacts through an interactive prompt and response sequence and graphics/CAD-like mode wherein the user implements and uses control logic and graphics thru the use of a series of graphical interfaces. The CAD-like graphical interface shall also permit the user to diagnose, simulate, and debug control logic by displaying current process values/logic states and calculated outputs.
      1) Each WS shall be configured to be universal in scope (e.g. has access to all system displays and data.)
      2) Each WS shall have a password security authentication to prevent the unauthorized access of system configuration activities.
      3) The security system shall limit or allow access to some or all of the process plant(s) and functionality using role-based authorization.
      4) The Operator shall be provided with a means of interacting with the various displays which assist monitoring (overviews), permit control intervention (groups), provide parameter review and adjustment (detail), are historical (archiving) and assist the Operator in diagnostics (alarms, schematics, menus) and prediction (using graphical trending or archived data points.)
      5) All screen selections shall be based on intuitive "picking" of display objects and menus on the screen. A common menu bar structure with pull-down menus shall be presented at the top of all displays to enable fast access amongst available WS functions. Multiple windows with icons shall also be available. Content of the menus shall form the display hierarchy.

6) The Operator shall interact with these displays, order changes in values, and modify configurations in a human- machine conversational mode via the following:
   a) Soft-desk interface (track ball/mouse, a full ASCII-QWERTY keyboard).
   b) Hard-desk interface (arranged by work cell (trackball, specialized keys, and keyboard layout for navigation and control action).
7) The entry device shall be integrated with the human- machine design structure to enable a minimum number of key strokes in common operations such as "Alarm Acknowledge" and "On/Off", "Fast/Slow" manipulations.
8) Long strings of alphanumeric codes or command line entries via buttons are unacceptable for process operating procedures.
9) In operations mode, all process graphic displays shall reside in non-volatile storage media resident in each WS and be updated in accordance with the display response time requirements specified herein.
10) All process graphics shall utilize advanced graphic features such as isometric representation of process equipment, tanks, and flow lines; line-fills which use the dynamic movement of color and patterns to indicate the current process flow routing in pipelines or channels; permissive dialog boxes which itemize all of the per missives, and their current state, associated with control strategies related to the currently displayed process graphic.
11) The graphic display hierarchy shall follow DCSP's graphic standards and library
12) Each WS shall be configured with displays arranged in a hierarchical manner which enable rapid movement between various levels via paging or other logic oriented functions. The hierarchy shall apply to both process and system oriented displays.
13) Additional graphical requirements and symbols shall conform to ISA 5.5 Graphic Symbols for Process Display.
14) Each WS shall have its own Real-Time Data Base (RTDB) that reflects the current state of all process variables.
15) All real-time process data shall be resident in the WS.

b. WS Tools Platforms (TP):
   1) The TP shall extend the functionality of the multitasking OS by providing application tools or extensions of the OS platform.
   2) The TP shall provide software to support:

a) User-operating system interface (shells) to allow the user to manipulate files and run application programs in a concurrent manner.
b) Database Management Systems (DBMS) which employ Structured Query Language (SQL) interface to a relational database.
c) Multimedia input/output to mass storage and image input/output i.e., optical disks using mapped files and special storage device drivers incorporated into the OS platform.

3) The display software furnished shall enable any WS to interact with any and all of the real-time plant, field, and process data that is provided in the system. Areas of operational access or "modes" for the WS shall be changeable on-line and shall be pre-configured by using a password mode configurator.
4) The WS shall support either single-screen or multiple-screen operation, as required by the design drawings and specification for each facility.
5) Multiple displays shall operate in a coordinated arrangement. As a minimum, multi-screen WS software shall provide the following:
   a) Direct input devices such as a mouse, trackball, or keyboard to operate with multiple screens. The monitoring and control actions shall be associated with the screen to which focus is applied via the pointing device or keyboard.
   b) Enable/disable input devices on-line.
   c) Redirect displays from one screen in the cluster to another and toggle any screen between multi-screen and single- screen mode.
   d) Call up multiple displays simultaneously with a single request.
   e) Determine on-line those screens that are to be allocated to multi-screen use.
6) Microsoft Windows and menus shall be used for the Graphical User Interface (GUI) to provide an intuitive windows mode. Windowing shall take advantage of the multi-tasking operating system capability. It shall allow a task to begin in one window while continuing work in another. It shall also allow a single interface within the system. As a minimum, the following applications that concurrently appear in its own window shall be:
   a) Network Manager
   b) Display Manager

c) Data Acquisition and Control Configurator
d) Report Configurator
e) Historian Configurator
f) Operator Message Interface
g) Trending
h) Spreadsheet
i) Virtual Terminal Mode
j) Help Functions

7) The following standards shall apply to maximize the interoperability and connectivity of the system and to provide object code compatibility between all hardware platforms used on this project:
   a) Floating point processor shall comply with IEEE-754.
   b) Network communications shall comply with IEEE-802.3/802.4.
   c) Compatible with network protocols TCP/IP.
8) WS devices shall also be dual ported to the DCSLAN, which provides an interface into all DCSLAN connected devices. This interconnectivity shall enable all WS, independent of their physical locations, to access all information which is available to another WS. All WS functionality shall be regulated by password authorization.
9) A collection of pre-built (preformatted) display fields that show lines (trends) representing changing data values from the real-time database and from the historical database shall be provided.
   a) The Trend Subsystem shall be able to trend any variable in the data base, both analog and discrete.
   b) The maximum number of trends shall be limited only by the display storage media capacity.
   c) Each trend line shall be capable of at least 900 samples of the process variable.
   d) Historical trend data shall be capable of being archived to hard drive, USB thumb drive, or CDRW to be displayed at any future date.
   e) Trends shall represent changing data values from the real- time database and from the historical database.
   f) Trends shall be configured on-line with the display configurator, and shall be laid out using the group display configurator.
   g) The on-line trend configurator shall be selectable from a Detail display, to allow change of trend area attributes and trend line attributes without disrupting the process.

h) A library of standard trend areas, X/Y plot areas, and profile plot areas which can be copied into any display shall be furnished. The trend areas shall vary in size (resolution) and shall be of two types: real-time and historical. The X/Y and profile plot areas shall also vary in size. The display builder and display configurator software shall include these areas in user-defined displays, and the display configurator shall be used to assign the desired configurable options. Trend areas to include as a minimum:

(1) Up to eight trend lines per trend area representing variable data types (Boolean, signed integer, real, and signed long integer).
(2) Tick marks indicating division of the axis.
(3) Time axis length shall be chosen freely.
(4) Y-axis scaling shall be independent of its length.
(5) Off-normal limits shall be available in different colors.
(6) Background color of a trend area shall be changeable.
(7) Trend line color shall be changeable per trend line.
(8) Solid trend shall be drawn instead of a line trend.
(9) X-Y trend objects (one variable versus another.)
(10) Reassignment to any process variable in the system.
(11) Text fields shall be defined and configured:
    (a) Loop Tag
    (b) Loop Descriptor
    (c) Any parameter engineering unit
    (d) Engineering Unit Descriptor
    (e) Scroll frequency for an entire trend area (limited to real-time trend objects)
    (f) Per-trend variable:
        - High range value
        - Low range value
        - Value at ruler (for direct readout)
        - Off-normal limits

i) Real-time trend areas shall scroll dynamically as data changes occur according to the selected scroll frequency (e.g., 1, 2, 5, 10, 30, 60 seconds).

j) Scrolling and updating of real-time trends start immediately after calling up the display.

k) Real time trends shall be capable of collecting and displaying all 1 second samples without averaging or compression.

l) Historical trend areas shall provide purely historized data from the historical database files, which shall include sample data and reduction group data; archived sample group data and archive reduction group data; restored archive sample group and archive reduction group data

m) Historical trend variables shall incorporate any data reduction and archiving functions thereof. On-line Historical Trend Area interactions shall include:

(1) Selection of parameters to be viewed from the Historian database

(2) Specification of the high and low scale of the Y-axis for each variable for more or less detail

(3) User definition of the time window (base time and/or time span) specified by the time axis in order to view another portion of the history or to view a portion in more or less detail.

(4) Use of a moveable ruler to position and numerically read out historical variables within a displayed time window

(5) Specification of off-normal limits

(6) Zero axis readings.

10) The X/Y plots shall contain two variables which are plotted against each other.

11) These variables shall be real-time data taken from object manager-connectable variables within the system or a file of X/Y pairs.

12) The data points shall be collected at a configured scan rate and displayed as a series of points or markers that can be connected.

13) Color shall be used to designate the latest X/Y pair and previously plotted points.

14) Via the use of colors, file data shall be visually compared to recent real-time data. Plots shall include as a minimum:

a) Background color of X/Y plot shall be changeable.

b) Objects shall be capable of being added to the background area.

c) Style selection of real-time and file plot data

d) Standard grid

e) Multiple colors for representing the most recent data point, real data, and file data.

15) The X/Y plot line attributes for each variable shall include: high scale value, low scale value, and delta change value (for

real-time data). Default values for these attributes shall be accessed directly.

16) The profile plot area shall display data accessed from a data array of the following type of data: float, long, integer, or byte.
17) The plot shall display each data point along the X-axis with the value of each point associated with the Y-axis.
18) The profile line shall include: high and low scale values, high and low alarm values, the start and end offset for the data array, and the location to which a selected point value is to be sent.
19) The profile style shall be either line profile or bar profile and updates occur simultaneously or by exception.
20) The Plot shall include as a minimum:
    a) Up to four lines of bar lines per plot area.
    b) A reference line representing the median value for each line
    c) Line color specified per lot line under normal conditions
    d) Off-normal limits specified in a different color
    e) Reference line color
    f) Lines or bar lines shall be mirrored along the Y-axis

c. Automatically Generated Displays:
    1) Automatically generated displays shall be fully operational displays, which are presented in three levels of control hierarchy:
        a) Station display: A station algorithm shall convey information about the system capacity parameters for a Process Control Module type station. This algorithm shall be installed automatically when the database is downloaded, and provides global data storage for system functions. Information displayed includes: percent of CPU time used for processing input/output, all algorithms and continuous control algorithms; free memory available; Object Manager scanner data; cumulative algorithm processor overruns; total DPU connections; and peer-to-peer point connection status.
        b) Control strategy and algorithm overview display: To access a control scheme without configuring displays, the operator shall be able to request the Control strategy and Algorithm Overview display. The current level of criticality (the highest priority alarm that exists in any algorithm within the control strategy) and relevant data shall be displayed for each control strategy and algorithm. All alarm information displayed or set by Default Displays shall be received from or sent to

Processors. This includes the acknowledged and/or unacknowledged status of the alarms. Displays for individual control strategies shall be accessed from the compound and algorithm overview display. Control strategy displays shall be live displays that allow interaction with all algorithms within a single control strategy. Control strategies from several processors shall be grouped and turned on or off as a group.

(1) Detail display: Detail displays for individual algorithms shall be accessible from the Control strategy and Algorithm Overview, Alarm History and Current Alarm displays. Detail displays shall allow operator manipulation of all valid algorithm parameters. They shall show all connectable algorithm parameters, a faceplate area and a real-time trend area (for continuous control algorithms). In graphic format and in a small area, faceplates shall provide information as to algorithm type and description; measurement, setpoint, output values; algorithm state and status; alarm condition; auto/manual and remote/local designation.

2) Preformatted Displays:

a) Preformatted displays provided shall be modified or new ones created through a menu-driven configuration and editing process.

b) Preformatted displays shall be linked to each other and to graphics to form a user-defined display hierarchy.

c) The group display shall present information for up to eight control algorithms in a four-over-four screen layout. It shall show each algorithm as a faceplate with a unique layout available for each algorithm type.

d) The display shall contain faceplates, trends, or X/Y plots or a combination of all three. The display builder and display configurator shall be used to edit displays.

e) Sequence algorithms shall be intermingled with Continuous algorithms n the group display when required. All control algorithm types/domains shall be supported. Group display interactions shall be performed with screen functions keys. Interactions to include as a minimum:

(1) Control and alarm monitoring of algorithms.

(2) Ramping or numeric entry of set points, ratios, targets, outputs, etc.

(3) Toggling discrete values and controller states.

(4) Requesting the Detail display for a selected algorithm.

(5) Direct access to the previous display.

3) Invoking Default Displays:

a) Default displays, preformatted displays, and user-defined displays must all be invoked in an identical manner.

b) Any specific pre-defined display shall be assigned to and called from any menu, attached to a hard annunciator key or soft (screen) key, called via an application program, or attached to an active display object with a display.

2.

E. WS Hardware Component Platform:

1. All hardware platforms which comprise the DCS shall exhibit object code compatibility in that the same object code can be executed on all hardware platform implementations without the need to recompile, relink, or change formats.

PART 3- EXECUTION (NOT USED)

END OF SECTION

SECTION 40 94 34
PRINTERS AND SCANNERS

PART 1 – GENERAL

1.1 REQUIREMENT

A. The DCSP is responsible for furnishing several types of printers and scanners that will be used in the operation of the DCS.

B. The categories of printers include the following:
1. Color Laser Printer (CP), desktop type
2. Black & White Laser Printer (BWP), desktop type
3. Color Scanner w/Printer (SCAN), desktop type
4. Multi-function Network Printer, floor standing type

C. The DCSP is responsible for meeting the requirements for each type of printer, which are specified in this section. As printer technology changes rapidly, the DCSP shall utilize printers that are (A) Current Generation and technology and (B) are of a brand and model used by the City of San Diego COMNET DCS

1.2 APPLICABLE SECTIONS

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego

1.3 RELATED SECTIONS

A. The location and quantities of printers are detailed in the design drawings and various specification sections within Division 40.

1.4 SUBMITTALS

A. The DCSP shall provide Submittals in accordance with Specification 01 33 00, Submittal Procedures.

1.5 SCOPE OF WORK

A. The DCSP shall furnish, install, and test laser color, black and white and multi-function where shown in the design drawings and contained in these specifications.

1.6 SPECIFICATION, CODES AND STANDARDS

A. The WORK shall comply with the current editions of the publication and codes identified in Section 40 90 04, References.

1.7 DEFINITIONS

A. Definitions of acronyms are identified in Section 40 90 05, Definitions.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. The DCSP shall furnish and install printers which are "network ready", with a pre-installed network interface card to allow easy connection to an Ethernet-based local area network. Include any related network printer management utilities.

B. The network interface card supplied shall be compatible with the operating system which is used for the operator workstations.

C. The DCSP shall furnish and install any additional hardware and software necessary to allow graphic printouts from the OWS, EWS, Laptops, and IWS.

D. The DCSP shall furnish and install cables and any other required devices to connect the printer to an Ethernet-based local area network.

2.2 ACCEPTABLE PRODUCTS

A. The DCSP shall ensure that the printers selected are fully compatible with the existing Enterprise wide COMNET DCS.

B. Prior to selecting and submitting on printers, the DCSP shall determine if the City has a COMNET standard printer manufacturer at the time of Project

contract. If a current standard exists, the DCSP shall utilize the City's standard manufacturer.

C. If no City COMNET standard for printers exists at the time of Project Contract, the DCSP shall provide products manufactured by either Hewlett Packard or RICOH.

PART 3 – EXECUTION

3.1 RESPONSIBILITIES OF THE DCSP

A. The DCSP shall furnish, install, and test the required number of printers as shown on the design drawings as required in these specifications.

B. Prior to startup, the DCSP shall deliver spare parts and service manuals for all printers provided.
   1. Network IP address will be provided by City.

C. The DCSP shall follow manufacturer recommended procedures for installation and startup.

D. The DCSP shall coordinate the installation and interfacing requirements among all items installed.

E. The DCSP shall maintain printers, including consumables (ink cartridges) for the duration of the Warranty Period as specified in the Project Prime Contract.

END OF SECTION

SECTION 40 94 43
PROGRAMMABLE LOGIC CONTROLLER SYSTEM

PART 1 - GENERAL

1.1 GENERAL:

A. Function: Used for process monitoring and control, by emulating functions of conventional panel mounted equipment such as relays, timers, counters, current switches, calculation modules, PID controllers, stepping switches, and drum programmers.

B. Programmable Logic Controller based systems are typically used in wastewater collection, pumping stations, Package Systems provided by equipment vendor.

C. DCSP shall provide integration services to integrate all PLCs used in the project. The integration services include but are not limited to the following:
   1. Lead all integration activities such as coordination meetings, joint testing and site commissioning etc.
   2. Provide information necessary for PLC configuration such as IP, port assignment, and others.
   3. Define data exchange requirements between PLC and DCS, and send the requirements to Package Systems vendor.
   4. Establish and test communication between PLC and DCS.
   5. Map PLC data into DCS database.
   6. Create and monitor diagnostic info of the communication between PLC and DCS.

1.2 APPLICABLE SECTIONS

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

   1. Division 1 – General Requirements
   2. Specification 01 33 00 – Submittal Procedures
   3. Division 26 – Electrical
   4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego.

1.3 SUBMITTALS

A. PLC Component Data: all submittals shall be in accordance with Sections 01 33 00, Submittal Procedures.

B. PLC Design: In addition to the submittal requirements, the DCSP shall provide all layout and shop drawings, including the following:
   1. Panel layout, including fully dimensioned and detailed external spatial views and internal layout
   2. Electrical schematics, including, new panel wiring, instrument wiring and power and grounding
   3. Layout of relays, breakers, switches and instrumentation provided, and applicable single line and wiring diagrams
   4. I/O Card Placement and layout
   5. Enclosures, including all associated hardware devices
   6. Detailed description and associated diagrams of all software components and firmware of the PLC

C. Operations and Maintenance Manuals: PLC O&M manual shall be provided as part of its Package Systems in accordance with applicable sections.

1.4 COORDINATION AND PROGRESS MEETING:

A. DCSP shall be responsible for the scheduling of meetings/workshops with parties that supplied Package Systems to coordinate the PLC integration and complete PLC integration into DCS system.

B. The purpose of the meetings shall be to review the requirements of data exchange, define data mapping between PLC and DCS and testing.

C. Representatives at the meetings shall have the competence and authority to make any and all necessary decisions.

PART 2- PRODUCT

2.1 TYPE:

A. PLC shall be Allen Bradley Logix family including ControlLogix, CompactLogix to match existing City standard.

B. PLC shall be capable to communicate with Emerson Ovation DCS system directly over Ethernet using Ethernet/IP protocol.

2.2 PARTS:

A. The PLC based systems shall include, as a minimum: Central processing unit (CPU), power supplies, input/output modules, controllers, I/O bases (chassis/rack), and factory assembled interconnecting cables. Provide all components required to make a complete and operational system.

B. PLC system shall include the following as a minimum:

1. CPU: Latest version of AB Logix family with appropriate Memory size. Provide redundancy CPUs if required by the contract document.
2. Power supply module: Shall use the latest version, 120 V ac, 60-Hz or 24 V dc. Provide redundant power supply module if required by the contract document.
3. Input/Output:

Discrete Input Modules:

a. Voltage: 120 V ac, 60-Hz or 24 V dc
b. Operating Power: 2 watts
c. Points per Module: 16 maximum
d. LED status indicator for each point
e. Isolation: Between input point and PLC, 1,500 volts rms.

Discrete Output Modules:

a. Voltage: 120 V ac, 60-Hz or 24 V dc
b. Operating Power: 2 watts
c. Load Rating: 2 amps continuous
d. Isolation: Between PLC and output point, 1,500 volts rms.
e. Points per Module: 16 maximum
f. LED status indicator for each point

Isolated Discrete Output Modules:

a. Type: Isolated Form C relay
b. Voltage: 120 V ac, 60-Hz or 24 V dc.
c. Isolated Outputs per Module: 8
d. Load Rating: 5 amps continuous.
e. Operating Power: 2.5 watts
f. Points Per Module: 8 maximum.
g. LED status indicator and fuse for each point.
h. Isolation: Between PLC and output point, 1,500 volts rms.

Analog Input/Output Modules:

a. Voltage: 4 – 20 ma and 1 – 5 volts.
b. Power: 3 watts
c. Differential Analog Points Per Module: 8 maximum.
d. Isolated Analog Output Points Per Module: 8 maximum
e. Isolation: Between PLC and I/O point and between I/O points, 1,500 volts rms
f. Input modules shall be HART.

Pulse Input Modules:

a. Input Voltage: 5V or 12-24V (user selectable)
b. Input Current: 7 mA at 5V; 7.0 to 1.5 mA at 12-24V
c. Points per Module: 4, maximum
d. Maximum Input Frequency: 100 KHz in counter mode
e. Maximum Count Value: 0-999,999 (programmable)

4. Communication Network module:
   a. Latest version of Ethernet Network module from AB Logix family product line for Ethernet/IP protocol.
5. Interface Products:
   a. Provide any hardware, such as interfacing cables required for accessing/programming/modifying logic or I/O configuration.
6. PLC Programming:
   1)
   b. Application program: Provide final PLC application program at the end of the project to the City. If it is password protected, the password shall be provided. Provide complete annotated soft copies of the developed application software complete with I/O assignments and network configurations.
   c. Application program shall be programmed based on City's standard using IEC 1131-3 standard languages including FB, Ladder logic, structured text and sequential flow chart.
7. Spare Parts:
   a. CPU: one (1)
   b. Power supply: three (3)
   c. Communication/network module: one (1)
   d. Spare I/O Cards Installed in I/O racks: For each type of I/O card, quantity = ten (10) percent of each type and size used, minimum one (1) each.
   e. Spare I/O Cards Provided Loose (Shelf Spares): For each type of I/O card, quantity = ten (10) percent of each type and size used, minimum one (1) each.
   f. Data Highway Card: One (1)
   g. I/O Rack: One (1)

C. Controller: The controller shall have its control strategies programmed in a "ladder logic" language. It shall be easily reprogrammed with a laptop computer as specified below. The PLC system shall be programmed by the Contractor to perform the specified control strategies and monitoring functions. Two documented copies, in hardcopy and electronic format, of the operating PLC program(s) shall be furnished to the Owner which shall allow direct, step-by-step, reloading of the PLC system program(s). The ladder logic shall reflect equipment name designations used in the PLC as well as the Contract Drawing equipment name designations (i.e., timer "Q" in the Contract Drawing may become timer OL in PLC program).

D. Communications: If the PLC is required to interface with the DCS via a datalink, is shall be done so by an Ethernet IP link. The serial link type used shall be determined by distances. The PLC system shall be provided with all appurtenances to support this requirement. The communications protocol shall be MODBUS with the PLC configured in a slave mode. The DCS will operate in the master mode.

E. PLC Control System Software: This Section covers the furnishing of standard and customized software, fully installed and fully configured in the control systems specified herein. It is the intent of this specification to have the PLC System Supplier furnish his latest generation, standard, field proven, fully debugged and supported software package for this application with a minimum of additions or changes. Customized or specially written software shall be furnished if required to meet all of the functional requirements specified herein. Any custom applications software required shall be fully integrated into the basic software and shall not require unique command structures. Software specified herein is described in broad, functional categories. The System Supplier shall furnish a complete software package including the functional requirements specified herein along with whatever additional software is required by the supplier for proper and efficient operation of the PLC Control System. All logic developed must be fully annotated with point tag names that match or comply with City standards and DCS I/O. Program subroutines will contain useful descriptions as to the functionality of the logic. Special programming to accommodate other systems will be fully annotated. All points, I/O and internal will have meaningful English Descriptions to identify the purpose of the point. All network paths and IP parameters will be fully identified, all serial connections (if any) will be fully disclosed and identified. No attempt has been made to list all software or list all characteristics of software required by the System Supplier to meet the functional requirements specified herein.

1. General: The software package shall provide a system capable of controlling system level activities and a higher level process control language allowing the operator to monitor and control the process through an interactive human interface. The software environment shall support a multi-programming atmosphere allowing concurrent execution of more than one program in a background/foreground mode or multi-tasking mode.
2. Throughout the execution of all software modules, the operator shall be presented with all of the command or operation choices available at that point in the program using sufficient verbiage or symbols to make the choices self-explanatory and unambiguous. Question and answer or fill-in-the-blank requests shall only be permitted where file names, tag names, or other unique text or numerical information is required.
3. System-level software shall include a real-time operating system, a calendar/time program, a file management program and a system of

diagnostic routines in addition to any compilers, editors, loaders, or assemblers required to support the process control software language.

4. All programs shall be self-configuring, such that they obtain the size and configuration of the system from parameters contained in the various files created during system generation. No parameters related to the hardware configuration shall be hard coded into any of the software.
5. System Level Software: System-level software shall include a complete and unmodified operating system furnished by the System Supplier that provides system-level functions as specified herein. Operating system software shall function automatically without operator intervention, except as required to establish file names and similar information.
6. Operating System Software: The real-time operating system software shall be the standard uncorrupted product of the host computer and shall provide the following minimum functions:
    a. Respond to demands from a program request or to demands from an operator.
    b. Dynamic allocation of the resources available in the system. These resources shall include main memory usage, computation time, peripheral usage, and I/O channel usage.
    c. Allotment of system resources on the basis of task priority levels such that a logical allocation of resources and suitable response times are assured.
    d. Queuing of requests in order of priority if one or more requested resources are unavailable.
    e. Resolution of contending requests for the same resource in accordance with priority.
    f. Service requests for execution of one program by another.
    g. Transfer data between programs as requested.
    h. Management of all information transfers to and from peripheral devices.
    i. Control and recovery from all program fault conditions.
    j. Diagnose and report real-time hardware device errors.
7. Program execution shall be scheduled on a priority basis. A multilevel priority interrupt structure is required. A program interrupted by a higher priority program shall be entered into a list of pending programs. Its execution shall be resumed once it becomes the currently highest priority program. Initiation of programs shall, as a minimum, be activated in the following ways:
    a. In response to external interrupts.
    b. At a scheduled time of the day.
    c. On an elapsed-time interval basis.
    d. On request by another program.
    e. On request from the data access panel.

8. The system shall allow periodic programs to be scheduled. The allocation of resources to a time scheduled program shall be based on its relative priority and the availability of computer system resources.
9. Start-up and Restart:
    a. Software shall be provided which initializes and brings a computer or any microprocessor based hardware unit from an inactive condition to a state of operational readiness.
    b. Initialization shall include determination of computer system status prior to start- up of initializing operating system software and initializing application software. Initialization shall also include the loading of all memory resident software, initialization of timers, counters, and queues, and initialization of all dynamic database values.
10. Shutdown: The software shall provide an orderly shutdown capability for shutdowns resulting from equipment failure, including computer processor failure, primary power failure, or a manually entered shutdown command. When the loss of primary power is sensed, a high-priority hardware interrupt shall initiate software for an immediate, orderly shutdown. When a shutdown occurs in response to a command or malfunction, the software shall control the affected hardware quickly and automatically to a secure state.
11. Diagnostics:
    a. Diagnostic programs shall be furnished with the software package to detect and isolate hardware problems and assist maintenance personnel in discovering the causes for system failures. The system manufacturer's standard diagnostic routines shall be used as much as possible. Diagnostic software and test programs shall be furnished for each significant component in the system.
    b. Diagnostic routines shall test for power supply, central processing unit, memory, and I/O bus failures as a minimum.
12. Calendar/Time Program: The calendar/time program shall update the second, minute, hour, day, month and year in the operating system and transfer accurate time and date information to all system level and application software. Variations in the number of days in each month and in leap years shall be handled automatically by the program. The operator shall be able to set or correct the time and date from the data access panel, only at the highest security level.

F. Operator Interface:
13. System-level software shall provide for creation and modification of alphanumeric displays, compression of display information for storage, and linking of dynamic files to database variables. Each display screen shall be able to be made up of static and dynamic alphanumeric information. The system shall be furnished with standard displays as specified herein. The system shall be capable of storing and utilizing all standard display formats.

14. Additionally, all display screens shall include a dedicated area that shall display the current time and date, and at least one line for system-level messages.

G. Standard Displays: The operator interface systems shall include at least the following standard, nonconfigurable displays.
   15. Current Alarm Summary: As specified in the alarm processing section of this Document.
   16. System Overview: Displaying the current status of major systems hardware components including the input/output hardware.
   17. Menu Displays: Indicating the various displays and application level choice available to the operator.
   18. Point Displays: Detailed displays in a standard format for all types of points in the system. Any point in the system shall be able to be displayed indicating all parameters associated with the point. Each entry in the display shall be labeled in engineering units.

H. Algorithms: System software shall support the implementation of algorithms for the determinations of control actions and special calculations involving analog and discrete inputs. These algorithms shall be capable of outputting positional or incremental control outputs or providing the product of calculations. The algorithms shall include alarm checks where appropriate. As a minimum, the following types of algorithms shall be provided:
   19. A calculator algorithm which performs functions such as summing several variables, raising to a power, roots, dividing, multiplying, and subtracting.
   20. A switch algorithm which reads the current value from its input address and stored it as the value of its output address. Two types of switches shall be accommodated, two outputs with one input and one output with two inputs.
   21. A 3 mode Proportional-integral-Derivative (PID) controller algorithm, with each of the 3 modes independently adjustable. The algorithm shall support both direct and reverse acting modes.
   22. Algorithms for lead, lag, dead time, and ration compensators.
   23. Algorithms to perform integration and totalization of analog process variables.
   24. Algorithms that drive the set point of a controller shall include provisions for bumpless transfer, which shall be implemented by use of a bias value.
   25. Algorithms shall be implemented and modified in the system at any time through the use of interactive software modules in a manner consistent with other interactive modules and shall not require any direct source of code changes.

I. Alarm Processing:
   26. Alarm processing software shall be provided to recognize and report alarm events and conditions to the Local Control Panel in an organized, unambiguous, clear, and convenient manner. Alarms shall be classified into at least two priority levels and at least two independent classes.

27. Alarm processing software shall generate alarms for the following conditions:
    a. Discrete input or output change of state is defined as an alarm in the control software.
    b. Analog value exceeding alarm limits defined in the control software.
    c. Analog rate of change exceeding limits defined in the control software.
    d. Failure of the PLC processor, mass memory device, process input/output hardware, or other major hardware component.
    e. Alarms shall be generated in each case above at the time of occurrence and at the time the condition returns to normal.

J. Testing: The City's representative shall witness testing of the PLC system. Solid-state logic systems shall be tested as complete assemblies. Testing of individual components or modules shall not be acceptable. The testing shall include a simulated test with the DCS interface to ensure the accurate passing of data between the systems.

K. Training: A manufacturer's representative shall supply two 8 hour days of onsite training for the Owner's personnel. The training shall include but not be restricted to, operation of programming unit, trouble shooting of system hardware and software, and program development.

L. 30 Day Acceptance Test:

28. After startup has been completed, the system shall undergo a 30 day acceptance test. The system must run continuously for 30 consecutive days. During this period, all system functions shall be exercised. Any System interruption and accompanying component, subsystem, or program failure shall be logged for cause of failure, as well as time of occurrence and duration of each failure. A failure shall cause termination of the 30 day acceptance test. When the cause of a failure has been corrected, a new 30 day acceptance test shall be started.
29. Each time the Contractor's technician is required to respond to a system malfunction, he must complete a report which shall include details concerning the nature of the complaint or malfunction and the resulting repair action required and taken.
30. The 30 day acceptance test shall be performed jointly with the DCSP during its 30 day DCS acceptance test.

M. Operations and Maintenance Manuals:

31. The Contractor shall furnish to the Owner five complete sets of operation and maintenance manuals. The manuals shall include date, information drawings, etc., for the system, subsystem, and all components, and shall include names, addresses and telephone numbers of equipment suppliers, representatives and repair facilities.
32. This shall include a complete description of the recommended operating procedures, maintenance procedures, and spare/replacement parts list for equipment items with catalog data, diagrams, and drawings or cuts describing the equipment. Each set shall include full size assembly and

wiring diagrams; drawings showing "as-build" conditions shall be furnished to the Owner.

33. This shall include backup programming on disc or thumb drive, all programming hardware and software (including all software packages must be licensed to the City). All configuration parameters, IP addresses, settings, network paths and gateways, serial port connection parameters, IO tag descriptors (and/or register addresses) will be identified.

PART 3 EXECUTION

3.2 GENERAL

A. Where shown on drawings, or specified, the DCSP shall furnish all materials, tools, equipment, consumables and supplies, hardware, firmware, software, and shall perform all labor required to integrate all PLCs in conjunction with the DCS.

B. The DCSP shall connect all PLCs to a network access point switch associated with the process control area, or nearest physical PCMs approved by the City's representative.

C. DCS shall connect each PLC via Ethernet Link Controller (ELC), as specified in 2.1.D of Section 40 94 23, Process Control Modules.

3.3 TRAINING

A. Training shall be provided in accordance with Section 40 98 06 – TRAINING

3.4 ENCLOSURES: CABINETRY

A. The PLC Field Cabinetry hardware and submittal requirements shall conform to the requirements of Section 40 95 13, Field Cabinetry.

END OF SECTION

SECTION 40 95 13
FIELD CABINETRY

PART 1 -- GENERAL

1.1 GENERAL

A. The DCSP shall provide a complete and operational, turn-key, Distributed Control System (DCS) capable of supporting all process operations for Project as specified in these Contract documents.

B. The DCSP shall furnish all materials, tools, equipment, consumables and supplies and shall perform all labor required to complete the work in this Specification.

C. This section identifies the different types of DCS cabinets to be provided under this Specification, e.g., the Process Control Module (PCM) Cabinet, Remote Input/Output (RIO) Cabinet, Patch Panels, and the Field Termination Cabinets.

1. As the names imply, the PCM cabinet shall house the DCS processors and related equipment, including redundant Power Supplies, electrical protective devices electrical grounding strips and Fiber Optic Patch Panels (specified elsewhere – if DCSPS equipment allows)
2. The RIO cabinet shall house DCS remote I/O modules, applicable redundant Power Supplies and related hardware, electrical grounding strips and electrical protective devices.
3. The PCM or Termination Cabinets shall contain all terminals and related hardware for termination of field inputs and outputs (I/O). This cabinet will provide terminal isolation between Discrete I/O (DI & DO) and Analog I/O (AI & AO) and shall contain all required I/O electrical protective devices for field wiring. The Termination Cabinet, when utilized, will contain screw-type termination (spring-pressure termination is not allowed) for all I/O wiring (including Analog shields) under the screw terminal. All I/O wiring shall be crimped to snap-tight type spade lugs as manufactured by T&B. No alternate is allowed.
4. It is the intent that each PCM and RIO cabinet shall be provided with an associated Termination Cabinet (as needed) to isolate the DCS hardware from the field hardware and to provide orderly single-point termination of all I/O. Direct termination of field wiring to the I/O modules is allowed without the written consent of the City's representative.

D. This section provides specific requirements for each cabinet and includes the design, testing and shipping of the Hardware described herein.

1.2 RELATED SECTION

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 - Submittals
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego.

1.3 REQUIREMENT

A. The DCSP, as part of their final design, shall be responsible for providing seismic analysis reports for each cabinet for the applicable Seismic Zone, and shall provide all required seismic bracing of cabinets.
   1. The DCSP shall submit six (6) hard copies and one (1) soft copy of all seismic reports to the City's representative prior to beginning any installation of cabinets. Submission shall be made in accordance with Specification 01 33 00, Submittal Procedures.

B. The DCSP shall be responsible for design review of all concrete 'house-keeping pads' required by the cabinets and any other structural modification necessary for installation. In the event the DCSP finds the housekeeping pad design is deficient, he shall immediately notify the City's representative and the Prime Contractor.

1.4 DESIGN CRITERIA

A. Environmental Conditions – Unless otherwise noted, provide cabinets suitable for the following environmental conditions:
   1. Indoor Environment – Process Area:
      a. Temperature: 50 degrees to 120 degrees F.
      b. Relative Humidity: 10 to 60 percent non-condensing.
      c. Enclosure Rating: NEMA 4X, 316 stainless steel
      d. Classification: non-hazardous
   2. Indoor Environment – Electrical / Control Room
      a. Temperature: 50 degrees to 78 degrees F.
      b. Relative Humidity: 10 to 60 percent, non-condensing.
      c. Enclosure Rating: NEMA 12, painted steel
      d. Classification: non-hazardous

3. Outdoor Environment:
    a. Temperature: 20 degrees to 120 degrees F.
    b. Relative Humidity: zero to 95 percent, non-condensing.
    c. Enclosure Rating: NEMA 4X, 316 stainless steel
    d. Classification: non-hazardous
4. Hazardous (classified) Environment:
    a. Temperature: 20 degrees to 120 degrees F.
    b. Relative Humidity: zero to 100 Percent non-condensing
    c. Enclosure Rating: NEMA 7 Class 1 Div I&II, Class A, B, C, or D, 316 stainless steel.
    d. Classification Area: Hazardous

1.5 CODES AND REGULATORY REQUIREMENTS

A. Fabricate and install cabinet and enclosures to the following industrial standards:
1. NEMA Standards Publication ICS6, Enclosures for Industrial Controls and Systems
2. UL 508A, Industrial Control Cabinet and/or CSA Standard C22.2
3. IEC 529, Classification of Degrees of Protection provided by enclosures
4. NFPA 79, Electrical Standards for Industrial Machinery
5. OSHA Standard 1920.147 – The Control of Hazardous Energy (Lockout/Tagout)
6. International Society of Automation (ISA)
7. American Petroleum Institute (API)
8. American National Standards Institute (ANSI)
9. Military Standards (MIL Standards)
10. National Fire Protection Association (NFPA)
11. Institute of Electrical and Electronic Engineers (IEEE)

B. Perform the design, and provide all enclosure work in compliance with the requirement of Underwriters Laboratories (UL) Bulletin 508A.

C. All electrical equipment, components, devices, etc. installed within the cabinet, shall be Underwriters Laboratories (UL) certified.

D. The DCSP shall install cabinets in compliance with requirements of all State and local Codes with respect to clearances and area classifications, and in accordance with seismic requirements.

E. The DCSP shall obtain seismic calculations and mounting details for each cabinet. Seismic calculations and mounting details shall be stamped, on each page of the submittal, by a registered structural engineer in the state of California. Coast for all seismic certifications shall be borne by the DCSP. Seismic calculations and mounting drawings shall be submitted in accordance with Specification 01 33 00, Submittal Procedures. No DCS related cabinet

shall be installed on site until seismic submittals have been returned "Approved".

1.6 DELIVERY, STORAGE, AND HANDLING

A. The DCSP shall provide protection for materials, components and equipment against loss or damage and from the effect of weather while in fabrication and at the approved staging area. Upon deliver to site, the Prime Contractor is responsible for protection of the DCS equipment during construction and installation. Prior to shipment to Project site, the DCSP shall store items in an indoor dry location, inclusive of corrosive-inhibitive vapor capsules in shipping containers, and related equipment as recommended by the capsule manufacturer. Provide a suitable controlled environment in storage areas for items subject to corrosion under damp conditions.

B. Provide protection for cabinets against loss or damage from the effects of weather upon receipt, and a suitable controlled environment for storage of cabinets, while stored in the approved staging area.

1.7 SUBMITTALS

A. The hardware submittal shall be in accordance with Section 01 33 00, Submittal Procedures. The submittal shall be provided in a singular, all-inclusive submittal which shall include but not be limited to:
   1. The DCSP shall provide all submittals in accordance with all requirements of the Specifications and shall submit hardware catalog information and specification sheets with selected model numbers identified.
   2. The DCSP shall provide six (6) hard copies and one (1) soft copy of complete cabinet shop drawings prior to fabrication of cabinets. The DCSP shall not begin cabinet fabrication until City's representative approval is obtained for its design. Details shall include location and dimensions of cabinet cutouts, location of any/all back of cabinet stiffeners and cabinet face to exact scale, terminations with their identification indicated, and the location and size of all equipment and devices to be mounted within and on the cabinet. The allowable conduit entrance area shall also be depicted. All shall be drawn to scale and accurately depict all information in sufficient detail to allow City's representative to determine compliance with the Contract Requirements. Poorly drawn details and/or lack of accuracy shall be grounds for rejection.
   3. Bill of Materials:
      a. Contractor will provide a complete and detailed Bill of Material (BOM) for each field mounted device and assembly as well as cabinet assemblies and sub-assemblies

b. BOM shall include all items within an enclosure. Each BOM shall be delineated by Process segment and on a PCM/RIO unique basis. Incomplete submittals may be rejected without further review.

4. Schematic and Wiring Diagrams:
   a. DCSP will provide six (6) hard copies and one (1) soft copy of all drawings showing both schematic and wiring diagrams for all circuits. Complete details on the circuit interrelationship of all internal, and external, devices associated with each Enclosure shall be submitted first, using schematic control diagrams.
   b. Subsequent to return of this first submittal, the DCSP shall submit six (6) hard copies and one (1) soft copy of all cabinet wiring diagrams. The Diagrams shall be submitted in accordance with Specification 01300 and shall contain:
      1) Component layout drawings (proportional layout), showing numbered terminals on components together with the unique number of the wire to be connected to each terminal.
      2) Wiring diagrams shall show terminal assignments including tagging identifying field primary and final measurement and control devices.
   c. As Constructed Drawings made during the project which differ from the original drawings, and/or the shop drawings shall be documented and shall be submitted to the Prime Contractor as "red-lined Record Drawings".
      1) Record Drawings shall be reviewed by City's representative prior to the acceptance of the project. The DCSP shall respond to all comments on the shop drawings made by City's representative either by making required corrections, or stating why corrections were not possible.
5. Assembly and Construction Drawings:
   a. DCSP shall provide six (6) hard copies and one (1) soft copy of assembly and construction drawings for each DCS enclosure to facilitate field installation: These drawings shall include dimensions, identification of all components, surface preparation, and finish data, nameplates, safety placarding, etc. These drawings also shall include room identification and enough other details, including prototype photographs, to define exactly the style and overall appearance of the assembly.
6. Installation, Mounting, and Anchoring Details:
   a. The DCSP shall provide six (6) hard copies and one (1) soft copy of installation, mounting and anchoring details, including housekeep pad size requirements and details, for all components and assemblies to be field-mounted, including conduit connection and entry details. Seismic calculations for the cabinet and mounting details shall be included as specified elsewhere.

7. Uninterruptible Power Supply:
    a. Complete product literature.
    b. Electrical load calculations showing the electrical loads and battery backup time under full loading.
    c. Wiring and connection diagrams
    d. The UPS submittal shall include Modbus Addressing and Network Configuration Data for monitoring the status of the UPS.
8. Calculations for sizing of Cabinetry Uninterruptible Power Supplies and Air Conditioning Units
    a. The DCSP will provide six (6) hard copies and one (1) soft copy of all calculations, as a submittal to determine the requirements for:
        1) Uninterruptible Power Supply Systems (UPS)
        2) Thermal Management System:
            a) DCSP to provide six (6) hard copies and one (1) soft copy (CD/DVD) of submittals depicting calculated heat gain for each PCM, RIO, Termination Cabinet or Local Cabinet which contains electronics. Calculations shall take into account the maximum ambient air temperature anticipated.
                (1) Where DCSP heat gain calculations indicate that cabinet temperatures for PCM, RIO and Termination Cabinets containing electronics cannot be held at or below 75 degrees F, the DCSP shall provide a Thermal Management System for the Cabinet. In the case of Local Cabinets containing electronics, the temperature shall be held 10 degrees F below the maximum temperature rating of the lowest-rated piece of cabinet electronics.
                (2) All Thermal Management Systems provided shall be housed in enclosures of the same material used for its associated electronics cabinet.
                (3) If cabinet-mounted Air Conditioners are used, the DCSP shall provide a means acceptable to the City's representative for disposal of any condensate generated.
                (4) A separate, non-UPS source of power (utility power), fed from an existing Lighting or Power Panel, to feed Thermal Management Systems shall be provided by others under Division 26. Thermal Management Systems utilizing 'Plant Air' shall not be used.

1.8 QUALITY ASSURANCE

A. The DCSP shall achieve product quality assurance by possessing the following:

1. System of traceability of the manufactured unit throughout production and testing in compliance with applicable Standards or other approved Quality Assurance Programs.
2. System of "burn-in" for all components and available supportive documents in compliance with applicable Standards or other approved Quality Assurance Programs.
3. Demonstrated record of prompt positive response to field failures
4. Documented program of failure analysis
5. Proof of compliance with relevant regulations, standards, specifications, and/or codes of the following sources: ISA, API, UL, NEMA, OSHA, ANSI, MIL, NFPA, JIC, IEEE, NEC, ICEA, and any other national state, municipal, and local laws, regulations, and codes.
6. Documented product safety policy relevant to all products intended to be furnished under this Contract.

PART 2 -- PRODUCTS

2.1 GENERAL

A. All cabinets to be located in process areas or outdoors shall be provided with an integral thermostatically controlled Thermal Management Systems as required under Part 1. Indoor cabinets mounted in conditions areas, or conditioned electrical rooms, may contain cleanable/replaceable filters and circulation fans to maintain cabinet temperature.

B. Field I/O wiring shall be terminated in the PCM cabinet, by others, or preferably. Termination in Termination Cabinets adjacent to or integral to, the PCM or RIO Cabinet. For integral configurations, two completely separate compartments must be maintained with individually lockable doors. All internal hardware to the individual cabinets shall be designed as if they were standalone cabinets.

C. Enclosures shall contain only those openings required for cabling and ventilation in accordance with area classification.

D. The cabinets shall be free from waves and other imperfections. Cabinet fronts shall not be recessed at the base. Adjoining cabinet sections shall be accurately shop- fitted to ensure satisfactory assembly in the field.

E. Check with the design drawings to determine where front-only, or front & rear, opening cabinets can be used based on space availability. All equipment and

wiring shall be accessible from the front and rear of the enclosure as appropriate.

F. Field wire entry capability shall be from the top and the bottom of the cabinet as required by the specific application and in accordance with DCSP submittal showing acceptable conduit entrance areas. Each cabinet shall, wherever possible, be one of the DCSP's standard sizes; however, the height shall not exceed 96 inches. All indoor cabinets shall be sized so that they can be moved through a 36-inch-wide doorway.

G. Ventilation openings in enclosures in all areas, based on area classification, shall be provided with dust filters and insect screens. Ventilation shall be provided with cleanable/replaceable filter backed louvers at top and bottom. Thermostatically controlled fans shall be located at air inlets so that the enclosure interior is pressurized. Filters shall be capable of removal and reinstallation without the use of tools. Exhaust vents shall contain the same dust filters and insect screens and shall be placed so as to facilitate cabinet top heat gain. Where area classification precludes ventilation opening, a recirculation type Thermal Management System shall be utilized.

H. Cabinets shall be of adequate strength to support mounted components during shipment and to support a concentrated load of 200 pounds on their top after erection, and shall be rated for Seismic Zone 4 requirements.

I. Each freestanding enclosure shall be mounted on a concrete housekeeping pad that elevates the cabinet in accordance with the Design Engineer's standard pad design.

J. Utility and UPS branch power shall be installed and terminated by others under Division 26. Each cabinet, as specified below, shall have an externally-mounted, weatherproof, modular (plug in) RJ-45 type Data Jack to support connection of the Industrial Hardened Workstations (FHS). Addition of the Data Jack shall not violate the NEMA integrity of the cabinet. Where possible Data Jacks shall be mounted 12 inches above grade.

K. All cabinets shall be provided with a temperature sensor to monitor cabinet temperature. The sensor shall provide a hardwired analog input signal to the DCS.

L. All cabinet doors shall be provided with limit switches which shall activate when the door is opened. Switches shall be double pole; one pole operating the cabinet light and the other pole providing supervised, 'door-open' indication to the DCS I/O. These points shall provide a hardwired digital input signal to the DCS.

M. Control panels, including those furnished by equipment manufacturers shall be provided according to the following requirements:
    1. Where indicated, control panels shall be provided with all required taps, fittings, rotameters, regulation and alarm interlocks to enable the implementation of a purge system which is in conformance with ISA S12.4 Type Z requirements. Dimensions shall be in accordance with manufacturer's requirements. Elevations and horizontal spacing shall be subject to City's representative approval.
    2. Panels shall be fabricated, piped and wired by fully qualified panel shop who are properly trained, experienced and supervised.
    3. See Section 40 90 07, Scope of Work, for control panels to be provided under this Contract.

N. Materials:
    1. Panel section faces shall be No. 10 gauge minimum thickness steel for free standing panels and No. 14 gauge minimum thickness steel for smaller panels. All materials shall be selected for levelness and smoothness.
    2. Relay rack high density type panels shall utilize standard relay racks with No. 14 gauge steel frame and supports.
    3. Structural Shapes and Strap Steel: ASTM A283.
    4. Bolting Material: Commercial quality carbon steel bolts, nuts and washers, all 1/2 inch diameter with UNC threads. Carriage bolts shall be used for attaching end plates. All other bolts shall be hex head machine bolts. All nuts shall be hot pressed hex, American Standard, heavy. Standard wrought washers shall be used for foundation bolts and attachments to building structures. All other bolted joints shall have S.A.E. standard lock washers.

O. Fabrication:
    1. End plates, top plates and top closure panels shall be furnished when required. End plates, top plates and top closure panels shall be removable with countersunk bolts to match panels. Top closure panels shall be furnished in lengths which match the widths of standard panels, except that one top closure panel may extend across two 4 feet 6 inches wide or five 2 feet 0 inches wide standard panels. The vertical joints of these panels shall align with the vertical joints of the standard panels.
    2. End closure or rear closure doors shall be provided. Such doors shall be flush fitting and gasketed and be of the hinged lift-off type with lockable door handles. A common key shall be provided for all doors on one panel assembly. Where removable access panels are indicated, they shall be furnished with dished handle fasteners. Screw driver 1/4 turn type fasteners are not acceptable.
        a. The flanged edges of all panels shall be straight and smooth. Corners shall be welded and ground smooth.
        b. The face of the panel shall be true and level after flanging.

c. All panel cut-outs and holes may be cut or drilled by any standard method that will not cause deformation. Burrs shall be ground smooth.
d. Adjacent panels shall be assembled with faces flush. Gaps or cracks shall not be visible from the front of the assembled instrument board.
e. Stiffeners shall be welded to the back of panels, as required to prevent panel deformation due to the weight of front of panel mounted instruments.
f. Panels shall be self-supporting as defined below.

P. Framework and Supports:
1. The rear of each panel section shall have a steel framework for supporting conduit, tubing, wireways, switches, air piping and all instrument accessory items such as relay or terminal enclosures, transducers, pressure switches, valves and air relays. The main frame work shall be constructed of standard structural shapes. Special shapes such as "Unistrut" may be used for secondary supports. Framework must not interfere with instrument connections or access needed for maintenance or adjustments.
2. Steel framework shall extend 2 feet 8 inches back of the panel face unless otherwise required. Where indicated, individual adjustable leg supports shall be provided at the back of the framework so that the entire panel shall be self-supporting.

Q. Finish:
1. Preparation: The front and rear face of the panel, both sides and the edges of all flanges, and the periphery of all openings shall be prepared as follows:
a. All high spots, burrs, and rough spots shall be ground smooth.
b. The surfaces shall be sanded or sandblasted to a smooth, clean bright finish.
c. All traces of oil shall be removed with a solvent.
2. Finishing:
a. A 3 mils dry coat of Amercoat 185, or equal primer shall be applied over the entire panel surface immediately after solvent cleaning.
b. Wet sand, dry, then quick glaze spot putty on the front of the panel only. Dry, then wet sand again and dry.
c. Apply a second 3 mils dry coat of alkyd enamel primer to the front of the panel.
d. Wet sand to smooth clear finish, then dry.
e. At least two 3-mil dry coats of air-dry, satin finish, alkyd enamel shall be applied over the entire surface. Color to be as selected by City's representative.
f. The Contractor shall furnish two 1-pint containers of the enamel to the City's representative.

3. Instrument Finishing: The final coats applied to painted surface of instrument cases, doors, or bezels which are visible from the front of panels shall be manufacturer's standard unless otherwise indicated. Black japan or "crinkle" finishes on instrument cases are not acceptable.

R. Mounting of Instruments:
1. The Contractor shall provide cut-outs, and shall mount all instrument items indicated to be panel mounted, including any instruments indicated to be furnished by other manufacturers.
2. The Contractor shall also mount, behind the panels, other instrument accessory items as indicated.
3. Rear of panel mounted equipment shall be installed with due regard to commissioning adjustments, servicing requirements and cover removal.
4. Wiring shall be kept clear of spare space to give maximum space for future additions.
   a.

S. Electrical Requirements for Control Panels:
1. The Contractor shall provide all wiring, conduit, wireways, and switches required to make instruments and other panel electrical devices operational.
2. Conduit, wireways, junction boxes and fittings shall be installed for all signal wire, all thermocouple and resistance thermometer lead wire including those between temperature sensors and temperature indicators.
3. Each terminal connection shall have a plastic plate with a terminal and instrument tag number. All wiring shall be identified with stamped tubular wire markers.
4. Freestanding panels shall be provided with switched two 18 watt LED lights which are powered from a source independent from that which powers the panel devices. One light shall be provided for every 4 feet of panel width and shall be mounted inside in the top of the back-of-panel area.
5. Freestanding panels shall be provided with a 15 amp, 120 volt service outlet circuit within the back-of-panel area which are powered from a source independent from that which powers the panel devices. The circuit shall be provided with one three wire, 120 volt, 15 ampere, duplex receptacle for every 4 feet of panel width spaced evenly along the back-of-panel area. As a minimum, two duplex outlets shall be provided for each panel.
6. Smaller panels shall be sized to adequately dissipate heat generated by equipment mounted in or on the panel.
7. Where smaller panels are mounted outside or in unshaded areas, they shall be provided with thermostatically controlled heaters capable of maintaining inside temperatures above 40 degrees F.
8. Smaller panels shall be provided with a hand-switch controlled two 18 watt LED light and a breaker protected 120 volt, 15 amp duplex receptacle.

9. Wiring Methods: Wiring methods and materials for all panels shall be in accordance with the NEC requirements for General Purpose unless otherwise indicated. Opening wiring in close cabinet type panels is allowed when indicated.
10. Construction:
    a. Wire for 115 volt circuits shall be No. 14 AWG stranded with Type THWN or THHN insulation. All terminals for external wiring connections shall be suitable for No. 12 AWG wire.
    b. Flexible conduit is not acceptable.
    c. Conduit fittings shall be cast fittings.
    d. Soldered or pressure crimped wire splicing in conduits shall be acceptable.
    e. For case grounding, panels shall be provided with a 1/4 inch by 1 inch copper ground buss completed with solderless connector for one No. 4 AWG bare stranded copper cable. The Contractor shall connect the copper cable to a system ground loop.
    f. Single case annunciator units with no remote logic which are installed at the top of a panel may be considered as being a terminal box when top of panel wire entry is indicated. If bottom of panel entry is indicated, terminal box shall be provided at the bottom of the panel and wired to the annunciator. Terminals shall be identified with plastic marker strips.
    g. Terminal boxes for incoming and outgoing signal leads shall be located at the top or bottom of the panel as indicated or as otherwise required.
11. Power Supply Wiring:
    a. Unless otherwise indicated, all instruments, all alarm systems, and all motor controls shall operate on 24V dc circuits.
    b. The Contractor shall furnish terminal box connections for the main power supply entry as indicated.
    c. Power supply switches for alarm units shall be three pole type, arranged to open both the power and alarm circuits. Each annunciator shall be equipped with a separate switch.
    d. Instruments located on a single panel section which serve one process unit may be connected to a common branch power circuit. The number of branch circuits shall be such that no circuit load exceeds 10 amps. Different panel sections and instruments serving different process units shall not use common branch circuits. A 15 amp, two-pole circuit breaker shall be provided in each branch circuit. When instruments do not come equipped with integral fuses, the panel fabricator shall furnish and install fuses as required for the protection of individual instrument against fault currents. Fuses shall be mounted on the back of the panel, in a fuseholder, with each fuse identified by a service name tag.

e. Each potentiometer type instrument, electronic transducer, controller or analyzer shall have an individual disconnect switch. Disconnect switches shall have metal or plastic tags listing the associated instrument tag numbers. Individual plug and cord set power supply connections may be used without switches when indicated.

f. Where alarm units are single unit types, one switch may be used to disconnect not more than six alarm units located on the same or adjacent panels.

12. Alarm Wiring: The Contractor shall provide all alarms including light cabinets, audible signal units, test and acknowledge switches and remote logic units as indicated. Interconnecting wiring to panel mounted initiating devices shall also be provided. Wiring from external initiating devices shall be provided by the Contractor. Where plug and cord sets are provided for component interconnection, the Contractor shall harness and support the cables in a neat and orderly fashion. Where separate wire is required, the Contractor shall install 16 AWG with THWN or THHN insulation between all components.

13. Signal Wiring:

a. Computer and Noncomputer Use: Signal wire shall be twisted shielded pair or triads in conduit or troughs. Cable shall be constructed of No. 16 AWG copper signal wires with THWN or THHN insulation. Color code for instrument signal wiring shall be:

1) Positive: Black (+).
2) Signal Ground Negative: White (-).
3) Equipment Ground: Green.
4) Ungrounded: Red.
5) Energized by Voltage Source External to Panel: Yellow.
6) DC Circuit: Blue.

b. Multiconductor cables where indicated shall consist of No. 16 AWG copper signal wires twisted in pairs, with 600 volt fault insulation. A copper drain wire shall be provided for the bundle with a wrap of aluminum polyester shield. The overall bundle jacket shall be PVC.

c. Multi-conductor cables, wireways and conduit shall provide for 10 percent allocation of spare, unused signal wires in addition to the indicated requirements.

14. Thermocouple Wiring:

a. The Contractor shall provide metal wire troughs, pullboxes, and thin walled conduit for duplex thermocouple lead wire in a manner which will facilitate field installation of lead wire without splices or terminal connections. The Contractor shall also provide the lead wire connections between multipoint temperature sensors and temperature indicators when indicated. When a thermocouple

junction box is indicated, it shall be located with the approval of the City's representative. The panel manufacturer shall install conduit and troughs and lead wires between the junction box and the instruments. Terminal material shall be compatible with extension wire used.

b. Thermocouple lead wire shall be No. 16 AWG with high temperature PVC insulation on each wire and PVC jacket overall, and shall conform to the latest ISA Specification for standard grade.

c. Conduit for thermocouple lead wire shall be in accordance with the following:

CONDUIT SIZE	1/2"	3/4"	1"	1½"	2"
NO. OF DUPLEX	1	4	6	16	26

d. Where the number of duplex lead wires exceeds 26, the wires shall be installed in rectangular ducts filled to not more than 40 percent capacity.

e. All thermocouple wireways and main conduits shall be sized to allow for 10 percent spare thermocouple leads.

f. Each signal, control, alarm, and indicating circuit conductor shall be designated by a single unique number which shall be shown on shop drawings. These numbers shall be marked on all conductors at every terminal using white numbered wire markers which shall be plastic-coated cloth, or shall be permanently marked heat-shrink plastic.

15. Terminal Blocks: Terminal blocks shall be molded plastic with barriers and box lug terminals, and shall be rated 15 amperes at 600 volts. White marking strips, fastened securely to the molded sections, shall be provided and wire numbers or circuit identifications shall be marked thereon with permanent marking fluid.

T. Color Conventions: Lens covers for indicating lights on all panels will be colored as follows:

1. Red ON when:
   a. Motor not running (STOPPED).
   b. Valve CLOSED (not fully opened).
   c. Circuit breaker CLOSED.
2. Green ON when:
   a. Motor running in forward direction (fast speed for multi-speed motors).
   b. Valve OPEN (not fully closed).
   c. Circuit breaker OPENED.
3. White ON when:
   a. Power available.

b. System in AUTOMATIC mode.
c. Monitoring taking place.

4. Amber ON when:
   a. Malfunction trip.
   b. Equipment locked out.
   c. Alarm condition.

U. Nameplates: Nameplates shall be provided for instruments, function titles for each group of instruments, and other components mounted on the front panel(s) as indicated. A nameplate shall be provided for each signal transducer, signal converter, signal isolator, and electronic trip mounted inside the panel(s). Nameplates shall be descriptive to define the function and system of such element. These nameplates shall be of the same material as those on the front of the panel(s). Adhesives shall be used for attaching nameplates. Nameplates shall be fabricated from black face white-center laminated engraving plastic. Painted surfaces shall be prepared to allow permanent bonding of adhesives. Colors, lettering, styles, abbreviations and sizes shall be in conformance with ISA-RP60.6 with an intended viewing distance of 3 feet to 6 feet.

V. Factory Inspection:
   1. Panels shall be inspected for compliance with requirements at the factory before shipment to the site. The Contractor shall notify the City's representative 2 weeks in advance of the testing date. A representative of the City's representative will visit the factory to make the inspection.
   2. Contractor shall perform the following tests prior to arrival of the City's representative:
      a. All air lines adequately tested for leaks.
      b. All alarm circuits rung out to determine their operability.
      c. Electrical circuits checked for continuity and where applicable, operability.
      d. Nameplates checked for correct spelling and correct size of letters.
      e. Other test required to place the panel in an operating condition.
   3. It shall be the responsibility of the Contractor to furnish all necessary testing devices and sufficient manpower to perform the tests required by the City's representative to determine conformance to the requirement of the Contract Documents.
   4. If the above tests have not been performed prior to the arrival of the City's representative, the Contractor shall reimburse the Owner for the cost of the extra time required for the inspector's services and travel expenses.

W. Shipment: Panels shall be crated for shipment using a heavy framework and skids. Panel sections shall be cushioned to protect the finish of the instruments and panel during shipment. Instruments which are shipped with the panel shall have suitable shipping stops and cushioning material installed to protect instrument parts from mechanical shock damage during shipment. Each panel crate shall be provided with removable lifting lugs to facilitate handling.

2.2 PROCESS CONTROL MODULE (PCM) CABINETS

A. PCM Cabinets shall be provided to house the DCS PCM hardware which interfaces to the DCS network and RIO, PLC / or Termination Cabinets.

B. The Cabinet shall be as required by area classification, gasketed, floor standing (minimum 72"w x 96"h x 24"d), with double doors and access from the front, and rear where applicable, of the cabinet. Doors shall have a 3-point, key-locking, 1/4 turn latching mechanism. Doors shall be 36-inches wide and hung by continuous full height piano hinges at the outside edges. (Integral cabinet configuration dimensions shall not exceed 72" wide)). Cabinet shall be provided with cable entry from the top and bottom (where applicable) as needed for entry of cables from cable trays and/or conduits. Cabinet shall be able to incorporate:

1. One (1) set redundant PCM
2. Redundant power supplies.
3. Redundant Communications modules
4. Redundant RIO communications modules if applicable
5. I/O cards or modules and all required appurtenances to function as a stand- alone node within the DCS.
6. Any cabinet and raceway shall be sized to accommodate equipped, spare, and future growth requirements of I/O and wiring, as well as for cables from I/O cards to the Termination Cabinet if used.
7. Weatherproof, exterior mounted, RJ-45 Data Jack, which shall be wired back to the closest port on the data highway/LAN switch.
8. UPS to power DCS PCM and loop powered instruments.

C. CABINET LAYOUT

1. PCM and I/O rack and cards shall be accessible from the front of the cabinet. Access for card I/O cable connections shall be from the front or rear of the cabinet, based on area requirements. A Separate wire-way shall be used to carry 120VAC signals. 120VAC power shall be separately routed within the enclosure for shielding and isolation from low-voltage signal wiring**.** Power entry to the cabinet and UPS Power Supplies shall be grouped together in an area of the Cabinet that is separated from PCM processors and I/O wiring assemblies.
2. Cabinet Power Distribution: Provide circuit breakers in the number and capacity required to protect all internal power circuits from overload and damage due to abnormal power conditions and/or device failure. Follow requirements for power circuits contained elsewhere in the Specifications. Group the circuit breakers together in a part of the Cabinet adjacent to power supplies. Associated wiring shall be routed in wireway and/or conduit provided for 120VAC power only. A main

circuit breaker / disconnect shall also be provided for the Cabinet, which shall switch electrical power to all internal Cabinet equipment.

3. Wireway: Internal Cabinet wiring shall be contained in wireway, or where this is not possible, wiring shall be bundled and tied with nylon ties and secured to the nearby cabinet walls with approved affixed mounts.

2.3 REMOTE INPUT/OUTPUT (RIO) CABINETS

A. RIO Cabinets shall be provided to house the DCS RIO hardware which interfaces to the DCS PCM and Termination Cabinets (if provided).

B. The Cabinet shall be as required by area classification, gasketed, floor standing (minimum 36"w x 96"h x 24"d), with single or double doors as appropriate, and access from the front, and rear of the cabinet where applicable based on site conditions. Doors shall have a 3-point, key-locking, ¼ turn latching mechanism. Doors shall be 36-inches wide and hung by continuous full height piano hinges at the outside edges. (Integral cabinet configuration dimensions shall not exceed 72" wide)). Cabinet shall be provided with cable entry from the top and bottom as needed for entry of cables from cable trays and/or conduits. Cabinet shall be able to incorporate:

1. Redundant PCM communications modules
2. Redundant power supplies
3. A minimum of 32 I/O cards or modules and all required appurtenances to function as a RIO node within the DCS.
4. Any cabinet and raceway shall be sized to accommodate equipped, spare, and future growth requirements of I/O and wiring, as well as for cables from I/O cards to the Termination Cabinet.
5. Weatherproof, exterior mounted, RJ-45 Data Jack, which shall be wired back to the closest port on the data highway/LAN switch.
6. UPS to power DCS RIO and loop powered instruments
7. Cabinet shall be sized to accommodate expansion and growth of twenty (20) percent of the I/O.

C. CABINET LAYOUT

1. RIO PCM communications modules and I/O rack and cards shall be accessible from the front of the cabinet. Access for card I/O cable connections shall be from the front, rear of the cabinet where applicable based on site conditions. Separate wireways shall be used to carry 120VAC signals. 120VAC power shall be separately routed within the enclosure for shielding and isolation from low voltage signal wiring.
2. Power entry to the cabinet and UPS Power Supplies shall be grouped together in an area of the Cabinet that is separated from PCM processors and I/O racks assemblies.

3. Cabinet Power Distribution: Provide circuit breakers in the number and capacity required to protect power circuits from overload and damage due to abnormal power conditions and/or device failure. Follow requirements for power circuits contained elsewhere in the Specifications. Group the circuit breakers together in a part of the Cabinet adjacent to power supplies. Associated wiring shall be routed in wireway and/or conduit provided for 120VAC power. A main circuit breaker / disconnect shall also be provided for the Cabinet, which shall switch electrical power to all internal Cabinet equipment.
4. Wireway: Internal Cabinet wiring shall be contained in wireway, or where this is not possible, wiring shall be bundled and tied with nylon ties and secured to the nearby cabinet walls with adhesive mounts.

2.4 FIELD TERMINATION CABINETS

A. Field Termination Cabinets, if required, shall be provided to interface between the DCS PCM/RIO cabinets housing the DCS system hardware and the field mounted instruments and devices. In addition to providing terminal blocks for connection of wiring, the Cabinets may also provide electrical isolation between DCS discrete output signals and the equipment being controlled, and between the DCS and any field signal operating at a voltage level other than 24VDC. Where necessary to ensure analog signal compatibility and/or isolate ground loops, signal isolators shall be provided and installed in the Termination Cabinets.

B. Cabinet shall be front access only, and shall provide openings at the top, or bottom, as needed for entry of cables from cable trays and/or conduits. The cabinet shall be as required by area classification, gasketed, floor standing (minimum 72”w x 96”h x 24”d), with double doors and 3-point latching mechanism, and key locking 1/4- turn. Doors shall be 36-inches wide and hung by continuous full height piano hinges at the outside edges. Cabinet shall incorporate:
   1. Knife blade fused terminal blocks shall be provided on every wire connection for convenient isolation of circuits without de-terminating wiring.
   2. Interposing Relays - Slave / Pilot Relays shall be provided in the Termination Cabinet for the electrical isolation of discrete output signals. Where 120-volt wetting voltages are present, interposing relays shall be isolated from relays handing low voltage.
   3. Signal Isolators – Provide in the Termination Cabinet as mentioned above.
   4. Power supplies: Provide a redundant power system for the Cabinet consisting of individual power supplies and automatic failover with alarm light, located in the bottom of the Termination Cabinets. All electronics

power supplies and loop- powered instruments shall be powered by the UPS as specified elsewhere.

5. Provide 3 terminal blocks for each 2-wire signal (2 conductors & shield), and 4-terninals for each 3-wire signal for landing field wiring and DCS wiring entering/exiting the Termination Cabinets. Also, provide all terminal blocks required for internal cabinet wiring and connections such as power supply, interposing relays, signal isolators, grounding and similar requirements. Provide terminals for all other wiring entering / leaving the Termination Cabinets as needed for landing connections. No wire splicing shall be used for connections in the Termination Cabinets.
6. Every wire conductor shall be individually labeled with its unique ISA identifying wire number in accordance with the requirements of the Contract Documents. Similar labels shall be attached to every terminal block.
7. Each conductor will be terminated in one of the following manners:
    a. Conductor may be terminated in a safety-type forked, spade terminal of appropriate size for the screw on the termination block. All conductors shall be crimp-type spade terminal as manufactured by T&B. Substitution is not allowed.
    b. If Phoenix Contact compression-type terminal blocks are utilized, each wire shall be ferruled or soldered tinned prior to terminating under the compression pawl.
    c. Conductor may be terminated in a ferruled terminal type of appropriate size for the screw on the termination block. All conductors shall be crimp-type ferruled terminal.
8. Labels and nameplates shall be provided for identification of each active component contained within the Termination Cabinets (i.e., interposing relays, power supplies, terminal blocks, and similar items).
9. Grounding: provide an electrical Cabinet ground bus and ground wiring system.
10. Signal Grounding: provide an isolated signal ground path and buss within the cabinet. All shields from signal wiring shall be grounded in the Termination Cabinets. Grounding and Signal grounding shall be terminated to the ground buses and connected to the DCS ground grid by other under Division 26.

C. CABINET LAYOUT

1. Cabinets shall be arranged with vertical columns of terminal blocks bounded on both sides by wireways. Wherever possible, DCS wiring shall be separated from field wiring within the wireways. DCS wiring shall be routed to the left side of terminal blocks and field wiring to the right side of terminal blocks. Separate wireways shall be used to carry 120VAC signals. 120VAC power shall be separately routed in conduit within the enclosure for shielding and isolation from signal wiring.

2. Interposing relays shall be housed in an area of the Cabinet that is separate from terminal blocks. Within this area, relays shall be separated according to whether they carry 24VDC or 120VAC signals. Relays shall be arranged so that all 120VAC signal wiring is contained in separate wireways from24VDC signals.
3. Power Supplies shall be grouped together in an area of the Cabinet that is separated from terminal blocks and relays, but may be located in adjacent areas on the DIN rail in order to facility interconnecting wiring.
4. Cabinet Power Distribution: Provide DIN rail mounted circuit breakers in the number and capacity required to protect power circuits from overload and damage due to abnormal power conditions and/or device failure. Follow requirements for power circuits contained elsewhere in the Specifications. Group the circuit breakers together in a part of the Cabinet that is separated from terminal blocks and relays, but is adjacent to power supplies. Associated wiring shall be routed in wireway and/or conduit provided for 120VAC power. A main circuit breaker / disconnect shall also be provided for the Termination Cabinets, which shall switch electrical power to all internal Cabinet equipment.
5. Cabinet Power Supply: The cabinet power supplies shall be provided from two independent sources, UPS and utility power. These shall be distributed separately within the cabinet to provide the sources of power as described herein.

D. Wireway: Internal Cabinet wiring shall be contained in plastic wireway, or where this is not possible, wiring shall be bundled and tied with nylon ties and secured to the nearby cabinet walls with adhesive mounts. Wireways shall also be provided at the top and bottom of the Cabinets to collect the wiring from the vertical wireways and direct it to the proper location.

E. Separate areas shall be provided on the DIN rail terminal blocks for each type of input / output points (i.e., Analog Input – AI, Analog Output – AO, Discrete Input – DI, and Discrete Output – DO). Separate areas shall also be provided in the Cabinets for interposing relays.

F. Cabinet shall be sized to accommodate expansion and growth of twenty (20) percent of the I/O.

2.5 Uninterruptible Power Supply (UPS)

A. UPS supply systems shall be provided by the DCSP for each PCM, RIO, Termination Cabinet and any Local Cabinet containing electronics, in this contract. The UPS shall be installed and terminated under Division 26 by others.

B. UPS systems shall be sized to match area supply voltages and will provide, as a minimum, two (2) hour of standby power, at the full rated load of the Cabinet plus 20% spares.

C. UPS shall be provided with external bypass mechanism to allow removal of the UPS for service without interrupting the PCM, etc.

D. Each UPS shall be provided with its own electrical protective Load Center, provided and installed by others under Division 26. Load Center will contain adequate number and ampacity of circuit breakers to facilitate all loads fed from that UPS. Load Center will be of appropriate voltage and have a main protective breaker of appropriate ampacity to match the KVA rating of the UPS.

E. UPS's shall be floor mounted adjacent to the cabinet being served. They shall be mounted on a rack above a minimum of 6-inches above finished floor. If requirements dictate, UPS shall have additional, self-contained battery capacity to ensure minimum standby times.

F. The UPS shall be provided with a Network Communications Module capable of Modbus and SNMP that will transmit UPS environmental data to the DCS.

G. The UPS shall be Liebert GXT4 with IS-Unity communications card or approved equal.

2.6 SHOP PAINTING

A. Powdered epoxy resin coatings applied in the shop shall protect all ferrous metal surfaces. Surfaces that will be inaccessible after assembly shall be hot-dip galvanized and flood coated with 2-part epoxy paint. All surfaces shall be cleaned and prepared in the shop prior to painting / coating. All mill scale, rust, lubricants, and other coatings shall be removed. Exposed surfaces shall be finished smooth, thoroughly cleaned, and filled as necessary to provide a smooth, uniform base for painting. All surfaces shall be treated with primer to resist rust and to form a bond between the metal and the paint.

B. As an alternative to powder coating, PCM and RIO enclosures shall be given one or more coats of rust-inhibiting primer and two coats of high-grade oil-resistant enamel, lacquer, epoxy or polyurethane finish both inside and out. Paint films that show sags, checks, blisters, teardrops, or fat edges will not be acceptable. Any such defects shall be repaired by the DCSP prior to shipping.

C. The DCSP shall include touch-up paint and primer with the equipment he is furnishing that shall be of the same type and color as the factory-applied finish paint and primer. One quart of finish color shall be furnished for future touch-up. Complete application instructions shall be furnished. The paint and instructions shall be boxed or crated to prevent damage and shall be clearly labeled.

D. The exterior finish colors of the enclosures shall be the DCSP's standard colors. Interior color shall be white. Where stainless steel enclosures are used, powder coating or painting is not required.

E. Where area classification dictates, or at the option of the DCSP all cabinets may be provided in 316 stainless steel as opposed to painting and epoxy coating.

2.7 WIRING REQUIREMENTS

A. General: The cabinets shall be provided with top or bottom terminal box connections for the main power supply entry. Each electronic component shall be equipped with a separate switch or disconnect means. Signal and low voltage wiring shall be run separately from power and 120-volt control wiring. Intrinsically safe wiring shall be run separately from non-intrinsically safe wiring.

B. Power Supplies: Low voltage DC power supplies shall be supplied. Low voltage direct-current power supplies for bulk instrumentation power shall be convection- cooled switching type. Line regulation shall be 0.4 percent for input line variations from 105 to 132 VAC, and load regulation shall be 0.4 percent for load variations from 0 to full load. Ripple and noise shall not exceed 100 mV peak-to-peak. Hold-up time at maximum load shall not be less than 16 milliseconds. Efficiency shall be better than 70 percent. Power supply shall be designed for continuous duty at full rated capacity operating in ambient temperatures from 0 to 50 degrees C. In addition, power supplies shall be sized so that they do not exceed 60 percent of their rated capacity, when operating under the full calculated electrical load of the connected control system equipment. Output shall be electronically current limited, and overvoltage shutdown shall be provided. Power supply output voltages shall be rated as required and adjustable plus or minus 5 percent.

C. Provide UPS power to all control cabinets to supply all DCS components and instrumentation, via Uninterruptible Power System provided by the DCSP and installed by others as part of Division 26.

D. Cabinet Power Supply: The cabinet power supplies shall be provided from two independent sources, UPS and utility power. These shall be distributed separately within the cabinet to provide the sources of power as described herein.

E. Interposing Relays: Interposing relays (IR) shall be 115-volt AC or 24-volt DC coils and have a minimum of 10-amp rated contacts and be suitable for the application. Mounting dimensions and drilling for AC and DC relays shall be identical. Relays shall be Phoenix Contact or equal.

F. Surge Protectors: Surge protectors shall be nominal 120 volts AC with a nominal clamping voltage of 200 volts. Surge protectors shall be non-faulting and un- interrupting design with a response time of not more than 5 nanoseconds. Surge protectors shall be as manufactured by Islatrol or L.E.A. Dynatech or equal.

G. Enclosure Lights and Receptacles: Enclosures shall be internally lighted by LED lamps, provided with guards and a door activated switch. One duplex GFCI, grounded twist lock type receptacle shall, also, be provided in each Cabinet enclosure section. The lights and receptacles shall be wired to outgoing terminal blocks for normal (utility, non-UPS) 120v -60Hz, single phase utility power supply. Power branch circuits will be installed by others under Division 26.

H. Limit Switches: Switches mounted on all Cabinet enclosure doors for intrusion detection and light activation, shall be proximity type and shall be self-contained, side or end sensitive as required. Output shall be a closed contact with no intrusion (supervised). Switches shall be Square D, Class 9007 Type C or Allen-Bradley 802T Series, or equal.

I. Terminal Blocks:
   1. Quantity:
      a. For external connections
      b. Wire spare or unused cabinet mounted elements to their cabinets' terminal blocks.
   2. General: Group to keep 120V ac circuits separate from 24V dc circuits.
      a. Connection Type: Screw connection clamp.
      b. Compression Clamp:
         1) Hardened steel clamp with transversal grooves penetrating wire strands providing a vibration-proof connection
         2) Guides strands of wire into terminal
      c. Screws: Hardened steel, captive and self-locking.
      d. Current Bar: Copper or treated brass.
      e. Insulation:
         1) Thermoplastic rated for minus 55 to plus 110 degrees C.
         2) Two funnel shaped inputs to facilitate wire entry.
      f. Mounting:
         1) Rail.
         2) Terminal block can be extracted from an assembly without displacing adjacent blocks.
         3) End Stops: One at each end of rail, minimum.
      g. Wire Preparation: Stripping only.
      h. Jumpers: Allow jumper installation without loss of space on terminal or rail.

i. Marking System:
    1) Terminal number shown on both sides of terminal block
    2) Allow use of preprinted and field marked tags
    3) Terminal strip numbers shown on end stops
j. Mark terminal block and terminal strip numbers as required

3. Terminal Block, 120-Volt Power:
    a. Rated Voltage: 600V ac
    b. Rated Current: 30 amp
    c. Wire Size: 22-10 AWG
    d. Rated Wire Size: 10 AWG
    e. Color: Gray body
    f. Spacing: 0.25 inch, maximum
    g. Manufacturer and Product: Entrelec; Type M4/6 or approved equal.
4. Terminal Block, Ground:
    a. Wire Size: 22-12 AWG.
    b. Rated Wire Size: 12 AWG
    c. Color: Green and yellow body
    d. Spacing: 0.25 inch, maximum
    e. Grounding: Ground terminal blocks electrically grounded to the mounting rail
    f. Manufacturer and Product: Entrelec; Type M4/6.P or approved equal.
5. Terminal Block, Blade Disconnect Switch:
    a. Use: Provide one for each discrete input and output field interface wire.
    b. Rated Voltage: 600V ac
    c. Rated Current: 10 amp
    d. Wire Size: 22-12 AWG
    e. Rated Wire Size: 12 AWG
    f. Color: Gray body, orange switch
    g. Spacing: 0.25 inch, maximum
    h. Manufacturer and Product: Entrelec; Type M4/6.SN or approved equal by Allen Bradley or Phoenix Contact
6. Terminal Block, Fused, 24V dc:
    a. Rated Voltage: 600V dc
    b. Rated Current: 6.3 amp
    c. Wire Size: 22-12 AWG
    d. Rated Wire Size: 12 AWG
    e. Color: Gray body
    f. Fuse: 5 by 20 GMA fuses
    g. Fuse Marking: Fuse amperage rating shown on top of terminal block
    h. Indication: LED diode 24V dc
    i. Leakage Current: 5.2 mA, maximum

j. Spacing: 0.32 inch, maximum
k. Manufacturer and Product: Entrelec; Type M4/6.SFD
l. Terminal Block, Fused, 120V ac:
m. Rated Voltage: 600 V ac
n. Rated Current: 6.3 amp
o. Wire Size: 22-12 AWG
p. Rated Wire Size: 12 AWG
q. Color: Gray body
r. Fuse: 5 by 20 GMA fuses
s. Fuse Marking: Fuse amperage rating shown on top of terminal block
t. Indication: Neon lamp 110V ac
u. Leakage Current: 1.8 mA, maximum
v. Spacing: 0.32 inch, maximum
w. Manufacturer and Product: Entrelec; Type M4/6.SFL or approved equal by Allen Bradley of Phoenix Contact.

J. Grounding: Internal copper grounding bus for ground connections on cabinets, consoles, racks, and cabinets. Cabinet grounding shall be as required under Section 40 95 15 – DCS Equipment Grounding.

K. Intrinsic Safety Barriers:
1. Intrinsically Safe Relays:
a. Monitor discrete signals that originate in hazardous area and are used in a safe area.
b. Manufacturer and Product: MTL, Inc.; Series MTL 2000. Or approved equal.
2. Intrinsically Safe Barriers:
a. Interface analog signals as they pass from hazardous area to safe area.
b. Manufacturer and Product: MTL, Inc.; Series MTL 6000. Or approved equal.

2.8 NAMEPLATES

A. Nameplates shall be provided for all I/O, PCM, RIO and miscellaneous DCS racks, and shall include function titles for each group of components mounted within the enclosures. A nameplate with identifying tag numbers coded to City's DCS numbering system shall be provided for each signal isolator, electronic trip, and other components mounted inside the enclosure(s). The nameplates shall be descriptive to define the equipment number, function, and system of each element. All nameplates shall be engraved phenolic, black-on white labels. Adhesive labels are not acceptable. The DCSP shall be select lettering, style, and sizes for approval by City's representative. Unless otherwise noted, mount all labels with stainless steel

screws, nuts, bolts, etc. Before being produced the DCSP shall submit a list indicating the wording and tag numbers of all equipment identification name plates to City's representative for approval in accordance with Specification 01300, Submittals.

PART 3 -- EXECUTION

3.1 PACKAGING FOR SHIPMENT/STORAGE

A. Enclose copies of the cabinet layout, wiring diagrams and installation detail documentation within manila envelopes and secure inside of each cabinet in a door pocket made for this purpose.

B. During the construction period, periodically provide and replace cabinetry and air conditioning filters. Replace the filters just prior to City's representative's final acceptance of the equipment.

C. During the construction period, provide and replace blown cabinet fuses.

3.2 INSTALLATION

A. DCSP shall perform a complete Factory Acceptance Test (FAT) in accordance with these Specifications for all cabinet configurations in accordance with the Specifications. FAT shall be executed at the approved staging area and witnessed by the City Representative.

B. DCSP shall provide jobsite delivery of enclosures in accordance with the requirements of these Contract documents.

C. During the installation of DCS cabinets it shall be the responsibility of the DCSP to provide personnel to oversee proper installation of all DCS cabinetry, grounding, peripherals and systems components, in addition to termination of I/O wiring, all of which is executed by others under Division 26.

D. The DCSP shall furnish the services of factory trained engineer(s) to check the completed installation and to perform all Loop Testing jointly with others, functional testing and make all necessary adjustments for satisfactory operation of the DCS.

E. All work, including installation oversight, calibration, testing, adjustment, start-up and maintenance, shall be done by qualified experienced personnel who are technically skilled in their trade, are thoroughly instructed, and are competently supervised.

END SECTION

SECTION 40 95 15
DCS EQUIPMENT GROUNDING

PART 1 GENERAL

1.1 THE REQUIREMENT

A. The Contractor shall furnish all tools, equipment, materials, consumables and supplies and shall perform all labor required to complete the WORK to fulfill the intent of the requirements outlined in the Specifications and Drawings. The purpose of this section is to ensure proper grounding for all DCS equipment and peripherals, supplied under this contract, for integration into the City of San Diego Enterprise Distributed Control System (DCS), COMNET.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. The work of the following Divisions and Sections applies to the work of this Section. Other Division and Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this work.

1. Section 01 33 00, Submittal Procedures.
2. Division 26, Electrical, applicable sections.
3. Section 40 94 00, Distributed Control System General Requirements.

B. Materials, equipment and devices furnished and installed under this Contract including raceway and electrical conductors furnished, installed, and connected shall be a specified under Division 16, Electrical.

1.3 REFERENCED SPECIFICATIONS, CODES AND STANDARDS

A. All work specified herein shall conform to or exceed the applicable requirements of the referenced portions of the following publications to the extent that the provisions thereof are not in conflict with other provisions of these specifications.

B. Comply with the current provisions of the following Codes and Standards.

1. Codes and Standards:
   a. All applicable City of San Diego Electrical Code, latest adopted edition.
   b. California Code of Regulations Title 8, Industrial Relations, Subchapter 5, Electrical Safety Orders.
   c. NECA.
   d. NFPA 70.
2. Commercial Standards:

a. ANSI/IEEE 80 Guide for Safety in AC Grounding.
b. ANSI/UL 467 Safety Standard for Grounding and Bonding Equipment.
c. IEEE 142 Grounding of Industrial and Commercial Power Systems.
d. ANSI/IEEE Standard 1100 (“Emerald Book”), IEEE Recommended Practices for Powering and Grounding Sensitive Electrical Equipment.
e. TIA J-STD-607-A Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications.
f. NEC and NFPA 70 (latest adopted versions).

C. All equipment furnished by the Contractor shall be listed by and shall bear the label of UL or of an independent testing laboratory acceptable to the City of San Diego.

D. The construction and installation of all electrical equipment and materials shall comply with all applicable provisions of the CAL OSHA Safety orders. (Title 8 CCR, as applicable), State Building Standards, and applicable local codes and regulations.

1.4 CONTRACTOR SUBMITTALS

A. Submittals shall be made in accordance with Section 40 94 00, Distributed Control System General Requirements.

B. Submittals shall also conform to the requirements of Sections on ‘Electrical Tests’, ‘Conductors’ and additional requirements specified herein. Submittals shall be made for, but not be limited to, the following:

1. Catalog literature for all products.
2. Ground Testing Plan and Procedures.
3. Certified copies of Ground Test results.
4. Field test procedures including lists of test equipment to be used.
5. Calibration certifications for all field test equipment. Certification shall be current within 180 days of testing.

1.5 QUALITY ASSURANCE

A. Quality assurance shall be in accordance with the requirements of Section on ‘Electrical General Provisions’ and ‘Electrical Tests’.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 GENERAL

A. The grounding plan drawings are diagrammatic and may not show all required grounding connections. The Contractor shall ground all DCS Controller, Remote I/O and 'B' Cabinet enclosures, whether or not the required grounding connections are shown on drawings, to complete the grounding system.

B. Except where specifically indicated otherwise, ground all exposed noncurrent-carrying metallic parts of DCS equipment, DCS raceway systems, and the A/C neutral of all DCS wiring systems in strict accordance with the state, and other applicable laws and regulations.

C. Ground connection to equipment and ground buses shall be by exothermically welded copper ground lugs.

3.2 COMPUTER OR TELECOMMUNICATIONS RACK OR FRAME GROUNDING

A. Rack framework grounding conductor: Each DCS equipment cabinet and equipment rack framework requires its own grounding connection to the grounding infrastructure. A minimum of a No. 6 AWG copper conductor shall be used for this purpose. The recommended conductor types are:

1. Bare copper.
2. Insulated green, UL VW1 flame rated.

B. Rack grounding connection point: Each DCS cabinet or rack shall have a suitable connection point to which the rack framework grounding conductor can be bonded. A dedicated rack ground bus, a 1-inch by 1/4-inch by rack width, copper ground bar or copper strip, shall be attached to the rack. A bond between the ground bar or strip and the rack shall exist. The mounting screws shall be of the thread-forming type, self-tapping or sheet metal screws are prohibited.

C. Bonding to the Rack:

1. When bonding the rack framework grounding conductors to the busbars on the cabinet or rack, two-hole irreversible compression lugs listed by a nationally recognized testing laboratory (NRTL) shall be used to insure that the ground connection does not become loose due to excessive vibration or movement of the attaching cable. Paint or other surface contact inhibitors should be removed before bonding straps are directly attached to metal enclosures or cabinet surfaces. Subsequently,

the connections should be properly treated to inhibit rust, corrosion, and moisture.

2. The connection to the rack should have the following characteristics:
   a. Bare metal-to-metal contact.
   b. Antioxidant recommended.

D. Bonding to the Grounding Infrastructure: Attach the opposite end of the rack framework or equipment grounding conductor (EGC) to the grounding infrastructure (CBN). The connection should use a compression type, through-bolt lug which is UL listed. All DCS equipment, should be connected to the signal reference grid busbar with low-inductance bonding straps or jumpers. Grounding straps should be as short as practicable to minimize inductive reactance in the path.

E. Rack Continuity: Every structural member of the cabinet or rack shall be grounded. This is achieved by assembling the cabinet or rack in such a way that there is electrical continuity throughout its structural members, as described below:

1. For Welded Racks: The welded construction serves as the method of bonding the structural members of the rack together.
2. Bolt Together Racks: Special consideration should be taken while assembling bolted racks. Removing paint at the point of contact with assembly hardware is an acceptable method of bonding. An alternate method is the use of two internal-external tooth lock washers: One under the bolt head contacting and cutting paint and one under the nut.
3. Even in equipment lineups where the cabinets are bolted together, bond each enclosure to the signal reference grid with its own strap.
4. All enclosure doors shall have independent ground straps which bridge the hinge point, providing grounding of the door to the main enclosure frame, or ground buss bar.

F. Grounding Equipment Chassis: All rack-mounted equipment shall be bonded and grounded via the chassis, in accordance with the manufacturer's instructions. The equipment chassis should be bonded to the rack using one of the following methods:

1. To meet the chassis grounding requirements; the manufacturer may supply a separate grounding hole or stud. This should be used with a conductor of proper size to handle any fault currents up to the limit of the circuit protection device feeding power to the equipment unit. One end of this chassis grounding conductor will be bonded to the chassis hole or stud, and the other end will be properly bonded to the cabinet copper ground bar or strip.
2. If the equipment manufacturer suggests grounding via the chassis mounting flanges and the mounting flanges are not painted, the use of

thread-forming tri-lobular screws and normal washers will provide an acceptable bond to the rack.

3. If the equipment mounting flanges are painted, the paint can be removed, or the use of the same thread-forming screws and aggressive internal-external tooth lock washers, designed for this application, will supply an acceptable bond to safety ground through the rack.
4. Assuming adequate grounding, solely through the equipment AC (alternating current) power cables containing a ground wire, is not allowed.

G. Electrostatic Discharge Wrist Straps: The use of static discharge wrist straps when working on or installing network or computer hardware is specified in most manufacturers' installation guidelines. Wrist strap ports shall be provided at each DCS enclosure and shall be permanently attached to the rack grounding busbar by a means that ensures electrical continuity to ground.

3.3 FIELD TESTS

A. Perform all field tests in accordance with Section on 'Electrical Tests'.

B. DCS Grounding:

1. Ground resistance testing shall be performed by an independent testing laboratory.
2. Measurement of ground resistance shall be in accordance with IEEE Standard 81.
3. Measurements of all grounding electrodes shall not exceed 25 ohms per Section 250.56 of the NEC. Resistance testing shall take place after installation but before connecting the earth grounding electrode to the remaining grounding system, but at no other time. The ground resistance tests shall be conducted with a fall-of-potential method instrument.
4. Verify that the impedance level of the EGC (equipment grounding conductor) does not exceed the values per Table 1 below based on the amperage rating of the over-current device for the feeder or branch circuit.
5. An "open ground" indication reveals no EGC connection. A high-impedance measurement indicates poor-quality connections in the equipment grounding system or an improperly installed EGC and must be repaired and retested by the Contractor at no extra cost.

Table 1

Overcurrent Device Rating (A)	Circuit Voltage to Ground	
	120 V	220/240/277 V
10	1.6	-----

15	1.0	1.0
20	0.8	0.7
25	0.6	0.6
30	0.5	0.5
40	0.4	0.3
60	0.10	0.10
100	0.10	0.07
125	0.06	-----
150	0.05	-----
200	0.04	-----

6. The Contractor shall verify that the ground reading through the ground bond conductor from the rack or enclosure, to the independent tri-ground system, or alternately to the UFER ground grid, is 1 ohm or less. Testing shall be provided by an independent ground testing agency in accordance with a City approved Ground Testing Plan. Failure to achieve proper signal grounding, shall require the Contractor to add additional tri-ground systems and larger bonding conductors, and retest to acceptable levels.
    a. At the conclusion of Ground Testing the Contractor shall submit copies of the certified testing report in accordance with Section 01 33 00, Submittal Procedures.

END OF SECTION

SECTION 40 95 33
DISTRIBUTED CONTROL NETWORK

PART 1 – GENERAL

1.1 NAMED TYPES:

A. DCS Network consists of DCSLAN (Facility Information Network (FIN), Process Information Network (PIN)), and DCSWAN (District Information Network (DIN)).

B. Remote Network is a network other than a DCS Network. A DCS Network shall not be directly connected to a Remote Network.

C. DCSLAN: Consists of two elements, FIN and PIN.

1. FIN – Fiber network connecting root switches to fanout switches
2. PIN – Cat 6 cabling between fanout switches and DCS drops.

D. DCSWAN: Inter-plant Wide Area Network (provided by the City COMNET group (DIN)).

E. Business Network Ethernet TCP/IP Communication Network (provided by City), which is also a Remote Network.

F. City Intranet is a Remote Network.

G. Internet is a Remote Network.

H. Wireless Networks are defined as Remote Networks.

1.2 RELATED SECTIONS

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego.

1.3 REQUIREMENT

A. The DCSP shall interface all DCS components to the DCS LAN at Project plant, which is designed by the Design Engineer and installed by others, under Division 26.

B. The assumptions made for the WORK involved in the section includes:
   1. Each DCSLAN communications network shall be capable of 1 Gbit/sec Ethernet communication system linking all DCS stations.
   2. DCSP shall coordinate with City for IP address assignments.
   3. Cabling shall be provided, installed and tested as specified.
   4. All inter-facility interface cabling shall be fiber optic.

1.4 NAMED TYPES

A. DCS Network consists of DCSLAN and DCSWAN

B. Remote Network is a network other than a DCS Network. A DCS Network shall not be directly connected to a Remote Network.

C. DCSLAN: Intra-plant (facility) Local Area Network (LAN), one at each of the plant facilities.

D. DCSWAN: Inter-plant Wide Area Network (provided by the City COMNET group)

E. Business Network Ethernet TCP/IP Communication Network (provided by City), which is also a Remote Network.

F. City Intranet is a Remote Network.

G. Internet is a Remote Network.

H. Wireless Networks are defined as Remote Networks.

1.5 OTHER NETWORK RELATED SECTIONS

A. Other information regarding the requirements for communication networks can be found in Section 40 95 34 , Fiber Optics.

1.6 SUBMITTALS

A. The DCSP shall submit six (6) hard copies and one (1) soft copy (CD/DVD) of detailed proposed final LAN design diagrams detailing network components, hardware, interfaces, etc. in accordance with Section 01 33 00, Submittal Procedures

B. Based on the Design Engineers Network design, the DCSP shall develop and submit six (6) hard copies and one (1) soft copy (CD/DVD) of a Link Budget Evaluation that calculates the total loss suffered by a transmitted signal across the various components and fiber channels with reference to the minimum receiver power required to maintain normal operation. The purpose of this submittal is to verify adequacy of network design and memorialize the expected signal budgets. The link budget for all point-to-point transmissions shall include the following parameters:
   1. The minimum transmit power guaranteed (minTx), expressed in dBm.
   2. The minimum receive power required (minRx), expressed in dBm.
   3. The loss of optical connectors and adapters (L), expressed in dBm.
   4. The number of connectors and adapters (n).
   5. The normalized fiber loss (FL), expressed in dB/km.
   6. The reach or distance to be achieved (d), expressed in km.
   7. The link budget and loss shall be calculated as follows:
      a. Link Budget in dB (LB) = (minTx)-(minRx).
      b. The total loss (TL) suffered by the transmitted signal along the given link, in dB: (TL) = n*(L) +d*(FL).
      c. Any amplifier gain or dispersion unit loss shall be taken into account in the calculations.

1.7 CODES AND REGULATORY REQUIREMENTS

A. Each communication network has been designed around the International Standards Organization's Open System Interconnection (OSI) model, IEEE 802.3 industry standards and support a hierarchical communications network.

B. All Work shall comply with:
   1. ISO/IEC 11801:2000
   2. ISO/IEC 15802-3:1998
   3. ISO/IEC 17799:2005
   4. ANSI/EIA/TIA-568-B.

1.8 DEFINITIONS

A. Definitions of acronyms are identified in Section 40 90 05, Definitions.

PART 2 – PRODUCTS

2.1 NETWORK ELEMENTS

A. All network elements shall consist of routers and switches, provided by the DCSP from a single Vendor.

B. Network Elements shall be compliant with industrial standards for network managed network elements in harsh environments. This includes the following characteristics:

1. Tolerance to high EMI/RFI.
2. Tolerance to temperature ranges from 0 degrees to 50 degrees C.
3. Tolerance to 95 percent relative humidity, non-condensing.
4. Tolerance to electrical power voltage variations.
5. Tolerance to vibration and physical shock.
6. Supports DIN rail mounting or rack mounting.
7. Powered by 24 V DC.
8. Network Elements shall support security features such as Authentication, Authorization, and Auditing. Security shall include password protection and Access Control Lists. Network Elements shall be capable of port disabling.
9. Network Elements shall support a browser based administration. Network administrators shall be able to log in to the network elements and provision the network elements.

2.2 FIBER OPTIC PATCH PANELS

A. Fiber Optic Patch Panels shall be provided by the DCSP, wall or rack mountable and designed to provide termination facilities for 24 fibers, see Section 40 95 34 for details. Fiber optic patch panels used shall match the existing Enterprise wide DCS installations wherever possible. Existing patch panels are the products of AT&T and Corning or approved equal.

2.3 NETWORK SWITCHES AND ROUTERS

A. The DCSP shall use industrial network switches and routers from Cisco and the DCSP shall guarantee the performance based on its choice of switch or router model. If possible the switches and routers selected shall match that of the existing Enterprise DCS, or shall be of a family that is a successor to the switches originally used. Switches and routers shall be fully backwards compatible with the existing network and network hardware.

B. All switches and routers shall have an IP address on the network. IP addressing scheme will be provided by City COMNET Group to the DCSP, at time of network setup.

C. All switches and routers shall provide built-in support for SNMP

D. All fanout switches shall support fiber links to the root switches via SFP hardware.

E. Multicast traffic shall be allowed on all switches on the DCSLAN

F. Port status shall be visible on LEDs

G. External media converters shall not be used between root and fanout switches.

PART 3 – EXECUTION

3.1 DCSLAN

A. The Design Engineer has designed each DCSLAN for each plant process segment to support the performance requirements and operating characteristics of the DCS. However, it is the responsibility of the DCSP to verify functionality of the DCSLAN and shall immediately notify the Prime Contractor and the City's representative of all operational problems found on the DCSLAN.

B. The DCSLAN shall consist of a dual redundant communications network at each facility.

C. The DCSLAN shall facilitate communications between devices using fiber optic and CAT 6 cables.

D. Each networked DCS device shall be dual ported onto the DCSLAN.

E. The DCSLAN, in its installed configuration shall be fault tolerant.

F. The DCSLAN provides connectivity between the WSs, PCMs, RIOs and Facility Historian System (FHS) to enable the timely update and archiving of process information and timely control response.
   1. To provide support of FHS, the DCSP will provide exterior- mounted Data Jacks on each PCM and RIO cabinet, as a minimum, as specified elsewhere in these Documents. Based on process functionality, or safety considerations, the Design Engineer may have added additional Data Jacks to support FHS, which are shown on the Drawings.
   2. Each Data Jack will be wired back to the nearest port on the appropriate data highway/LAN network switch. Cat-6 LAN cabling shall be provided and installed by others, under Division 26.

G. The DCSLAN designs, and associated documentation, provide the configuration and equipment inventory requirements of a fully dual redundant Ethernet network for all process segments, which shall operate independently of the other plants LANs.

H. VLANs shall conform to standard IEEE 802.1Q.

I. VLAN designs segment traffic onto the appropriate VLAN. VLANs are independent from each other, in particular with regards to bandwidth control and

segmentation. Typical traffic segmentation strategies include defining VLANs and traffic priority schemes. Other VLANs and network traffic prioritization schemes can be defined for administration traffic and operational traffic. Operational traffic may be further subdivided into file transfer traffic (backups) and non-file transfer traffic. Non-FTP traffic shall include VLANS to support applications such as trouble ticket, work management, and other operational applications. Network Design shall provide traffic segmentation and prioritization capabilities to support work cells, where required by specifications.

J. Classic DMZ Network Design utilizes firewalls to isolate the DCS network from the Remote Networks.

K. Network Design shall use standard Cat 6 cables or fiber optic cables for links between Network Elements as specified in the TIA/EIA 568-B set of standards. Cat 6 and fiber optic link cables are provided and installed by others, under Division 26

L. All network devices shall be included in the sizing calculations of the UPS systems. All network devices shall be powered and backed up by DCSP supplied UPS systems provided under Division 40, and installed by others in Division 26.

M. Laminated plastic nameplates conforming to standard ASTM D 709 shall be provided for all network hardware. Nameplates shall include the function, network address, and identifier (ISA Tag) of the device.

N. PCM Data Highway Performance:
   1. Networks are designed with due consideration for quality of services (QoS), bandwidth, latency, and high performance within a plant automation application.
   2. LAN networks shall be robust, scalable, secure, and manageable; and must provide high availability (24x7x365) for single points of failure.
   3. Communication speed shall be capable of 1GB on all ports
   4. Operating Length: 6,000 feet, minimum.
   5. Stations Supported per Highway: 256, minimum.
   6. Time Synchronization interval shall be every 1 minute, minimum, using multicast messaging.

O. Redundancy and Reliability:
   1. The network design supports a network topology design that is fault tolerant. Fault tolerance shall be defined as 99.999 percent system uptime of critical network equipment consisting of the network backbone and associated servers.
   2. The design is to ensure continuing communications between servers and workstation (WSs) under any of the following conditions:
      a. A port on a network adapter fails
      b. A network cable fails

c. A port on a switch fails
d. A switch fails

3. Communications system are fully redundant; no single failure of communications component results in loss of communications to any DCS station.
4. Redundant Components: Including, but not limited to, communications controllers, modems, power supplies, data highway cables, and cable connectors.
5. The DCSLAN design shall incorporate automatic detection of communications system component failure.
6. The DCSLAN design shall incorporate automatic switchover from failed communications system component to backup component without any interruptions to normal operations.
7. The DCSLAN shall alarm switchover and identify the failed component in alarm message to the NMS.
8. Communication system shall not be affected by connection, disconnection, and failure of DCS distributed processing stations (PCMs).

P. Network Elements Performance Requirements:

1. Network Elements shall be able to monitor and alarm for network performance.
2. Excessive loss of packets and elevated network congestion issues shall be alarmed via standard network administration protocols such as SNMP. Network congestion, loss of packets, CRC errors, collisions, IGMP Snooping, defective frames, and the number of packets sent/received and other Quality of Service (QOS) levels shall be defined for various traffic types.

3.2 DCSWAN

A. The DCSWAN shall be provided by the City COMNET Group.

3.3 INDIVIDUAL FACILITIES

A. Treatment Plant Communications

1. The new design includes all process segments of the Plant on one physical LAN.
2. Fiber optic cables in support of the LANs are routed in separate new conduits, raceways or duct banks.
3. Redundant paths are provided in separate conduit so as to provide no single point of network failure in the event of a cable strike, or failure.

END OF SECTION

SECTION 40 95 34
FIBER OPTICS AND INSTALLATION

PART 1 GENERAL

1.1 WORK IN THIS SECTION

A. The Work of the following Divisions and Sections applies to the Work of this Section. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Fiber optic cable shall consist of optical fibers, strength members, and jacketing. Associated components shall include optical fiber connectors, optical patch panels, terminal bay cabinets, and splice closures as indicated. Fiber optic cables shall be installed exclusively in inner duct. The Fiber Optic CONTRACTOR (FC) shall install the fiber optic cabling in new, or existing, raceways, concrete-encased duct-banks, conduits, manhole systems in strict accordance with drawings, notes and other specification sections where applicable. Where new raceway is required within structures to support fiber optic cables, those conduits shall be either EMT, GRC or PVC coated GRC, as appropriate for the process area and as specified in Division 26. Fiber optic Termination Panels and Patch panels shall be located in existing or new facility buildings in strict accordance with drawings, notes and other specification sections where applicable.

C. References in this section to 'cable' shall refer to fiber optic cable.

D. FC shall provide LC connectors unless otherwise specified.

1.2 SCOPE

A. The intent of this Specification is that the Fiber Optic CONTRACTOR (FC) will provide a complete and operational, turn-key Fiber Optic based Backbone network, capable of supporting GigaBit plus communications in support of the specified DCS systems at each facility, and locations as shown on drawings.

B. The FC shall furnish all materials, tools, equipment, consumables and supplies and shall perform all labor required to complete the work in this Specification.

C. The FC shall integrate the fiber optic backbone network, with each existing or new facility DCS LAN and WAN, Wide Area Network, Firewalls, Switches and Routers, as shown on drawings and as directed by City COMNET network support staff.

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. ASTM INTERNATIONAL (ASTM)
1. ASTM C 338 (1993; R 2003), Standard Test Method Softening Point of Glass.
2. ASTM D 4976 (2004a) Standard Specification for Polyethylene Plastics Molding and Extrusion Materials.

B. Building Industry Consulting Service International (BISCI)
1. Telecommunications Distribution Methods Manual.
2. Cabling Installation Manual.

C. ELECTRONIC INDUSTRIES ALLIANCE (EIA)
1. EIA 455-168A (1992) FOTP-168 Chromatic Dispersion Measurement of Multimode Graded-Index and Single-Mode Optical Fibers by Spectral Group Delay Measurement in the Time Domain
2. EIA 455-169A (2001) FOTP-169 Chromatic Dispersion Measurement of Optical Fibers by the Phase-Shift Method
3. EIA 455-25C (1996) FOTP-25 Repeated Impact Testing of Single-Mode Fiber Optic Cables and Cable Assemblies
4. EIA 455-30B (1991) Frequency Domain Measurement of Multitude Optical Fiber Information Transmission Capacity
5. EIA 455-33A (1988) FOTP-33 Fiber Optic Cable Tensile Loading and Bending Test
6. EIA 455-41 (1993) FOTP-41 Compressive Loading Resistance of Fiber Optic Cables
7. EIA 455-46A (1990) FOTP-46 Spectral Attenuation Measurement for Long-Length, Graded-Index Optical Fibers
8. EIA 455-47B (1992) FOTP-47 Output For Field Radiation Pattern Measurement
9. EIA 455-51A (2001) FOTP-51 Pulse Distortion Measurement of Multi-mode Glass Optical Fiber Information Transmission Capacity
10. EIA 455-53A (2001) FOTP-53 Attenuation by Substitution Measurement for Multimode Graded-Index Optical Fibers or Fiber Assemblies Used in Long Length Communications Systems
11. EIA 455-80B (1996) FOTP-80 Cutoff Wavelength of Un-cabled Single-Mode Fiber by Transmitted Power
12. EIA 455-81B (2000) FOTP-81 Compound Flow (Drip) Test for Filled Fiber Optic Cable

13. EIA 455-82B (1991) FOTP-82 Fluid Penetration Test for Fluid-Blocked Fiber Optic Cable

D. TELECOMMUNICATIONS INDUSTRIES ASSOCIATION (TIA)
1. EIA/TIA 455-165A (1993) Standard for Mode-Field Diameter Measurement by Near-Field Scanning Technique
2. TIA 455-104A (1993, R 2005) Standard for Fiber Optic Cable Cyclic Flexing Test
3. TIA 455-78B (2002) Optical Fibers - Part 1-40: Measurement Methods and Text Procedures – Attenuation
4. TIA/EIA 492 AAAA
5. TIA/EIA 492 CAAB
6. ANSI/TIA/EIA-526-7 Optical Power Loss Measurements of Installed Single-mode Fiber Cable Plant.
7. ANSI/TIA/EIA-526-14-A, Optical Power Loss Measurements of Installed Multimode Fiber Cable Plant.
8. ANSI/TIA/EIA-568 Commercial Building Telecommunications Cabling Standard
9. TIA/EIA-568-B.2, Transmission performance specification for 4 pair 100 Ohm Category 6 cabling
10. ANSI/TIA/EIA-569-A Commercial Building Standard for Telecommunications Pathways and Spaces
11. ANSI/TIA 569-B Commercial Building Standard for Telecommunications Pathways and Spaces
12. ANSI/TIA/EIA-606 The Administration Standards for the Telecommunications Infrastructure of Commercial Building
13. ANSI/TIA/EIA-607 Commercial Building Grounding and Bonding Requirements for Telecommunications
14. ANSI/TIA/EIA-TSB-67 Telecommunications System Bulletin Technical Systems Bulletin, Transmission Performance Specifications for Field Testing of Unshielded Twisted Pair Cabling Systems.

E. ISO: ISO/IEC 11801 (2002) Information Technology – General Cabling for Customer Premises.

F. ITU: ITU-T G.652 Characteristics of single-mode optical fiber and cable

G. IEC: IEC 60793-2-50 Type B1.3.

H. NATIONAL FIRE PROTECTION ASSOCIATION: NFPA-70, National Electric Code.

I. UNDERWRITERS LABORATORY: All Fiber Optic Cable and equipment furnished by the FC in this Section shall be listed by and shall bear the label of Underwriters' Laboratories, Incorporated, (UL) or of an independent testing laboratory acceptable to the City of San Diego (City).

1.4 SUBMITTALS

A. General
1. All submittals shall be provided in accordance with Specification 01 33 00 – Submittal Procedures, as a minimum, and in accordance with specialty submittal requirement below.
2. All submittal of this section shall be provided with six (6) hard copy and one (1) soft copy [USB storage device]

B. Informational Submittals:
1. Preconstruction Submittals: The following preconstruction submittals shall be submitted to the City's representative for approval and approved prior to installation of any fiber optic cable:
   a. Qualifications of personnel working with fiber optic cable
   b. Quality Assurance Plan
      1) Pre-Installation Test Plan, Fiber Optic Cabling
      2) Post-Installation Test Plan, Fiber Optic Cabling
      3) Primavera P6 Fiber Optic Cable Master Installation Schedule, inclusive of all work related to this Specification Section
2. Product Data: The following Product submittals shall be submitted to the City's representative for approval and approved prior to issuing any Purchase Orders for all applicable Fiber Optic Products. Data shall include a complete list (Bill of Material – BOM) of all material, parts, special tools, consumables and supplies, each with current unit prices, source of supply, and vendors contact information, including telephone numbers. Manufacturer's product data shall be submitted for the following items:
   a. Fiber Optic Cable
   b. Splice Organizers
   c. Pre-Connected Cable Assembly
   d. Fiber Optic Terminal Cabinets
   e. Optical Patch Panel Assemblies
   f. Fiber Optic Line/Patch Cables
   g. Inner Duct
   h. Cable Supports and Management Systems
   i. Cable Trays/Ladder Rack
   j. Fire stopping Material

C. Action Submittals:

1. Test Reports: FC shall submit test reports for approval, to the City's representative, not later than 14 calendar days after the completion of each test. Test Reports shall be submitted as follows:
    a. Factory Test Certificates.
    b. Fiber Optic Cable Bi-Directional, Optical Time Domain Reflectometer (OTDR) pre-installation tests, "on-reel" on site. No cable installation shall occur until the "on-reel" test report has been submitted and approved by City representative.
    c. Fiber Optic Cable Bi-Directional, Optical Time Domain Reflectometer (OTDR) post-installation tests, Installed and terminated.
    d. Unidirectional End-to-End Attenuation Tests.
    e. Unidirectional End-to-End Bandwidth Tests.
        1) The OTDR, Attenuation and Bandwidth 'tests' result information for each link shall be recorded in the memory of the field-test instrument upon completion of the test, and immediately transferred to CD/DVD in the presence of the City representative, to provide non-volatile backup. The CD/DVC shall be transmitted to the City representative immediately upon completion of daily testing.
        2) The test result records saved within the field-test instrument shall be transferred into a Windows™-based database utility that allows for the maintenance, inspection and archiving of these test records.
        3) These results shall be transferred to the PC or laptop unaltered, i.e., "as saved by the tester" at the end of each test. The popular 'csv' format (comma separated value format) does not provide adequate protection and shall not be acceptable. The database for the completed job shall be stored and delivered to the City representative on CD/DVD; this CD/DVD shall include the software tools, complete with applicable licenses, required to view, inspect, and print any selection of test reports.
2. Pulling Plan: The FC shall submit a proposed Fiber Optic Cable Pulling Plan. The Pulling Plan shall be submitted for approval to the City's representative not later than 21 calendar days prior to the scheduled start of cable placement.
    a. The Pull Plan: Will identify all Fiber raceway segments to be pulled.
    b. Will identify the proposed methodology of placement for each segment.

c. Will show proposed ‘unique Reel Number Identifications’, ‘cable start and stop footage measurements’, Cable(s) ID number, as well as cable type and fiber count.
d. Will show calculated pulling tension for the segment and proposed methodology for measuring pulling tension in each segment.
e. State manufactures maximum allowed pulling tension for each segment.

1.5 QUALIFICATIONS

A. FC may place cable with his own forces or through a sub-contractor. However, all personnel installing inner-duct work, or cable shall be performed by personnel who have experience in placing fiber optic cabling in conduit, cable trays, and underground duct systems.

B. Fiber optic cable splices, terminations and testing shall be made by certified cable splicers who have had experience in fusion and in-line compression splicing and terminating fiber optic cables. Personnel working pursuant to this section, may, at the City representative option, be required to demonstrate technical competence by performing sample work and/or by displaying their state qualifications/certificates. FC personnel may be required, at no additional cost to the City, to provide sample work shall involving performing a minimum of 10 (ten) acceptable sample splices and 10 (ten) terminations, in the presence of the City representative.

1.6 QUALITY ASSURANCE PLAN

A. FC shall prepare a Quality Assurance Plan. The Plan shall include as a minimum:
1. Shall include a schedule of when tests will be performed relative to installation milestones, specific test procedure that will be used, a list of test equipment that will be used including manufacturer, model number, range, resolution accuracy and shall conform to the specified requirements.
2. List and show all test equipment Calibration certificates, valid within the last 180 calendar days.
3. Show detailed procedures defining methods to ensure compliance to contract drawings and specifications by drawing control, inspection and procurement records.
4. Show when and how each system will be tested, material testing procedures and certification records.
5. Shall address whether cladding modes have been stripped prior to testing, source wavelength (peak), spectral width full width/half maximum (FWHM), mode structure, fiber end preparation, and

bandwidth measurements of fiber links both greater and less than 1 kilometer.

B. Test plan shall be submitted and approved by the City representative in a timely fashion to the PMT, and 'Approved' at least 30 calendar days prior to the start of the Earliest Test Plan item.

1.7 STORAGE AND HANDLING

A. Care shall be exercised in handling materials during construction.

B. The FC shall be solely responsible for proper handling and storage of all fiber Optic cabling and Fiber Optic apparatus. The FC shall ensure that all Fiber Optic cable reels are ordered, received and stored with hard reel-shields in place. [Reels received without reel-shields may, at the sole discretion of the City, be required to be returned].

C. Fiber Optic cabling shall be stored in a clean, dry environment, approved by the City representative, until installation. Fiber Optic cable reels shall be stored with proper orientations such that large reels do not create a crush- weight on fiber.

D. Adequate care shall be exercised when handling and storing reels of cable to prevent damage to the cable. Cable with dents, flat spots, or other sheath distortions shall not be installed

E. Fiber Optic ancillary apparatus, such as connectors, splice cases, patch panels, terminal enclosures, etc. shall be stored indoors in a clean, dry environment at all times.

PART 2 PRODUCT

2.1 OPTICAL FIBERS

A. Named Types:

1. Single Mode Type: Single-Mode (SM) fiber must be the equivalent graded index optical glass. Core diameter of the fiber shall be approximately 8.7 (μm) micrometer. Cladding diameter shall be 125 (μm) plus or minus 3 micrometer (μm). Core cladding offset shall be less than 1 micrometer. Minimum tensile strength of the fiber after primary protective coating shall be greater than 350,000 kilopascal (50,000 psi). Softening point of the clad material of the optical fiber shall be 1630 degrees C plus or minus 50 degrees C in accordance with ASTM C 338, or the optical fiber shall meet the requirements in paragraph entitled,

"Splice Compatibility Test." Corning's SMF-28e+ Ultra Single-mode or equal.

2.

B. Fiber Primary Protective Coating: Optical fiber shall be coated with suitable material to preserve the intrinsic high tensile strength of the glass fiber. Outside diameter of the coated optical fiber shall be 250 plus or minus 15 micrometers. Coating material shall be readily removable, mechanically or chemically, without damaging the optical fibers when the removal is desired.

C. Optical Fiber Color-Code Coating: Primary protective coated SM and MM fibers shall be coated with a color-code coating for individual fiber identification. Maximum outside diameter of color-code coated fiber shall be less than 300 micrometers.

D. Colorants: Color concentrates or inks used to color code the optical fibers and the loose buffer tube shall not be susceptible to migration and chemical reaction with surrounding compounds.

2.2 FIBER OPTIC CABLE

A. Fiber Optic Cable specified under this section shall be provided and staged by the DCSP. However, the fiber optic cable shall be installed by the fiber optic subcontractor and that Work shall be performed under Division 26, inclusive of all fiber terminations, fiber optic pre-installation testing and fiber optic post installation testing. All testing to be witnessed by the City's representative and the DCSP.

B. Cable Length: Cable shall be manufactured continuous with no factory splices. FC, at his discretion, may use 'master-reels', or individual segment reels, as long as proper identification, handling and storage methods are utilized. All cable reels shall have factory-affixed reel identifiers.

C. Materials and Construction:
   1. Materials used within a given cable shall be compatible with all other materials used in the same cable when such materials come into intimate contact. All cable components used shall have no adverse effect on optical transmission or on the mechanical integrity characteristics of the fiber placed in the cable. All materials used shall be non-toxic, non- corrosive, and shall present no dermal hazard.
   2. Minimum required material components applied to fiber optic cable construction shall be central core member, color-coded optical fiber, color-coded loose tube design with:
      a. Gel-free water bloacking technology around loose tube, inner jacket, pulling strength members, and outer jacket.

b. In addition, variations in sequence and construction structural components will be considered when necessary.
c. The fiber shall be manufactured by the outside vapor deposition (OVD) process.

D. Central Core Member: A central core member shall be included to serve as a cable core foundation to reduce strain on the fibers but not to serve as a pulling strength member. Material of the central core member shall be non- metallic.

E. Named Types:
1. 24-fiber cable shall contain multi-mode (MM) or single mode (SM) fibers, as required and as shown on drawings, Type Corning ALTOS , or equal,.
2.

F. Loose Tube Buffering: Color-code coated fibers shall be surrounded with a loose tube buffering for protection from external mechanical and environmental influences. Loose tube buffering shall be color coded for the tube identification.

G. Inner Jacket: Buffer tubes shall be located concentrically around the cable central core member and covered with a polyethylene inner jacket. Polyethylene inner jacket shall be polyethylene in accordance with ASTM D 4976. Pulling Strength Member: Aramid type material shall be used as pulling strength members in the cable to provide pulling strength of at least 2700Newton (600 pounds) for the cable, during the installation process.

H. Cable Outer Jacket: Black, high-molecular weight, polyethylene materials in accordance with ASTM D 4976 shall be applied longitudinally over all the inner jacket and sheathing strength member to form the cable outer jacket. Outer jacket shall be smooth, concentric, non-nutrient to fungus, and free from holes, splits, blisters, or other imperfections.

I. Overall outside diameter of any cable type shall not exceed 0.75 inch.

2.3 CABLE IDENTIFICATION SYMBOL

A. General:
1. An ID shall be hot stamped on the outer jacket of the fiber optic cable at periodic intervals shall be at least every 5 feet.
2. Color shall be white.

B. Identification Approach:

1. Some Cable identification is easily stamped on the cabling at the factory, while other information is not so easily accomplished.
    a. Each cable shall have embossed on the outer jacket of the cable, in white lettering, the following; The Manufacturer's ID or Model Number of the cable. The Type of cable e.g. MM or SM. The number of fibers in the cable. The Footage Marker of the cable. All of the above shall be stamped on the cable at intervals of five (5) feet.
    b. At FC option, each cable shall have the ISA Cable Identification Number, as shown on the drawings, either: (1) embossed on the outer jacket of the cable, in white lettering, or (2) alternately place onto the cable a printed label, of the wrap-on self-laminating type, which contains the unique ISA Cable Identification Number. If option 1 is used, Cable Identification stamping shall be at intervals of five (5) feet. If option 2 is used, Cable Identification tags shall be placed at each end of the cable within five (5) feet of the terminus and at the entrance and exit points of all intermediate points as follows: Pull-boxes, handholes, manholes, cable-tray, splice cases, etc.

C. Cable Reel Identifier:
    1. Each cable reel shall be uniquely identified on the exterior of each fiber optic reel by the manufacturer. In addition, the beginning and ending cable reel footage identifiers shall be placed on the exterior of the reel by the manufacturer.
    2. When preparing the Pulling Plan, the FC shall use this unique cable identifier, as well as the proposed starting and ending footages, for each conduit segment to be pulled.

2.4 REPLACEMENT CABLE

A. In addition, a reel of each size (FO count), and type, of cable furnished by the FC, not less than .5 kilometers in length, shall be provided. This cable shall be turned over to the City representative immediately after on-reel, bi- directional, 'on-site OTDR testing is completed.

2.5 PRE-CONNECTED CABLE ASSEMBLY

A. FC shall supply factory assembled pre-connectorized cable assembly to interface FO cables with the patch panel bulkhead feed-through receptacle. FC shall terminate all fibers, used as well as spares. FC shall supply and install dust caps for all terminated fibers.

B. Single fiber optic cable assembly shall be housed in a cassette form single fiber connector terminated on the three (3) meter length of single fiber, single

mode cable. Single fiber cable shall contain a buffered optical fiber and shall be the same as that provided in the multi-fiber cable.

C. Connector/cable interface shall be able to withstand a tensile force of 110 Newton (25 pounds) without detrimental effects on the connector loss characteristics.

D. Each connectorized cable assembly shall have a loss of less than or equal to 0.5 dB

2.6 OPTICAL PATCH PANEL ASSEMBLIES

A. All cable terminations shall be made in optical patch panel assemblies. Patch panel assemblies shall be of the pre-assembled chassis type with associated rack-mounting hardware.

B. Splice attenuation shall not exceed 0.2 db. Splice shall be covered with a protective sleeve.

C. FO Patch Panels are to be located 'within' the Fiber Optic Terminal Cabinets (FOTC) enclosures as shown on drawings; typically located adjacent to the DCS PCM cabinet.

2.7 FIBER OPTIC TERMINAL CABINETS

A. FOTCs shall be front access only.

B. Cabinet's frame shall consist of vertical and horizontal tubular aluminum extrusions with a minimum wall thickness of .150. Front to rear aluminum extruded corners shall be at least .125 thick.

C. Rear door, top panel, and side panels shall be a minimum 316 Stainless Steel.

D. FOTC shall be NEMA 12 or NEMA 4X, based on Area Classification. Where Area Classifications dictate NEMA 4X, the cable entry shall be sealed with EYS type fittings and sealed only after final cable testing.

E. Ten (10) feet of fiber shall be coiled prior to termination to Patch Panel within the FOTC. This requires cable handling and dressing mechanisms within the FOTC that shall be subject to City representative approval as part of the enclosure submittal.

F. FOTC shall be wall mounted, and seismically rated and braced.

G. FOTCs shall provide for strain relief of incoming cables as well as providing connector panels and connector couplings adequate to accommodate the number of fibers to be terminated.

H. All FOTCs shall incorporate radius control mechanisms to limit bending of the fibers to the manufacturer's recommended minimums.

I. Couplers shall be mounted on a panel that, in turn, snaps into the housing assembly.

J. FOTCs shall have a common key lock that opens all FOTCs installed for this project, or a common City lockset as directed by City representative.

K. FOTCs shall be rack-mounted, unless specified otherwise in the drawings. Size should be 24-fiber.

2.8 SPLICE ORGANIZERS

A. Single mode fibers shall be fusion spliced with a protective sleeve covering and stored in an organizer with a minimum of 450 millimeters (18 inches) spare coiled buffer tubing.

2.9 FIBER OPTIC CONNECTORS

A. FOT fiber optic single mode connectors (LC/APC – angle polish) shall be suitable for optical circuits.
   1. Connectors: Attenuation per mated pair shall not exceed 0.75 dB (individual) and 0.5 dB (average). They shall sustain a minimum of 200 mating cycles per EIA/TIA – 455-21 without violating specifications. Connectors shall meet the following performance criteria:

Test	Procedure	Max. Attenuation Change (dB)
Cable Retention	FOTP-6	0.2 dB
Durability	FOTP-21	0.2 dB
Impact	FOTP-2	0.2 dB
Thermal Shock	FOTP-3	0.2 dB
Humidity	FOTP -5	0.2 dB

B. Manufacturer: Corning or equal

2.10 FIBER OPTIC LINE/PATCH CABLES

A. All fiber optic patch cords shall be duplex zip cords, factory terminated and 100 percent tested.

B. All fiber optic patch cords shall match fiber optic panel termination connector, i.e., green LC/APC to LC/APC for angle polish.

2.11 FIBER OPTIC INNER DUCT

A. This specification applies to the following:
   1. Flexible, Plenum and Riser-rated inner duct
   2. Flexible, Plenum and Riser-rated MaxCell Cells

B. Pull cord: Each inner duct shall come with pull cord. Pull cord shall be 1/4- inch polypropylene or equivalent with a minimum tensile strength of 1250 pounds. Pull cord shall be installed in the inner duct prior to delivery to the construction site. The pull cord shall extend 6 feet beyond the termination at each end.

C. Conduit and inner duct plugs: The Fiber Optic conduit plugs will be Jack Moon Duct Plug from TYCO or equal. Inner duct will be affixed to the interior of the Duct Plug by an approved means, in accordance with MaxCell or TYCO technical bulletins.

PART 3 EXECUTION

3.1 FACTORY TEST

A. Fiber optical cable shall comply with the optical and mechanical test requirements of this section.

B. The MANUFACTURER shall certify OTDR test, optical, and mechanical performance for each reel. Manufacturers' Certification shall be delivered with the fiber optic cable when it arrives.
   1. Factory testing documentation shall be submitted to the City representative upon receipt of cable, and before any on-site OTDR testing commences.

C. Optical Performance:
   1. Single-Mode Fibers in the Cable:
      a. Optical attenuation of each optical fiber in the cable (reeled) shall be no greater than 0.4 dB/Km at 1310 nm, plus or minus 50 nm, optical spectrum window and 0.3 dB/km at 1550 nm. Attenuation shall be measured on completed cable reel length, and normalized linearly to 1 Km. Measurement method shall be in accordance with TIA 455-78B, at central wavelength 850 nm nominal.
      b. Pulse dispersion of each optical fiber in the cable (reeled) shall be no greater than 3.5 picoseconds/nm-Km within the emissive

region of 1285-1330 nm. Measurement method shall be in accordance with EIA 455-168A and EIA 455-169A.

c. Mode field diameter at 850 nm optical spectrum window shall be within 10 plus or minus 1 micrometer. Measurement method shall be in accordance with EIA/TIA 455-165A at central wavelength 850 nm nominal. When this requirement is not met, the fusion splice compatibility test shall be applied.

d. Cut-off wavelength for 850 nm optical spectrum window shall be within 1200 plus or minus 70 nm. Measurement method shall be in accordance with EIA 455-80B.

D. Mechanical Performance:

1. Minimum Bend Radius: Cable shall be able to withstand bending to a minimum radius of 10 times the cable outer diameter without tensile load applied, and of 20 times the cable outer diameter with maximum tensile load applied (during installation), without damage to cable components or degradation of the optical fiber performance at room temperature.
2. Tensile Strength: Fiber optical cable shall withstand a pull force of at least 2700 Newtons (600 pounds force per square inch) to be applied to the pulling strength member during the installation, and a tensile load of at least 300 Newtons during operation without incurring any damage or detriment to fiber optical cable and optical performance. Tensile strength test shall be in accordance with EIA 455-33A.
3. Flexing or Bending Cycles: Fiber optical cable shall withstand at least 20 bending cycles at minimum bend radius without damage to the fiber optic cable components or degrading optical performance. Cyclic flexing test shall be in accordance with TIA 455-104A.
4. Crush Resistance: Minimum crush resistance of the fiber optical cable shall be greater than 650 Newton/centimeter (cm) without damage to cable components or degrading optical performance. Crush resistance test shall be in accordance with EIA 455-41.
5. Impact Resistance: Fiber optical cable shall be capable of withstanding 20 impacts, at five Newton-meters force, without damage to cable components, or degradation of optical performance. Impact resistance test shall be in accordance with EIA 455-25C.
6. Waterbloacking Compound Drip Test: Optical cable shall be tested for the ability of the waterblocking compound in the interior of the inner jacket and loose tube buffer to resist flow at the temperature range of minus 40 degrees C to 60 degrees C in accordance with EIA 455-81B.
7. Fluid Penetration: Optical cable shall be capable of preventing the entry and axial migration of pressurized water when subjected to fluid penetration testing in accordance with EIA 455-82B.

3.2 TEMPERATURE ENVIRONMENT

A. Fiber optical cable shall comply with the mechanical performance requirements herein while used in duct applications where the temperature varies from minus 8 degrees C to plus 38 degrees C. Optical performance degradation shall be less than five percent of the optical performance requirements in the temperature range of minus 20 degrees C to plus 60 degrees C. Fiber optical cable shall not be damaged in storage where the temperature may vary from minus 40 degrees C to plus 65 degrees C.

3.3 FIBER SPLICES

A. The use of fiber optic splicing is to be minimized. The FC shall perform all cable splicing with certified personnel approved by the City representative. Outside plant fiber splices shall be fusion type and made along the fiber route where shown on the design drawings, or when FC reel lengths and related cable 'budget' are not a concern. FC shall ensure that Splices shall exhibit an loss not greater than 0.2 dB. All splice measurements shall be made at appropriate frequencies for cable type. All splices shall be mounted in trays within splice enclosures.

B. Completed splice shall be covered with a protective sleeve heat shrink type to restore the protective properties of the fiber coating and buffering. Deviations to the splice, location and pulling plans, will be permitted upon approval by the City representative, and shall be provided at no additional cost to City.

C. All fiber colors shall be continuous from end to end. No switching or staggering of color scheme within the cable at splice points shall be allowed.

D. Cables shall be brought out of manhole, handhole or intermediate pull-box in a controlled environment to perform the fiber fusion splice operation. Splice shall be completed by returning the cable to the manhole, etc. such that the excess cable does not impede future entrance and utilization of the enclosure. Cable shall be secured within the enclosure at intervals not in excess of 3 ft. utilizing standard galvanize racking hardware, provided by the FC. Racking hardware shall maintain minimum bend radius requirements.

E. Field verification of all cable measurements end-to-end, before installation, is required to avoid any and all mid-span splices.

3.4 UNDERGROUND CABLE INSTALLATION

A. It is the responsibility of the FC to install all fiber optic cabling, in raceway, ductbanks, etc. provided and installed by others, under Division 26 of the specifications. It is the responsibility of the FC to inspect all raceway and

ensure that raceway has been installed in accordance with bend radius requirements and that all raceway is mandreled and clean, ready of cable installation. When placing Fiber Optic cabling the FC shall ensure that proper roller stands and sheaves are used to prevent strain or damage to the cabling during installation.

B. In the event that the FC's installation crews witness any anomaly to the fiber during installation they are to immediately stop installation and notify the City's representative.

C. Securing Cable:
   1. Immediately after cable placement, a permanent identification tag shall be attached to visible cable sections. Cables shall be checked to ensure that the markings are intact.
   2. Cables and equipment shall be supported and secured as indicated in the design drawings. Where the specific method of support is not shown, supports and fasteners shall be used to secure cables and equipment in position. Metallic supports and fasteners shall be Stainless Steel. All cables shall be routed along the interior sides of manholes and shall be secured such that no more than a 4" catenary is evident between fasteners.
   3. No fewer than four, and preferably eight (8), cable/racking hooks shall be required per manhole and shall be provided by the FC.
   4. Clamps and straps consisting of stainless steel clamps and black-nylon ty-wraps shall be used as necessary to properly secure the cable
   5. Sequential cable markings along the cable, prior to and after each end of splice point, shall be recorded on the sequential cable form and submitted for approval.

D. Bending:
   1. Caution shall be used by the FC when bending cable to avoid kinks or other damage to the sheath. Bend radius shall be as large as possible with a minimum of 10 times the cable diameter. Minimum radius shall be increased when necessary to meet cable manufacturer's recommendation. Cables shall not rest against any sharp edges.
   2. Minimum bending radii shall not be exceeded as specified by the cable manufacturer during placement.

E. Pulling:
   1. Pulling lines shall be attached to both cable ends when cable is destined for bi-directional pull, and fitted with factory-installed pulling eyes. Cables not equipped with a pulling eye shall have the pulling line attached to the cable end by means of a cable grip. Core hitches shall not be used.

2. Cable reels shall be located and aligned so that the cable is pulled out from the top of the reel into the duct or conduit in a long, smooth bend without twisting. Cable shall not be pulled from the bottom of the reel. A cable feeder guide of proper dimensions shall be used at the mouth to guide the cable into the duct or conduit.
3. Rigging shall be set up at the pulling end so that the pulling line and cable exit on a line parallel with the duct or conduit to prevent either from rubbing against the edge or mouth. Cable ends shall not be pulled around sheave wheels. When the sheave or pulley cannot be positioned to obtain sufficient cable end slack for proper racking and splicing with the pulling line attached to the end of the cable, a split cable grip may be used to obtain the necessary slack.
4. Unless direct burial cable, conductors shall be protected from earth, concrete or asphalt during a pull by plastic or canvas tarp covering the ground.
5. The FC shall perform all cable installation in conformance with the cable manufacturer's installation guidelines. Do not exceed cable manufacturer's recommendations for maximum pulling tensions. Where indicated in the Pulling Plan cable tension shall be monitored with a manometer.

F. Lubricant:
1. The FC shall use pulling lubricant to minimize pulling tension and prevent sheath damage when pulling cables into ducts and conduits. Lubricant shall be applied to the cable sheath with a lubricator. When pulling has been completed, the exposed cable ends shall be wiped clean of lubricant.
2. Lubricants shall be compatible with and intended for use with plastic-sheathed cables. Soap and grease type lubricants shall not be allowed.
3. All equipment and the pulling set shall be checked to minimize interruptions once pulling begins. Cable shall be pulled without stopping until the required amount of the cable has been placed. When the pulling operation is halted before the pull is completed, the tension of the pulling line shall not be released. When pulling is resumed, the inertia of the cable shall be overcome by increasing the tension in small steps a few seconds apart until the cable is in motion. Cable shall be paid from the top of the reel by rotating the reel in the feed direction at the rate of pull. Cable shall not be stripped off the reel by hand-pulling.

G. Damage and Defects:
1. FC shall use a tension monitoring device (Manometer) to ensure that the maximum pulling tension that may be applied to the cable to be pulled into a conduit section is not exceeded, unless cable is being pulled by

hand. Any damage to the cable due to exceeding the maximum tension will require a new cable furnished by the FC at his cost.

2. Cable shall be carefully inspected by the FC for sheath defects or other irregularities as it is paid out from the reel. When defects are detected, pulling shall stop immediately and the cable section shall be repaired or replaced at the sole discretion of the City representative. A system of communications shall be maintained between pulling and feed locations so that pulling can be stopped instantly, when required.
3. Cable shall be hand guided through intermediate manholes and into the next duct section when making pull-through. Proper rigging shall be used in the intermediate manhole to keep the pulling line and cable aligned with the exit duct to prevent the line or cable from rubbing against the edge of the duct. Cables in pull-through manholes shall be set up and racked before the cable ends in adjacent manholes are set up and racked.
4. Cable ends pulled into manholes, vaults, or terminal locations that are not to be racked or otherwise permanently positioned immediately shall be tied in fixed positions to prevent damage to the cables and provide adequate working space.

H. Seal:

1. Ducts or inner duct in which cable is placed shall be sealed with appropriate plugs or seals as specified elsewhere. This material shall be inserted between the cable and the duct and in all unused ducts, in order to prevent damage to the cable sheath and to prevent the entrance of dirt or water into the Ducts from the manhole or vault.
2. Cables shall be provided in continuous lengths as required to accomplish the required installation without splices from termination to termination, except where field splices are specifically shown on approved field installation design submittals.

3.5 CABLE INSTALLATION IN CABLE TRAYS

A. Except where shown by the design engineer, fiber optic cables shall not be installed in the same cable tray with ac power cables containing power in excess of 208 volts to ensure physical safety of FC installers, and subsequent safety of City personnel.

B. The cable tray pathways shall be as specified in Division 26, Electrical.

C. Cables placed in cable trays shall be installed in a neat and orderly manner.

D. Cables in vertical trays shall be individually retained with Velcro straps at a maximum of 6 ft. on center.

E. Provide and install cable management and support as required.

3.6 CABLE INSTALLATION IN CONDUIT

A. All conduits housing fiber optic cable shall be at least 3/4 inch in size. The conduit should be sized appropriately in accordance with the EIA/TIA 569A. Conduits are installed by others, under Division 26, Electrical.

B. Any conduits housing fiber optic cable shall have an inside bend radius of at least ten times the internal diameter of the conduit or the manufacturers specified bend radius of the fiber, whichever is greater.

C. All conduits housing fiber optic cable shall be terminated with an insulated bushing to prevent damage to the conductor during installation or shall be terminated with a Jack Moon (Tyco) sealing plug after cable installation.

D. All conduits, and inner duct, installed for fiber optic cable must be installed by others with a nylon pull cord.

E. All conduit and trays shall be supported to the structure, independent of other services. Refer to Division 26, Electrical, regarding conduit support.

F. All conduits that are larger than two inches and will house fiber optic cable must be filled with inner duct or MaxCell equivalent cells prior to the installation of the fiber optic cable. See the following table:

Conduit Size	**# of Inner ducts**
3" conduit	3-1" inner ducts
4" conduit	3-1" plus 1-1¼" inner ducts
5" conduit	3-1" plus 2-1¼" inner ducts

3.7 BACKBONE CABLE SERVICE COILS

A. Install backbone cable service coils with length of ten (10) feet and a coiled diameter as required by manufacturer at each end of all new fiber optic cables to control excess cable lengths before terminating fiber strands.

B. Install backbone cable service coils in 24' x 24' x 6' NEMA 1 enclosure within four feet of cable entrance inside of room. Use four adhesive holders and hook and loop fasteners to bind fiber service coil in four places with separation of 90 degrees and secure the slack fiber to the interior of the junction box. Tie wraps are not permitted.

3.8 FIRE STOPPING

A. Provide fireproof seals where required in accordance with the National Fire Protection Association (NFPA) and the National Electric Code (NEC), Article 200-221 and EIA/TIA 569 standards.
   1. Fireproofing around raceways or conduits shall be provided by others as called for on design drawings and Division 26, Electrical.

3.9 TESTING

A. Pre-Installation Testing, Fiber Optic Cables
   1. The FC is responsible for conducting full pre-installation testing of the Fiber Optic Cabling in accordance with this section and section 1.04.B
   2. Pre-Installation testing will be accomplished, bi-directionally, utilizing an Optical Time Domain Reflectometer (OTDR) and will be accomplished on each fiber, of each cable while still on the shipping reel. Pre-installation testing will be accomplished without any apparatus, connectors, etc., with the exception of the OTDR Launch cord/cable, affixed to the fiber under test.
   3. Prior to commencement of pre-installation testing, the FC will submit a Testing Plan which will address testing methodology for both Pre-and Post Installation testing. This plan should specify all parameters under which the FC will be testing the cables. All test equipment, test procedures, and testing techniques shall be specified in the Test Plan
      Note: no fiber optic cable may be placed until:
      a. The Test Plan is submitted and approved by City representative.
      b. The Pre-Installation OTDR testing is complete for all cables.
      c. The OTDR Test Report, CD/DVR, report software, etc. for Pre-Installation Testing has been submitted to the City representative.
      d. The FC receives written notice that the City's representative is ready and in place (Approval to Proceed)
   4. The City's representative will witness all pre-installation fiber optic testing. The City's representative will perform no less than 25 percent spot-witnessing of Pre-Testing and may, at his sole option, witness 100 percent of the testing.
   5. During testing the FC will log each cable, by real and/or cable identification number, and will provide a testing sign-off sheet for each reel tested. FC will continue to reference this same reel and/or Cable ID number in his pulling plan such that testing data can be tracked to each cable segment(s) for post-installation testing.
   6. During testing the City's representative may suspend testing at any time, if in his sole opinion, testing is not being conducted in accordance with this section, or the Testing Plan.
   7. During testing the City's representative may fail any reel of cable that has obvious flaws as determined by the OTDR. Should the cable flaw be within the first or last 10 percent of the reel length being tested, or if in

the sole opinion of the City's representative there is sufficient usable length on the reel, the FC may be allowed to re-spool the usable cable and re-test it at another time. If in the sole opinion of the City's representative a cable reel is 'rejected', the FC shall replace, and retest, that length of rejected cable at the FC's sole expense.

8. At the conclusion of Pre-Installation Testing the FC and the City representatives, will immediately sign each of the Reel Testing Sheets.
9. At the conclusion of Pre-Installation Testing the FC will immediately download the OTDR data, in the presence of the City representative, and burn that data to CD/DVD for record purposes. One Copy of the Disk will be turned over to the City representative.
10. The Hard Copy Report of the Pre-Installation OTDR Test will be provided in accordance with the Submittal Requirements in Section 1.03

B. Post-Installation Testing Fiber Optic Cables:

1. The FC is responsible for conducting full Post-Installation testing of the Fiber Optic Cabling in accordance with this section.
2. Post-Installation testing will be accomplished, bi-directionally, utilizing an Optical Time Domain Reflectometer (OTDR) and will be accomplished on each fiber, of each cable on the fully installed cable network. Post-Installation testing will be accomplished with each segment cable connectorized and attached to its respective bulkhead fitting at the Fiber Optic Patch Panel associated with each end of the cable. Additionally, the OTDR launch cord/cable will be affixed to the Patch Panel at one end of the fiber under test and a landing/cord cable at the other to make cable definition obvious.
3. Prior to commencement of Post-Installation testing, the FC will have submitted a Testing Plan which will address testing methodology for Post Installation testing. This plan should specify all parameters under which the FC will be testing the cables.
4. The FC shall provide written notice of his intent to perform Post-Installation Testing of Fiber Optic Cabling a minimum of thirty (30) calendar days prior. Note: Submission of the Testing Plan or test reports does not constitute written notice for this purpose.
5. The FC shall not proceed with Post-Installation testing until he receives written notice that the City representative is ready and in place (Approval to Proceed).
6. The City's representative will witness 100 percent of the Post- Installation testing.
7. During testing the FC will log each cable segment by cross-referencing to the Pre-Installation testing real and/or cable identification number, and will provide a testing sign-off sheet for each Cable Segment tested.

8. During testing the City's representative may suspend testing at any time, if in his sole opinion, testing is not being conducted in accordance with this section or the Testing Plan.
9. During testing the City's representative may fail any Cable Segment that has obvious flaws as determined by the OTDR. Should the cable flaw be associated with connectorization or faulty Patch Panel Bulkheads, the FC will be given the opportunity to repair and retest that segment at a later time. If in the sole opinion of the City's representative a Cable Segment is 'rejected', the FC shall remove the defective cable, replace it with a new Pre-Tested cable, and retest that Cable Segment at the FC's sole expense.
10. At the conclusion of Post-Installation Testing the FC, and the City representative, will immediately sign each of the Cable Segment Testing Sheets.
11. At the conclusion of Post-Installation Testing the FC, will immediately download the OTDR data, in the presence of the City representative, and burn that data to CD/DVD for record purposes. One Copy of the Disk will be turned over to the City representative.
12. The Hard Copy Report of the Post-Installation OTDR Test will be provided in accordance with the Submittal Requirements in Section 1.03

3.10 TEST REQUIREMENTS

A. Test equipment used for verifying installation testing shall be calibrated by a certified testing company within 30 days of use. Calibration certification shall be provided to the City's representative immediately prior to the start of testing.

B. Single and Multi-mode OTDR Test: The OTDR shall conform to the following minimum requirements:
   1. Operating wavelengths: single-mode at 1310nm and 1550nm plus or minus 20 nanometers in accordance with ANSI/TIA/EIA-526-7, Method A.1, Two Reference Jumper or the equivalent method. All single-mode links shall be certified with test tools using laser light sources at 1310 nm and 1550 nm. All multi-mode links shall be certified at 850 nm and 1300 nm.
   2. Attenuation Range (one way): minimum 5 dB at 1,300 nm
   3. Attenuation Resolution: 0.01 dB
   4. Accuracy: plus 0.5 dB.
   5. OTDRs shall have digital readout capability and shall have a means of providing a permanent record in the form of both electronic and hardcopy printout report displaying the OTDR tracegraph.
   6. Test results:
      a. Reflective events (connections) shall not exceed 0.5 dB.
      b. Non-reflective events (splices) shall not exceed 0.3 dB.

c. End-to-End Attenuation Tests: An attenuation measurement test set shall consist of an optical power meter and an optical power source. Attenuation measurement test set shall be in accordance with the applicable National Bureau of Standards (NBS) standards for a stable optical source. Meter may be analog or digital. End-to- end attenuation test reading shall be included on the test reference loss. The attenuation/insertion loss test shall be in single-direction only, in accordance with TIA/EIA-526-7, Method A-1.

C. Measurement test set shall conform to the following minimum requirements:
   1. Operating wavelengths: single-mode at 1310 and 1550 nanometers plus or minus 10 nanometers.
   2. Attenuation Range: at least 30 dB at 1,300 nm
   3. Attenuation Resolution: 0.01dB
   4. Accuracy: The accuracy of the attenuation measurement test set shall be plus or minus 5 percent.
   5. Optical source shall be capable of coupling sufficient power into the fiber so that the light received at the meter is within the meter delectability limits.

D. End-to-End Bandwidth Tests:
   1. Bandwidth test shall conform to the following minimum requirements:
      a. Operating wavelengths: single-mode at 1310 and 1550 plus or minus 10 nanometers
      b. Bandwidth range: minimum 1000 megahertz
      c. Bandwidth Resolution: 1 megahertz
      d. Accuracy: plus or minus 0.5 megahertz
      e. Measurement Method: Swept Frequency

E. Magnified Optical End Face inspection:
   1. Fiber end faces shall be inspected after connectorization but before termination at 250X or 400 X magnifications. 250X magnification are suitable for inspecting multimode and single mode fibers. 400X magnification may be used for detailed examination of single mode fibers.
   2. Scratched, pitted or dirty connectors shall be diagnosed and corrected.

PART 1 - GENERAL

1.1 WORK INCLUDED

A. The DCSP shall design, develop, and start up the DCS Application process control software.

B. The work of this Section shall include:
   1. Project management and revision control
   2. Applications software workshop, if and when required by City's representative
   3. Applications software submittals
   4. Applications software development
   5. Software testing
   6. Software installation
   7. Startup

C. All Application Software developed for this Project shall fully conform with and be integrated into the existing Enterprise wide COMNET DCS. New Application Software development shall follow, as closely as possible, the control scheme Application Software of the existing system(s).

D. The DCSP shall provide all loop tuning and software modifications employed throughout the startup and testing period with actual process to provide operation exhibiting stable and controllable response to all process changes, steady state operation, and alteration of control parameters such as set point, with robust and fault tolerant functionality, all in accordance with the requirements of these specifications.

E. All Application Software developed for this project shall follow the Best Practices for Designing Control as defined in Emerson's "Control Builder User Guide for Ovation" documentation.

F. All Application Software developed by DCSP for the CoSD DCS becomes the property of CoSD and may be modified, deleted, copied and reused for other functions or in other drops or other plants. The CoSD will not retransmit any Application Software beyond the exclusive use in the CoSD (COMNET) DCS.

1.2 RELATED SECTIONS

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 - Submittals
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego

1.3 DIVISION OF WORK

A. The DCSP shall provide and implement the applications software required to complete the Work.

B. The DCSP shall have overall system responsibility and shall provide all work necessary to satisfy all requirements of this and related sections.

C. The software of this Section at a minimum shall include software, programming and configuration of: PCM control code, graphics code, trend groups and reports.

D. Definition of Software Types:
   1. Standard Software: Software packages that are independent of the project on which they are used. Standard software includes system software and process monitoring and control software.
      a. System Software: Application independent software developed by Microsoft. Includes, but is not limited to Microsoft operating systems, file management utilities, text editors, debugging aids, and diagnostics.
      b. DCS Software (DCSS): Software packages independent of the specific process control project on which they are used. Includes, but is not limited to, providing capability for, data acquisition, monitoring, alarming, man-machine interface (MMI), data collection, data retrieval, trending, report generation, control, and diagnostics.
   2. Application Software:
      a. Software to provide functions unique to this Work and that are not provided by standard software alone.
      b. Configuring databases, tables, displays, reports, parameter lists ladder logic, and control strategies required to implement functions unique to this Project.

1.4 WORK SEQUENCE AND SCHEDULE

A. DCSP shall integrate all elements of this section to their P6 fragnet schedule and integrate this schedule information into the Prime DCSPs Master Baseline Schedule.

1.5 CODES AND REGULATORY REQUIREMENTS

A. City of San Diego, COMNET Graphic Display Standards, 1995.

1.6 PREREQUISITES FOR SOFTWARE DEVELOPMENT

A. Process & Instrumentation Diagrams (P&IDs) – DCSP shall utilize P&ID drawings developed by the Design Engineer. Should the DCSP determine errors or omissions in the P&IDs that would affect software development schedules, he shall immediately notify the City's representative and the Prime DCSP. DCSP shall keep diligent red-line markups of all P&ID modifications, additions or clarifications.

B. Loop Diagrams & Specifications: DCSP shall utilize Loop Drawings developed by the Design Engineer. However, the DCSP is responsible for providing DCS-level details e.g. I/O termination identification, software level addresses, etc., to the Design Engineer to allow him to finalize the Project as-constructed Loop Drawings.

C. Fully attributed I/O Lists and attributed Control Narratives: DCSP shall annotate and attribute the Design Engineers I/O list, and shall annotate Design Engineer's Control Narratives with all assumptions, corrections and changes, for each process segment of the Project. The DCSP shall maintain red-line markups of all changes to facilitate final as-constructed documentation.

D. Control Strategies: The DCSP shall review Project Control Strategies for completeness. Should the DCSP find any errors or omissions, or have questions as to functionality, he shall immediately notify the City's representative.

E. The DCSP shall develop process graphics descriptions for all graphics programming, for all process segments, as part of the Software Submittal(s) for that process segment. The DCSP shall ensure that new graphics development conforms with existing COMNET DCS standards and will function with, and be integrated onto, the existing Enterprise wide DCS.
   1. At a minimum, the process graphics descriptions will include:
      a. Graphic hierarchy
      b. Navigation/Paging
      c. Operator inputs and control templates
      d. Action buttons and menus

e. Color coding, alarming, background fills, animation

1.7 SOFTWARE DESIGN WORKSHOPS

A. DCSP may request software design workshops for the work in this section on a process area by process area basis to clarify any questions or confirm compliance with City DCS standards. Should the DCSP require workshops, they shall submit the request through their Prime contractor to be processed through the City's representative.

1.8 DCS SOFTWARE SUBMITTALS

The DCS Software Submittal (DCSSS) shall be singular and all inclusive, submitted in accordance with Section 01 33 00, Submittal Procedures. The DCS Software Submittal shall include, but not be limited to:

A. The DCSP shall provide all Submittals in accordance with Section 01 33 00, Submittal Procedures. DCSP shall provide six (6) hard copies and one (1) soft copy (USB Storage Device) of all submittals.

B. Logic Diagrams: The DCSP shall develop and submit logic diagrams for all new PCM codes for City's representative approval. Diagrams shall be organized and bundled in a way that facilitates optimum review by the City's representative. All PCM codes shall be annotated with comments.

C. Graphic Diagrams: An English narrative of each data acquisition or control loop mission and anticipated action. Narratives shall enumerate the signal point name, signal descriptor, associated PCM number, associated system template displays, system functions activated by signal (i.e., interlocks, alarms, logs, etc.)

D. I/O Database: The DCSP shall develop and submit a fully attributed I/O database. The I/O database shall be organized and bundled in a way that facilitates optimum review by the City. The complete listing of the DCS database shall list each data point's relevant parameters such as range, contact orientation, limits, incremental limits, I/O card type, I/O hardware address and assignment as minimum.

E. Reports: The DCSP shall document and submit all reports being developed units this contract.

F. PCM Software Standards: The DCSP shall develop PCM software standards based on the Function Blocks listed in this Section.

G. DCS Standards: The DCSP shall utilize the existing City COMNET software standards to the greatest degree possible.

H. A complete set of PCM configuration sheets depicting each loop linkage. Each loop shall be on its own 11" x 17" sheet.

1.9 DCS GRAPHIC SUBMITTAL

The DCS Graphic Submittal (DCSGS) shall be singular and all inclusive, submitted in accordance with Section 01 33 00, Submittal Procedures. The DCS Graphics Submittal shall include, but not be limited to:

A. One complete set of all WS-accessible displays which are unique to this project (i.e., process global, system global, process regional, systems regional, process group, process loop, process component, integrated tutorials, integrated process tutorials, integrated documentation, user assistance.)

B. The DCSP shall ensure that all graphics development, and graphics submittal, conform to the existing graphics layouts, linkages and formats used throughout the COMNET Enterprise.

C. The Graphics Submittals shall contain displays in full size color graphic format and replicate the proposed screen contents. All background colors shall be identical to that of the screen content. All displays shall be arranged in a hierarchical order with references to associated WS's.

D. A system display linkage diagram which defines the hierarchical order and the linkages via page, down, left, right commands.

E. A definition of each display's data fields by tag numbers, utilizing City's standard.

F. A definition of each display's dynamic elements which shall blink, change color, rotate or change shape in response to process changes, and conforms to the City's standard.

G. A listing of all "help" text associated with each display screen, arranges in conformance to the City's standard.

PART 2 PRODUCTS

2.1 PCM APPLICATION SOFTWARE DESIGN CRITERIA

A. PCM Program Design:

1. DCSP shall develop and submit PCM Application software in strict accordance with these requirements and following existing City COMNET software standards.

2. The PCM shall be used to provide each process segment automatic control, alarm functions, and continuous loop control. Specific PCM functional requirements are described in the control narratives of source code for the current system provided as part of the Contract Document.
3. The DCSP shall organize the PCM application software into:
    a. Sections:
        1) Contains all logic for a specific unit operation.
        2) Each section consists of a general logic sub sections and, followed by unit operation sub sections.
    b. Subsections: Contains logic for specific equipment such as a pump, valve or loop.
    c. Functional Blocks:
        1) Building block for pumps, valves, loop control, analog processing, and alarm switches.
        2) Requirements for standard DCS/PCM function blocks to be provided are specified herein.
4. Program Documentation:
    a. Note and describe start of a new program section.
    b. Briefly describe control objectives.
    c. Identify subsections.
    d. Subsection documentation includes brief description of control objective followed by a description and tag of the equipment being controlled.
5. The DCSP shall provide an organizational index for PCM applications software that can be used to quickly search and locate a specific process section.

B. Program Flow Diagram:
1. Develop Program Flow Diagrams (PFDs) showing software Sections, subsections and functions blocks, subprograms, and their interrelationships. Provide written description of each section subsection and function block that will be used in the actual program.
2. PFD for each analog loop and PID loop configuration to include written descriptions of setpoint ramps, loop initialization, interface with DCS, etc.
3. PFD submittals shall follow SAMA Standards.

C. PCMs shall have redundant Ethernet Link Controllers (ELC) to communicate with PLCs at Packaged system (or OEM). Appropriate protocols shall be loaded in ELC to ensure successful communication between PCM and PLCs.

2.2 DCS APPLICATION SOFTWARE DESIGN REQUIREMENTS

A. General:
   1. DCSP shall develop and submit PCM Application software in strict accordance with these requirements, and conforming as closely as possible with existing City COMNET standards.
   2. The DCSP shall develop the DCS design to convey accurate information to the plant operations staff so they can make informed process control decisions and provide the platform to execute the control decisions.
   3. The following outlines key objectives in designing the DCS graphics displays: New graphics will be developed with the application of Graphic User Groups. Graphic User Groups will consist of representatives from the City Operations/Management Staff, COMNET engineers, design engineers (optional) and qualified graphic experts representing the DCSP. Additional members may be included as required. Established formats, look and feel will be followed unless re-designed by the Graphic User Group

B. General Display Organizational Philosophy:
   1. Graphic displays provide the vehicle for Operations to accomplish supervisory control over the entire treatment process. Organization of these graphics displays into a consistent homogeneous hierarchy that permits fast, easy and intuitive navigation between the displays is essential for plan operations. The DCSP shall use its standard graphic and library together with current City COMNET displays and standards to generate the new displays for the DCS.

2.3 DCS/PCM I/O DATABASE

A. DCS/PCM I/O Database: The DCSP shall provide a Database tool that has the following functions:
   1. Coordinate, manage and document all PCM points.
   2. Access to all database points and attributes (including live data) shall accessible and maintainable thru standard query language.
   3. A comprehensive database listing shall be provided that contains the following as minimum: Point Tag, English Description, Set/Reset Descriptions, Limits, Engineering Units, Wire Tag Designations to be used on Loop Diagrams and when landing I/O wires in PCM Cabinets, Alarm Priorities, Alarm Limits, Alarm Delays, Alarm Cutout Points, Hardware Addresses, Third-party I/O linkage details including protocols and addressing Packed Group Point usage and descriptions, Point Origination.

B. Configuring the DCS Controller:
   1. The DCS Controller shall be configured from an EWS using a standard Emerson Process Management (EPM) studio, DCS Controller

configuration shall conform to City COMNET standards and shall integrate into the existing Enterprise wide COMNET DCS.

2.4 TOTALIZATION REQUIREMENTS

A. DCSP shall provide diagnostic totalization for all field assets and DCS components, in accordance with existing COMNET DCS standards. This Totalization may include:
   1. All runtimes and start/stops for rotating equipment greater than 5hp including, but not limited to: Pumps, conveyers, augers, fans, blowers and rakes.
   2. All successful open/closes of all motor operated valves, gates and other mission critical valves.
   3. The runtime for each DCS components and UPS.
   4. Accumulated analog values of power monitoring for all UPS, switchgear and motor control centers where said devices are capable of interfacing to DCS.
   5. Totalization code shall be resident in the PCM in which the I/O is attached.
   6. A reset of the totalization shall only be initiated by authorized personnel.
   7. Each totalizer IO value shall be attributed with the Asset ID associated with the piece of equipment.
   8. Totalization accumulations shall be based on EWS input ranging between 1 minute and 1 year.

B. At a minimum, upon totalization reset, the previous total shall be recorded in the Historian

PART 3 – EXECUTION (NOT USED)

END OF SECTION

SECTION 40 96 04
SECURITY

PART 1 - GENERAL

1.1 REQUIREMENT

A. The DCSP shall secure the DCS from all accidental and malicious attacks using best management practices and utilizing appropriate technologies and secure network designs.

B. The DCSP shall protect all entry points.

C. All facility DCSLANs (collectively DCS Network) shall be, at a minimum, logically separated from the City of San Diego, and the Plant, Business Network on physically separate network devices.

D. Network Management Software shall monitor all devices on the DCS Network.

E. Antivirus software shall be compatible with the City's present antivirus software and shall monitor the DCS Network and virus files shall be maintained to the current status to detect malicious code, prevent it from infecting the system, and remove malicious code that has infected the system. Antivirus update mechanism shall be coordinated with the City.

1.2 RELATED SECTIONS

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego.

1.3 SUBMITTALS

A. All Submittals shall be developed and submitted in accordance with Section 01 33 00, Submittal Procedures.

B. Submittals of this Section shall be included in hardware and software submittals, specified elsewhere.

C. DCSP shall submit manufacturer cut-sheets for all network security equipment.

D. Prior to configuration of the firewalls, DCSP shall submit a list of all firewall rules to be implemented, which shall, after ORT, become part of change management procedures.

E. DCSP shall submit their final design and drawings of the DMZ, including connections to the business network, and the DCSLAN, and DCSWAN.

1.4 CODES AND REGULATORY REQUIREMENTS & REFERENCE

A. IEC62443: Security for Industrial Process Measurement and Control

B. ISO IEC 17799: 2005

C. NIST SP 800

1.5 DEFINITIONS

A. Definitions of acronyms are identified in Section 40 90 05, Definitions.

PART 2 - PRODUCTS

2.1 REMOTE ACCESS SERVER(S)

A. When shown on Drawings, the DCSP shall provide a remote access server(s) with built in firewall for access to Remote Network(s).

PART 3 – EXECUTION

3.1 NOT USED.

END OF SECTION

SECTION 40 98 00
PROJECT MANAGEMENT SERVICES

PART 1 – GENERAL

1.1 THE REQUIREMENT

A. The Work of the DCSP requires all project management services to complete the tasks specified in these RFP documents for the Project.

B. Notwithstanding the requirements in Division 1 and other requirements of the contracts documents the DCSP's Project Manager and representatives shall perform the Work of this section.

1.2 REFERENCES

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego.

1.3 SPECIFICATIONS:

A. Definitions:

1. Definitions of acronyms are identified in Division 40.
2. A DCSP Project Manager and the team shall be established and shall be comprised of personnel who are familiar with this type of DCS work and the existing City Enterprise wide DCS. The PM and the team shall oversee the design, implementation, construction, and support of the DCS Work.
3. Project Manager (PM) and the team shall perform the necessary DCSP project management services to ensure that the DCS provided under this contract is fully functional in accordance with Contract requirements, and works seamlessly integrating into the City's Enterprise wide COMNET DCS
4. Process segments: The implementation of this project may include multiple process segments comprising the overall Distributive Control System for this portion of the Project. Each process segment may require separate engineering design(s), design approvals, procurement, staging,

programming/configuration, readiness testing, and installation, and commissioning of the DCS at the Project site.

PART 2 – PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 PROJECT MANAGEMENT

A. The DCSP shall provide a Project Manager to perform the necessary project management services. The DCSP shall provide all project management services required to complete the DCS Work specified in these documents. DCSP Project Management and administrative services shall be performed at the approved staging site and Project site, as required. The required minimal project management services are defined in the following sections.

3.2 PROJECT COMMUNICATIONS

A. Communications Structure:
   1. A communication structure and escalation procedure will be developed between the DCSP, Prime Contractor and the City as part of the Prime Contract.
   2. The DCS Project Manager (PM) will coordinate and communicate project activities with the Contractor and City's representative.
   3. The PM shall coordinate n ew DCS upgrades, as well as existing DCS modifications (when specified) with the City's representative and Plant Staff.
   4. The PM shall have strong verbal and written communication skills and be fluent in English.

3.3 PROJECT SCHEDULE

A. The DCS Work of the process segments shall be initiated and completed in accordance with the Contractors Master Baseline Schedule, as required by Division 1
B. The DCSP shall develop within their P6 fragnet schedule, sufficient granularity, inclusive of goals, internal DCSP milestones and contractual milestones to demonstrate proper schedule coordination with the Contractors Master Schedule.

3.4 PM TASKS

A. The DCSP shall take full responsibility for DCS-related project management services required to meet the requirements of the RFP documents. At a minimum, the DCSP shall perform the tasks below as required by the Work:
   1. Regular coordination meetings with the Contractor and City's representative review progress, as scheduled by the Contractor

2. The DCSP shall provide weekly status reports to the Contractor, depicting DCS development and readiness, through the construction phase of the project.
3. Project Delivery Plan (PDP), which defines the overall delivery of each process segment of the project. The PDP shall include the following items:
    a. Delivery Philosophy
    b. Control System Architecture, Device Networks, Local Networks and Communications Interfaces
    c. Design Approach
    d. Software Development and Testing Criteria
    e. Procurement Plan
    f. Construction Coordination Plan
    g. Document Management and Revision Control Strategy
    h. Communication Network Plan
    i. FAT, Field Testing (including ORT), Start up and Commissioning Plan
    j. Operations and Maintenance Manual Criteria
    k. Training Requirements Criteria
    l. Health and Safety Plan
    m. QA/QC Plan Requirements
4. Scheduling, The DCSP shall be responsible for updating the DCS portion of the project schedule as necessary.
5. Schedule of Values / Detailed Cost Breakdown
6. Scheduling of training:
7. Invoicing to Contractor, on a monthly schedule
8. The DCSP shall execute periodic quality reviews of the delivery of the DCS, including management QA/QC and delivery of:
    a. Record Management and Document Control
    b. Testing Records
    c. Acceptance Records
    d. Inspection Records
    e. Maintenance Records
9. Prepare Outage requests Forms or Plant permits as required
10. Prepare and provide operation and maintenance manuals

3.5 PROJECT IMPLEMENTATION

A. General: Project Implementation is generally defined as the actual implementation of the work required under the Contract. During the implementation of each of the five segments, the DCSP is required to fulfill a number of project management requirements. The delivery of each Segment shall be based on four Phases, including the Engineering/ Design Phase, Procurement, Staging, Programming and Testing Phase, Field Construction/ Commissioning Phase, Maintenance Phase. It is expected that the Phases for

each Segment will be performed in order as identified below. The following project management services are required to be performed by the DCSP.

B. Engineering/Design Phase:
   1. In the Engineering/ Design Phase, the DCSP shall complete the detailed design of the DCS as specified in the contract documents. The DCSP is also responsible for the following project management services during the Engineering and Design Phase:
      a. The DCSP shall coordinate all activities related to the DCS design of the project.
      b. The DCSP shall review and confirm requirements as necessary with the Prime Contractor and the City's representative.

C. Procurement, Staging, Programming and Testing Phase
   1. In the Procurement, Staging, Programming and Testing Phase, the DCSP shall procure the equipment required in the final design documents and stage the system at the approved staging site. The project management services related to these activities include, but are not limited to:
      a. The DCSP shall coordinate and schedule the procurement, delivery and storage of all required equipment and materials on a timely basis.
      b. Procurement of hardware and software shall be based upon requirements defined within these Project specifications and refined during the Engineering/Design Phase.
      c. Procurement schedules shall be communicated to the Prime Contractor and the City's representative.
      d. The DCSP shall be responsible for the development of the approved staging area.
      e. The DCSP shall be responsible for all permitting activities related to the staging area construction, if any.
      f. The DCSP shall coordinate the moving and storage of all materials between manufacturing site and staging area and between the staging area and the Project site. DCSP shall be responsible for coordinating deliver of DCS components at site with the Prime Contractor.
      g. The City's representative and the Prime Contractor shall be provided the opportunity to inspect inventory and staging set-up.
      h. DCSP shall manage all licensed software and the development of all controls, graphics, and database programming and DCS configuration.
      i. The Factory Acceptance Testing shall be witnessed and signed- off by the City's representative prior to the installation of the system.

D. Field Construction/Commissioning Phase
   1. In the Field Construction/Commissioning Phase, the DCSP shall coordinate installation, construction and commissioning activities of all

DCS-related components in accordance with these Specifications. The project management services related to these activities include:

a. The DCSP shall coordinate the overall sequence and schedule of control systems construction and installation.
b. The DCSP shall coordinate and participate in Preconstruction Safety Conference, and shall adhere to the Prime Contractor's Safety Plan at all times.
c. The DCSP shall coordinate the F A T , O R T , system, software and performance testing.
d. The DCSP shall establish a Health and Safety plan for construction activities which adheres to the Prime Contractors Safety Plan as well as the City's safety standards.
e. The DCSP shall perform loop check and commissioning activities. The DCSP shall be responsible for manning all PCM locations, Main Control Room(s) and Workstation locating in performance of Loop Testing. The Prime Contractor shall be responsible for coordinating and manning at all field device, instruments and Foreign Device (Skid-mounted and package system) in support of Loop Testing.

E. Maintenance Phase

1. In the Maintenance Phase, the DCSP shall provide ongoing support services and warranty repair in accordance with Division 1 of the Contract.
   a. The DCSP shall establish warranty and maintenance procedures to meet operations and maintenance criteria of the Plant.
   b. The DCSP shall coordinate operations and maintenance activities with City's representative and plant Operations staff.
   c. The DCSP shall monitor system performance and perform corrective maintenance as required.
   d. The DCSP shall provide warranty service reports to the City's representative or City COMNET staff, within 48 hours of the completion of each service or warranty event.

END OF SECTION

SECTION 40 98 01
ENGINEERING AND DESIGN SERVICES

PART 1 - GENERAL

1.1 SUBMITTALS

A. The DCSP shall take full responsibility for developing an approved DCS design that meets the specifications set forth in these Contract Documents. The hardware and software design shall be developed by the DCSP and submitted using a submittal review process in accordance with Specification 01300, Submittals.

B. The DCSP shall group or arrange submittals in a methodical and logical fashion such that the City's Representative and Design Engineers have all the required information to perform its review. For example, grouping of all hardware including workstations, PCM, Field Cabinets, Networking and the like, for a process area, would be acceptable.

C. The DCSP shall develop a complete list of all submittals (technical and administrative) required by all Contract Documents for all process segments in accordance with the prime contractor schedule requirements of the Contract.

D. The DCSP shall plan for a pre-submittal conference to finalize the needs of the City's Representative and Design Engineers to eliminate as much rework as possible. DCSP shall present an outline and samples of the proposed submission to the City's Representative in this conference.

E. The DCSP shall provide adequate time in their schedule to accommodate the review of the City's Representative and any and all re-submittals.

F. Loop Diagram Submittals:
   1. Loop Diagrams: The preparation of the loop diagrams is the responsibility of the Contractor. However, the DCSP is responsible for providing to the Contractor all the DCS-level information, including termination designation, software addressing levels, I/O card assignments, etc. on a timely basis to facilitate development of these documents. DCSP portions of the Loop Diagrams shall be submitted in accordance with Specification 01 33 00, Submittal Procedures.
   2. In addition to other DCS-related construction level as-built drawings, DCSP shall be responsible for providing red-line mark-ups of the Loop Diagrams and P&IDs, as required. Red-line mark-ups shall be provided on a timely

basis to allow Engineers and Contractor time to finalize as-built documentation.

1.2 RELATED SECTIONS

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego.

PART 2 – PRODUCTS (NOT USED)

PART 3 – EXECUTION

3.1 ENGINEERING AND DESIGN TASKS

A. The list below is intended to be used as a guide for DCSP and not intended to be all inclusive and complete. At a minimum, DCSP shall perform the tasks below as required by the Work:

1. Workshop Participation; as may be required for development of software, Operations training, special maintenance requirements, etc.
2. Submittals (Refer to Division 40 and Section 01 33 00, Submittal Procedures.)
3. Develop and submit DCS-PCM-related termination information
4. Develop and submit DCS-related portions of loop drawings
5. Develop and submit DCS-related portions of P&IDs
6. Develop and submit mounting details for all DCS equipment, including seismic calculations and certifications.
7. Civil Design, if and when required
8. Structural Design, if and when required
9. Electrical Design requirements for DCS-related equipment
10. Mechanical Design requirements for DCS-related equipment
11. Develop and submit Control System Block Design
12. DCS Design
13. Work Scopes for DCS-related Sub Contractors
14. Historian Format Designs, if and when specified
15. I/O Database Design including point attributes
16. Technical Calculations

17. Control Strategy Review and functional verification
18. Control Strategy programming
19. Graphic Design Workshops, and graphics development
20. System security design
21. Red-line markups of all As-Built Documents
22. As-Built Documentation updated Red-lines during Construction
23. Review and coordinate all submittals from DCSP subcontractor.
24. Coordinate information among DCSP and Prime Contractor subcontractors' submittals
25. Coordinate Panel Drawing design
26. Develop and submit Panel Drawings
27. Approved Staging Area design and build out
28. DCSP staging area equipment and furniture

3.2 DCSP QA/QC AND DESIGN ASSISTANCE REQUIREMENTS

A. As the DCSP is operating under and 'assigned subcontractor', 'sole-source provider' arrangement with the City, various items of Quality Control and of design assistance to the Project Design Engineers is required of the DCSP. Some, but not all, of the assistance items required of the DCSP are as follows:
   1. The DCSP shall be responsible for thorough review of the project design documents, annotating any DCS related errors, omissions, size conflicts, environmental difficulties, etc. and so notifying the Project Design Engineer on a timely basis.
   2. The DCSP may be called upon by the City, or the Design Engineers to participate in RFI responses to DCS—related orr I&C questions posed by other subcontractors. The DCSP shall provide immediate response to such RFIs.
   3. The DCSP may be called upon by the Design Engineers to provide technical detail, review and/or approval of designs being executed via change-order to the Project. DCSP shall promptly provide such services.
   4. During the course of construction, the DCSP shall have their field engineers verify various aspects of installation are being installed within the Project specification and DCS manufacturer's requirements. This is particularly true of I/O and fiber optic conduit, raceway or duct bank installation, conduit cabinet entrance locations, physical obstructions to the DCS and environmental requirements. Inspection and notification requirements are stated throughout Division 40 Specifications.
   5. The DCSP shall verify that special DCS grounding requirements and installation, as specified in Division 40, are performed correctly and in accordance with the specifications and DCs manufacturer's requirements.
   6. The DCSP shall verify that the UPS' provided under the DCS portion of the contract, but install by others under Division 26, is placed, wired,

installed and tested in accordance with Specifications and DCS manufacturer requirements.

7. The DCSP shall be responsible for oversight of I/O wiring installation to ensure subcontractor does not combine conduits, or route dissimilar I/O wiring in common conduits e.g. Analog I/O with Discrete I/O.
8. The DCSP shall be responsible for coordinating with Package System suppliers or other Foreign Device Manufacturer's equipment to ensure that data-links are installed correctly, communications protocols are coordinated, etc.
9. The DCSP shall be responsible for oversight of all I/O wiring termination, being provided by others under Division 26, to ensure that I/O wiring is tagged correctly, routed and dressed neatly and terminated on correct locations, at the DCS end I/O wiring only.
10. Integration of new configuration across all Multi-Networked DCS Installations.
11.

B. The costs for all QA/QC Engineering Service above shall be borne solely by the DCSP under his assigned subcontract.

END OF SECTION

SECTION 40 98 02
PROCUREMENT, STAGING, PROGRAMMING

PART 1 – GENERAL

1.1 DEFINITIONS

A. Equipment: Tools, products, items, devices, or machines needed for the correct functioning of the DCS and its supporting systems.

B. Materials: Materials are physical substances used as inputs to production or manufacturing of the DCS. The definition of materials also includes finished materials, which includes equipment.

C. Procurement: DCSP manufactures DCS equipment and procures third party equipment in accordance with contract documents.

D. Staging: Approved site that receives shipments of equipment and materials to be set up or staged, used for programming all equipment as a system and for Factory Acceptance Testing.

E. Programming: Programming of all software systems.

F. Testing: All testing required prior to shipping to each facility.

1.2 RELATED SECTIONS

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Equipment, Materials, etc. shall be certified as Underwriters Laboratories (UL) compliant.

1.3 PROCUREMENT

A. The DCSP is responsible for procuring all materials related to the delivery of the Work.

B. The DCSP shall coordinate procurement to meet the project schedule and the needs of the City Representative.

C. The manufacturer's standard equipment suitable for applicable service conditions shall be provided, unless otherwise specified in the individual Specifications.

D. Like items of products furnished and installed in the Work shall be end products of one manufacturer and of the same series or family of models to achieve standardization for appearance, operation and maintenance, spare parts and replacement, manufacturer's services, and implement same or similar process instrumentation and control functions in same or similar manner.

E. Interchangeable components of the same manufacturer shall be provided for similar components, unless otherwise specified.

F. Design and manufacture with due regard for health and safety of operation, maintenance, and accessibility, durability of parts, and shall comply with applicable OSHA, state, and local health and safety regulations.

G. Coating materials shall meet federal, state, and local requirements limiting the emission of volatile organic compounds and for worker exposure.

1.4 PREPARATION FOR SHIPMENT

A. Systems may be manufactured at remote facilities, but shall be assembled at the DCSP approved staging site. The DCSP shall:
   1. Mark or tag, using ISA tagging scheme, the separate parts and assemblies for field assembly.
   2. Cover machined and unpainted parts that may be damaged by elements with a strippable protective coating.
   3. Products shall be packaged or crated to provide protection from damage during shipping, handling, and storage.
   4. Packages and crates shall be marked or tagged to indicate its purchase order number, bill of lading number, contents by name, name of project and Seller, equipment number, and approximate weight.
   5. Spare Parts and Special Tools shall be delivered at same time as Products delivery.
   6. Accessories shall be delivered at same time as Products delivery.
   7. Accessories shall be furnished so that each item of equipment may be placed in full operation.
   8. Accessories include, but are not limited to, light bulbs/LEDs, fuses, enclosure keys, special tools, and other items as required for initial operation.

B. Delivery of Products:

1. Deliver products in accordance with accepted current Project Schedule and coordinate to avoid conflict with the Work and conditions at Site.
2. Deliver products in undamaged condition, in original container or packaging, with identifying labels intact and legible. Include on label, date of manufacture and shelf life, where applicable.
3. DCSP shall record receipt of Products at the approved Staging Site, and upon receipt of Products shall inspect for completeness and evidence of damage during shipment. Receipt and inventory of Products must be witnessed by the City representative.
4. Should there appear to be damage, DCSP shall inform the City's representative and the project Prime Contractor and shall immediately make necessary arrangements to repair or replace the item.
5. DCSP shall expedite replacement of damaged, incomplete, or lost items, so as not to delay progress of the Work.

1.5 MOVING AND STORAGE OF EQUIPMENT

A. General

1. The DCSP is responsible for the movement, as well as the safe storage, of all material from the factory, to the approved staging area and ultimately to its installed location. To adhere to this requirement, the DCSP must perform the following:
2. Unloading of Products: Unless otherwise specified, after acceptance by inspecting party products will be unloaded by DCSP in accordance with manufacturer's instructions.
3. Handling, Storage, and Protection:
    a. Products shall be handled and stored in accordance with manufacturer's written instructions and in a manner to prevent damage.
    b. Products shall be stored in an approved environment within the staging area and at each installation site.
    c. Storage shall be arranged in a manner to provide easy access for inspection.
    d. Periodic inspections of stored products shall be performed by the DCSP to assure that products are maintained under specified conditions, and free from damage or deterioration.
    e. A running account of products in storage shall be kept by the DCSP to facilitate inspection.
    f. Electrical, instrumentation, control products, and equipment containing bearings shall be stored in weather-tight structures maintained between 60-120 degrees F, with humidity control.
    g. Electrical, instrumentation, and control products, shall be protected and insulated against moisture, water, and dust damage.

h. Products that are ready for installation shall be stored in dry and well-ventilated areas that are not subject to extreme changes in temperature or humidity.

1.6 DCS APPROVED STAGING SITE

1. The proposed staging site shall be submitted to the City in accordance with Specification 01 33 00, Submittal Procedures. The City shall approve the staging site in writing. The DCSP shall also perform project management, engineering, programming, assembly, testing and support services at the approved staging site.
2. The DCSP shall be responsible for providing all utility power source, potable water (tap) and sanitary sewer services at the approved staging site. The DCSP shall bear the cost of power, water and sewer.
3. The DCSP shall provide necessary tenant improvement for the approved staging site space, power/ground and acceptable environmental conditions.
4. The DCSP shall be responsible for provide parking space for the DCSP staff City inspection staff. Where required, the DCSP shall pay for parking.
5. The DCSP shall provide the necessary equipment at the staging site to perform the required programming, DCS setup, testing and support activities, furnish and build-out the staging site, and disassemble after Final Completion.
6. FAT results shall be reviewed and accepted by the City's Representative before systems are transported to the various sites for installation.
7. The DCSP shall establish security measures, and pay all security costs, to protect the equipment at the approved staging. Prime Contractor shall be responsible for DCS security once transported to the project site.
8. The staging site shall meet the environmental requirements established in the 'Moving and Storage' portion of these specifications.
9. The staging site shall be accessible to the appropriate DCSP, DCSP subcontractor and City staff.
10. The staging site shall adequately accommodate DCSP staff, storage of equipment, and setup of system for testing purposes in accordance with building codes, ADA requirements and OSHA requirements.
11. The staging site shall meet the City's workplace safety requirements as well as the Prime Contractor's safety plan.
12. The DCSP shall provide a plan and schedule for the construction and setup of the approved staging site.
13. The DCSP shall provide lighting to meet applicable safety requirements to allow erection, application, or installation of materials and equipment, and observation or inspection of the Work.
14. The DCSP shall make the necessary provisions to maintain adequate environmental conditions to facilitate progress of the Work, to meet

specified conditions for installation of materials, and to protect materials, equipment, and finishes from damage due to impact, temperature or humidity.

15. The DCSP shall provide adequate forced air ventilation of enclosed areas to cure installed materials, to dispense humidity, and to prevent hazardous accumulations of dust, fumes, vapors, or gases.
16. The DCSP shall pay all costs of installation, maintenance, operation, removal, and fuel consumed at the approved staging area prior to transport and installation.

PART 2 – PRODUCTS (NOT USED)

PART 3 – EXECUTION

3.1 PROJECT DELIVERY SERVICES - PROCUREMENT AND STAGING

A. The DCSP shall take full responsibility for the procurement, delivery and staging of all equipment and materials required by these Contract Documents. The list below is intended to be used as a guide for DCSP and not intended to be all inclusive and complete. At a minimum, DCSP shall deliver the following to achieve a complete delivery, including procurement, staging, installation, testing, maintenance, upgrades and warranty, as required by the Work such as:

1. All COTS and DCSP software and firmware
2. All hardware for DCS
3. All DCS-related LAN and required network equipment
4. All UPS for all DCS and LAN equipment
5. All required cabinetry for DCS equipment
6. All furniture for all DCS Workstations
7. All DCS network connectivity
8. All DCS PCM-related cabling including copper, fiber optic, conduits, interducts, etc.
9. All Control System Databases
10. All Integration Equipment
11. All Security equipment
12. All specified Spare Parts and tools

3.2 PROGRAMMING

A. The DCSP shall take full responsibility for the configuration and programming of all software, and firmware required by these Contract Documents. The list below is intended to be used as a guide for DCSP and not intended to be all inclusive and complete. At a minimum, DCSP shall deliver the following to achieve a complete operating DCS:

1. All coordination of software development
2. All Control Strategy programming

3. All System software development and programming and configuration
4. All Control System Database programming
5. All Integration to "other," Foreign Device systems as required by these specifications
6. All local Historian Configuration and programming, when and where specified.
7. All Security configuration and access programming
8. All Graphics programming/configuration
9. All Trending and alarm configuration

B. All detailed programming requirements are specified in other sections.

END OF SECTION

SECTION 40 98 03
INSPECTION AND TESTING SERVICES

PART 1 GENERAL

1.1 GENERAL

A. The DCSP is responsible for all testing of all software and hardware and their operation together in project segments and the overall Enterprise-wide DCS, as a complete system.

B. The DCSP is responsible for supplying all testing tools, such as operating systems and test software, testing tools, simulation hardware and software, and equipment.

C. Inspections and tests shall be carried out to demonstrate that the Work complies with the requirements detailed in these specifications.

D. Test results shall be measurable; the performance of the test object shall be clearly specified in terms of conditions, inputs, and outputs. The specification of the whole system or relevant part shall be the starting point in all cases.

E. All testing must be accomplished in accordance with Division 1, General Requirements.

1.2 SUBMITTALS

A. The DCSP shall develop and submit to the City's representative, test procedures for all testing required by these Contract Documents in accordance with Specification 01 33 00, Submittal Procedures.

1.3 REFERENCES

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.

1. Division 1 – General Requirements
2. Specification 01 33 00 – Submittal Procedures
3. Division 26 – Electrical
4. Division 40 – Process Integration

B. Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego.

PART 2 – PRODUCT

2.1 TYPES OF INSPECTION & TESTING

A. The DCSP shall provide the following types of tests:
   1. Factory Acceptance Testing (FAT)
   2. Operational Readiness Testing (ORT)
   3. Contractor Functional Testing and Commissioning support
   4. Thirty Day Performance Acceptance Testing
   5. Integration Period Testing Support

PART 3 – EXECUTION

3.1 EXECUTION SERVICES

A. For all types of inspections and testing the DCSP shall provide experienced personnel and management in field (Staging Site, and Plant Site) to coordinate and complete all aspects of the Work in this specification.

B. At the Staging Site:
   1. The DCSP shall maintain DCS hardware and standard software by completing the following:
      a. Preventive maintenance.
      b. Demand maintenance.
      c. Replacement of failed components and parts.
      d. Replenishment of spare parts, where applicable.
      e. Recordkeeping.

C. Startup and Testing Team: Provide a team, as required by project, of experienced DCS systems engineers, hardware maintenance, and software configuration staff at the Plant site during the total period required to:
   1. Check the installation, termination, and adjustment of all subsystems and their components.
   2. Perform complete onsite tests.
   3. Provide startup assistance to the prime contractor and City staff.

3.2 FACTORY ACCEPTANCE TEST (FAT)

A. General: The complete system, including all, DCS equipment, peripheral devices and interconnecting cables shall be assembled on the DCS manufacturer's test floor or City pre-approved Staging site, and all programs shall be completely tested under simulated operating conditions. Further tests shall be performed in the field at time of start up with external sensors and field wiring connected to determine final specification compliance.

B. Four certified copies of all test data and results shall be submitted to the City. All test documentation and results shall comply with ISA RP55.1 (R1983) Type 2 and Type 3 documentation standard.

C. The equipment shall be operationally tested for compliance with the conditions of these Specifications. FAT set up shall include simulated inputs. On line configuration of the monitoring and control loops using simulated inputs shall be demonstrated without error or malfunction. Logs and report generation capability shall be demonstrated by simulating process inputs and manually entering data.

D. The DCSP shall submit a detailed FAT specification to the City at least six (6) weeks in advance of commencement of the FAT. The City shall be notified at least 30 days in advance of the FAT and reserves the right to have representatives in attendance.

E. Each item of equipment shall be fully inspected, calibrated and tested for function, operation and continuity of circuits as applicable. Exceptions shall be approved in writing from the City.

F. System performance shall be tested using a complete integrated system including all peripheral devices and interconnecting cables assembled on the test floor, complete operational programs loaded, and simulated inputs applied. The DCSP shall carry out a 100-hour full system test during which the entire system shall operate continuously without failure, all in accordance with the requirements of the specifications and drawings. If a system component fails during the test, the 100-hour test period shall be restarted after its operation is restored.

G. After successful completion of the FAT, four (4) certified copies of all test results shall be furnished to the City together with a clear and unequivocal statement that all FAT requirements have been met. The City will give written notice of the acceptability of the FAT within 30 days of receipt of the FAT results.

H. City's Representatives shall witness the FAT and at least 30 days written notice shall be given prior to date of starting tests. One copy of each acceptance test procedure shall be submitted to the City 20 days prior to the start of the acceptance test.

I. In the event that the system does not function as specified, it shall be modified to meet the specification requirements, and shall be retested as specified herein. Costs for all such retesting and witnessing shall also be borne by the DCSP.

All of the City's' representatives travel and per diem costs associated with all FAT testing and retesting shall be borne by the DCSP.

J. Prior to installation, all PIN, FIN, and DIN cable shall be factory tested by the DCSP to verify that the attenuation does not exceed prescribed limits and to

ensure that concealed or internal discontinuities which could cause reflections do not exist. In conformance with the submittal requirements of these specifications, the DCSP shall submit certified test reports which contain the following data:

1. Dielectric constant
2. Outside diameter of inner conductor
3. Inside diameter of outer conductor
4. Attenuation constant
5. Plot of each cable attenuation frequency response per 100 feet of cable.
6. All data links, which shall be the final hardware, application software, and node addresses installed in the field shall be tested during the operational readiness test.

K. Factory Acceptance Testing of Contractor Provided Package Systems

1. The DCSP shall support the FAT for all major packaged systems that contain PLC's.
2. The DCSP shall attend the packaged system FAT and shall provide all temporary hardware and software to monitor the packaged system control and data transfer for compatibility with the DCS programming for the packaged system.
3. The DCSP shall pay for all costs associated with travel to the package system FAT.
4. The package system FAT's that require the DCSP attendance are:
   a. High Purity Oxygen System FAT

3.3 INSTALLATION

A. Physical installation of the DCS PCM assemblies may be accomplished by the DCSP or as required others, under the contract. The DCSP shall provide all labor required for oversight of the installation and to verify proper installation of all equipment.

B. Subsequent to the installation of all DCS equipment, the DCSP shall certify to the City's representative that the DCS has been properly installed.

C. The DCSP shall furnish the services of trained engineer(s) to check the completed installation and to make all necessary adjustments for satisfactory operation of the DCS.

D. There shall also be furnished complete installation drawings and instructions in accordance with these Specifications. Final as built drawings, and Loop Diagrams are the responsibility of the prime contractor and/or Design Engineer. The DCSP shall furnish all drawings and technical assistance to these parties to complete these drawings.

E. If any device (including network cables) has been installed by others in a faulty manner, the DCSP shall notify the City's representative immediately.

3.4 OPERATIONAL READINESS TESTING

A. The DCSP shall time the complete DCS system testing after installation.
   1. This shall ensure that those components provided under this Contract, having adjustable features are set carefully for the specific conditions and applications of this installation and that the components and systems are within the specified limits of accuracy.
   2. The DCSP, as part of this process, shall furnish qualified engineers to assist City Operations staff with the tuning of PID loops to ensure proper operation of process equipment.
   3. The DCSP shall notify the City's representative if any existing components, including field devices or instruments provided by others, are found to be defective.
   4. Defective DCS elements which were provided under this Contract, which cannot achieve proper calibration or accuracy, either individually or within the system, or subsystem, shall be replaced and the City's representative shall be notified.
   5. The DCSP shall be responsible for performing all DCSP related portions of loop checks and testing procedures. DCSP shall be responsible for manning all PCMs, Control Room, remote Workstation locations, etc. Prime Contractor shall be responsible for manning all field devices, instruments, etc. in order to ensure a complete end-to-end loop test.
   6. Analog input channels shall be verified at a minimum of five points: 0, 25 percent, 50 percent, 75 percent and 100 percent of span by applying simulated analog test signals (using a calibrated signal generator). Applied test data shall be processed by the associated PCM using programs assigned to the particular data channels being simulated with the resulting engineering unit data presented on a display.

B. A complete DCS test shall be performed by the DCSP, including interfaces with, foreign devices and networks. All modes of operation and HMI interactions shall be exercised. All data communication equipment shall be thoroughly tested for function and accuracy. DCSP shall be responsible for DCS related items during this test and the prime contractor shall be responsible for all field devices and instruments.

C. Upon the satisfactory completion of all DCS installation tests, six (6) hard copies and one (1) soft copy in a format acceptable to the City of a certified report, including all test documentation, shall be furnished to the City's representative together with a clear and unequivocal statement that the installed system has been successfully calibrated, tuned, inspected and tested. These documents shall be submitted in accordance with Specification 01 33 00, Submittal Procedures. The City's representative will give acceptance of the installation tests within 21 days of receipt of the test report if the results of the installation tests are acceptable.

D. The DCSP shall submit six (6) hard copies and one (1) soft copy of a procedure for field hardware and software tests. In addition, a full functional procedure that pertains to the control system logic and graphic displays shall be submitted for approval by the City's representative. The procedure shall include:
   1. The object to be tested
   2. The aspects of the object to be tested
   3. The kind of tests to be carried out
   4. The conditions under which the tests shall be performed
   5. The procedures to be followed
   6. The expected results and how the results will be evaluated
   7. When the tested aspect has passed the test

E. Systems shall be exercised through operational tests in the presence of the City's representative in order to demonstrate achievement of the specified performance.

F. The equipment shall be operationally tested for compliance with the conditions of these Specifications. Online configuration of the monitoring and control loops shall be demonstrated without error or malfunction. Logs and report generation capability shall be demonstrated by simulating process inputs if actual inputs are not available from process components with City approval.

G. The proper control of all final control elements and control panels shall be verified by tests conducted in accordance with the requirements specified herein. Where feasible, system commissioning activities shall include the use of water to establish service conditions that simulate, to the greatest extent practicable, normal final control element operating ranges and environmental conditions. Final control elements, control panels, and ancillary equipment shall be tested under start-up and steady-state operating conditions to verify that proper and stable control is achieved using the DCS and local field mounted control circuits. All hardwired control circuit interlocks and alarms shall be operational. The control of final control elements and ancillary equipment shall be tested using both manual and automatic (where provided) control modes.

H. All control stations incorporating proportional, integral and/or differential (PID) control circuits shall be initially tuned using mathematical methods such as Ziegler-Nichols or Tyreus-Luyben rules in order to establish the initial parameters for closed loop control. The tuning parameters shall be refined experimentally, by applying control signal disturbances and adjusting the gain, reset and/or rate setting(s) as required to achieve a proper response. Measured final control element variable position/speed set-point settings shall be compared to measured final control element position/speed values at 10 percent, 50 percent and 90 percent of span and the results checked against specified accuracy tolerances. Specified accuracy tolerances are defined as the root-mean-square-summation of individual component accuracy requirements. Individual component accuracy requirements shall be as specified in the contract or as specified by published

manufacturer accuracy specifications whenever contract accuracy requirements are not specified.

I. Completion of all system commissioning and test activities shall be documented by a certified report, including all test forms with tests data entered, delivered to the City's representative with a clear and unequivocal statement that all system commissioning and test requirements have been satisfied. The City's representative will give written acceptance of the system commissioning and test activities.

J. In the event that the system does not function as specified, it shall be modified to meet the specification requirements, and shall be retested as specified herein. Costs for all such retesting and witnessing shall be borne by the DCSP.

K. Six (6) hard copies and one (1) soft copy of certified test data and results shall be submitted to the City's representative in accordance with Specification 01 33 00, Submittal Procedures.

3.5 DCS PERFORMANCE TEST

A. DCS performance testing shall commence after ORT and inspections have been conducted and accepted in accordance with the following B, C, D, and E, and shall demonstrate that all components of the control system can meet all contract requirements with the equipment operating over full operating ranges under actual operating conditions.

B. All commissioning and test activities shall follow detailed test procedures, and check lists, previously submitted by Contractor and approved by the City. All tests data shall be acquired using equipment as specified and recorded on test forms, previously submitted by Contractor and approved by the City.

C. The proper control of all final control elements and control panels shall be verified by tests conducted in accordance with the requirements specified herein. Where feasible DCS performance testing activities shall include the use of water to establish service conditions that simulate, to the greatest extent practicable, normal final control element operating ranges and environmental conditions. Final control elements, control panels, and ancillary equipment shall be tested under start up and steady state operating conditions to verify that proper and stable control is achieved using the distributed control system and local field mounted control circuits. All hardwired control circuit interlocks and alarms shall be operational. The control of final control elements and ancillary equipment shall be tested using both manual and automatic (where provided) control modes.

D. All control stations incorporating proportional, integral and/or differential control circuits shall be tuned experimentally, by applying control signal disturbances and

adjusting the gain, reset and/or rate setting(s) as required to achieve a proper response. Measured final control element variable position/speed set point settings shall be compared to measured final control element position/speed values at 25 percent, 50 percent and 75 percent of span and the results checked against specified accuracy tolerances.

1. Various tests required during testing may require the presence and control of a licensed wastewater operator. It is incumbent on Contractor to coordinate all tests are conducted within the regulations.
2. Contractor and its sub-contractors are responsible for the field-end testing and operation of all equipment, which may require manipulation by a licensed wastewater operator.
3. The DCSP shall be responsible for staffing at PCM cabinets, DCS peripheral equipment locations and the main control room, during commissioning phases.

E. During the commissioning phase, and possibly beyond, as may be required, the DCSP shall be responsible for coordinating, and working with Operations, in providing fine tuning of the PID controllers to ensure proper process operation. The DCSP shall also aid in setting alarm limits, top of scale setting etc., in concert with Operations.

F. Subsequent to the commissioning and performance testing of process equipment furnished by others, the DCSP shall conduct a successful 30-day performance acceptance test for the DCS furnished under this contract. In the test, the entire DCS shall be continuously operated and maintained (i.e., 7 days per week, 24 hours per day) during the test period with zero downtime resulting from DCS system failures. If a system failure occurs, the 30-day test shall be considered a failure and not acceptable. The DCSP shall reinitiate the 30-day test. The DCS shall be acceptable only after all equipment has satisfied the performance test requirements and demonstrated a system availability of 99.98 percent.

G. The system availability shall be calculated based on the following equation:

System Availability = (MTBF x 100%)/(MTBF + MTTR), where:

1. A= system availability in percent
2. MTBF = average time interval between consecutive system failures
3. MTTR = average time required to repair system failure

H. Thirty Day Acceptance Test: During this period, all System functions shall be exercised. Any System interruption and accompanying component, subsystem, or program failure shall be logged for cause of failure, as well as time of occurrence and duration of each failure. A failure may be categorized as "minor" so long as the fundamental monitoring and control functions of the system are not affected. For example, failure of a peripheral equipment, such as a printer, would fall in the minor failure category. A minor failure shall halt the 30-day acceptance

test. Upon correction of the failure, the test may continue for the remaining during. If a component failure causes disruption to proper operation of the system, it shall be considered a “major” failure. A major failure shall cause termination of the 30-day acceptance test. When the cause of a failure has been corrected, a new 30-day acceptance test shall start.

I. The DCSP shall submit a performance test completion report which shall state that all contract requirements have been met and which shall include (1) a listing of all DCS equipment maintenance/repair activities conducted during testing and (2) a listing of all components which were unable to operate successfully. The performance testing report shall be submitted in accordance with Section 01 91 14 – Testing, Integration, and Startup Submittals. Final acceptance, in writing, of the DCS will be provided by the City.

3.6 INTEGRATION PERIOD TESTING SUPPORT

A. The DCSP shall provide support during the integration period. The support shall be as described in Section 01 91 14 – Testing, Integration, and Startup

END OF SECTION

SECTION 40 98 04
FIELD CONSTRUCTION/COMMISSIONING SERVICES

PART 1 – GENERAL

1.1 THE REQUIREMENT

A. The DCSP shall be responsible for all DCS related Field Construction/Commissioning services for the facilities within this contract document.

B. The DCSP shall be responsible for monitoring Contractor Field Construction/Commissioning services, to ensure that no negative impact to DCS commissioning is occurring. In the event of such impacts, the DCSP shall immediately notify the City's representative of the impact.

1.2 REFERENCES

A. The Work described in the following sections also applies to the Work in this section. Other sections of the specifications not referenced below shall also apply to the extent required for proper performance of this Work.
   1. Division 1 – General Requirements
   2. Specification 01 33 00 – Submittal Procedures
   3. Division 26 – Electrical
   4. Division 40 – Process Integration

B. Specifications: Codes and Standards: The Work shall comply with the current editions of the publication and codes as adopted by the City of San Diego.

1.3 SUBMITTALS

A. The list below is intended to be used as a guide for DCSP and not intended to be all inclusive and complete. At a minimum, DCSP shall be responsible for the submittals below as required by the Work:
   1. Technical, operational and administrative submittals.
   2. DCS Systems Construction and Installation Schedule to be included and incorporated into the Contractor's master baseline schedule.
   3. Installation details for new UPS systems, Load Centers and both utility and UPS power and grounding, for those portions provided by the DCSP.
   4. Details for installation of all DCSP provided systems, including:
      a. All network communications.
      b. I/O wiring and termination schemes.

c. Utility and UPS power and grounding for all DCS equipment.

5. The Design Engineer is responsible for generating a complete set of P&ID Drawings for the project. However, the DCSP is responsible for providing the Design Engineer with the DCS design, termination architecture, etc. required to complete the DCS redlines of the P&ID . The Contractor shall be responsible for producing the Loop Drawings with support from the DCSP.
6. Health and Safety Plan.
7. Results of all field verification of existing conditions and documentation, where applicable.
8.
9. All test results including, but not limited to, Network Communications, including fiber optic cable tests, DCS calibration, loop checks, ground tests, and system tests.
10. Verification that each training class/course has been successfully completed, in accordance with Section 40 98 05.

PART 2 – PRODUCTS (NOT USED)

PART 3 - EXECUTION

A. Outage Forms: The DCSP shall ensure that all City required outage forms, or City/Plant work permits are completed prior to commencement of any construction.
   1. All outage request/permits shall be submitted with three hard copies and one soft copy to the City's representative.

B. General:
   1. The DCSP shall coordinate installation, construction and commissioning activities with the City's representative in accordance with the Contract Documents.
   2. The DCSP shall coordinate and participate in Preconstruction Safety Conference as specified in Division 1.
   3. The DCSP shall coordinate the overall sequence of control systems construction and installation, by the Contractor, with the City's representative.
   4. The DCSP shall establish a Health and Safety Plan for construction activities, for integration into the Contractor's H&S Plan.
   5. The DCSP shall perform all DCSP related loop checking, functional testing and commissioning in accordance with these Contract Documents.
   6. The DCSP shall coordinate system cutover and outage requests through the City's representative.

7. City's representative shall inspect all DCS and I&C system installation prior to cutover.
8. The DCSP shall coordinate the DCS system, software and performance testing with the City's representative.

C. The DCSP shall pay particular attention to both Contractor Construction sequencing and Commissioning scheduling.
   1. To ensure that the DCSP is closely monitoring and coordinating these efforts, he shall participate in weekly Commissioning and Start-Up Meetings with the City's representative and the Contractor, including attendance in the Joint Test Group meetings
   2. The DCSP shall provide a fragnet type P6 schedule, excerpted from the Contractor's master baseline status schedule, updated monthly, which shows progress and all planning activities for individual and overall Segment activities. The City's representative will review and approve/disapprove the FragNET Schedule and may require additional granularity in the schedule, if in the sole opinion of the City's representative there is not sufficient granularity in the schedule.

END OF SECTION

SECTION 40 98 05
QUALITY CONTROL

PART 1 - GENERAL

1.1 QUALITY PROGRAM

A. The DCSP shall institute a Quality Control Plan (QCP) which utilizes organized methodologies and industry standards. All manufacturing, design, development, production, installation, and field service resources of the DCSP shall be certified as conforming to all of the requirements of international quality management standard ISO 9001. The certification shall be submitted to the City's representative in accordance with Section 01 33 00, Submittal Procedures. This certification shall be a "Certification of Quality" from an internationally recognized certification agency. The plan shall include the following aspects at a minimum:

1. Quality assurance organization which complies with ISO 9001 guidelines.
2. System of traceability of manufactured unit and system software throughout development, production and testing.
3. System of "burn-in" for all components and available supportive documents.
4. Record of prompt shipments in accordance with contract obligations
5. Documented program of failure analysis.
6. Documented product safety policy relevant to all products intended to be furnished under this Contract.
7. Demonstrated record of prompt positive response to field failures.

B. Provide DCS of rugged construction design for the site conditions. Provide only new, standard, first-grade materials throughout, conforming to standards established by Underwriter's Laboratories (UL), Inc., and so marked or labeled, together with manufacturer's brand or trademark.

C. Provide material and equipment in accordance with applicable codes and standards, except as modified by the specifications.

D. Refer to Section 01 45 16, Contractor Quality Control.

1.1 SUBMITTALS

A. DCSP Project Specific Quality Control Plan (CQP): Submit, not later than 30 days after receipt of Notice to Proceed.

1.2 RISK MANAGEMENT PLAN

A. The DCSP shall assess and document all potential project risks. Risk assessment and mitigation shall include:

1. Risks shall be documented in a format to be communicated to the City's representative.
2. Each risk shall be classified in terms of probability, impact, and status.
3. High impact risks shall be discussed at project progress meetings.
4. Each risk shall have an associated mitigation plan.

1.3 DCSP QUALITY CONTROL PLAN (QCP)

A. General:

1. Plan shall identify personnel, procedures, control, instructions, test, records, and forms to be used.
2. DCS Construction will be permitted to begin only after acceptance of the Quality Control Plan (CQP).

B. Content:

1. Plan shall cover the intended quality control organization for the entire Contract and shall include the following, as a minimum:
   a. Organization: Description of the quality control organization, including a chart showing lines of authority.
   b. Quality Control Staff: The name, qualifications, duties, responsibilities, and authorities of each person assigned a QC function.
   c. Submittals: Procedures for scheduling, reviewing, certifying, and managing submittals, including those of sub DCSPs, offsite fabricators, suppliers and purchasing agents.
   d. Testing: Control, verification, and acceptance testing procedures for each specific test to include the test name, frequency, specification paragraph containing the test requirements, the personnel and laboratory responsible for each type of test, and an estimate of the number of tests is required.
   e. Procedures for tracking preparatory, initial, and follow-up control steps and control verification, and acceptance tests, including documentation.
   f. Procedures for tracking deficiencies from identification through acceptable corrective action. These procedures will establish verification that identified deficiencies have been corrected.
   g. Reporting procedures, including proposed reporting formats; include a copy of the CQC report form.

C. Acceptance of Plans: Acceptance of the DCSP's basic and addendum QC plans is required prior to the start of DCS construction. Acceptance is conditional and will be predicated on satisfactory performance during the construction. The City reserves the right to require DCSP to make changes in the QC plan and operations including removal of personnel, as necessary, to obtain the quality specified.

D. Notification of Changes: After acceptance of the QC plan, DCSP shall notify City's representative, in writing, a minimum of 7 calendar days prior to any proposed change in the plan. Proposed changes are subject to acceptance by the City's representative.

1.4 SUBMITTAL QUALITY CONTROL

A. The QC organization shall be responsible for certifying that all submittals are in compliance with the Contract requirements. City's representative will furnish copies of test report forms upon request by DCSP, or DCSP may use other forms as approved by City representative.

1.5 TESTING QUALITY CONTROL

A. Testing Procedure:

1. Perform tests specified or required to verify that control measures are adequate to provide a product which conforms to Contract requirements. Perform the following activities and record the following data:
   a. Verify testing procedures comply with contract requirements.
   b. Verify facilities and testing equipment are available and comply with testing standards.
   c. Check test instrument calibration data against certified standards and provide certification to City's representative.
   d. Verify recording forms and test identification control number system, including all of the test documentation requirements, have been prepared.
   e. Documentation:
      1) Record results of all tests taken, both passing and failing, on the QC report for the date taken.
      2) Include specification paragraph reference, location where tests were taken, and the sequential control number identifying the test.
      3) Actual test reports may be submitted later, if approved by City's representative, with a reference to the test number and date taken.
      4) Provide directly to City's representative an information copy of tests performed by an offsite, or commercial test facility,

if applicable. Test results shall be signed by an engineer registered in the state where the tests are performed.

1.6 COMPLETION INSPECTION

A. QC System Manager shall conduct an inspection of the DCS Work at the completion of all Work or any contract milestone established by a completion time stated in the Contract.

B. Punch list:

1. QC System Manager shall develop a punch list of DCS items which do not conform to the Contract requirements.
2. Include punch list in the QC report, indicating the estimated date by which the deficiencies will be corrected.
3. The QC System Manager or staff shall make a second inspection to ascertain that all deficiencies have been corrected and so notify the City's representative.
4. These inspections and any deficiency corrections required will be accomplished within the time stated for completion of the entire Work or any particular increment thereof if the Project is divided into increments by separate completion dates.

PART 2 – PRODUCTS (NOT USED)

PART 3 – EXECUTION (NOT USED)

END OF SECTION

SECTION 40 99 90
PACKAGE CONTROL SYSTEMS

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. The Institute of Electrical and Electronics Engineers, Inc. (IEEE): C62.41, IEEE Recommended Practice on Surge Voltages in Low-Voltage AC Power Circuits.
2. International Society of Automation (ISA): S50.1, Compatibility of Analog Signals for Electronic Process Instruments.
3. National Electrical Manufacturers Association (NEMA):
   a. 250, Enclosures for Electrical Equipment (1000 Volts Maximum).
   b. AB 1, Molded Case Circuit Breakers and Molded Case Switches.
   c. ICS 2, Industrial Control Devices, Controllers and Assemblies.
4. National Fire Protection Association (NFPA): 70, National Electrical Code (NEC).
5. Underwriters Laboratories Inc. (UL): 508A, Standards for Safety, Industrial Control Panels.

1.2 SYSTEM DESCRIPTION

A. Assemble panels and install instruments, plumbing, and wiring in equipment manufacturer's factories.

B. Test panels and panel assemblies for proper operation prior to shipment from equipment manufacturer's factory.

1.3 SUBMITTALS

A. Action Submittals:

1. Bill of material, catalog information, descriptive literature, wiring diagrams, and Shop Drawings for components of control system.
2. Catalog information on electrical devices furnished with system.
3. Shop Drawings, catalog material, and dimensional layout drawings for control panels and enclosures.
4. Panel elementary diagrams of prewired panels. Include in diagrams control devices and auxiliary devices, for example, relays, alarms, fuses, lights, fans, and heaters.
5. Plumbing diagrams of preplumbed panels and interconnecting plumbing diagrams.

6. Interconnection wiring diagrams that include numbered terminal designations showing external interfaces.
7. Seismic anchorage and bracing data sheets and drawings as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:

1. Programmable Controller Submittals:
   a. Complete set of user manuals.
   b. Fully documented ladder logic listings.
   c. Function listing for function blocks not fully documented by ladder logic listings.
   d. Cross-reference listing.
   e. Modbus Data Table
      1) All soft points passed between the DCS and PLC must be referenced with Modbus addressing and format.
      2) PLC will act as a slave to the DCS utilizing Modbus TCP/IP
   f. Communications hardware and configuration
2. Manufacturer's list of proposed spares, expendables, and test equipment.
3. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers' Field Services

1.4 DELIVERY, STORAGE, AND HANDLING

A. Prior to shipment, include corrosive-inhibitive vapor capsules in shipping containers and related equipment as recommended by capsule manufacturer.

1.5 EXTRA MATERIALS

A. Spares, Expendables, and Test Equipment:

1. Selector Switch, Pushbutton, and Indicating Light: 20 percent, one minimum, of each type used.
2. Light Bulb: 100 percent, 2 minimum, of each type used.
3. Fuse: 100 percent, 5 minimum, of each type used.
4. Surge Suppressors: 20 percent, one minimum, of each type used.

PART 2 PRODUCTS

2.1 GENERAL

A. Section 40 90 00, Instrumentation and Control

2.2 INSTRUMENT TAG NUMBERS

A. A shorthand tag number notation is used. For example:

12FIT345 [pH]

Notation	Explanation
12	Unit process number
FIT	ISA designator for Flow Indicating Transmitter
345	Loop number
[pH]	Same notation shown at 2 o'clock position on ISA circle symbol on Process and Instrument Diagram

2.3 SIGNAL CHARACTERISTICS

A. Analog Signals:

1. 4 to 20 mA dc, in accordance with compatibility requirements of ISA S50.1.
2. Unless otherwise specified or shown, use Type 2, two-wire circuits.
3. Transmitters: Load resistance capability conforming to Class L.
4. Fully isolate input and output signals of transmitters and receivers.

B. Discrete Signals:

1. Two-state logic signals.
2. Utilize 120V ac sources for control and alarm signals.
3. Alarm signals shall be normally open, close to alarm isolated contacts rated for 5-ampere at 120V ac and 2-ampere at 30V dc.

2.4 CORROSION PROTECTION

A. Corrosion-Inhibiting Vapor Capsule Manufacturers:

1. Northern Instruments; Model Zerust VC.
2. Hoffmann Engineering; Model A-HCI.

2.5 CONTROL PANEL

A. Panel Construction and Interior Wiring: In accordance with the National Electrical Code (NEC), UL 508, state and local codes, and applicable sections of NEMA, ANSI, and ICECA.

B. Conform to NEMA ratings as specified in individual equipment sections.

C. Minimum Metal Thickness: 14 gauge.

D. NEMA 250, Type 4X Panels: Type 316 stainless steel construction unless otherwise specified.

E. Doors:

1. Three-point latching mechanisms in accordance with NEMA 250 Type 1 and 12 panels with doors higher than 18 inches.
2. For other doors, stainless steel quick release clamps.

F. Cutouts shall be cut, punched, or drilled and finished smoothly with rounded edges.

G. Access: Front, suitable for installation with back and sides adjacent to or in contact with other surfaces, unless otherwise specified.

H. Temperature Control:

1. Size panels to adequately dissipate heat generated by equipment mounted on or in the panel.
2. Furnish cooling fans with air filters if required to dissipate heat.
3. For panels outdoors or in unheated areas, furnish thermostatically controlled heaters to maintain temperature above 40 degrees F.

I. Push-to-Test Circuitry: For each push-to-test indicating light, provide a fused push-to-test circuit.

J. Lighting: Minimum of one hand switch controlled internal 100-watt incandescent light for panels 12 cubic feet and larger.

K. Minimum of one 120-volt GFCI duplex receptacle for panels 3 cubic feet and larger or any enclosure containing a processor that is capable of communicating with a laptop computer.

L. Finish:

1. Metallic External Surfaces (Excluding Aluminum and Stainless Steel): Manufacturer's standard gray unless otherwise specified.
2. Internal Surfaces: White enamel.

M. Panel Manufacturers:

1. Hoffman.
2. H.F. Cox.

N. Breather and Drains: Furnish with NEMA 250, Type 4 and 4X panels.

1. Manufacturer and Product: Cooper Crouse-Hinds; ECD Type 4X Drain and Breather; Drain Model ECD1-N4D, Breather Model ECD1-N4B.

2.6 PROGRAMMABLE CONTROLLERS/HMI HARDWARE

A. Programmable Controller (PLC) Hardware:

1. General:
   a. PLC system shall be Allen-Bradley ControlLogix series, as specified below. No substitutes allowed.
   b. Not all equipment listed below may not be used the package control system.
   c. Control processors shall be provided in a redundant configuration where noted on the individual equipment specifications.
   d. All products shall be the latest version of each module.
2. Control Processor: Units shall be Allen-Bradley; Model 1756-L71.
3. Power Supply Module: Units shall be Allen-Bradley; Model 1756-PAR for redundant configuration and Model 1756-PA75 for non-redundant configuration.
4. PLC I/O Chassis: 10-slot chassis shall be Allen-Bradley; Model 1756-A10, 17-slot chassis shall be Allen-Bradley; Model 1756-A17.
5. Redundancy Module: Units shall be Allen-Bradley; Model 1756-RM.
6. Ethernet Communications Module: Units shall be Allen-Bradley; Model 1756-EN2T.
7. Digital Input Module: Units shall be Allen-Bradley; Model 1756-IA16I, with Model 1756-TBCH I/O Module Terminal Interface.
8. Digital Output Module: Units shall be Allen-Bradley; Model 1756-OA16I, with Model 1756-TBCH I/O Module Terminal Interface.
9. Analog Input (HART) Module: Units shall be Allen-Bradley; Model 1756-IF16H, with Model 1756-TBCH I/O Module Terminal Interface.
10. Analog Output Module: Units shall be Allen-Bradley; Model 1756-OF8, with Model 1756-TBNH I/O Module Terminal Interface.

B. Human Machine Interface (HMI) Hardware:

1. General: Operator Interface System shall be Allen-Bradley, as specified below. No substitutions allowed.
2. Graphic Display Terminal: Units shall be Allen-Bradley PanelView Plus 1500.

2.7 CONTROL PANEL ELECTRICAL

A. UL Listing Mark for Enclosures: Mark stating "Listed Enclosed Industrial Control Panel" per UL 508A.

B. I&C and electrical components, terminals, wires, and enclosures UL recognized or UL listed.

C. Control Panels without Motor Starters:

1. Furnish main circuit breaker and a circuit breaker on each individual branch circuit distributed from power panel.
2. Locate to provide clear view of and access to breakers when door is open. Group on single subpanel. Provide typed directory.
3. Circuit Breakers:
    a. Coordinate for fault in branch circuit trips, branch breaker, and not main breaker.
    b. Branch Circuit Breakers: 15 amps at 250V ac.
    c. Breaker Manufacturers and Products:
        1) Heineman Electric Co.; Series AM.
        2) Airpax/North American Philips Controls Corp.; Series 205.
        3) "Or-equal."

D. Control Panels with Three-Phase Power Supplies and Motor Starters:

1. Interlock main circuit breaker with panel door.
    a. Mount logic controls, branch circuit breakers, overload reset switches, and other control circuit devices.
    b. Mount operator controls and indications on front access door.
2. Circuit Breakers:
    a. In accordance with NEMA AB 1.
    b. 18,000-ampere RMS symmetrical rating, minimum at 480 volts, unless otherwise specified.
    c. Breakers, except Motor Branch Breakers: Molded case thermal magnetic.
    d. 14,000ampere RMS symmetrical rating, minimum at 480 volts, unless otherwise specified in package system equipment specification sections.
    e. Tripping: Indicate with operator handle position.
3. Magnetic Motor Starters:
    a. Full voltage, NEMA ICS 2, Class A, Size O minimum.

b. Include three-pole bimetallic or eutectic alloy thermal overload relays sized for each motor.
c. Manual reset type with reset button mounted on panel door.

4. Motor Control: 120V ac (except intrinsically safe circuits where applicable).
   a. Power Control Transformer:
      1) Sufficient capacity to serve connected load, including 200VA for duplex outlet plus 100VA (minimum).
      2) Limit voltage variation to 15 percent during contact pickup.
      3) Fuse one side of secondary winding and ground the other.
      4) Furnish primary winding fuses in ungrounded conductors.
5. Power Monitoring Relay:
   a. Protect three-phase equipment from single phasing, phase imbalance, or phase reversal.
   b. Separate, isolated contact outputs to stop motors and activate alarm light during abnormal conditions.
   c. Transient Voltage Protection: 10,000 volts.
   d. Manufacturer and Product:.
      1) Furnas; Class 47
      2) "Or-equal."
6. Power Distribution Blocks: Furnish to parallel feed tap on branch circuit protective devices. Do not "leap frog" power conductors.
7. Terminations for Power Conductors: Suitable for use with 75 degrees C wire at full NFPA 70, 75 degrees C ampacity.

E. Wiring:

1. ac Circuits:
   a. Type: 600-volt, Type MTW stranded copper.
   b. Size: For current to be carried, but not less than 14 AWG.
2. Analog Signal Circuits:
   a. Type: 300-volt, Type 2 stranded copper, twisted shielded pairs.
   b. Size: 18 AWG, minimum.
3. Other dc Circuits.
   a. Type: 600-volt, Type MTW stranded copper.
   b. Size: 18 AWG, minimum.
4. Separate analog and other dc circuits by at least 6 inches from ac power and control wiring, except at unavoidable crossover points and at device terminations.
5. Enclose wiring in sheet metal raceways or plastic wiring ducts.
6. Wire Identification: Numbered and tagged at each termination.
   a. Wire Tags: Machine printed, heat shrink.
   b. Manufacturers:
      1) Brady PermaSleeve.
      2) Tyco Electronics.

3) "Or-equal."

F. Wiring Interface:

1. For analog and discrete signal, terminate at numbered terminal blocks.
2. For special signals, terminate power (240 volts or greater) at manufacturer's standard connectors.
3. For panel, terminate at equipment on/with which it is mounted.

G. Terminal Blocks:

1. Quantity:
   a. For external connections.
   b. Wire spare or unused panel mounted elements to their panels' terminal blocks.
   c. Spare Terminals: 20 percent of connected terminals, but not less than 10.
2. General: Group to keep 120V ac circuits separate from 24V dc circuits.
   a. Connection Type: Screw connection clamp.
   b. Compression Clamp:
      1) Hardened steel clamp with transversal grooves penetrating wire strands providing a vibration-proof connection.
      2) Guides strands of wire into terminal.
   c. Screws: Hardened steel, captive, and self-locking.
   d. Current Bar: Copper or treated brass.
   e. Insulation:
      1) Thermoplastic rated for minus 55 to plus 110 degrees C.
      2) Two funnel shaped inputs to facilitate wire entry.
   f. Mounting:
      1) Rail.
      2) Terminal block can be extracted from an assembly without displacing adjacent blocks.
      3) End Stops: One at each end of rail, minimum.
   g. Wire Preparation: Stripping only.
   h. Jumpers: Allow jumper installation without loss of space on terminal or rail.
   i. Marking System:
      1) Terminal number shown on both sides of terminal block.
      2) Allow use of preprinted and field marked tags.
      3) Terminal strip numbers shown on end stops.
      4) Mark terminal block and terminal strip numbers as shown.
3. Manufacturer and Product: Phoenix Contact Entrelec or equal.

H. Grounding: Internal copper grounding bus for ground connections on panels, consoles, racks, and cabinets.

I. Relays:

1. General:
   a. Relay Mounting: Plug-in type socket.
   b. Relay Enclosure: Provide dust cover.
   c. Socket Type: Screw terminal interface with wiring.
   d. Socket Mounting: Rail.
   e. Furnish holddown clips.
2. Control Circuit Switching Relay, Nonlatching:
   a. Type: Compact general purpose plug-in.
   b. Contact Arrangement: 3 Form C contacts.
   c. Contact Rating: 10A at 28V dc or 240V ac.
   d. Contact Material: Silver cadmium oxide alloy.
   e. Coil Voltage: As noted or shown.
   f. Coil Power: 1.8 watts (dc), 2.7VA (ac).
   g. Expected Mechanical Life: 10,000,000 operations.
   h. Expected Electrical Life at Rated Load: 100,000 operations.
   i. Indication Type: Neon or LED indicator lamp.
   j. Push-to-test button.
   k. Manufacturer and Product: Potter and Brumfield; Series KUP.
3. Control Circuit Switching Relay, Latching:
   a. Type: Dual coil mechanical latching relay.
   b. Contact Arrangement: 2 Form C contacts.
   c. Contact Rating: 10A at 28V dc or 120V ac.
   d. Contact Material: Silver cadmium oxide alloy.
   e. Coil Voltage: As noted or shown.
   f. Coil Power: 2.7 watts (dc), 5.3VA (ac).
   g. Expected Mechanical Life: 500,000 operations.
   h. Expected Electrical Life at Rated Load: 50,000 operations.
   i. Manufacturer and Product: Potter and Brumfield; Series KB/KBP.
4. Control Circuit Switching Relay, Time Delay:
   a. Type: Adjustable time delay relay.
   b. Contact Arrangement: 2 Form C contacts.
   c. Contact Rating: 10A at 240V ac.
   d. Contact Material: Silver cadmium oxide alloy.
   e. Coil Voltage: As specified or shown.
   f. Operating Temperature: Minus 10 to 55 degrees C.
   g. Repeatability: Plus or minus 2 percent.
   h. Delay Time Range: Select range such that time delay setpoint fall between 20 to 80 percent or range.
   i. Time Delay Setpoint: As specified or shown.
   j. Mode of Operation: As specified or shown.
   k. Adjustment Type: Integral potentiometer with knob external to dust cover.
   l. Manufacturer and Products: Potter and Brumfield.

1) Series CB for 0.1-second to 100-minute delay time ranges.
2) Series CK for 0.1- to 120-second delay time ranges.

J. Intrinsic Safety Barriers:

1. Intrinsically Safe Relays: Monitor discrete signals that originate in hazardous area and are used in a safe area.
   a. Manufacturer and Product: MTL, Inc.; Series MTL 5000.
2. Intrinsically Safe Barriers: Interface analog signals as they pass from hazardous area to safe area.
   a. Manufacturer and Product: MTL, Inc.; Series MTL 5000.

K. Front-of-Panel Devices in Conjunction with NEMA 250, Type 1 and 12 Panels:

1. Potentiometer Units:
   a. Three-terminal, oiltight construction, resolution of 1 percent and linearity of plus or minus 5 percent.
   b. Single-hole, panel mounting accommodating panel thicknesses between 1/8 and 1/4 inch.
   c. Include legend plates with service markings.
   d. Manufacturers and Products:
      1) Allen-Bradley; Model 800T.
      2) Eaton/Cutler-Hammer; Model 10250T.
      3) "Or-equal."

2. Indicating Lights:
   a. Heavy-duty, push-to-test type, oiltight, industrial type with integral transformer for 120V ac applications.
   b. Screwed on prismatic glass lenses in colors noted and factory engraved legend plates for service legend.
   c. Manufacturers and Products:
      1) Eaton/Cutler-Hammer; Type 10250T.
      2) General Electric; CR2940U.
      3) "Or-equal."

3. Pushbutton, Momentary:
   a. Heavy-duty, oiltight, industrial type with full guard and momentary contacts rated for 10 amperes continuous at 120V ac.
   b. Standard size legend plates with black field and white markings for service legend.
   c. Manufacturers and Products:
      1) Square D; Class 9001, Type K.
      2) Eaton/Cutler-Hammer; Type T.
      3) General Electric; Type CR-2940.
      4) "Or-equal."

4. Selector Switch:
    a. Heavy-duty, oiltight, industrial type with contacts rated for 120V ac service at 10 amperes continuous.
    b. Standard size, black field, legend plates with white markings, for service legend.
    c. Operators: Black knob type.
    d. Single-hole mounting, accommodating panel thicknesses from 1/16 inch to 1/4 inch.
    e. Manufacturers and Products for Units with up to Four Selection Positions:
        1) Eaton/Cutler-Hammer; Type T.
        2) Square D; Type K.
        3) "Or-equal."
    f. Manufacturers and Products for Units with up to 12 Selection Positions:
        1) Rundel-Idec; Standard Cam Switch.
        2) Electroswitch; 31.
        3) "Or-equal."

L. Front-of-Panel Devices Used in Conjunction with NEMA 250, Type 4X Panels:

1. Potentiometer, Watertight:
    a. Three-terminal, heavy-duty NEMA 250, Type 4X watertight construction, resolution of 1 percent and linearity of plus or minus 5 percent.
    b. Single-hole, panel mounting accommodating panel thicknesses between 1/8 and 1/4 inch.
    c. Include engraved legend plates with service markings.
    d. Manufacturer and Product: Allen-Bradley; Bulletin 800H.
2. Indicating Lights, Watertight:
    a. Heavy-duty, push-to-test type, NEMA 250, Type 4X watertight, industrial type with integral transformer for 120V ac applications and corrosion-resistant service.
    b. Screwed on prismatic lenses and factory engraved legend plates for service legend.
    c. Manufacturers and Products:
        1) Square D; Type SK.
        2) Allen-Bradley; Type 800H.
        3) "Or-equal."
3. Pushbutton, Momentary, Watertight:
    a. Heavy-duty, NEMA 250, Type 4X watertight, industrial type with momentary contacts rated for 120V ac service at 10 amperes continuous and corrosion-resistant service.

b. Standard size, black field, legend plates with white markings for service legend.
c. Manufacturers and Products:
1) Square D; Type SK.
2) Allen-Bradley; Type 800H.
3) "Or-equal."

4. Selector Switch, Watertight:
a. Heavy-duty, NEMA 250, Type 4X watertight, industrial type with contacts rated for 120V ac service at 10 amperes continuous and corrosion-resistant service.
b. Standard size, black field, legend plates with white markings, for service legend.
c. Operators: Black knob type.
d. Single-hole mounting, accommodating panel thicknesses from 1/16 to 1/4 inch.
e. Manufacturer and Products:
1) Square D; Class 9001, Type SK.
2) Allen-Bradley; Type 800H.
3) "Or-equal."

2.8 NAMEPLATES, NAMETAGS, AND SERVICE LEGENDS

A. Nametags: Permanently mounted bearing entire ISA tag number.

1. Panel Mounted: Plastic, mounted to instrument behind panel face.
2. Field Mounted: Engraved Type 316 stainless steel, 22-gauge minimum thickness, attached with stainless steel.

B. Service Legends (Integrally Mounted with Instrument) and Nameplates:

1. Engraved, rigid, laminated plastic type with adhesive back. Furnish service legends and nameplates to adequately describe functions of panel face mounted instruments.
2. Color: White with black letters.
3. Letter Height: 3/16 inch.
4. For each panel, face mounted laminated nameplate inscribed with the panel name and tag number. Color shall be white with black letters 1/2 inch high.

C. Standard Light Colors and Inscriptions: Unless otherwise specified in individual equipment specifications, use the following color code and inscriptions:

Tag	Inscription(s)	Color
ON	ON	Green
OFF	OFF	Red

Tag	Inscription(s)	Color
OPEN	OPEN	Green
CLOSED	CLOSED	Red
LOW	LOW	Amber
FAIL	FAIL	Amber
HIGH	HIGH	Amber
AUTO	AUTO	White
MANUAL	MANUAL	Yellow
LOCAL	LOCAL	White
REMOTE	REMOTE	Yellow
FORWARD	FORWARD	Red
REVERSE	REVERSE	Blue

1. Lettering: Black on white and amber lenses; white on red and green lenses.
2. Standard Pushbutton Colors and Inscriptions:
   a. Use following unless otherwisenoted:

Tag Function	Inscription(s)	Color
OO	ON OFF	Black Black
OC	OPEN CLOSE	Black Black
OCA	OPEN CLOSE AUTO	Black Black Black
OOA	ON OFF AUTO	Black Black Black
MA	MANUAL AUTO	Black Black
SS	START STOP	Black Black
RESET	RESET	Black

Tag Function	Inscription(s)	Color
EMERGENCY STOP	EMERGENCY STOP	Red

b. Lettering Color:
   1) Black on white and yellow buttons.
   2) White on black, red, and green buttons.

D. Grounding:

1. Coordinate surge suppressor grounding in field panels and field instrumentation as specified in Section 26 05 26, Grounding and Bonding for Electrical Systemsand suppressor manufacturer's requirements.
2. Provide control panels with an integral copper grounding bus for connection of suppressors and other required instrumentation.

PART 3 EXECUTION

3.1 ELECTRICAL POWER AND SIGNAL WIRING

A. Restrain control and signal wiring in control panels by plastic ties or ducts. Secure hinge wiring at each end so bending or twisting will occur around the longitudinal axis of wire. Protect bend area with a sleeve.

B. Arrange wiring neatly, cut to proper length, and remove surplus wire. Install abrasion protection for wire bundles passing through holes or across edges of sheet metal.

C. Use manufacturer's recommended tool with sized anvil for crimp terminations. No more than one wire may be terminated in a single crimp lug. No more than two lugs may be installed on a single screw terminal.

D. Do not splice or tap wiring except at device terminals or terminal blocks.

3.2 PROTECTION

A. Protect enclosures and other equipment containing electrical, instrumentation and control devices, including spare parts, from corrosion through the use of corrosion-inhibiting vapor capsules.

B. During Work, periodically replace capsules in accordance with capsule manufacturer's recommendations. Replace capsules at Substantial Completion.

SECTION 41 22 13.13
OVERHEAD BRIDGE CRANE

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Society of Mechanical Engineers (ASME):
   a. B30.2, Overhead and Gantry Cranes (Top Running Bridge, Single or Multiple Girder, Top Running Trolley Hoist).
   b. B30.10, Hooks.
   c. B30.11, Monorails and Underhung Cranes.
   d. B30.17, Overhead and Gantry Cranes (Top Running, Single Girder).
   e. HST 1M, Performance Standard for Electric Chain Hoists.
   f. HST 2M, Performance Standard for Hand Chain Manually Operated Chain Hoists.
   g. HST 4M, Overhead Electric Wire Rope Hoists.
2. Crane Manufacturer's Association of America (CMAA):
   a. 70, Electric Overhead Traveling Cranes.
   b. 74, Top Running & Under Running Single Girder. Electric Overhead Traveling Cranes.
3. National Electrical Manufacturer's Association (NEMA):
   a. MG 1, Motors and Generators.
   b. 250, Enclosures for Electrical Equipment (1,000 volts maximum).
4. National Fire Protection Association (NFPA): 70, National Electrical Code (NEC).
5. Occupational Safety and Health Act (OSHA).
6. Underwriters Laboratory (UL): 674, Electric Motors and Generators for Use in Division 1 Hazardous (Classified) Locations.

1.2 DESIGN REQUIREMENTS

A. Top-Running Multiple-Girder Overhead Traveling Crane: CMAA No. 70 and ASME B30.2 and B30.17.

B. Top-Running and Underhung Single-Girder Overhead Traveling Cranes: CMAA No. 74, and ASME B30.11.

C. Crane Service Class: CMAA No. 74.

D. Trolley Service Class: CMAA No. 70.

E. Wire Rope Hoist Service Class: ASME HST 4M and CMAA No. 70 or No. 74.

F. Chain Hoist Service Class: ASME HST 1M and CMAA No. 70 or No. 74.

G. Hook: ASME 30.10.

H. Building Clearances: CMAA No. 70 and No. 74. Where bridge span exceeds 40 feet, increase clearance to 6 inches.

I. Stress and Safety Factors: CMAA No. 70 and No. 74. Properly select materials of construction for stresses to which subjected.

J. Safety of Operation, Accessibility, Interchangeability, and Durability of Parts: ASME B30.2.0 and OSHA requirements. Design equipment for environment operated.

K. Provide system, equipment, and components, including supports and anchorages, designed in accordance with Section 01 61 00, Common Product Requirements**.**

1.3 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Make, model, weight, and horsepower of each equipment assembly.
   b. Complete catalog information, descriptive literature, materials of construction, and specifications on bridge drive system, end trucks, runway stops, foot walks and platforms, wheels, shafting, drive motor, gears and bearing, steel framing, trolley drive system, hoist motor and assemblies, hook, brakes, starting system, variable speed drive system, conductors (bus bar, festoon, cable reel), controls, remote control system, and accessories.
   c. Structural design calculations for runway beams and support system, and calculations of loads on support structure stamped by a California registered professional civil or structural engineer**.**
   d. Detail Shop Drawings of crane runways, brackets, hangers, and their attachments to building structural steel.
   e. Power and control wiring diagrams, including terminals and numbers.
   f. Motor nameplate data in accordance with NEMA MG 1 and include any motor modifications.
   g. Factory finish system.

B. Informational Submittals:

1. Special shipping, storage and protection, and handling instructions.
2. Manufacturer's printed installation instructions.
3. Manufacturer's Certification of Compliance that the factory finish system is identical to the requirements specified herein.
4. Factory Functional Test Report
5. Suggested spare parts list to maintain the equipment in service for a period of 3 years**.** Include a list of special tools required for checking, testing, parts replacement, and maintenance with current price information.
6. List special tools, materials, and supplies furnished with equipment for use prior to and during startup and for future maintenance.
7. Operation and Maintenance Data: As specified in Section 01 78 23, Operation and Maintenance Data.
8. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers' Field Services**.**

1.4 ENVIRONMENTAL REQUIREMENTS

A. Temperature: Maximum 100 degrees; minimum 60 degrees F.

B. Humidity: 70 percent.

C. Atmosphere: Moderately corrosive.

1.5 EXTRA MATERIALS

A. Furnish for each remote control crane:

1. One transmitter.
2. One battery.

PART 2 PRODUCTS

2.1 GENERAL

A. Provide overhead bridge crane with top-running bridge beam and under-running trolley as shown on the Drawings, with rated weight capacity as shown on the Drawings.

B. Crane manufacturer to coordinate equipment requirements with steel structures, panels, drive motor, control panel, trolley and hoist, hoisting cable or chain, hook, crane mounted conductors, rails, stops, and electrical equipment controls.

C. Where adjustable speed drives or remote control systems are required, crane manufacturer to furnish a coordinated operating system.

2.2 CRANE DATA TABLE

Parameter	Quantity or Description
Bridge Beam Span	51'-6"
Bridge Depth	2'-0"
Number of Bridge Girders	2
Hook Height-Retracted	19'-11"
Heights of Bottom Flange of Bridge Beam AFF	21'-0"
Bridge Beam Type	Top Running
Trolley Type	Under Running
Bridge Crane Rated Capacity	10 Tons
Minimum Horizontal Distance from Hook to Centerline of Rail Beams at Full Range of Trolley Travel	75"
Pendant	2 remote wireless pendants to be provided
Speed of Travel	
High Hook Requirements	
Low Hook Requirements	

A. See supplements to this section for additional requirements.

2.3 RUNWAY

A. Runway beams, brackets, and associated framework furnished under Section 05 12 00, Structural Steel Framing. Furnish runway beams, brackets, and associated framework in accordance with Section 05 12 00, Structural Steel Framing.

B. Runway rails shall conform to cross-sections and weights per yard as specified in CMAA No. 70 or No. 74. Furnish rails, rail connections, crane stops, and conductors by crane manufacturer.

2.4 BRIDGE

A. Furnish girders from structural shapes proportioned to resist vertical, lateral, and torsional forces.

B. Construct bridge end trucks in accordance with CMAA No. 70 or No. 74. Furnish end trucks with rail sweeps and impact-absorbing bumpers.

C. Furnish runway stops attached to resist force applied when contacted and locate at limit of travel of bridge. Runway stops shall not engage the wheels.

D. Provide bridge travel limit switches, located approximately 5 feet from each end of bridge runway, or as required such that bridge travel speed is reduced to low speed prior to bridge engaging runway end-stops. Bridge drive speed past the limit switch locations shall be limited to low speed.

E. Wheels: Rolled or forged steel with treads and flanges heat treated, or cast iron wheels with chilled tread. Minimum tread hardness 200 Brinell. Clearances, wheel loads, and tolerances in accordance with CMAA No. 70 or No. 74. Wheel axles of alloy steel, machined and ground to receive inner bearing races. Use rotating axles and wheels mounted by press fit and keys. For top-running cranes provide rotating axles and wheels mounted by press fit and keys. For under-running trolley provide fixed axles with wheels accurately machined and ground to receive inner bearing races.

F. Bridge driving machinery consisting of a cross shaft driven by an electrical motor through a gear speed reducer unit. Cross shaft, high-grade steel, turned, ground, polished, and adequately supported with self-aligning bearings. Shaft diameter to resist torsional strains when bridge is traveling under full load, or when stopped suddenly. Furnish oil-tight speed reducer gear case and support on common base with bridge brake. Bridge motors shall be provided with VFDs capable of adjusting the speed between 52 FPM and 105 FPM.

G. Drive Gears: Helical, spur or herringbone type, rolled or cast steel, with machine cut teeth.

H. Bearings: Combination radial and thrust type, double row, spherical ball, either prelubricated and sealed or fitted for pressure lubrication. Pressure lubrication fittings for maintenance accessibility.

I. Brakes: Electrically operated, adjustable, suitable for the service class indicated, with rated torque capacities as specified in CMAA No. 70 or CMAA No. 74.

2.5 TROLLEY

A. Frame: Ductile iron construction. Design to control deflection of trolley assembly while transmitting the carrying load to bridge rails. Provide under-running trolley type.

B. Drive shall consist of trolley drive shaft, driven by an electric motor through a gear reduction unit.

C. Drive shall consist of chain sprocket mounted on shaft. Furnish chain to within 5 feet of operating floor level. Drive shaft shall drive the trolley wheels through a gear and pinion or spur gear arrangement.

D. Furnish roller assembly stabilizers on single-girder trolley units to prevent tipping during load pickup.

E. Wheels: 4-inch diameter rolled C-1040 steel, accurately machined and ground to receive inner bearing races. Furnish alloy steel axles. Rotating axles with wheels mounted press fit and keys, or with keys alone. Minimum tread hardness 210 Brinell.

F. Drive Gears: Helical, spur or herringbone type, rolled or cast steel, with machine cut teeth.

G. Bearings: Combination radial and thrust type, double row, angular contact ball bearings or single-row tapered roller bearings. Bearings prelubricated and sealed, or fitted for pressure lubrication. Locate pressure lubrication fittings for accessibility during maintenance.

H. Brakes: Suitable for service class and rated torque capacities as specified in ASME B30.11. Furnish stops on trolley rails or beams.

I. Provide trolley travel limit switches, located approximately 6 feet to 8 feet from each end of trolley rails/beams, or as required such that trolley travel speed is reduced to low speed prior to trolley engaging the trolley end-stops. Trolley drive speed past the limit switch locations shall be limited to low speed.

J. Trolley Motors: 2 motors at maximum 1.0 Hp each. Provide 2-speed VFD with speed settings of 75 feet per minute and 19 feet per minute. Provide

TEFC, NFMA design B, squirrel cage induction type, inverter duty rated motors.

2.6 HOIST

A. Wire Rope Hoisting Machinery: Rope drum driven through gear reductions, load blocks, hook, hoisting rope, sheaves, and hoist braking. Drum size and length sufficient for minimum two turns of cable remaining on drum when hook is at lowest position. Furnish reeving as specified on supplement located at end of section. Provide right and left-hand grooved drum when two-part double reeving is specified.

B. Rope drum and surrounding members constructed to minimize abrasion, crushing or jamming of hoist rope. Load blocks enclosed type. Hoisting rope extra flexible, improved plow steel wire rope, made especially for hoist service.

C. Hook: Construct with sufficient ductility to open noticeably before hook failure, equipped with safety latch, free to rotate 360 degrees with rated load and positively held in place with locknuts, collars or other devices.

D. Brakes: Mechanical and electric load brake and controls, designed in accordance with ASME 4M, and adjustable to compensate for wear. Provide gear brake and inverter duty motor brake.

E. Chain Hoisting Machinery: Load chain wheel driven through gear reductions, an electric motor, a hand chain wheel**,** load blocks, sheaves, chain, hook, and hoist braking.

F. Chain: Nonjamming alloy type**.** Chain hoists shall have chain storage adequate for storing the full lift length of chain and shall be designed and located to avoid interference while hoisting. Provide 30 feet of available lift.

G. Hook: Construct with sufficient ductility to open noticeably before hook failure, equipped with safety latch, free to rotate 360 degrees with rated load, and positively held in place with locknuts, collars or other devices.

H. Brakes: In accordance with ASME HST 1M and HST 2M, adjustable to compensate for wear, positive action, Weston type mechanical load brake, with uniform composition lining and forged steel alloy latch pawl.

I. Hoist Motor: Nominal motor horsepower between 5 Hp and 7.5 Hp. Provide 2-speed VFD with speed settings of 17 FPM and 4 FPM.

2.7 ELECTRICAL

A. Furnish electrical equipment including motors, motor starters, pendant control, control systems, wire, and conduit. Bridge conductors may be removed for shipment. Crane wiring by crane supplier.

B. Electrical: In accordance with NFPA 70, NEC Article 610.

C. Furnish motors compatible with adjustable frequency, variable speed, drive system suitable for hoist, trolley, and bridge drive applications. Controls with 120-volt ac, microprocessor based, pulsed width modulation design, withstand 45 degree C temperatures, housed in NEMA 250, Type 4 enclosure, and supplied with 200 percent overcurrent protection.

D. Bridge and trolley conductor voltage drops from runway supply taps shall permit the crane motors to operate within voltage tolerances of plus or minus 10 percent, when building supply voltage is at plus or minus 5 percent of design voltage.

E. Enclosed Bus Bar Conductors: Stainless steel clad hard copper enclosed in insulation. Collector mechanism components: aluminum, stainless steel, plastic, or other noncorrosive materials.

F. Grounding: External in accordance with NFPA 70, NEC Article 250.

2.8 CONTROLS

A. Furnish electric cranes with pendant control having momentary contact pushbuttons with a device which will disconnect motors from line on failure of power. Device shall not permit any motor to be restarted until controller handle is brought to the OFF position, or a reset switch or button is operated. Furnish with undervoltage protection as a function of each motor controller, or by magnetic main line contactor.

B. Controls: Fully magnetic, plain reversing type, housed in NEMA 250, Type 12 enclosure, with contactors of sufficient size and quantity for starting, accelerating, reversing, and stopping duty for specified crane service class.

C. Bridge and Trolley Drives: Soft start controls, 460/230-volt ac series device, installed in between drive motor and motor starter with torque and acceleration rate adjustable, suitable for crane service, and work in conjunction with crane controls.

D. Backup Pushbutton Control Stations: Heavy-duty, oil tight, suspended from trolley, with control transformers to supply 120-volt ac power to pushbutton control station. Pushbutton enclosure supported with chain or wire rope. Control wire cable attached to support chain or wire rope at not more than 6-foot intervals. Furnish control station buttons for control of bridge, trolley, and hoist, ON/OFF main line contactor power switch which removes all power from crane and controls.

E. Remote Control System: Infrared, line-of-sight system, handheld and capable of operating all crane functions.

F. Control motions indicate direction of resultant crane motion. Furnish spring-loaded switch motions, with return to OFF position when switch is released and designed to prevent runaway crane situations.

G. Crane motions shall stop automatically when crane can no longer receive remote signals and designed to stop when control signal for any motion becomes ineffective.

H. Remote Control Crane Motions: Hook raise and lower, trolley movement, bridge movement, and crane power up and power. Furnish an EMERGENCY OFF pushbutton station which will disconnect main line power via a remote switch, and manual reset function to activate all motions after an EMERGENCY OFF event.

2.9 ACCESSORIES

A. Equipment Identification Plate: 16-gauge stainless steel with 1/4-inch die-stamped equipment tag number securely mounted in a readily visible location. Mounted on separate components of each crane assembly, to facilitate assembly in the field.

B. Lifting Lugs: Equipment weighing over 100 pounds.

2.10 FACTORY FINISHING

A. Prepare and prime coat in accordance with Section 09 90 00, Painting and Coating.

2.11 SOURCE QUALITY CONTROL

A. Factory Inspections: Inspect control panels and equipment for required construction, electrical connection, and intended function.

B. Factory Tests and Adjustments**:** No-load run test all equipment furnished.

C. Factory test report shall include Test Data Sheets.

2.12 MANUFACTURER

A. CraneVeyor Corporation, El Monte, CA

B. TC American

C. Spanco

D. Or equal

PART 3 EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's printed instructions.

B. Provide lubrication and lubrication fittings.

3.2 FIELD FINISHING

A. Equipment as specified in Section 09 90 00, Painting and Coating.

3.3 FIELD QUALITY CONTROL

A. Functional Test: Conduct on each crane.

1. Alignment: Test complete assemblies for proper alignment and connection, and quiet operation.

B. Performance Test:

1. Conduct on each crane.
2. Load tests in compliance with OSHA, ASME B30.11, and ASME B30.16.

3.4 MANUFACTURER'S SERVICES

A. Manufacturer's Representative: Present at Site or classroom designated by Owner for minimum person-days listed below, travel time excluded:

1. One person-days for installation assistance and inspection.
2. One person-days for functional and performance testing and completion of Manufacturer's Certificate of Proper Installation.
3. One person-days for prestartup classroom or Site training.

4. One person-days for facility startup.

B. See Section 01 43 33, Manufacturers' Field Services and Section 01 91 14, Testing, Integration, and Startup.

END OF SECTION

SECTION 41 22 23.19
MONORAIL HOISTS AND JIB CRANES

PART 1 GENERAL

1.1 GENERAL

A. Provide monorail hoists and jib cranes as shown on structural and mechanical drawings. Rated weight capacity shall be shown on the Drawings.

1.2 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American National Standards Institute (ANSI): MH27.1, Underhung Cranes and Monorail Systems.
2. American Society of Mechanical Engineers (ASME):
   a. B30.10, Hooks.
   b. B30.11, Monorails and Underhung Cranes.
   c. HST 1M, Performance Standard for Electric Chain Hoists.
   d. HST 2M, Performance Standard for Hand Chain Manually Operated Chain Hoists.
   e. HST 4M, Performance Standard for Overhead Electric Wire Rope Hoists.
3. National Electrical Manufacturer's Association (NEMA):
   a. MG 1, Motors and Generators.
   b. 250, Enclosures for Electrical Equipment (1,000 volts maximum).
4. National Fire Protection Association (NFPA): 70, National Electrical Code (NEC).
5. Occupational Safety and Health Act (OSHA).
6. Underwriters Laboratory (UL): 674, Electric Motors and Generators for Use in Division 1 Hazardous (Classified) Locations.

1.3 DESIGN REQUIREMENTS

A. Monorail System: Specifications for Underhung Cranes and Monorail Systems, ANSI MH27.1 and ASME B30.11.

B. Hoist: ASME B30.11, Hoist Manufacturers' Institute.

C. Trolley: ANSI MH27.1.

D. Wire Rope Hoist Service Class: ASME HST 4M.

E. Chain Hoist Service Class: ASME HST 1M.

F. Hook: ASME 30.10.

G. Stress and Safety Factors: ANSI MH27.1 and ASME B30.11. Properly select materials of construction for stresses to which subjected.

H. Safety of Operation, Accessibility, Interchangeability, and Durability of Parts: ASME B30.11 and OSHA requirements.

I. Provide system, equipment, and components, including supports and anchorages, designed in accordance with Section 01 88 15, Anchorage, Thrust Restrain and Bracing.

1.4 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Make, model, weight, and horsepower of each equipment assembly.
   b. Complete catalog information, descriptive literature, materials of construction, and specifications on hoist, wheels, gears and bearing, trolley drive system, hoist motor and assemblies, hook, brakes, starting system, variable speed drive system, conductors (bus bar, festoon, cable reel), controls, remote control system, and accessories.
   c. Structural design calculations for monorail track and support system and calculations of deflection and loads on building steel stamped by a California registered professional civil or structural engineer**.**
   d. Detail Shop Drawings of monorail track, brackets, hangers, and their attachments to building structural steel.
   e. Power and control wiring diagrams, including terminals and numbers.
   f. Motor nameplate data in accordance with NEMA MG 1, and include any motor modifications.
   g. Factory finish system.
   h. Design calculations and connection details for the wall-mounted bracket connections, by a licensed California civil or structural engineer in the employ of the Contractor.

B. Informational Submittals:

1. Special shipping, storage and protection, and handling instructions.
2. Manufacturer's printed installation instructions.
3. Manufacturer's Certification of Compliance that factory finish system is identical to requirements specified herein.
4. Factory Functional Test Report.

5. Suggested spare parts list to maintain the equipment in service for a period of 3 years. Include a list of special tools required for checking, testing, parts replacement, and maintenance with current price information.
6. List special tools, materials, and supplies furnished with equipment for use prior to and during startup and for future maintenance.
7. Operation and Maintenance Data: As specified in Section 01 78 23, Operation and Maintenance Data.
8. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers' Field Services**.**

1.5 ENVIRONMENTAL REQUIREMENTS

A. Temperature: Maximum 100 degrees; minimum 60 degrees F.

B. Humidity: 70 percent.

C. Atmosphere: Moderately corrosive.

1.6 EXTRA MATERIALS

A. Furnish for each remote control crane:

1. One transmitter.
2. One battery.

PART 2 PRODUCTS

2.1 GENERAL

A. No "or-equal" or substitute products will be considered.

B. Hoist and trolley manufacturer to coordinate equipment requirements with steel structures, drive motor, hoisting cable or chain, hook, track, stops, and electrical equipment controls.

C. Where adjustable speed drives or remote control systems are required, crane manufacturer to furnish a coordinated operating system.

2.2 SUPPLEMENTS

A. See supplements to this section for additional requirements.

2.3 TRACK OR CANTILEVER JIB BOOM

A. Monorail: Furnish monorail track or cantilever jib boom in accordance with Section 05 12 00, Structural Steel Framing. Provide steel I-beam reinforced

with ccp channels and stiffeners. Provide A36 steel and 316 stainless steel bolts and hardware.

B. Track Design Criteria:

1. Cross-Section: Design for stresses not exceeding 60 percent of material's yield strength and deflection not to exceed 1/800 of span.
2. Span: As shown on Drawings. Ratio of span to top flange width shall not exceed 60 to 1 for spans over 16 feet. Lower load-carrying flange minimum of 3-1/4-inch width and have raised running or wear tread.
3. Couplings: Web type at track joints with maximum gap at track ends of load-carrying flange of 1/16 inch and 3/16 inch at turntable, switch, or free ends.
4. Stops: Furnish stops and impact-absorbing bumpers at both boom or track ends.
5. Design for vertical force increased by 25 percent for impact.
6. Design for longitudinal force of 10 percent of vertical force.
7. Design for torsional forces caused by eccentric loading, lateral forces, or offset connections.
8. Consider fatigue and stress on bottom flange due to wheel loading.

C. Track Suspension:

1. Furnish clamps, hanger rods, and fittings to support live and dead load of hoist, trolley, controls, motors, and track.
2. Hanger Rods: High carbon, cold-rolled alloy steel with unified national fine, Class 2 screw thread ends.
3. Vertical Adjustment: 1 inch adjustable.
4. Lubricant: Permanent factory prelubricated joints.

2.4 WALL MOUNTING BRACKETS FOR JIB CRANE

A. Provide A36 steel wall mounting brackets supplied by job crane manufacturer, with 316 stainless steel bolts and mounting hardware.

2.5 TROLLEY

A. Frame: Welded steel, cast steel, or ductile iron construction, or a combination thereof. Construct to control deflection of trolley assembly while transmitting the carrying load to running surface.

B. Drive shall consist of trolley drive shaft, driven by an electric motor through a gear reduction unit.

C. Drive shall consist of chain sprocket mounted on shaft. Furnish chain to within 5 feet of operating floor level. Drive shaft shall drive the trolley wheels through a gear and pinion or spur gear arrangement.

D. Furnish roller assembly stabilizers on single-girder trolley units to prevent tipping during load pickup.

E. Wheels: Rolled or forged steel, accurately machined and ground to receive inner bearing races. Furnish alloy steel axles. Rotating axles with wheels mounted press fit and keys, or with keys alone. Minimum tread hardness 210 Brinell.

F. Drive Gears: Helical, spur or herringbone type, rolled or cast steel, with machine cut teeth.

G. Bearings: Combination radial and thrust type, double row, angular contact ball bearings or single-row tapered roller bearings. Bearings prelubricated and sealed, or fitted for pressure lubrication. Locate pressure lubrication fittings for accessibility during maintenance.

H. Brakes: Suitable for service class and rated torque capacities as specified in ASME B30.11.

2.6 HOIST

A. Wire Rope Hoisting Machinery: Rope drum driven through gear reductions, load blocks, hook, hoisting rope, sheaves, and hoist braking. Drum size and length sufficient for minimum two turns of cable remaining on drum when hook is at lowest position. Furnish reeving as specified on Supplements at end of section. Provide right and left-hand grooved drum when two-part double reeving is specified.

B. Rope drum and surrounding members constructed to minimize abrasion, crushing or jamming of hoist rope. Load blocks enclosed type. Hoisting rope extra flexible, improved plow steel wire rope, made especially for hoist service.

C. Hook: Construct with sufficient ductility to open noticeably before hook failure, equipped with safety latch, free to rotate 360 degrees with rated load and positively held in place with locknuts, collars or other devices.

D. Brakes: Mechanical and electric load brake and controls, designed in accordance with ASME 4M, and adjustable to compensate for wear.

E. Chain Hoisting Machinery: Load chain wheel driven through gear reductions, an electric motor load blocks, sheaves, chain, hook, and hoist braking.

F. Chain: Nonjamming alloy type. Hand wheel shall have a guard that prevents chain slipping or jumping. Chain hoists shall have chain storage adequate for storing full lift length of chain and shall be designed and located to avoid interference while hoisting.

G. Hook: Construct with sufficient ductility to open noticeably before hook failure, equipped with safety latch, free to rotate 360 degrees with rated load, and positively held in place with locknuts, collars or other devices.

H. Brakes: In accordance with ASME HST 1M and ASME HST 2M, adjustable to compensate for wear, positive action, Weston type mechanical load brake, with uniform composition lining and forged steel alloy latch pawl.

2.7 ELECTRICAL

A. Furnish electrical equipment including motors, motor starters, pendant control, control systems, wire, and conduit.

B. Electrical: In accordance with NFPA 70, NEC Article 610.

C. Furnish motors compatible with adjustable frequency, variable speed, drive system, 40 to 1 speed range, suitable for hoist, trolley, and bridge drive applications. Controls with 120V ac, microprocessor based, pulsed width modulation design, withstand 45 degree C temperatures, housed in NEMA 250, Type 4 enclosure, and supplied with 200 percent overcurrent protection.

D. Monorail conductor voltage drops from monorail track supply taps shall permit the hoist and trolley motors to operate within voltage tolerances of plus or minus 10 percent, when building supply voltage is at plus or minus 5 percent of design voltage.

E. Enclosed Bus Bar Conductors for monorails: Stainless steel clad. Collector mechanism components aluminum, stainless steel, plastic, or other noncorrosive materials.

F. Festooned Flat Cable Conductors for jib cranes: Flexible cable, carried by heavy-duty roller, permanently lubricated roller bearings, with monorail support system that will dispense and retrieve flexible cable without twisting or tangling, and 20 percent spare conductor in each cable assembly.

G. Grounding: External in accordance with NFPA 70, NEC Article 250.

2.8 CONTROLS

A. Hoist and Trolley: Pendant control having Momentary contact pushbuttons with a device which will disconnect motors from line on failure of power.

Device shall not permit any motor to be restarted until controller handle is brought to the OFF position, or a reset switch or button is operated. Furnish with under voltage protection as a function of each motor controller, or by magnetic main line contactor.

B. Pushbuttons: Fully magnetic, plain reversing type, housed in NEMA 250, Type 12 enclosure, with contactors of sufficient size and quantity for starting, accelerating, reversing, and stopping duty for specified hoist service class.

C. Trolley Drives: Soft start controls, 460/230V ac series device, installed between drive motor and motor starter with torque and acceleration rate adjustable, suitable for trolley drive service, and work in conjunction with crane control and pendant system.

D. Remote Control System: Infrared, line-of-sight system, handheld and capable of operating all monorail functions.

E. Backup Pendant Pushbutton Control Station: Heavy-duty, oil tight, suspended from hoist with control transformers to supply 120V ac power to pushbutton control station. Pushbutton enclosure supported with chain or wire rope. Control wire cable attached to support chain or wire rope at not more than 6-foot intervals. Furnish control station buttons for control of hoist and trolley ON/OFF main line contactor power switch which removes all power from control station.

F. Control motions indicate direction of resultant monorail motion. Furnish spring-loaded switch motions, with return to OFF position when switch is released and designed to prevent runaway monorail situations.

G. Monorail and jib crane motions shall stop automatically when monorail and jib crane can no longer receive remote signals and designed to stop when control signal for any motion becomes ineffective.

H. Remote Control Monorail and Jib Crane Motions: Hook raise and lower, trolley movement, and monorail power up and power down. Furnish an EMERGENCY OFF pushbutton station which will disconnect main line power via a remote switch, and manual reset function to activate all motions after an EMERGENCY OFF event.

2.9 ACCESSORIES

A. Equipment Identification Plate: 16-gauge stainless steel with 1/4-inch die-stamped equipment tag number securely mounted in a readily visible location.

B. Lifting Lugs: Equipment weighing over 100 pounds.

2.10 FACTORY FINISHING

A. Prepare and prime coat in accordance with Section 09 90 00, Painting and Coating.

2.11 SOURCE QUALITY CONTROL

A. Factory Inspections: Inspect control panels and equipment for required construction, electrical connection, and intended function.

B. Factory Tests and Adjustments**:** No-load run test all equipment furnished.

C. Factory test report shall include Test Data Sheets.

2.12 MANUFACTURER

A. CraneVeyor Corporation.

B. TC American.

C. Spanco.

D. Or equal.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's printed instructions.

B. Provide lubrication and lubrication fittings.

3.2 FIELD FINISHING

A. Equipment as specified in Section 09 90 00, Painting and Coating.

3.3 FIELD QUALITY CONTROL

A. Functional Tests: Conduct on each hoist and monorail system.

1. Alignment: Test complete assemblies for proper alignment and connection, and quiet operation.

B. Performance Test:

1. Conduct on each hoist and monorail system.
2. Load tests in compliance with OSHA, ASME B30.11, and ANSI MH27.1

3.4 MANUFACTURER'S SERVICES

A. Manufacturer's Representative: Present at Site or classroom designated by Owner, for minimum person-days listed below, travel time excluded:

1. One person-days for installation assistance and inspection.
2. One person-days for functional and performance testing and completion of Manufacturer's Certificate of Proper Installation.
3. One person-days for prestartup classroom or Site training.
4. One person-days for facility startup.

B. See Section 01 43 33, Manufacturers' Field Services and Section 01 91 14, Testing, Integration, and Startup.

3.5 SUPPLEMENTS

A. The supplements listed below, following "End of Section," are a part of this Specification.

1. Hoist/Monorails Data Sheet (Screening Building Lower Level)
2. Hoist/Monorail Dimension Sheet (Screening Building Upper Level)
3. Induction Motor Data Sheet.

SECTION 43 05 11
GENERAL REQUIREMENTS FOR EQUIPMENT

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:

1. This section specifies general requirements which are applicable to all motorized equipment. The Contractor is responsible for ensuring that all motorized equipment meets the requirements of this section in addition to the specific requirements of each individual equipment specification section.

B. Equipment Lists:

1. Equipment lists, presented in these specifications and as specified on the drawings, are included for the convenience of the Project Representative and Contractor and are not complete listings of all equipment, devices and material required to be provided under this contract. The Contractor shall prepare his own material and equipment takeoff lists as necessary to meet the requirements of this project.

1.2 QUALITY ASSURANCE

A. Arrangement:

1. The arrangement of equipment shown on the drawings is based upon information available to the Owner at the time of design and is not intended to show exact dimensions conforming to a specific manufacturer. The drawings are, in part, diagrammatic, and some features of the illustrated equipment installation may require revision to meet actual submitted equipment installation requirements; these may vary significantly from manufacturer to manufacturer. The Contractor shall, in determining the cost of installation, include these differences as part of his bid proposal. Structural supports, foundations, connected piping, valves, and electrical conduit specified may have to be altered to accommodate the equipment actually provided. No additional payment shall be made for such revisions and alterations.

B. References:

1. This section contains references to the documents listed below. They are a part of this section as specified and modified. Where a referenced document cites other standards, such standards are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, has been discontinued or has been replaced.

Reference	Title
ABMA Std 9	Load Ratings and Fatigue Life for Ball Bearings
ABMA Std 11	Load Ratings and Fatigue Life for Roller Bearings
ANSI B1.1	Unified Inch Screw Threads (UN and UNR Thread Form)
ANSI B1.20.1	Pipe Threads, General Purpose (Inch)
ANSI B16.1	Gray Iron Pipe Flanges and Flanged Fittings, (Classes 25, 125, and 250)
ANSI B18.2.1	Square and Hex Bolts and Screws (Inch Series)
ANSI B18.2.2	Square and Hex Nuts (Inch Series)
ANSI S2.19	Mechanical Vibration – Balance Quality Requirements of Rigid Rotors, Part 1: Determination of Permissible Unbalance, Including Marine Applications

C. Unit Responsibility:

1. The Contractor shall cause equipment assemblies made up of two or more components to be provided as a working unit by the unit responsibility manufacturer, where specified. The unit responsibility manufacturer shall coordinate selection, coordinate design, and shall provide all mechanical equipment assembly components such that all equipment components furnished under the specification for the equipment assembly, and all equipment components specified elsewhere but referenced in the equipment assembly specification, is compatible and operates reliably and properly to achieve the specified performance requirements. Unless otherwise specified, the unit responsibility manufacturer shall be the manufacturer of the driven component equipment in the equipment assembly. The unit responsibility manufacturer is designated in the individual equipment specifications found elsewhere in this project manual. Agents, representatives or other entities that are not a direct division of the driven equipment manufacturing corporation shall not be accepted as a substitute for the driven equipment manufacturer in meeting this requirement. The requirement for unit responsibility shall in no way relieve the Contractor of

his responsibility to the Owner for performance of all systems as provided in the General Conditions of the Contract Documents.

2. The Contractor shall ensure that all equipment assemblies provided for the project are products for which unit responsibility has been accepted by the unit responsibility manufacturer(s), where specified. Unit responsibility for related components in a mechanical equipment assembly does not require or obligate the unit responsibility manufacturer to warranty the workmanship or quality of component products not manufactured by them. Where an individual specification requires the Contractor to furnish a certificate from a unit responsibility manufacturer, such certificate shall be submitted prior to shop drawing final approval. No other submittal material will be processed until a Certificate of Unit Responsibility has been received and has been found to be satisfactory. Failure to provide acceptable proof that the unit responsibility requirement has been satisfied will result in withholding approval of progress payments for the subject equipment even though the equipment may have been installed in the work.

D. Balance:

1. Unless specified otherwise, for all machines 10 HP and greater, all rotating elements in motors, pumps, blowers and centrifugal compressors shall be fully assembled, including coupling hubs, before being statically and dynamically balanced. All rotating elements shall be balanced to the following criteria:

   a. $$U_{per} = 6.015\frac{GW}{N}$$

   b. Where:
      1) U_{per} = permissible imbalance, ounce-inches, maximum
      2) G = Balance quality grade, millimeters per second
      3) W = Weight of the balanced assembly, pounds mass
      4) N = Maximum operational speed, rpm

2. Where specified, balancing reports, demonstrating compliance with this requirement, shall be submitted as product data. Equipment balance quality grade shall be *G* 2.5 ($G = 2.5$ mm/sec) or better in accordance with ANSI S2.19.

3. Pumps with overhung impellers only require the impeller to be dynamically balanced. The rotating element shall be fully machined to ensure that it is inherently balanced.

1.4 SEISMIC AND ANCHOR BOLT REQUIREMENTS

A. Anchor and brace equipment to resist seismic loads specified in Section 01 88 15. Seismic design and engineering calculations in accordance with Section 01 88 15. Anchor bolt design and material accordance with Division 5 Specifications.

PART 2 PRODUCTS

2.1 FLANGES AND PIPE THREADS

A. Flanges on equipment and appurtenances provided under this section shall conform in dimensions and drilling to ANSI B16.1, Class 125. Pipe threads shall conform in dimension and limits of size to ANSI B1.1, coarse thread series, Class 2 fit.

B. Threaded flanges shall have a standard taper pipe thread conforming to ANSI B1.20.1. Unless otherwise specified, flanges shall be flat faced.

C. Flange assembly bolts shall be heavy pattern, hexagonal head, carbon steel machine bolts with heavy pattern, hot pressed, hexagonal nuts conforming to ANSI B18.2.1 and B18.2.2. Threads shall be Unified Screw Threads, Standard Coarse Thread Series, Class 2A and 2B, ANSI B1.1.

2.2 BEARINGS

A. Unless otherwise specified, equipment bearings shall be oil or grease lubricated, ball or roller type, designed to withstand the stresses of the service specified. Each bearing shall be rated in accordance with the latest revisions of ABMA Methods of Evaluating Load Ratings of Ball and Roller Bearings. Unless otherwise specified, equipment bearings shall have a minimum L-10 rating life of 50,000 hours. The rating life shall be determined using the maximum equipment operating speed.

B. Grease lubricated bearings, except those specified to be factory sealed and lubricated, shall be fitted with easily accessible grease supply, flush, drain and relief fittings. Extension tubes shall be used when necessary. Grease supply fittings shall be standard hydraulic alemite type.

C. Oil lubricated bearings shall be equipped with either a pressure lubricating system or a separate oil reservoir type system. Each oil lubrication system shall be of sufficient size to safely absorb the heat energy normally generated in the bearing under a maximum ambient temperature of 60 degrees C and shall be equipped with a filler pipe and an external level indicator gage.

D. All bearings accessible to touch, and located within 7 feet measured vertically from floor or working level or within 15 inches measured horizontally from stairways, ramps, fixed ladders or other access structures, shall either incorporate bearing housings with sufficient cooling to maintain surface temperature at 65 degrees C or less for continuous operation at bearing rated load and a 50 degrees C ambient temperature or shall be provided with appropriate shielding shall be provided that will prevent inadvertent human contact.

2.3 V-BELT ASSEMBLIES

A. Unless otherwise specified, V-belt assemblies shall be Dodge Dyna-V belts with matching Dyna-V sheaves and Dodge Taper-lock bushings, Wood's Ultra V-belts with matching Ultra-V sheaves and Wood's Sure-Grip bushings, or equal.

B. Sheaves and bushings shall be statically balanced. Additionally, sheaves and bushings which operate at a peripheral speed of more than 5500 feet per minute shall be dynamically balanced. Sheaves shall be separately mounted on their bushings by means of three pull-up grub or cap tightening screws. Bushings shall be key seated to the drive shaft.

C. Belts shall be selected for not less than 150 percent of rated driver horsepower and, where two sheaves sizes are specified, shall be capable of operating with either set of sheaves. Belts shall be of the antistatic type where explosion proof equipment is specified.

2.4 PUMP SHAFT SEALS

A. General:

1. Seals for water and wastewater pump shafts shall be either stuffing box or mechanical seals. For industrial wastewater service, or for fluids other than water or municipal wastewater, the recommendations of the seal manufacturer shall be followed for selection of appropriate seals. Unless specified otherwise, stuffing boxes and mechanical seals shall conform to the requirements set forth in this paragraph.

B. Mechanical Seals shall meet the following requirements, unless otherwise specified in the individual equipment sections:

1. Unless otherwise specified in the detailed pump specifications, mechanical seals shall be split mechanical seals requiring no field assembly, other than assembly around the shaft and insertion into the pump. They shall be self-aligning, and self-centering, single seals. They shall be of a nondestructive (nonfretting) type requiring no wearing sleeve for the shaft. Shafts for pumps specified with mechanical seals shall be furnished with no reduction in size through the seal area (no shaft sleeve). Where the detailed specifications call for cartridge instead of split seals, all other requirements of this paragraph apply.
2. Metal parts shall be Type 316 or 316L stainless steel. Springs shall be Hastelloy C, Elgiloy, or other Duplex SS selected for resistance to chloride attack. Rotary faces shall be silicon carbide or chrome oxide. Stationary faces shall be silicon carbide for solids bearing fluid service and carbon for clean water service. Elastomers shall be ethylene propylene or fluorocarbon. Mechanical seals shall be suitable for operation between full vacuum (0 psia) up to 200 percent of the maximum specified operating pressure, but in any event not less than 200 psig.

3. Seal chambers shall be provided with vented solids removal restriction bushings except for enclosed line shaft pumps where the seal barrier fluid is used for line shaft bearing lubrication. The bushing shall both control the amount of flushing water flow and restrict solids and gas accumulation from the seal face area.
4. Candidate seals include:
    a. Chesterton 442 seals provided with Chesterton/SpiralTrac solids removal restriction bushings Version N or D, as recommended by EnviroSeal Engineering Products, Ltd, Nova Scotia, Canada.
    b. AESSEAL RDS seals with Cyclops bushing.
    c. John Crane 3710 seals with Type 24SL bushing.
    d. Or equal.
5. Seals on pumps for contaminated water service (sludge, grit, wastewater, scum, reclaimed water, etc.) shall be drilled and tapped for connection of a clean water flushing supply.
6. Seals for all vertical pumps (whether column or volute type) shall be provided with a second flush connection. Vertical pumps shall have a vent valve attached to the mechanical seal to eliminate air from the seal chamber prior to pump start; start-up procedures shall include venting instructions; and for remotely started pumps, the vent system shall be automated. Where specified in the detailed specifications, permissive confirmation automatic vent systems shall be provided.

C. Shaft Packing:

1. Where shaft packing is specified, stuffing boxes shall be tapped to permit introduction of seal liquid and shall hold a minimum of five rows of packing. Stuffing boxes shall be face attached. Stuffing box and shaft shall be suitable for field installation, without machining or other modifications, of the mechanical seal.
2. Unless otherwise specified, lantern rings shall be bronze or Teflon, packing shall be die-molded packing rings of non-asbestos material suitable for the intended service and as recommended by the manufacturer, and glands shall be bronze, two piece split construction. Lantern rings shall be of two-piece construction and shall be provided with tapped holes to facilitate removal. Lantern rings shall be drilled and tapped 1/4 NC-20. The impeller end of the packing on all but line shaft pumps with external source water lubricated bearings shall be fitted with a SpiralTrac, Version P packing protection system as manufactured by EnviroSeal Engineering Products, Ltd, Nova Scotia, Canada.
3. The section of each shaft or impeller hub that extends through or into the stuffing box shall be fitted with a replaceable stainless steel sleeve with a Brinell hardness of not less than 500. The sleeve shall be held to the shaft to prevent rotation and shall be gasketed to prevent leakage between the shaft and the sleeve. Minimum shaft sleeve thickness shall be 3/8 inch.

2.5 COUPLINGS

A. When the couplings specified in this Section are not suitable for the intended service, specify the required coupling in the respective equipment section.

B. Unless otherwise specified in the particular equipment sections, equipment with a driver greater than 1/2 HP, and where the input shaft of a driven unit is directly connected to the output shaft of the driver, shall have its two shafts connected by a flexible coupling which can accommodate angular misalignment, parallel misalignment and end float, and which cushions shock loads and dampens torsional vibrations. The flexible member shall consist of a tire with synthetic tension members bonded together in rubber. The flexible member shall be attached to flanges by means of clamping rings and cap screws, and the flanges shall be attached to the stub shaft by means of taper lock bushings which shall give the equivalent of a shrunk-on fit. There shall be no metal-to-metal contact between the driver and the driven unit. Each coupling shall be sized and provided as recommended by the coupling manufacturer for the specific application, considering horsepower, speed of rotation, and type of service.

C. Where torque or horsepower capacities of couplings of the foregoing type is exceeded, Thomas-Rex, Falk Steel Flex, or equal, couplings will be acceptable provided they are sized in accordance with the equipment manufacturer's recommendations and sizing data are submitted. They shall be installed in conformance to the coupling manufacturer's instructions. Custom-designed, fabricated couplings for the 750 Hp two-stage variable speed centrifugal sewage pumps are shown on the Mechanical Drawings.

2.6 GUARDS

A. Exposed moving parts shall be provided with guards which meet all applicable OSHA requirements. Guards shall be fabricated of 14-gage steel, 1/2-13-15 expanded metal screen to provide visual inspection of moving parts without removal of the guard. Guards shall be galvanized after fabrication and shall be designed to be readily removable to facilitate maintenance of moving parts. Reinforced holes shall be provided. Lube fittings shall be extended through guards.

2.7 CAUTION SIGNS

A. Equipment with guarded moving parts which operates automatically or by remote control shall be identified by signs reading "Caution - Automatic Equipment May Start At Any Time". Signs shall be constructed of fiberglass material, minimum 1/8 inch thick, rigid, suitable for post mounting. Letters shall be white on a red background. The sign size and pattern shall be as shown on the drawings. Signs shall be installed near guarded moving parts.

2.8 GAGE TAPS, TEST PLUGS AND GAGES

A. Gage taps shall be provided on the suction and discharge sides of pumps, blowers and compressors. Pressure and vacuum gages shall be provided where specified. Gage taps, test plugs, and gages shall be as specified in Division 40.

2.9 NAMEPLATES

A. Nameplates shall be provided on each item of equipment and shall contain the specified equipment name or abbreviation and equipment number. Equipment nameplates shall be engraved or stamped stainless steel and fastened to the equipment in an accessible and visible location with stainless steel screws or drive pins.

2.10 LUBRICANTS

A. The Contractor shall provide for each item of mechanical equipment a supply of the required lubricant adequate to last through the specified commissioning period. Lubricants shall be of the type recommended by the equipment manufacturer and shall be products of the Owner's current lubricant supplier. The Contractor shall limit the various types of lubricants by consolidating them, with the equipment manufacturer's approval, into the least number of different types. Not less than 90 days before the date shown in his construction schedule for starting, testing and adjusting equipment, the Contractor shall provide the Owner with three copies of a list showing the required lubricants, after consolidation, for each item of mechanical equipment. The list shall show estimated quantity of lubricant needed for a full year's operation, assuming the equipment will be operating continuously.

2.11 ANCHOR BOLTS

A. Anchor bolts shall be designed for lateral forces for both pullout and shear in accordance with the provisions of the structural plans and specifications. Unless otherwise stated in the individual equipment specifications, anchor bolt materials shall conform to the provisions of the structural plans and specifications.

2.12 SPARE PARTS

A. Spare parts, wherever required by detailed specification sections, shall be stored in accordance with the provisions of this paragraph. Spare parts shall be tagged by project equipment number and identified by part number, equipment manufacturer, and subassembly component (if appropriate). Spare parts subject to deterioration, such as ferrous metal items and electrical components, shall be properly protected by lubricants or desiccants and encapsulated in hermetically sealed plastic wrapping. Spare parts with individual weights less than 50 pounds and dimensions less than 2 feet wide, or 18 inches high, or 3 feet in length shall be stored in a wooden box with a hinged wooden cover and locking hasp. Hinges shall be strap type. The box shall be painted and identified with stenciled lettering stating the name of the equipment,

equipment numbers, and the words "spare parts." A neatly typed inventory of spare parts shall be taped to the underside of the cover.

PART 3 EXECUTION

3.1 GENERAL

A. Installation of equipment accessories included in this section shall be as recommended by the equipment manufacturer unless otherwise specified in the individual equipment specification section.

END OF SECTION

SECTION 43 05 13
RIGID EQUIPMENT MOUNTS

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:

1. This section specifies minimum requirements for rigid equipment mounts (baseplates, soleplates, and mounting blocks) and their installation on equipment pads. Completed equipment supports shall consist of equipment pads, equipment anchors, and rigid equipment mounts (baseplates, soleplates, or mounting blocks) set in grout.

2. Unless alternate requirements for equipment mounts are specified in the applicable equipment specification, the requirements of this section shall be applied to rigid mounts for all rotating or reciprocating equipment that is used to mix, convey, or pressurize fluids (gases and liquids). The requirements of this section shall also apply whenever referenced in specifications for other types of equipment. If conflict exists between this section and requirements of individual equipment manufacturers, the more restrictive requirements shall prevail.

B. Definitions:

1. Specific equipment mounting terminology used in this section conforms to the following definitions:
   a. Baseplate:
      1) Fabricated (welded structural steel elements), cast, or plate steel base providing a common mounting element on which the legs, feet, or mounting surfaces of equipment are mounted by means of bolted connections.
   b. Soleplate:
      1) A machined plate, spanning an opening in the floor or equipment pad, providing a common mounting element on which the legs, feet, or mounting surfaces of equipment are mounted by means of bolted connections.
   c. Mounting Blocks:
      1) Multiple smaller baseplates on which individual legs, feet or equipment supports are mounted when equipment or drivers are not fastened to a common baseplate or sole plate.
   d. Equipment Pad:
      1) Concrete foundation (block or slab) supporting and elevating equipment mounts above the supporting structural floor slab or local grade.
   e. Mounting Pads:

1) Thickened or raised areas of baseplates and soleplates where the feet or mounting surfaces of mounted equipment and drivers are bolted and/or doweled to the baseplate or soleplate.

f. Leveling Blocks:
   1) Temporary steel blocks placed under baseplates, soleplates, or a mounting block at leveling positions (at equipment anchors) for the purpose of leveling baseplates, soleplates, or mounting blocks prior to grouting.
g. Shims:
   1) Thin stainless steel plates of a uniform thickness installed on top of Leveling Blocks for fine adjustment of level. Shims may also be used between equipment or drivers and baseplates, soleplates, or mounting blocks for equipment alignment purposes specified in Section 43 05 14.
h. Wedges:
   1) Pairs of uniformly tapered metal blocks that are stacked with the tapered surfaces reversed (relative to the other wedge) so that the top and bottom surfaces of the wedges are parallel. Wedges are used between equipment pads and baseplates, soleplates, or mounting blocks for the purpose of leveling baseplates, soleplates, or mounting blocks.
i. Mounting Stud:
   1) Threaded rod or bolts anchored to baseplates, soleplates, or mounting blocks for the purpose of mounting equipment or ancillary devices onto baseplates, soleplates, or mounting blocks.
j. Reinforcement Dowels:
   1) Steel reinforcement rods embedded in concrete, across a cold joint, for the purpose of transferring loads or force across the joint.
k. Machine Alignment Dowels:
   1) Tapered diameter rods inserted in tapered diameter holes for the purpose of aligning machinery. The practice of drilling tapered diameter holes through machinery and baseplates so that Machine Alignment Dowels may be inserted to facilitate alignment of machinery is known as Doweling.
l. Leveling Position:
   1) A location on the top of a concrete equipment pad where leveling tools and equipment will be temporarily installed or used for the purpose of leveling baseplates, soleplates, and mounting blocks prior to grouting.
m. Grout Manufacturer:
   1) Refers to the manufacturer of the epoxy grout system used for installation of rigid equipment mounts.
n. Grout Manufacturer's Technical Representative(s):
   1) Refers to the technical representative(s) of the Grout Manufacturer.

C. Equipment Mounting Requirements:

1. Unless otherwise specified, equipment and drivers shall be rigidly mounted on a common cast iron or fabricated steel baseplate or soleplate grouted into place on a concrete equipment pad. Under no circumstances shall baseplates, soleplates, or

mounting blocks be grouted directly to concrete slabs or floors. Equipment that uses an interdependent equipment and driver mounting configuration (equipment that is bolted onto the driver frame and equipment that supports the driver entirely from the equipment frame) may be bolted directly on concrete or grout surfaces of equipment pads if the driver is less than five horsepower. Bolting equipment directly on concrete or grout surfaces of equipment pads is not acceptable for equipment and drivers that do not have an interdependent equipment and driver mounting configuration.

1.2 QUALITY ASSURANCE

A. References:

1. This section contains references to the following documents. It is a part of this section as specified and modified. In case of conflict between the requirements of this section and those of the listed document, the requirements of this section shall prevail.
2. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid. If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, whether or not the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
ANSI/HI 1.4	Centrifugal Pumps – Installation, Operation and Maintenance
ANSI/HI 2.4	Vertical Pumps – Installation, Operation and Maintenance
API RECOMMENDED PRACTICE 686	Recommended Practices for Machinery Installation and Installation Design
ASTM E329	Inspection and Testing Agencies for Concrete, Steel, and Bituminous Materials as Used in Construction
MIL-PRF-907E	Anti-Seize Thread Compound, High Temperature
SSPC	Society for Protective Coatings Specifications, Vol. 2
IBC	2001 International Building Code (including local amendments)

B. Quality Control By Contractor:

1. To demonstrate conformance with the specified requirements for rigid equipment mounts, the Contractor shall provide the services of an independent testing

laboratory that complies with the requirements of ASTM E329. The testing laboratory shall sample and test equipment mount related materials as indicated in this section. Costs of testing laboratory services shall be borne by the Contractor.

2. For equipment with drivers 20 horsepower and greater, the Contractor shall furnish the services of a grout manufacturer's technical representative that has been factory trained by the grout manufacturer. The grout manufacturer's technical representative shall perform training and quality control of epoxy grout installation for rigid equipment mounts as indicated in this section.

1.3 SUBMITTALS

A. The following information shall be provided in accordance with the submittal requirements specified in Section 01 33 00.

1. A copy of this specification section, with addendum updates included, (referenced sections need not be included for Section 43 05 13) with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check marks (□) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated, and therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph, referenced to a detailed written explanation of the reasons for requesting the deviation. The Construction Manager shall be the final authority for determining acceptability of requested deviations. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration. Copies of this specification section shall be numbered and marked (specification number and eqiuipment number) for inclusion (filing) with the associated equipment submittal requirements.
2. Schedule of rigid equipment mount installations specified in paragraph 2.01.
3. Name, employer and certificates or other information documenting compliance with the journeyman qualifications requirements for millwrights who will install rigid equipment mounts, as specified in paragraph 3.03 Leveling.
4. Certificates or other documentation issued by the epoxy grout manufacturer that demonstrates that the grout manufacturer's technical representative has been factory trained on installation of epoxy grout for equipment mounts, as specified in paragraph 1.02 Quality Control by Contractor.
5. Shop drawings for all equipment pads, equipment anchors, and baseplate, soleplate or mounting block details. Shop drawings shall depict size and location of equipment pads and reinforcement; equipment drains; equipment anchor, size, location, and projection; expansion joint locations; elevation of top of grout and grout thickness; elevation of top of baseplate; soleplate; or mounting block; size

and location of electrical conduits; and any other equipment mounting features embedded in equipment pads. Shop drawings for equipment pads, equipment anchors, and baseplate, soleplate, or mounting blocks shall be numbered and marked (specification number and equipment number) for inclusion (filing) with the associated equipment submittal requirements.

6. Equipment anchor calculations specified in paragraph 2.02.
7. Results of grout strength tests, as specified in paragraph 3.03 Grouting.
8. Completed Rigid Equipment Mount Installation Inspection Checklist Forms (Form A), as specified in paragraph 3.02 Epoxy Grout Quality Control.
9. List of Contractor's equipment installation staff that has completed epoxy grout manufacturer's grout installation training specified in paragraph 3.02 Epoxy Grout Training.

PART 2 PRODUCTS

2.1 GENERAL

A. Prior to initiating any installation efforts, the Contractor shall produce a rigid equipment mount installation schedule containing the expected dates for installing equipment anchors and preparation of equipment pads for leveling, grouting, and final equipment anchor clamping for each item of equipment. The schedule shall list the equipment, by equipment tag number, and shall list applicable equipment specification section, motor horsepower, and name of the Contractor's representative responsible for quality control during installation of rigid equipment mounts. The schedule shall be accompanied by written verification of equipment anchor clamping torque from the manufacturer of each item of equipment to be installed with rigid equipment mounts.

2.2 CONCRETE EQUIPMENT PADS

A. Concrete equipment pads shall be as shown in the structural details for equipment pads and equipment anchors for rigid mounted equipment.

B. The Contractor shall submit equipment anchor calculations for all equipment with drivers 20 horsepower and greater. Equipment anchor calculations shall demonstrate that equipment anchor size, embedment, and edge distance comply with the CBC and ACI 318-14, and are sufficient to resist the maximum lateral and vertical forces specified in Section 43 05 11-2.11. Equipment anchor calculations shall be sealed by a registered structural or civil engineer licensed in the State of California.

2.3 BASEPLATES, SOLEPLATES, AND MOUNTING BLOCKS

A. General:

1. Unless otherwise specified, Type I baseplates, soleplates, and mounting blocks shall be a minimum of 1 inch thick for equipment with drivers 20 horsepower and

larger. All Type I baseplates, soleplates, and mounting blocks shall have edges of surfaces bearing on grout rounded to a radius of not less than 0.25 inch. Horizontal corners of Type I baseplates, soleplates, or mounting blocks shall be rounded to a radius of not less than two inches to avoid producing stress risers on the grouted foundation. Grout pouring holes (minimum 4 inches in diameter for epoxy grout, minimum 2 ½ inches in diameter for cementitious nonshrink grout) shall be provided in all baseplates and soleplates and all baseplates and soleplates shall have grout release holes. Mounting blocks may be grouted without grout pouring holes provided that no dimension of the mounting block (width or length) exceeds 18 inches. Grout relief or vent holes (minimum 1 inch in diameter) shall be provided in all baseplates, soleplates, and mounting blocks. Internal stiffeners shall be provided on all cast and fabricated baseplates and shall be designed to allow free flow of grout from one section of the baseplate to another. The minimum acceptable opening in cross bracing and stiffeners shall be 2-inches high by 6-inches in width. All welds shall be continuous and free from skips, blowholes, laps and pockets.

2. Mounting holes for equipment anchors shall be drilled through baseplates, soleplates, and mounting blocks. Mounting holes for equipment anchors shall not be burned out and they shall not be open slots. All mounting studs shall be Type 316 stainless steel. An anti-seize or anti-galling compound, as specified in paragraph 2.06, shall be applied to all mounting stud threads prior to installing nuts on mounting studs. Terminations requiring connections to baseplates, soleplates, or mounting blocks shall be acorn nuts welded to the under side of the baseplate or nuts welded to the underside of the baseplate and plugged with cork, plastic plugs or grease. In no case shall the fastener terminate only into the metal base. Where baseplates, soleplates, or mounting blocks are leveled using jackscrews, jackscrew threads shall be tapped in thickened pads or otherwise in sufficient metal to provide ease in adjusting level.
3. Mounting pads for equipment shall be machined after all welding and stress relieving and shall be coplanar within 0.002 inch per foot in all directions. Mounting pads shall extend not less than 0.5 inch beyond the perimeter of the foot or mounting surface of the mounted equipment, in any direction.
4. Equipment baseplates shall provide common support for the equipment and driver (and flywheel, if one is specified). Baseplates for equipment with drivers 20 horsepower and greater shall be furnished with eight transverse alignment (horizontal) positioning jackscrews for alignment of equipment drivers on horizontal surfaces of baseplates. Two of the eight transverse alignment/positioning jackscrews shall be installed in perpendicular directions in a horizontal plane at the mounting position for each corner or foot of the equipment driver. (Eight additional jackscrews shall be provided for transverse alignment of the flywheel, if flywheels are specified.)

B. Type I Baseplates:

1. Type I baseplates shall be plate or fabricated structural steel baseplates with thickened steel mounting pads for doweling and bolting equipment to the baseplate. The baseplates shall be rectangular in shape for equipment other than centrifugal refrigeration machines and pump baseplates, which may be "T" or "L" shaped to accommodate the equipment drive and accessories. Baseplates for split case pumps shall include supports for suction and discharge elbows, if required by the specified configuration. Perimeter members shall be beams with a minimum depth equal to 1/10th of the longest dimension of the baseplate. Beam depth need not exceed 14 inches provided that the deflection and misalignment is kept within acceptable limits as determined by the manufacturer.

C. Type II/III Baseplates:

1. Type II and Type III Baseplates, which are applicable for vibration isolation mounting, are specified in Section 43 05 18.

D. Type IV Baseplates:

1. Type IV Baseplates shall be cast iron with thickened mounting pads for doweling and bolting equipment to the baseplate. Cast iron baseplates shall be sealed in accordance with the requirements for bleeding surfaces specified in Section 09 90 00 prior to grouting.

E. Soleplates:

1. Where soleplates are provided, the underside shall be scribed with the words “This Side Down” using welding rod material prior to milling the mounting pad for each equipment foot or mounting surface. Mounting surfaces and mounting pads on soleplates shall be milled flat to a tolerance of not less than 0.002 inch per foot in all directions. Soleplates shall be machined for an indexed fit to the mounted equipment or driver.

F. Mounting Blocks:

1. Where equipment is fabricated or cast with feet or mounting surfaces that are not fastened to a common baseplate or soleplate, as in dry-pit bottom suction pumps, the equipment may be supported on individual concrete piers or equipment pads in lieu of a common baseplate or soleplate and equipment pad. In such instances, the equipment shall be supported at the feet or mounting surfaces on individual mounting blocks, which shall be leveled and grouted into place on the individual piers or equipment pads as specified in this section. Vertical volute-type pumps weighing more than 2000 pounds shall be mounted on mounting blocks under each foot or mounting surface for the pump. All mounting blocks shall be furnished with jackscrew threads (three locations, minimum) tapped in the mounting block for the purpose of leveling mounting blocks with jackscrews.

2.4 GROUT FOR EQUIPMENT PADS

A. Epoxy Grout for Equipment Mounting:

1. Unless otherwise specified, grout for setting bearing surfaces of baseplates, soleplates, and mounting blocks on equipment pads shall be Epoxy Grout for Equipment Mounting as specified in Section 03 62 00. Where the term epoxy grout is used in the context of details and specifications for equipment mounting it shall mean Epoxy Grout for Equipment Mounting.

B. Cementitious Nonshrink Grout:

1. Cementitious Nonshrink Grout, specified in Section 03 62 00, may be used for setting bearing surfaces of baseplates, soleplates, or mounting blocks on equipment pads where equipment drivers are 20 horsepower and smaller and the combined weight of equipment and driver is less than 1000 pounds. Where the term nonshrink grout or cementitious grout is used in the context of details and specifications for equipment mounting it shall mean Cementitious Nonshrink Grout. Training and quality control by the grout manufacturer's technical representative is not required for rigid equipment mounts installed with cementitious non-shrink grout.

2.5 EPOXY PRIMER

A. Epoxy primer shall be a lead free, chrome free, rust inhibitive, two-component epoxy primer specifically designed for use on metal substrates and in conjunction with epoxy grout. The epoxy primer shall be a product of the epoxy grout manufacturer.

2.6 ANTI-SEIZE/ANTI-GALLING COMPOUND

A. Anti-seize or anti-galling compound shall be a molybdenum disulfide and graphite combination in an aluminum complex base grease conforming to MIL-PRF-907E. Acceptable products include Jet Lube 550 by Jet Lube, Inc., E-Z Break by LA-CO, or equal.

PART 3 EXECUTION

3.1 GENERAL

A. Grouting for installation of equipment on equipment pads shall take place prior to connecting any field piping or electrical and instrumentation systems. Unless the Construction Manager accepts an alternate installation procedure in writing, baseplates, soleplates, and mounting blocks shall be leveled and grouted with the equipment removed. Pumps shall be installed in accordance with this section and ANSI/HI 1.4 or ANSI/HI 2.4, as appropriate for the type of pumping equipment installed.

B. Connecting piping with flexible connections and/or expansion joints shall be anchored such that the intended uses of these joints are maintained in the piping system without imposing strain on the equipment connections.

C. Where an equipment manufacturer's installation requirements include a rigid connection between the machine and connecting piping systems, the Contractor shall delete any flexible coupling (including equipment connection fittings) shown on the drawings and install the equipment in the following manner, in lieu of installing the flexible coupling:

1. The equipment pad shall be prepared as shown on the details for rigid equipment mounts.
2. The baseplate, soleplate, or mounting blocks supporting the equipment shall be installed, leveled, and grouted in place as specified in this section.
3. The equipment shall be installed, aligned and doweled in place as shown and specified.
4. The piping shall be installed and aligned to the equipment connections and the field piping connections without welding one of the joints for one section of pipe between the equipment connection and the field piping and all valving. All flanged joints shall be bolted up and pressure tested.
5. All piping shall be fully supported by supports designed to accept their full weight and thrust forces.
6. The final sections of piping shall be aligned with the equipment and field connections without the use of jacks, chain falls or other devices to force it into alignment.
7. The final piping joints shall be welded only after the previous steps have been completed and accepted by the Construction Manager.

3.2 EPOXY GROUT TRAINING AND QUALITY CONTROL

A. Epoxy Grout Training:

1. Prior to commencing rigid equipment mount installation work on equipment pads, the Contractor shall furnish the services of a grout manufacturer's technical representative to conduct a training school for the workers that will be using the epoxy grout for rigid equipment mount installations. The school shall be not less than 4 hours in length and shall cover all aspects of using the products, from mixing to application. This requirement, however, shall not be construed as relieving the Contractor of overall responsibility for this portion of the work. The epoxy grout manufacturer shall furnish a list of school attendees that have been satisfactorily trained to perform epoxy grout installation for equipment mounting.

B. Epoxy Grout Quality Control:

1. For equipment with drivers 20 horsepower and greater, the epoxy grout manufacturer's technical representative shall provide quality control services for epoxy grout installation in rigid equipment mounts. The epoxy grout manufacturer's technical representative shall be on site to inspect and verify that the application personnel have successfully performed surface preparation, epoxy grout application, and Quality Control Inspection in accordance with these specifications for a representative portion of the epoxy grout installation work.
    a. Specifically, the epoxy grout manufacturer's technical representative shall perform the following services for at least one rigid equipment mount installation for each equipment type and size:
        1) Inspect ambient conditions during various phases of epoxy grouting installation for conformance with the epoxy grout manufacturer's requirements.
        2) Inspect the surface preparation of concrete substrates onto which epoxy grout materials are to be applied, for conformance to the specified application criteria, including but not limited to substrate profile, degree of cleanliness, and moisture.
        3) Inspect the surface preparation of the metallic substrates onto which the epoxy primer is to be applied.
        4) Inspect the epoxy-primed metallic substrate for coverage and adhesion.
        5) Inspect preparation and application of epoxy grout form work for conformance to the specifications.
        6) Inspect and record that the "pot life" of epoxy grout materials is not exceeded during installation.
        7) Inspect epoxy grout for cure.
        8) Inspect and record that localized repairs made to grout voids are in conformance with the specification requirements.
        9) Conduct a final review of completed epoxy grout installation for conformance to these specifications.

3.3 INSTALLATION

A. Concrete Equipment Pad Preparation:

1. After the concrete is fully cured, the top of the equipment pad shall be roughened by chipping the surface. Chipping shall remove all laitance and defective or weak concrete and result in a rough surface profile with a 0.25 inch minimum amplitude. Chipping shall expose broken aggregate without dislodging unbroken aggregate from the cement matrix and shall not cause fractures below the concrete surface. Leveling surfaces of the concrete that have been finished smooth and level for baseplate, soleplate, or mounting block leveling at equipment anchors shall be protected from damage during chipping. A light duty, hand held

pneumatic chipper with a chisel type tool shall be used for chipping the equipment pad concrete surface. Abrasive blast, bush-hammer, jack hammers with sharp chisels, heavy chipping tools, or needle gun preparation of concrete surfaces to be grouted is not acceptable.

2. Prior to leveling activities, satisfactory removal of defective or weak concrete shall be demonstrated in the presence of the Construction Manager by operating the chipper on the chipped concrete surface at locations identified by the Construction Manager. The chipped surface of the concrete shall be such that the final baseplate, soleplate, or mounting block elevation results in the grout manufacturer's recommended grout thickness of a minimum of 4-inches between the surface of the equipment pad and the lower baseplate flange, underside of the soleplate or underside of mounting block.
3. All dust, dirt, chips, oil, water, and any other contaminants shall be removed and the surface protected with plastic sheeting until grout is installed.
4. Concrete equipment pad surfaces that have been finished smooth and level for use as leveling positions shall be protected from damage during chipping activities. Alternatively, leveling positions may be restored on chipped surfaces. Leveling positions shall be restored by installing leveling blocks or leveling plates for jackscrews on a high compressive strength epoxy putty (Philadelphia Resins, Phillybond Blue 6A, or equal). Leveling blocks and leveling plates shall be installed level on the epoxy putty.

B. Baseplates, Soleplates, and Mounting Blocks:

1. All surfaces of baseplates, soleplates, and mounting blocks to be in contact with epoxy grout shall be cleaned to SSPC SP-6 and shall be primed with epoxy primer within 8 hours of cleaning.

C. Leveling:

1. All machinery shall be mounted and leveled by journeyman millwrights. Precision surveying equipment shall be used for leveling. Machinists' spirit levels will not be permitted for leveling purposes for any baseplate, soleplate, or mounting block with a plan dimension greater than 4 feet. Baseplates and mounting blocks shall be leveled to a maximum tolerance of 0.002 inch per foot or as otherwise required by the equipment manufacturer, if more stringent. Soleplates shall be leveled to 0.0005 inch per foot or as otherwise required by the equipment manufacturer, if more stringent. An anti-seize or anti-galling compound specified in paragraph 2.06 shall be applied to all equipment anchor threads prior to beginning baseplate, soleplate, or mounting block leveling.
2. All baseplates, soleplates, and mounting blocks shall be leveled against steel surfaces (jackscrew plates, leveling blocks, leveling nuts, support plates, or other steel surfaces). Use of other materials for leveling purposes is strictly and specifically prohibited. Unless otherwise specified, baseplates, mounting blocks, and soleplates shall be leveled as indicated in the leveling details. Leveling equipment and tools shall be stainless steel leveling blocks and shims, steel

wedges, or jackscrews bearing on leveling plates. Leveling nuts may be used for leveling baseplates and soleplates weighing less than 200 pounds. The use of leveling nuts for leveling mounting blocks is not permitted.

3. After baseplates, soleplates, or mounting blocks have been leveled on the leveling equipment, the Contractor shall clamp the baseplates, soleplates, or mounting blocks in position by installing the equipment anchor nuts and washers. Clamping torque shall be less than the final clamping torque specified in paragraph 2.01, but sufficient to hold the baseplate, soleplate, or mounting block in position. The Contractor shall verify that the correct level and position of the baseplate, soleplate, or mounting block has been maintained after clamping on the leveling equipment.
4. Leveling blocks shall be stainless steel, four inches square and 1-1/2 inches thick with an open-ended slot terminating in the center for the equipment anchor. Leveling blocks shall be machined flat on all horizontal surfaces and placed under the baseplate or soleplate at each equipment anchor. Shims shall be pre-cut stainless steel, slotted for removal after grouting, and shall extend not less than three inches beyond the baseplate, soleplate or mounting block. Leveling blocks and shims shall be coated with a light oil just prior to beginning the leveling and grouting work. Shims shall be placed so the tabs on the shims are easily accessible.

D. Grouting:

1. Grout forms shall be built of minimum 0.75 inch thick waterproof plywood and shall be securely braced (minimum brace size shall be two-by-four lumber). Forms shall be designed for a minimum of 6 inches hydrostatic head above the final elevation of the grout, to assist in flow during installation. Equipment mounting grout shall be furnished with expansion joints installed at four to six foot intervals, perpendicular to the centerline of baseplates.
2. Forms shall be coated with three coats of paste wax on all areas that will come in contact with the grout to prevent the grout from bonding to the forms. Forms shall be waxed before assembly to prevent accidental application of wax to surfaces where the grout is to bond. Before any forms are installed, all concrete surfaces that will contact epoxy grout shall be free from any foreign material, such as oil, sand, water, wax, grease, etc. Forms shall be liquid-tight. Any open spaces or cracks in forms, or at the joint between forms and the foundation, shall be sealed off, using sealant, putty, or caulking compound. All outside vertical and horizontal edges of the grout shall have 45-degree chamfers as indicated in the equipment anchor details for rigid equipment mounts. Match chamfers in concrete portions of the equipment pad. Block outs shall be provided at all shimming and leveling positions to allow removal of leveling equipment and tools after the grout has cured. Jackscrews shall be coated with a light oil or other acceptable bond-breaking compound prior to grouting in order to facilitate removal after the grout has cured.

3. The 45-degree perimeter chamfer strip shall be located at the final elevation of the grout. The final elevation of the grout on baseplates with exposed I-beam or C-channel supports shall be at the top of the lower support flange. The top of the grout, on all other baseplates soleplates, and mounting blocks, shall be at least 1.0 inch above the bottom or underside of the baseplate, soleplate, or mounting block and shall not be higher than the top of the baseplate, soleplate, or mounting block. The grout's final elevation shall not be so high as to bond the equipment anchor nut and washer.
4. The resin and hardener for epoxy grout for equipment mounting shall be mixed in accordance with the epoxy grout manufacturer's recommendations. Epoxy grout shall be placed at the center of one end of the baseplate or soleplate and worked toward the ends in such a manner as to force the air out from beneath the baseplate or soleplate and out the vent holes, to eliminate voids. Epoxy grout shall be placed in a manner that avoids air entrapment, using a head box to pour grout into the grout holes. When the head box is moved to the next grout hole, a 6-inch high standpipe shall be placed over the grout hole and filled with grout. Use of vibrating tools and/or jarring (rapping or tapping) forms to facilitate grout flow is not permitted during placement of epoxy grout.
5. The Contractor shall exercise care to never allow the grout to fall below the baseplate level once the grout has made contact with the baseplate. Grout placement shall be continuous until all portions of the space beneath the baseplate, soleplate, or mounting block have been filled. Subsequent batches of grout shall be prepared so as to be ready when the preceding batch has been placed. Under no circumstances shall the grouting operation be halted because of lack of grout mix. After the entire baseplate is full, 6-inch high standpipes shall be maintained over each grout hole, to continue purging of air. When the grout has started to take an initial set (typically this is determined by a noticeable increase in temperature and no flow of grout at the vent holes) the standpipes shall be removed and excess grout cleaned from all surfaces.
6. Where the cavity under a baseplate or mounting block extends above the elevation of the top of the bolting flange for the baseplate or mounting block, grouting may be completed in two pours. Under these circumstances, the first grout pour shall be continuous until the lower face of the bolting flange for the baseplate or mounting block is submerged in grout a minimum of one inch. The second grout pour shall be completed with standpipes and air purges as specified in the previous paragraph.
7. Grout forms shall be checked for leaks throughout grout pours. Leaks shall be repaired immediately to prevent formation of voids. A final check of baseplate, soleplate, or mounting block level and elevation shall be performed before the grout sets.
8. A grout sample shall be taken for each equipment pad that has a baseplate, soleplate, or mounting block set in grout. The sample shall be placed in a cylinder of sufficient size to yield three two-inch cubes as test samples. The samples shall be tagged with project name, date, time, the equipment number and ambient temperature at the time of placement. Once the epoxy grout cylinder has been

completely filled, it shall be placed next to the foundation of the equipment being grouted and allowed to cure for 48 hours. After 48 hours, the test cylinder shall be tested in accordance with the grout manufacturer's recommendations by the independent testing laboratory specified in paragraph 1.02 Quality Control by Contractor. The results shall be reported directly to the Construction Manager. Forms shall be removed only after the grout has cured sufficiently and upon specific permission from the Construction Manager.

E. Completion:

1. Upon acceptance by the Construction Manager and the equipment manufacturer's representative and after the grout has reached sufficient strength, grout forms and block outs at leveling positions shall be removed. Leveling blocks and shims or wedges and support plates shall be removed, leveling nuts and jack screws shall be backed off to allow the grout to fully support the baseplate, mounting block, or soleplate. Take care not to damage the grout during removal of extended shimming material or leveling equipment and tools.
2. The equipment anchor nuts shall be tightened sequenchly, using calibrated indicating torque wrenches, to develop the full clamping force required by the equipment manufacturer.
3. Equipment anchor nuts shall be tightened in increments of not more than 25 percent of the final torque value in an alternating pattern to avoid stress concentration on the grout surface. After tightening equipment anchor nuts to final values, apply additional wax, grease, or mastic to all exposed portions of the equipment anchor beneath the baseplate, soleplate, or mounting block.
4. After applying additional wax or mastic to exposed portions of equipment anchors, block outs (pockets) for access to leveling nuts, leveling blocks and shims, or wedges shall be filled with the grout material installed under baseplates, soleplates, or mounting blocks and pointed after the equipment anchor nuts have been tightened to final values. Jackscrews shall be removed and holes in the baseplate, soleplate, or mounting blocks filled with a flexible sealant (silicone rubber) or a short cap screw.
5. Check for baseplate, soleplate, or mounting block movement (soft foot) by individually loosening and re-tightening each equipment anchor. Vertical movement at each equipment anchor shall be measured and recorded during loosening and retightening and shall not exceed 20 micrometers (0.001 inch). Vertical movement shall be measured using a magnetic-based dial indicator on the baseplate, soleplate, or mounting block referenced to the epoxy grout surface of the equipment pad or other approved method. Soft foot conditions shall be sufficient cause for removal and reinstallation of grout and baseplates, soleplates, or mounting blocks.
6. Check for grout voids by tapping along the upper surfaces of the baseplate, soleplate, or mounting block. Grout voids shall be sufficient cause for removal and reinstallation of grout and baseplates, soleplates, or mounting blocks. Grout

voids shall be marked. At the discretion of the Construction Manager, grout voids may be repaired as specified in Chapter 5, Section 3.16 of API 686.

3.4 FINAL INSPECTION

A. The Construction Manager will conduct a final inspection with the Contractor for conformance to requirements of the contract documents.

END OF SECTION

SECTION 43 20 05
MACHINE ALIGNMENT

PART 1 GENERAL

1.1 DESCRIPTION

This section specifies requirements for alignment of directly coupled mechanical equipment weighing 1000 pounds or more and/or greater than 100 horsepower furnished or modified under this contract. Equipment direct coupled to the motor with drivers 100 horsepower and less and belt or chain driven machinery are specifically exempted from the requirements of this section. This section also includes requirements for alignment software and equipment to be furnished to the Owner on commissioning of the project.

1.2 QUALITY ASSURANCE

A. GENERAL:

1. All equipment shall be aligned using laser alignment equipment to the tolerances specified by the subject equipment manufacturer or the criteria specified in this section, whichever is more stringent.

B. ALIGNMENT CRITERIA:

1. Unless otherwise specified by more stringent manufacturers' requirements, all mechanical equipment affected by this section shall be aligned to the following criteria:

Maximum Tolerable Misalignment

Speed, rpm, maximum	Short Couplings (Distance between flex planes ≤ 4")		Spacer Shafts angle at each flex plane in mils/inch or projected offset in mils/inch of spacer length
	Offset (mils)	Angularity (mils/inch)	
600 and less	5.0	1.0	1.8
900	3.0	0.7	1.2
1200	2.5	0.5	0.9
1800	2.0	0.3	0.6
3600	1.0	0.2	0.3
7200	0.5	0.1	0.15

Notes: (1) Soft foot (machine frame distortion) shall be not more than 2.0 mils for any speed.

(2) Separately mounted equipment connected by offset universal joints are exempted from the offset and angularity requirements, but all units must be installed and leveled as specified in this section.

C. ALIGNMENT EQUIPMENT:

1. Alignment equipment used to perform the work required under this section shall employ laser alignment techniques to achieve the required tolerances. The equipment shall be computer based and its software shall be compatible with current Windows® based spreadsheets and databases. The equipment shall employ a hand-held field computer using a graphic interface to determine actual alignment and necessary corrective action to bring equipment into required tolerance. The link between field measurement components and the computer shall be through cable, infrared, or wireless transmission.

1.3 REFERENCES

A. This section contains references to the following documents. They are a part of this section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section and those of the listed documents, the requirements of this section shall prevail.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

Reference	Title
Shaft Alignment Handbook	Shaft Alignment Handbook, Third edition, John Piotrowski, Marcel Dekker Inc.

PART 2 PRODUCTS

2.1 EQUIPMENT

A. Laser alignment equipment shall be [Rotalign® Ultra] as distributed by Ludeca, Inc., of Doral, Florida, or equal.

2.2 ITEMS TO BE FURNISHED TO OWNER:

A. The following shall be furnished to the Owner upon completion of all alignment work for the project or appropriate portion thereof and prior to substantial completion of the project or portion thereof:

1. All alignment records, in both hard copy and in computer memory. The hard copy shall be signed and dated by the technician performing the alignment work and shall be witnessed by the Construction Manager.
2. One complete [Rotalign® Ultra] equipment system, or approved equal, including plastic carrying case, transducer, receiver, equipment mounting brackets, connecting cable, hand-held computer and computer software for use in records computer, or the equivalent complete setup as accepted for the project.

PART 3 EXECUTION

3.1 GENERAL

A. After machine base grouting, all machines mounted on baseplates or soleplates specified above shall be aligned as specified under this section.

B. Alignment work shall be performed by journeyman millwrights skilled in this type of work under the supervision of a technician trained in the use of the laser alignment by the manufacturer or vendor of the alignment equipment. The use of untrained laborers, carpenters or apprentices for this work will not be acceptable.

3.2 PROCEDURE

A. SEQUENCE:

1. Machines supported on integral feet or support pads shall be leveled, grouted and aligned in the following order: driven machine; intermediate bearings or machines; and driver. Under certain circumstances, such as a diesel engine driving a generator, it may be preferable to reverse this order and set the driver first. The Contractor shall submit a written request for a reversal of the alignment order to the Construction Manager and the Construction Manager must approve any change in alignment order in writing before it will be allowed.

B. ALIGNMENT:

1. All machines shall be rough aligned without any connections to piping, electrical and instrumentation systems. Upon completion of all field connections, alignment shall be rechecked to demonstrate no change. If change has occurred, the Contractor shall eliminate any external forces affecting machine alignment.
2. Next, soft foot (machine frame distortion) shall be measured and brought to within the permissible tolerances (see Paragraph 1.02 B, Note 1). Thereafter, the alignment shall be rechecked and the alignment process repeated if necessary to bring all machinery to final alignment tolerances.

3.3 VERIFICATION

A. FACTORY PERSONNEL:

1. Where required by other sections in this project manual, factory authorized installation technicians representing the equipment manufacturer shall witness final alignment work. After completion of all alignment work, acceptance of the work shall be documented in writing by factory installation technicians.

B. VERIFICATION:

1. All alignment work shall be independently checked using the shaft and coupling spool method described in the Shaft Alignment Handbook. All final results of the alignment work shall be subject to inspection and verification by the Construction Manager.

END OF SECTION

SECTION 43 23 03
GENERAL REQUIREMENTS FOR CENTRIFUGAL FLOW PUMPING EQUIPMENT

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:

1. This section, when referenced in the detailed specification section, provides minimum requirements applicable to centrifugal flow pumping equipment furnished under this contract. More restrictive requirements, where found in individual pump specifications, shall supersede requirements of this section.
2. "Detailed pump specification", "detailed specification", "individual pump specification", "referencing section", or words of similar import in this section, shall mean the specification section where the requirements for specific pump performance are presented. "Pumping unit", whenever and wherever used, shall mean the complete pumping assembly, including driver (whether engine, turbine, or motor) and shall include all accessories such as variable speed drives required for motor operation, gear reducers, intermediate shafting and bearings, flywheels, and all supports for all equipment furnished with the pump.
3. A number of provisions of this section shall be required for a subset of pumps. These requirements (refer to Paragraphs 1.05 and 1.07 of this Section) are in addition to requirements applicable to all pumps. The subset of pumps is defined as pumping equipment meeting any of the following criteria:
   a. All pumping unit specifications where the words "Custom Engineered" appear in the title of the specification section.
   b. Where a particular Section 43 23 03 provision is specifically cited in the detailed sectionfor a particular pump.

B. Definitions:

1. The following definitions apply for classifying pumps specified in this and referencing sections:
   a. General: Terminology and definitions in this Section follow those established in ANSI/HI 9.1 - 9.5, unless otherwise noted.
   b. Solids Bearing Liquids: Liquids to be pumped containing, or assumed to contain, solids that require appropriate pump design considerations and/or materials of construction. Solids Bearing Liquids are liquids with settleable and/or floatable solids exceeding 50 mg/L and shall include wastewater, stormwater, primary effluent, return sludge, return activated sludge (RAS), trickling filter circulation, and similar services.

c. Clear Liquids: Liquids to be pumped generally free of deleterious solids. Clear Liquids shall include potable water, heat reservoir, raw water, secondary effluent pumping, and similar services.

d. Efficiency: For the purposes of this section and sections referencing this section, efficiency, as related to pumps, shall be the ratio of the pump output power (water horsepower) divided by the pump input power (brake horsepower) required to deliver the total head, with meanings as defined in ANSI/HI 1.2.3.8 and ANSI/HI 2.2.3.8.

e. Net Positive Suction Head – 3 Percent Reduction (NPSH3): For the purposes of this section and sections referencing this section, NPSH3 shall mean the value of net positive suction head resulting in a reduction of 3 percent in the developed pump discharge head when the pump is tested in accordance with procedures established by the Hydraulic Institute. NPSH3 is the successor designation to NPSHR (net positive suction head required). Where NPSHR is used in the Contract Documents it shall be taken to mean NPSH3.

f. NPSH Margin: For the purposes of this section and sections referencing this section, "NPSH Margin" wherever used shall mean Net Positive Suction Head Available (NPSHA) divided by the candidate pump's Net Positive Suction Head-3 Percent Reduction (NPSH3) for the specific operating condition in question.

1.2 TYPE

A. Provisions and requirements contained in this section apply specifically to centrifugal flow pumps, both vertical and horizontal, commonly falling into the generic types covered by ANSI/HI 1.1 through 1.4 and 2.1 through 2.4. This section does not apply, except by specific reference, to positive displacement pumps of any type.

1.3 REFERENCES

A. This section (Section 43 23 03) contains references to the following documents. They are a part of this section and any referencing section as specified and modified. Where a referenced document contains references to other standards, those documents are included as references under this section as if referenced directly. In the event of conflict between the requirements of this section or any referencing section and those of the listed documents, the following order of precedence shall prevail (in the order of primacy):

1. The referencing section.
2. This section.
3. The referenced document.

B. Unless otherwise specified, references to documents shall mean the documents in effect at the time of Advertisement for Bids or Invitation to Bid (or on the effective date of the Agreement if there were no Bids). If referenced documents have been discontinued by the issuing organization, references to those documents shall mean

the replacement documents issued or otherwise identified by that organization or, if there are no replacement documents, the last version of the document before it was discontinued. Where document dates are given in the following listing, references to those documents shall mean the specific document version associated with that date, regardless of whether the document has been superseded by a version with a later date, discontinued or replaced.

1.4 DESIGN REQUIREMENTS – ALL PUMPS:

A. General:

1. Equipment furnished under all sections referencing this section shall conform to the requirements and objectives of paragraph 6.1, ANSI/API 610, unless specifically stated in this and the detailed specification section. All components associated with the rotating elements in the drive train, including equipment supports and supports for rotating elements, shall be selected and designed to function without damage or disassembly at reverse rotational speeds up to 150 percent of maximum operational speed during flow reversals through the

pump. The complete pumping unit shall operate without overload on any component at any point along the pump's entire full-speed operating curve. Pumps required by virtue of the specified operating conditions to operate against a closed valve or throttled for any period of time exceeding five seconds shall be furnished with drivers sized to operate continuously at the power requirement for that condition even though the power requirements at the rated condition may be less.

2. With the exception of submersible pumps and the inlet connection for pumps designed to operate in open forebays or wet wells, pump connection nozzles shall be designed for the loads and moments stipulated in ANSI/HI 9.6.2. Where ANSI/HI 9.6.2 does not cover a specific pump type or category, or where that document is silent on allowable nozzle loads or a particular type of nozzle load (e.g. thermal pipe strain), the Contractor shall furnish documentation from the manufacturer attesting to the limitations on loads and moment forces that can be tolerated on each connection and recommended connection details to be used.

B. Pump Selection:

1. Proven Designs:
   a. Pumps furnished under all sections referencing this section shall be proven designs that shall have been in service under similar conditions of service with no objectionable performance characteristics. The Contractor shall furnish a detailed list, duly signed by an officer of the pump manufacturer's corporation and notarized, of installations with contact information supporting qualification under this requirement with the information required under paragraph 1.08. In order to satisfy this requirement, the listed pump shall be of the same size volute or bowl, discharge case and nozzle size, impeller design (including number of vanes) and shall be operating under similar conditions of pumped fluid, head, capacity, speed, rotation, and Net Positive Suction Head Available (NPSHA).
   b. The Contractor may propose equipment that cannot meet this requirement only under the following conditions:
      1) The proposed design has been in successful operation under similar conditions of volute or bowl, discharge case and nozzle size, impeller design (including number of vanes), pumped fluid, head, capacity, rotation and NPSHA, or
      2) The proposed design has been in operation in designs where both larger and smaller inlet nozzle size pumps have been in service for a period of not less than five years, and impeller design (including number of vanes), pumped fluid, head, capacity, speed and NPSHA are similar to that for the proposed installation. Under no circumstances will an existing pump design operating at a higher speed than those currently in service in similar applications be considered.
   c. If the proposed pump qualifies under either exception [(b.1) or b.2)], the Contractor shall demonstrate, by operation of a test pump in a fully equipped hydraulic test facility, that the proposed pump in the size and at the speed

proposed, with the proposed impeller design will have acceptable operating characteristics (vibration, case noise, no indication of suction or discharge recirculation) under the conditions specified for the proposed installation. The test pump shall be set up and a witnessed demonstration shall be performed prior to designing, fabrication and testing any of the equipment proposed for the specific installation.

2. General Performance Criteria:
    a. Pumps furnished under this section and any referencing section shall operate without loss of head due to cavitation or vibration over the entire specified range of flow and head conditions and shall be specifically selected for NPSH margin requirements specified for the pump conditions of service. Pump selections which do not provide the specified margin will be rejected.
3. General Design Criteria:
    a. All pumps furnished under sections referencing this section shall be designed in accordance with applicable portions of ANSI/HI 1.1 – 1.4, 2.1 – 2.4, ANSI/HI 9.6.2 and ANSI/HI 9.6.6 and the requirements of this section. The pumps shall be specifically designed to pump the fluid described in the detailed specification and shall operate without clogging or fouling caused by material in the pumped fluid at any operating condition within the range of service specified.
    b. Unless otherwise noted or specified, pump head capacity curves shall slope in one continuous curve within the specified operating conditions. No points of reverse slope inflection capable of causing unstable operation will be permitted within the specified zone of continuous duty operation. Pumps with head/capacity curves with a reverse inflection are specifically prohibited if these characteristics will cause unstable operation within the specified range of operating conditions and where startup/shutdown conditions entail operation against a slow opening/closing valve.
    c. Pumps specified to operate at constant speed shall function without loss of head or capacity due to cavitation or excessive vibration over the entire specified range of flow and head conditions defined by the region bounded by Condition Points A, B, C, D, and E and any other continuous duty operating condition specified in the detailed specification referencing this section and shall be selected to place Condition Point C in the detailed specification within the PACL region determined by suction specific speed for the proposed pump and the limits from the table below.
    d. Pumps specified to operate at variable speed shall function without loss of head or capacity due to cavitation or excessive vibration over the entire specified range of flow and head conditions defined by the region bounded by Condition Points A, B, C, D, and E and any other continuous duty operating condition specified in the detailed specification referencing this section in the Allowable Operating Region as defined in ANSI/HI 9.6.3 and as indicated on the test curve developed for the specific pump model. Unless

otherwise specified in the section referencing this section, acceptance criteria shall include the following:

1) Operating Condition Points B and C and any other continuous duty operating point specifically required in the detailed specification shall reside within the region defined by ANSI/HI.9.6.3
2) Unless otherwise noted in the detailed specification referencing this section, Operating Condition Point A may reside in the area outside the POR as defined in ANSI/HI 9.6.3. Condition Point C shall be located within the POR;and Condition B shall be located within the POR, or within 5 BEPQ percentage points (in terms of flow) outside the POR so long as Condition Point C resides in the POR.

e. Pumps shall be specifically selected for NPSH margin requirements specified for the pump conditions of service. Pump selections which do not provide the specified margin will be rejected.
f. ANSI/HI 1.3, paragraph 1.3.2.2.
g. Exceptions to the foregoing will be considered by the Construction Manager only when the Contractor can provide certified test data demonstrating conclusively a wider region of stable pump performance. The test data shall include suction pressure pulse information as well as actual service information for the same impeller design and trim, operating at the same speed, capacities and head for the same size pump as required for the specified application.

C. Critical Speeds and Natural Frequencies:

1. General:
   a. The criteria of this paragraph apply to all pumps. Pumps exhibiting adverse behavior after installation from resonance, vibration or fatigue shall be repaired or replaced at no cost to the Owner. The criteria shall apply to the equipment in like new condition as well as the as worn condition (i.e., when all parts, individually and as a composite, reach the manufacturers' maximum tolerances). Critical speed and natural frequency data submittal requirements depend upon the pump:
      1) For the more critical pumps that are covered under paragraph 1.05 the Contractor is required to submit analytical reports confirming requirements on critical speeds and natural frequencies prior to pump fabrication as specified in that paragraph.
      2) Unless otherwise specified, for constant speed pumps and variable speed pumps with suction size less than 6-inch diameter – no critical speed submittal is required.
2. Lateral Rotor Dynamics:
   a. The complete pumping unit, including all related frames, supports, enclosures, and casings, shall be free from dangerous critical speeds from 20 percent below to 30 percent above the operating speeds required to

achieve the specified performance characteristics. The logarithmic decrement for each damped natural frequency (forward or backward) shall be greater than +0.3, and the amplitude magnification factor shall not exceed 3, for any natural frequency within this range.

b. Process sensitivities are such that operation at infinitely variable speed within the specified operational conditions is an absolute requirement. Any remedy imposing a locked-out speed interval or intervals will not be considered an acceptable remedy for identified critical speeds. Acceptable remedies include combinations of adjustments in rotor geometry or materials, and the substitution of energy absorbing couplings. Other remedies may be considered so long as they are justified in writing and the proposal sealed and signed by the design professional retained by the manufacturer to perform the system mass elastic system analyses.

3. Torsional and Combined Shaft Stress:

a. For constant torque applications, the pump rotor shall be free from torsional response which produces combined (steady plus alternating torque induced) stresses exceeding 30 percent of the material's elastic limit (but no more than 18 percent of the material's ultimate tensile strength) at any speed from 10 percent below to 20 percent above that required by the specified operating conditions, or during startup, shutdown or motor control transients.

4. For variable torque applications (including variable speed pumps, vertical pumps and pumps with large overhung loads) the pump rotor and any intermediate shafting shall be free from torsional responses which, in accordance with MIL STD 167-2, produce combined (torsional steady and alternating) peak shear stresses at points of stress concentration (calculated in accordance with the requirements of this section) that exceed 4 percent of the material's ultimate tensile strength, nor more than 50 percent of the material's fatigue limit, whichever is less.

D. Component Design Criteria:

1. General:

a. Unless otherwise specified, combined stresses in steel frames and supports shall not exceed those permitted by the AISC Manual of Practice. Combined stresses in cast, forged, rolled, or fabricated pressure retaining components, frames and supports shall not exceed that allowed for the given material in Section VIII, Division 1 of the ASME Code. Design pressures for pressure-retaining parts shall be not less than twice the pump's shutoff head at the manufacturer's listed maximum operating speed. Pump casing strain at any head on the full speed operating curve (including allowances for increases caused by specified multi-stage applications) shall not result in distortions at the bearing housings greater than the maximum allowable by the bearing manufacturer to provide the specified bearing life.

b. The term "combined stresses" in this section shall mean the sum of all operating stresses, including stresses induced by dynamic and static forces as developed via the analysis procedures stipulated in this section. Static forces (x, y, z, and moments in all planes) shall include the relevant maximum nozzle

loads specified in ANSI/HI 9.6.2 or as stipulated by the pump manufacturer. Dynamic forces shall include both steady state and transient stresses induced by operating conditions within the zone of operation established by the specified operating conditions.

2. Anchorage and Equipment Mounts:
   a. The Contractor shall cause the pump manufacturer to be responsible for the design of the anchor bolting system and equipment supports for each separately mounted component furnished under the detailed specification. Anchorage and equipment support requirements for pumps shall conform to the requirements of Section 43 05 13 and the standards of the Hydraulic Institute.
   b. Anchor bolts and connecting bolts for all pumps and assemblies supported by other assemblies furnished under this section, or sections referencing this section, shall be designed in accordance with the structural plans and specifications. All operation and maintenance manuals for all pumps and assemblies shall contain criteria for anchor and baseplate bolt torque values.
   c. Unless otherwise recommended by the equipment manufacturer, all pump discharge nozzles shall be restrained using the equipment connection fitting specified.
   d. Equipment mounts for vertical volute type pumps weighing more than 1000 pounds, with discharge nozzles 6 inches in diameter and greater, shall employ soleplates conforming to the requirements of Section 43 05 13.
      Soleplate mounting conforming to Section 43 05 13 shall also be provided for all separately supported components in the pump drive system. Fabricated steel supports regardless of design and the nature of the structural shapes used for such proposed supports, will not be accepted.
   e. Soleplates shall be designed to span openings for equipment connections and provide access to maintenance points. Soleplates shall be of sufficient section to key, not less than 1 inch, into the supporting grout provided for bonding the soleplate to the structure. Soleplates shall be of sufficient size to bolt the pump base to the soleplate and allow dowelling the pump base to the soleplate without encumbering the anchor bolts required for clamping the soleplate to the structure. Soleplates shall have the words" THIS SIDE DOWN" engraved in the underside (grout side) of each plate.
   f. Equipment mounts for horizontal pumps shall be designed in accordance with Section 43 05 13 and paragraph 7.3, ANSI/API 610 and shall provide common support for the pump and motor (and flywheel, if one is specified). Baseplate bolting shall conform to assumptions contained in ANSI/HI 9.6.2. Pump base shall be drilled and dowel pinned to the base plate in addition to bolting.
   g. Tapered dowel pins shall be used to record the final position of all machine bases on soleplates or pump baseplates. Dowel pins shall be hardened and machine-ground conforming to the requirements of ANSI/ASME B18.8.2. Holes for tapered dowels shall conform to the requirements set forth in Appendix A of ANSI/HI B18.8.2.

3. Torsional and Combined Shaft Stresses:
    a. Shaft stresses shall be calculated using the following equation and the stress concentration factors in the table below.

$$S = S_{cf} \times \frac{G \times D \times \Delta_{\Theta}}{2 \times L}$$

where:

S = stress, psi

S_{cf} = stress concentration factor, dimensionless

D = minimum shaft diameter at point of concentration, inches

Δ_{Θ} = twist in shaft between adjacent masses, radians

L = effective length between masses, inches

G = shear modulus of shaft material, lb/in2

The S_{cf}, to be applied at all the roots of all keyways and changes in shaft diameter shall be as follows:

S_{cf}	Ratio of fillet radius to shaft diameter
4.3	0.0025
3.7	0.01
3.05	0.02
2.75	0.03
2.6	0.04
2.55	0.05 and greater

Values of S_{cf} between data points in the table above shall be based upon a straight line interpolation.

4. Shaft Deflection:
    a. Pump shafts on volute type pumps shall be designed to provide sufficient stiffness to operate without distortion or damaging vibration throughout the range of service specified. Shaft deflection at the face (impeller side) of the shaft seal shall be limited to no more than 1.5 mils at any operating condition within the zone described by the specified continuous duty operating

conditions. Deflection at the shaft seal shall be calculated as required by provisions set forth in Paragraph 1.05 Shaft Radial Load and Deflection.

5. Bearings:
    a. Unless otherwise specified, anti-friction bearings for pumps shall be selected for a minimum L–10 life of 50,000 hours in accordance with ABMA 9 or 11. Anti-friction bearings for Custom Engineered pumps shall have bearings selected for an L–10 life of 100,000 hours in accordance with ABMA 9 or 11. Bearings for other elements in the rotating system such as motors, intermediate shaft bearings, and flywheel bearings shall be selected using the same criteria as specified for the pump. Bearing selection shall be based upon the worst combination of continuous duty operating conditions specified and shall include both steady state and transient loads. Calculations supporting the selection of bearing sizes shall be provided as Product Data.
6. Bearing Isolators:
    a. Unless otherwise specified, all pump and motor bearings shall be fitted with bearing isolators, specifically selected for the size and type bearing. Bearing isolators shall be labyrinth, non-fretting type designed to expel contaminants by centrifugal force and prevent escape of lubricants. Vapor block capability shall be provided. Bearing seals shall be Inpro/Seal, model AM or approved equal.
7. Pump Shaft Seals:
    a. Unless otherwise specified in the detailed specification, pump shaft seals shall be packing as specified in Section 43 05 11.

E. Net Positive Suction Head Margin Limitations:

1. General:
    a. Pumps furnished under this section and sections referencing this section shall be selected for NPSH (Net Positive Suction Head) margin limitations using the criteria set forth in this section. Net Positive Suction Head Required - 3 Percent Reduction (NPSH3) characteristics for the candidate pump shall be based upon documented test, performed on a pump not more than two nominal pump diameters larger or smaller than the proposed pump with an impeller of the same geometry as that proposed for the pump to be used for the subject application, and operating at the same speed as the pump for the proposed application. The Contractor shall document the basis for pump selection based upon NPSH margin limitations as set forth in this paragraph. The detailed specification sections provide NPSHA (Net Positive Suction Head Available) information for anticipated operating conditions for each application. This information is generally referenced to a specific elevation, stated in terms of project datum. It shall be the Contractor's responsibility to cause the pump manufacturer to adjust the NPSHA information in the specification section to the elevation of the pump impeller eye for the specific pump model and size proposed for the application. NPSH3, as used in the

following paragraphs, shall mean the NPSH3 at the impeller eye, determined in accordance with ANSI/HI 11.6 or 14.6, as applicable for the proposed pump. The Contractor shall cause the pump manufacturer to document the method used to determine NPSH3 for the proposed pump and justifying compliance with the NPSH margin limitations established under this paragraph for each specified operating condition in material submitted under paragraph 1.08. The documentation shall include justification of the NPSH3 tests used to develop NPSH3 characteristics, including the following:

1) Date, test procedure, and test logs of original NPSH3 information used to project requirements for pump selected for the application.
2) Test pump size, impeller diameter, impeller model, eye diameter, and speed.
3) Calculations projecting NPSH3 test information to NPSH3 curve information for the pump proposed for the application.
4) Calculations demonstrating compliance with the NPSH margin requirements established in this paragraph.

b. The Contractor shall submit the manufacturer's margin calculations justifying the proposed pump selection with the material required under Paragraph 1.08. The NPSH margin ratios specified in this paragraph shall be the minimum acceptable margin ratios. If the proposed pump requires greater margin ratios to operate within the specified operating conditions without loss of head due to cavitation, then it shall be the responsibility of the Contractor to bear all costs associated with achieving the required margin ratio by lowering the elevation of the pump setting, lowering the elevation of the structure or other means. Any such adjustments shall be subject to review and acceptance by the Construction Manager.

c. Individual restrictions that apply to NPSH margin shall be as set forth below, depending upon the type of pumping equipment and the fluid to be pumped.

2. Centrifugal Pumps – Wastewater Service:

a. The following restrictions shall apply to pumps for wastewater and all solids bearing liquids applications including storm water.

1) Pumps classified as centrifugal pumps under ANSI/HI 1.1 – 1.2 with suction specific speeds less than 8500 with cast duplex stainless steel impellers and specific speeds less than 5000, a minimum NPSHA/NPSH3 margin ratio of 1.1 shall apply to pumps at any operating condition within 85 percent and 115 percent of best efficiency capacity. The minimum acceptable NPSH margin ratio at any other location on the pump's head/capacity curve shall be 1.2.
2) Pumps with suction specific speeds greater than the above limitations shall have NPSH margins of 1.5 and 2 applicable to the capacity envelope limitations defined previously. Under no circumstances shall the absolute value of the margin above NPSH3 be less than 3.5 feet.

3) Pumps with suction specific speeds greater than the above limitations, and pumps with impeller materials that do not meet the requirement for duplex cast stainless steel set forth in this section, and all pumps with suction specific speeds greater than 10,000 shall have NPSH margins not less than 2.5 at operating conditions within ±15 percent of best efficiency capacity and not less than 3.5 for all operating conditions falling outside the ±15 percent of best efficiency capacity envelope. Under no circumstances shall the absolute value of the margin for pumps qualifying with the foregoing restrictions, be less than 3.5 feet greater than NPSH3.

3. Centrifugal Pumps - Clear Liquid Service:
   a. The minimum NPSH margin requirements set forth in the table below shall apply to water and all non-solids bearing liquid pumps classified as centrifugal pumps under ANSI/HI 1.1 – 1.2 with specific speeds less than 7000 fitted with cast duplex stainless steel or aluminum bronze impellers and to pumps with cast duplex stainless steel impellers or aluminum bronze impellers and specific speeds less than 4000. Under no circumstances shall the absolute value of the margin above NPSH3 be less than 3.5 feet.

Power per stage, Kw	Operating Condition Within POR	Operating Conditions Outside POR
< 75	1.1	1.2
≥ 75 but ≤ 225	1.05	1.1
>225	1.2	1.3

   b. Pumps with specific speeds greater than the above limitations, pumps with impeller materials that do not meet the requirement for duplex cast stainless steel set forth in this section, and all pumps with suction specific speeds greater than 10,000 shall have NPSHA margins not less than 3.0 at operating conditions within ±15 percent of the best efficiency capacity and not less than 4.0 for all operating conditions falling outside the ±15 percent of best efficiency envelope. Under no circumstances shall the absolute value of the margin above NPSH3 be less than 3.5 feet.

F. Electric Motors:

1. General:
   a. Unless otherwise specified, pumps shall be electric motor driven. All motors shall be selected to be non-overloading at any operating point along the pump's full speed operating curve, including all points located beyond specified operating conditions. All vertical motors shall be solid shaft construction. Hollow shaft motors will not be accepted. Motors furnished with pumps specified for operation at variable speed shall be inverter duty types

conforming to the requirements of Section 43 05 11 and shall be compatible with the variable speed equipment furnished with the pump.

b. Motor bearings shall be protected with bearing isolators as specified in Paragraph 1.04 Component Design Criteria.

2. Motors for Custom Engineered Pumps:

a. In addition to the information submitted under the requirements of Section 43 05 11, the Contractor shall provide certified reed frequency calculations for both the motor rotor and frame for vertical motors driving custom engineered pumps with the data to be submitted under Paragraph 1.08. Upon completion of construction of motors for custom engineered pumps, each rotor and frame and the completed assembly shall be given a bump test to confirm reed frequency calculations in the dynamic analysis modeling work performed under Paragraph 1.05 Rotor Critical Speed Analysis and System Design. The results of the bump test, certified by an officer of the manufacturing corporation and notarized, shall be submitted as Product Data under Paragraph 2.09.

b. All vertical motors shall meet motor face dimension tolerances as follows:

Motor face bolt circle diameter, inches	Motor face runout, inches
12	0.002
16.5 through 24.5	0.002
30 through 42	0.003
42 and larger	0.005

c. Motor face register concentricity, referenced to the shaft centerline, shall be not greater than 0.002 inches, if the motor is furnished without jack screws. Motor shaft total indicated runout (TIR) shall not exceed 0.002 inches.

3. Balance:

a. Motors rated 50 horsepower and greater, all motors driving custom engineered pumps and all motors operating at less than 1200 rpm shall be precision balanced motors conforming to the requirement set forth in the table below.

Speed, rpm	Mils displacement (peak to peak)
3000 and above	0.5
1500 - 2999	1.0
1000 - 1499	1.0
<1000	1.5

b. The Contractor shall provide certified balance logs attesting to achieving these requirements, as Product Data under Paragraph 2.09. Displacement readings shall be taken at the shaft with an FFT analyzer at 1X speed. Balance logs shall be notarized and signed by an officer of the manufacturing corporation.

4. Custom Electric Motors:
   a. Custom motors shall be provided in accordance with Section 43 05 11. Custom motors shall be provided for pumps to be supplied under the following Sections:
      1) Section 43 23 15.
      2) Section 43 42 56.04.

1.5 ADDITIONAL DESIGN REQUIREMENTS

A. Scope:

The following paragraphs present requirements that apply to only some pumps on the project. In each of the paragraphs, the first sub-paragraph titled "General" explains when the paragraph applies.

B. Rotor Critical Speed Analysis and System Design:

1. General:
   a. The requirements of this paragraph shall apply to all pumping equipment in detailed specifications where the words "Custom Engineered" appear in the title of the specification section, and elsewhere when the referencing specification section stipulates. The analyses shall be applied to the equipment in like new condition as well as the as worn condition (i.e., when all parts, individually and as a composite, reach the manufacturers' maximum tolerances).
2. Requirements:
   a. The complete pumping unit, including rotating elements, frames, supports, and all related structural elements, including pump, motor and bearing supports, shall be subjected to a lateral rotordynamic analysis, including a rotordynamic critical speed analysis, to identify and eliminate harmful resonant conditions.
   b. The complete pumping unit rotating element including pump, motor, intermediate shafting and flywheel rotors (if specified), and all other elements in the power train (or powered via the power train) shall be designed and manufactured to limit torsional stresses.
   c. Overhung shaft pumps and between bearings pumps operating in single volute casings shall be subject to analysis for shaft deflection in accordance with the terms of this section.

d. The torsional and rotordynamic analyses shall together be termed the pumping equipment's "mass elastic design". No fabrication work on any component for the equipment specified under this section and any referencing section shall be started until the mass elastic design has been completed and has been reviewed by the Construction Manager.

e. If the Contractor proposes the use of alternative methods for the required analyses, documentation shall be submitted justifying the substitution. The documentation shall include justification that product results will be equivalent to that specified and with an equivalent level of accuracy. The location and description of projects of an equivalent size where the procedure has been employed and the length of time these projects have been in actual service shall also be included.

3. Professional Qualifications:

a. The Contractor shall cause the manufacturer of the pumping equipment to retain the services of an independent professional engineering firm, employing a qualified design professional, which has been engaged in performance of the required, mass elastic design analyses on equipment of similar size and complexity. The design professional shall have experience working with a pump manaufacturer. The design professional's firm shall submit a notarized certification attesting to having no contractual arrangements with the proposed pump manufacturer. The pump manufacturer's internal engineering organizations, regardless of qualifications, are specifically prohibited from doing this work. This provision, however, shall not be construed as relieving the Contractor of overall responsibility for this portion of the work.

b. The mass elastic design shall be the product of a design professional, registered to practice mechanical engineering in at least one of the States comprising the United States, who has been responsible for the design of not less than five systems similar to that specified in the detailed specification section. The design professional shall have been engaged in this type of analysis and shall directly supervise the performance of the work and be responsible for analysis of results and recommendations for any corrections to the specific rotating system and the associated frames and supports. The Contractor shall submit the design professional's qualifications as a part of the initial submittal information required under this section.

c. The Owner and Construction Manager believe the following firms are capable of providing services which will satisfy the requirements of this paragraph. This statement, however, shall not be construed as an endorsement of a particular firm, nor shall it be construed that a named firm's standard service will comply with the requirements of this Section. Candidate firms performing these analyses satisfactorily in the past include:

1) DynaTech , Roseville, California
2) Engineering Dynamics Incorporated, Houston, Texas
3) No Bull Engineering (Corbo, Malanoski & Associates), Brandon, Vermont

4) Or equal.

d. The Contractor may propose a firm other than those listed. However, before a substitute firm can perform the analyses, the proposed firm's qualifications, the qualifications of personnel proposed for assignment to this project, along with examples of analyses performed on similar pumping equipment using the Corbo and Malanoski procedures specified in this section shall be submitted for review by the Construction Manager. Examples shall include the types of graphical displays required under this section as well as a complete report describing the analyses performed and the recommendations arising out of the analysis results. Construction Manager retains the right to reject any proposed firm with justification.

4. Reports, Calculations and Recommendations:
   a. All reports, calculations and recommendations resulting from the required analyses shall bear the design professional's original signature and professional registration seal. All reports, recommendations and calculations produced under this paragraph shall be submitted under the requirements of this section, as follows:
      1) Following completion of the pumping equipment's mass elastic design, Contractor shall cause the design professional to prepare a plain-English "Executive Summary" report with a narrative including: a description and assumptions about proposed operating system; detailed description of the analysis process; results of analyses and findings; detailed recommendations for modification of the Pumping Unit (defined in Paragraph 1.01 Scope), if any; and sufficient graphical depictions to describe the information to a lay reader. Detailed calculations and extensive data reports are not to be submitted at this time and will cause the entire report to be rejected, if included. This Executive Summary shall be submitted for review and acceptance prior to pump or component fabrication. The Executive Summary report shall state that analysis procedures have complied fully with the requirements of this section and that the proposed system will meet all of the requirements set forth herein for limitations in stresses, deflection and fatigue limits. The design professional shall affirm in writing that all requirements of this section have been achieved or shall specifically state where exceptions have been taken, with justification citing recognized authorities for taking such exceptions. The reports shall be signed and sealed by the design professional, as specified, and shall be notarized.
      2) Following review and approval of the Executive Summary, the Contractor shall cause the design professional to review and address any comments from the Construction Manager and incorporate all changes that may be required. Subsequently, Contractor shall direct the design professional to issue a complete, "Final Report" with a revised Executive Summary, recommendations binding on the manufacturer, calculations, data and

other supporting information. The format and documentation for this report shall follow the requirements of ANSI/HI 9.6.4. The Contractor shall submit this report as Product Data.

3) Upon completion and receipt of certified results of the bump tests required for the motor rotor, frame and assembly, the design professional shall review the data and submit a "Supplemental Report", as Product Data, either accepting the test results or recommending alterations to assembly structures to adjust for differences between calculated values used for the original analyses and actual values determined subsequent to motor fabrication.

4) Upon completion of installation and as a part of the initial test procedures, the design professional responsible for the mass elastic design shall visit the site and inspect the installed equipment. Prior to the initiation of any field tests, the design professional shall issue a report attesting that the equipment, as installed, conforms to the recommendations contained in the report setting forth the results of the mass elastic system design or recommendations for remedies should the supplied equipment contain features or characteristics deviating from the original recommendations and calculations.

5) During initial testing of the equipment, the design professional shall be prepared with all necessary monitors, instruments and recorders, and shall conduct an in-situ torsional vibration test on one of the installed pumping units, to be selected by the Construction Manager, to confirm the torsional natural frequency results of the original mass elastic system design. The torsional vibration test shall be conducted with transducers suitable for narrow band spectrum analysis, including strain gauges, magnetic or optical pulse demodulation, or shaft position encoders. If the torsional vibration test should reveal any anomalies that cause the equipment to be out of compliance with the requirements of this section, the design professional shall conduct torsional vibration tests on all other like pumping units and submit a comprehensive report, sealed and signed as specified above, detailing the reasons for failure to comply with these specifications and recommendations for attaining compliance. The design professional shall consider all feasible options for compliance and shall provide detailed descriptions of the modifications required to achieve the required performance. Those recommendations accepted by the Construction Manager shall be implemented by the Contractor at no cost to the Owner.

5. Methodology:
   a. Lateral Rotor Dynamic Analysis:
      1) The rotor dynamic analysis shall follow the procedure prescribed in Corbo and Malanoski, 1998, and shall include the following features:

a) The procedure shall consider all speeds required to operate the equipment within the envelope of specified continuous operating conditions specified.

b) The procedure shall produce Campbell diagrams for the proposed operating conditions depicting all potential sources of excitation to check interference with all relevant frequencies up to, and including, not less than 6 times (6X) operating speed.

c) For all pumps, the analysis shall also consider vane pass excitation at rev/2.

   (1) Unless specifically accepted by the Construction Manager, the range in variation of component characteristics shall comply with the ranges recommended in Corbo and Malanoski, 1998.

d) The mathematical modeling tools to be employed for the analyses and the procedure to be used shall be as described in the references specified in Paragraph 1.05 Rotor Critical Speed Analysis and System Design with the following modifications:

   (1) The mathematical model of the rotating element shall be built on a rotordynamics code such as FEATURE or DYROBES. Use of a finite element modeling program for this purpose will be unacceptable. The model shall specifically be constructed to contain axisymmetrical models of the rotor and casing. This model shall be used to determine the natural frequencies of the rotating elements.

   (2) A finite element code such as NASTRAN or ANSYS shall be used to construct three dimensional models of the casing and support structures for the equipment furnished under this contract. This model shall be used to determine the natural frequencies of the support structures and casing as well as the pump bearing frames.

   (3) The axisymmetrical model shall then be adjusted, preferably by changing component materials or sizes, or by changing component type, until its output frequencies agree with the models constructed under b).

e) Physical adjustments to provide the required characteristics shall be preferably by changes in component dimensions and secondarily by providing torsionally resilient dampening devices such as fluid-damped couplings or all metallic couplings such as manufactured by Bibby and Holset. Couplings or dampeners using rubber or similar elastic materials shall not be used.

f) The final report shall include three-dimensional graphic presentation of frame and shaft distortion and rotor element performance at identified critical speeds within the pump's operating range.

b. Torsional Dynamic Analysis:

1) The methodology used for evaluation of the mass elastic system and shaft combined stresses shall follow the approach prescribed in Corbo and Malanoski, 1996, using either the Matrix-Eigenvalue or Holzer methods for determining natural frequencies. The computer analysis results shall be verified by hand calculations for the fundamental frequency and for mode shapes. Exciting frequencies to be considered during the analysis shall be 0.5, 1, and 2 times running speed, vane passing frequencies and twice vane passing frequencies for the pump impeller/cutwater-diffuser vane combinations, line and twice line frequency, motor pole frequency and motor starting transients. Forcing function magnitudes used for the analysis shall be not less than 10 percent of the maximum transmitted torque. The analysis shall also include evaluation of control pulse frequencies induced by variable frequency drives or engine power stroke frequencies, if provided as part of the specified system. The analysis report shall include a statement produced by the variable frequency drive manufacturer detailing all control pulse frequencies generated by the equipment between 1/4 and 18 times motor running speed.
2) Unless otherwise justified by documentation supported by independent studies, the analysis procedure shall use the range of factors recommended in Corbo and Malanoski, 1996. The Contractor shall produce a Campbell-type interference diagram showing the relationship between operating range, natural frequencies and exciting frequencies with all relevant frequencies up to, and including, not less than 6 times (6X) operating speed. The stress analysis procedure shall be based upon a finite element analysis technique using a digital computer program that has been field calibrated with not less than five similar installations.
3) The analysis shall include a time-integration study showing transient peak stresses resulting from startup, shutdown and motor control transients if synchronous drives are specified. The diagrams shall include calculated stresses throughout the range of frequencies considered in the analysis. Tomographic diagrams, displaying colorimetrically stresses at all positions in the pump shaft and all frames, including roots at changes in section and keyways or other stress concentrating locations, shall be provided with the analysis report. The diagram shall indicate operating speeds identified that produce the peak stresses and shall be specific for speeds inducing identified peak stresses at keyways, changes in section and at connections to other components. The reported stresses shall be combined stresses incorporating all identified loads from torsional, lateral and hydraulic sources.

c. Shaft Radial Load and Deflection:
1) Calculation of radial thrust loads shall be performed in accordance with the methodology set forth in ANSI/HI 1.3, paragraph 1.3.5.1. Shaft deflection calculations shall be performed in accordance with ANSI/HI 1.3.5.4. Shaft deflection criteria and limits shall be as required by API 610 (ISO 13709). Calculations justifying the shaft and bearing sizes (selected

in accordance with the requirements of this Section, performed at 0%, 20%, 40% 60%, 80% 100% and 120% of BEP Flow and head shall be submitted with the information specified under Paragraph 1.08.

1.6 QUALITY ASSURANCE – ALL PUMPS

A. Quality Certification:

1. All manufacturers and manufacturing sites proposed by the Contractor for supply of equipment furnished under this section and sections referencing this section shall hold current certification under ISO 9001. Application for certification under ISO 9001 shall not be deemed as an acceptable substitute for current certification. Documentation attesting to current certification shall be signed by an officer of the manufacturer's corporation and shall be notarized. The documentation shall also include the manufacturer's written Quality Assurance/Quality Confirmation (QA/QC) program and the documentation plan necessary for ISO 9001 certification.

B. Unit Responsibility:

1. The Contractor shall assign Unit Responsibility to the pump manufacturer in conformance with the requirements of Section 43 05 11.

C. Performance Confirmation:

1. Hydrostatic Tests:
   a. All pressure sustaining parts shall be subjected to factory hydrostatic tests. Hydrostatic tests shall conform to the requirements of paragraph 8.3.2 of ANSI/ ANSI/API 610. Castings shall be held at the test pressure for 30 minutes for all pumps with discharge nozzles 14 inches in diameter and less and for 60 minutes for pumps with discharge nozzles 16 inches in diameter and greater. Test results shall be certified correct by an officer of the pump manufacturer's corporation, and shall be notarized.
2. Performance Guarantee:
   a. Unless specified otherwise in the detailed specification, pump performance (flow and head, efficiency and NPSH3) shall be guaranteed by the pump manufacturer to the criteria specified under this paragraph.
   b. Equipment performance documentation, including test data, where tests are specified, shall include sufficient test points (not less than 8) to document hydraulic performance along the complete head/capacity curve from shutoff to maximum capacity and shall cover all full speed operating points specified in the detailed specification section referencing this Section. Tests conducted at specified operating conditions shall be the inlet throttled to produce the NPSHA indicated for that specific condition in the detailed specification. NPSH3 tests shall be performed for not less than four full speed operating

conditions, but not less than all specified operating conditions and at Best Efficiency.

c. Test procedures shall conform to those set forth in ANSI/HI 14.6 acceptance grade 1U, and as specifically detailed in these specifications. However, any increase in flow or head permitted under acceptance grade 1U shall not result in overload (nameplate basis, S. F. = 1.0) of the specified motor power rating at any location on the pump's head/capacity curve. Performance tests shall be conducted at the specified maximum speed. Affinity relationship-predicted test results will not be accepted.

d. Acceptance criteria for head and capacity test results, based upon the rated condition specified in the detailed specification shall be as required in ANSI/HI 11.6 and 14.6, acceptance grade 1U, with the above stated limitation with respect to motor power overload.

e. Acceptance criteria for NPSH3 at any specified operating condition shall be the values proposed by the Contractor in the submittal curves submitted under Paragraph 1.08 and duly accepted by the Construction Manager, with a tolerance of plus 0, minus unlimited, with the exception that suction specific speed, as calculated for the specific pump, shall not exceed the limitation established under Paragraph 1.04 Pump Selection.

f. The guarantee shall include a statement to the effect that the pump will operate within the operating regions specified in the detailed specification. The guarantee shall be in writing, shall be signed by an officer of the manufacturing corporation, and shall be notarized. Under no circumstances shall deviations from specified operating conditions result in overload of the driver furnished with the equipment, nor shall such deviations result in power requirements greater than the driver's nameplate (1.0 service factor) rating.

3. Non-Witnessed Tests:

a. Unless specified otherwise, all pumps shall be performance tested in accordance with ANSI/HI 14.6, Acceptance Grade 1U, with the above restrictions on motor power overload. The factory tests shall include test data for each full speed performance requirement (Condition Points A and B specified in the detailed specification) and any other points stipulated for this test procedure in the detailed specification. These tests shall be conducted with the pump inlet throttled to provide the specified NPSHA. If specified in the detailed specification, test data at the full speed operating conditions shall include shaft vibration and case noise.

b. The test setup in the manufacturer's test facility shall duplicate as closely as possible the inlet conditions in the proposed installation, using temporary baffles and other means. Where submersible pumps are to be furnished with inlet nozzles and/or discharge elbows or adapters, the pumps shall be tested with these components fitted to the pumps. The specified performance requirements shall apply to the complete pumping assembly including any inlet nozzles, and discharge elbows or adapters. Certified test data shall include separate readings for inlet and discharge head for each data point.

c. Not less than eight test points shall be taken, including not less than three within ± eight percent (in terms of rated flow) of the rated condition (Condition Point A) and not less than two test points within ±4 percent of the pump's best efficiency point at the test speed. In addition, one test point shall be sufficient to define head and power requirements at shutoff head.

d. NPSH3 tests shall be performed in accordance with ANSI/HI 14.6, paragraph 14.6.8.5.2.1, Type 1 Test except that not less than 4 tests shall be performed at the test motor speed to completely cover the range of operating conditions specified in the detailed specification. One of the test points shall be at Best Efficiency (BEP) flow to confirm the test pump's suction specific speed. Translation of test results to specified operating conditions shall be in accordance with ANSI/HI 14.6, paragraph 14.6.6.1.1 so long as the exponent used can be supported by certified test data performed on a pump of the same type, size, speed and specific speed as that of the proposed pump. Test data justifying the exponent shall include NPSH3 tests at both the proposed and test speeds and shall include test points at BEP and at least three other points on the test pump head/capacity curve at least 15 percentage points removed from the BEP. The results of the NPSH3 tests shall be used to confirm the NPSH margins for each specified operating condition. NPSH3 tests for submersible wastewater pumps shall be performed using the method described in Figure 11.6.8 in ANSI/HI 11.6. All NPSH3 tests shall extend from 50 percent to 140 percent of Best Efficiency Flow at full speed, or to not less than 10 percent (in terms of flow) past the flow at Operating Condition B, whichever is greater. Failure to achieve specified performance or performance proposed in accepted submittal documents (capacity and head, efficiency or NPSH3), whichever is more restrictive, shall be cause for rejection. Acceptance tolerances shall be as set forth in Paragraph 1.06 Performance Guarantee.

e. All test procedures shall be in strict conformance with the referenced standards, except prediction of performance of a trimmed impeller from test data of the larger impeller will not be permitted. If trimming is required, the pump shall be retested. Under no circumstances shall deviations from specified operating conditions, though allowed by the referenced standards, result in overload of the driver furnished with the equipment, nor shall such deviations result in power requirements greater than the driver's nameplate (1.0 service factor) rating.

f. The Contractor shall furnish the Construction Manager with not less than four weeks' advance written notice of the date and place of the non-witnessed tests.

g. All test results, including test logs and generated curves, shall be certified correct by an officer of the pump manufacturer's corporation and shall be notarized. Contractor shall submit test results as Product Data.

1.7 QUALITY ASSURANCE – ADDITIONAL REQUIREMENTS

A. Scope:

1. In addition to the requirements under Paragraph 1.06 applicable to all pumps, the following are required for the subset of larger and custom engineered pumps defined in Paragraph 1.01 Scope Failure to meet these requirements will likely require remanufacture of the pumps or rework of one or more of the pump components to achieve the required and necessary pump stability characteristics. All costs associated with such remanufacture or rework and retesting shall be borne by the Contractor.
   a. All custom engineered pumps, and other pumps where required by the detailed specification, shall be subject to a witnessed factory performance, NPSH3 and pressure pulse tests in accordance with the provisions of this portion of the Specifications.
   b. The Contractor shall furnish the Construction Manager with not less than two weeks' advance written notice of the date and place of the witnessed tests.

B. Performance Testing:

1. Witnessed Tests:
   a. The Contractor shall furnish the Construction Manager with not less than four weeks' advance written notice of the date and place of the witnessed tests.
2. Performance Tests:
   a. Factory performance tests shall conform to the requirements of ANSI/HI 14.6, Acceptance Grade 1U. The factory tests shall include test data for each full speed performance requirement (Condition Points A and B specified in the detailed specification) and any other points stipulated for this test procedure in the detailed specification. These tests shall be conducted with the pump inlet throttled to provide the specified NPSHA or as otherwise detailed in the accepted test plan. Test data shall also include suction and discharge pressure pulse, shaft vibration and case noise at the full speed.
   b. The test setup in the manufacturer's test facility shall duplicate as closely as possible the inlet conditions in the proposed installation, using temporary baffles and other means. Where centrifugal pumps are furnished with inlet elbows, inlet adapters or inlet reducers, the pumps shall be tested with the elbow, adapter or reducer fitted to the pump and specified performance criteria shall apply to the complete pump assembly, including losses through any elbow, adapter or reducer. Where submersible pumps are to be furnished with inlet nozzles and/or discharge elbows or adapters, the pumps shall be tested with the inlet nozzles or adapters and the specified performance

requirements shall apply to the complete pumping assembly including any inlet nozzles, and discharge elbows or adapters. Under no circumstances shall NPSHA exceed that specified in the detailed specification during any performance test. Certified test data shall include separate readings for inlet and discharge head for each data point.

c. Not less than eight test points shall be taken, including not less than four within ±8 percent (on the basis of rated flow) of the rated condition (Condition Point A) and not less than two test points within ±4 percent of the pump's best efficiency point at the test speed. In addition, one test point shall be sufficient to define head and power requirements at shutoff head and one test point to define flow at Condition Point B.

3. NPSH3 Tests:

   a. NPSH3 tests shall also be performed to confirm the data used to establish NPSHA margin for each specified operating condition. NPSH3 tests for submersible wastewater pumps shall be performed using the method described in Figure 11.6.8 in ANSI/HI 11.6. All NPSH3 tests shall extend from 30 percent to 140 percent of Best Efficiency Flow at full speed, or to not less than 10 percent (in terms of flow) past the flow at Operating Condition B, whichever is greater. Failure to achieve guaranteed performance or performance proposed in accepted submittal documents, whichever is the more restrictive (capacity and head, efficiency or NPSH3) shall be cause for rejection. Tolerances and restrictions shall be as set forth in Paragraph 1.06 Non-Witnessed Tests, above, for non-witnessed tests.

4. Pressure Pulse Tests:

   a. Pressure pulse testing shall be performed on all dry pit centrifugal pumps provided under specifications containing the term 'Custom Engineered' in the specification section title or where specified in individual pump specification sections. Pressure pulse testing equipment shall include sufficient calibrated transducers to measure both static and dynamic pressures simultaneously at the pump discharge and suction; the latter if a centrifugal dry pit pump. The transducers shall be suitable for narrow band spectrum analysis and shall be mounted less than one pipe diameter away from the pipe wall, with suction and discharge gauge taps at acceptable mounting locations. Operating pressure capability of the sensors shall selected on the basis that the peak rating shall be less than four times the expected maximum pressure at the measurement location, with total accuracy (combined non-linearity, non-repeatability, and hysteresis as defined by IEC 61298-2) less than one percent of full scale. Sensors at pump inlets shall be capable of compound pressure output. Output from the sensors shall be recorded by vibration data acquisition equipment, with manual notation of either static or dynamic pressure being unacceptable. A frequency range from DC to 20 times the maximum operating speed of the pump shall be used for dynamic pressure measurements. A lower frequency range for static measurements may be used if desired. Pressure data shall be obtained from steady operating conditions

during testing, and for presentation purposes shall be the result of 16 full averages at the maximum frequency range. Static pressures must be corrected for elevation and velocity head.

b. Pressure pulse test procedures shall consist of operating the pump at full speed and manipulating the position of the discharge valve to record simultaneous flow, head, vibration and pressure pulse data beginning with the discharge valve positioned to achieve flow and head at Condition Point B and increasing head by 5 percent increments until the magnitude of the pressure pulses at the pump inlet and discharge increase by not less than 30 percent at which time the test run shall be terminated.

c. Reporting shall consist of description of the measurement system and must include both frequency and pressure range of the sensors. A National Institute of Standards of Technology-traceable calibration curve for each sensor, obtained in the last calendar year, shall be provided as part of the report appendix. Dynamic pressures shall be displayed in a spectral format, with any discrete peaks identified with harmonic order relative to pump speed and flow. Any significant non-integer dynamic pressure peak, defined as a peak with amplitude equal to or greater than 25% of the largest discrete peak, shall be marked in the spectrum and a source of the peak described and explained in the test report.

5. Model Tests:

a. Where allowed in the detailed specification or upon specific application with adequate justification by the manufacturer, confirmation of performance of large pumps may be demonstrated by testing the prototype at reduced speed or by testing a model of the prototype pump. NPSH3 tests shall also be performed to confirm the data used to establish NPSHA margin for each specified operating condition. Failure to achieve guaranteed performance (capacity and head, efficiency or NPSH3) shall be cause for rejection. Physical model testing shall be performed at qualified, commercial facilities, with at least 10 years of continuous operation. All tests shall be conducted in accordance with ANSI/HI 1.6 or 2.6. with the following restrictions:

1) If the prototype is tested at reduced speed the ratio of test speed to prototype speed shall not be less than 0.66:1.

2) Model test ratios shall not be less than 0.33:1, model to prototype.

3) Impellers for model tests shall be not less than 12 inches in diameter.

4) Impellers for prototype pumps shall be subject to a model-to-prototype profile comparison using templates ratioed from the impeller used for the completed and accepted model test. Impeller profiles shall be compared for the x, y and z planes. If model testing is proposed for any or all of the specified tests, the Contractor shall include the proposed methodology for profile confirmation as a part of the submittal material required under Paragraph 1.08. Impeller profile comparison shall be performed with a representative of the Construction Manager present. All costs associated

with travel and subsistence of the Construction Manager's representative shall be borne by the Contractor.

5) Acceptance criteria, based upon projected prototype performance from model test results using Hydraulic Institute approved affinity relationships, shall be as set forth above under Paragraph 1.06 Non-Witnessed Tests.
6) Restrictions set forth above for witnessed tests shall apply.

b. The Contractor shall furnish the Construction Manager with not less than two weeks' advance written notice of the date and place of the model tests.

6. Test Certification and Reporting:
   a. All test results, including test logs and generated curves, shall be certified correct by an officer of the pump manufacturer's corporation and shall be notarized. Contractor shall submit test results as Product Data.

7. and runs shall be repeated with different monitoring points to assure proper convergence.

1.8 SUBMITTALS

A. In addition to the material listed in the detailed specification, the following submittals shall be provided in accordance with Section 01 33 00:

1. Documentation of successful pump designs as specified under Paragraph 1.04 Proven Designs.
2. Certificate of Unit Responsibility attesting that the Contractor has assigned unit responsibility in accordance with the requirements of this section and Section 43 05 11-1.02 Unit Responsibility. No other submittal material will be reviewed until the certificate has been received and found to be in conformance with these requirements.
3. A copy of this specification section and the referencing section and all other applicable specification sections governing the pump, drive and driver, supports and specified appurtenances. The specification copies shall be complete with addendum updates included, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations from specification requirements. Check-marks (□) shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and, therefore requested by the Contractor, each deviation shall be underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of the paragraph not underlined will signify compliance on the part of the Contractor with the specifications. The submittal shall be accompanied by a detailed, written justification for each deviation. Failure to include a copy of the marked-up specification sections, along with justification(s) for any requested deviations to the specification requirements, with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.

4. A copy of the contract document control diagrams and process and instrumentation diagrams relating to the submitted equipment, with addendum updates that apply to the equipment in this section, marked to show specific changes necessary for the equipment proposed in the submittal. If no changes are required, the drawing or drawings shall be marked "no changes required". Failure to include copies of the relevant drawings with the submittal shall be cause for rejection of the entire submittal with no further review.
5. Documentation of certification in accordance with ISO 9001 as specified under Paragraph 1.06 Quality Certification.
6. Predicted pump performance curves for each condition point specified showing head, power, efficiency, and NPSH3 on the ordinate plotted against capacity (in mgd) on the abscissa. Curves for variable speed pumps shall be provided to demonstrate operation at all speeds required to achieve the specified reduced speed operating conditions. All curves shall clearly display the specified operating conditions and conformance with PACL limits, as specified in Paragraph 1.04 Pump Selection.
7. NPSH margin calculations performed for each specified operating condition.
8. Motor submittal information as specified in Sections 26 19 00 and 26 20 00. In addition, this information shall include certified calculations for motor rotor and frame reed frequencies, as specified under Paragraph 1.04 Electric Motors.
9. Complete description and sketch of proposed test setup for factory test if a factory test has been required under the detailed specification section or as required by the provisions of this Section. Submittal material shall include sample calculations and proposed test log format.
10. Drawings showing general dimensions and confirming the size of pumps, motors, drives and specified appurtenances; piping connections; construction details of equipment (including bearings and bearing isolators); wiring diagrams; and weight of equipment.
11. Variable-speed drive information as required under Section 26 19 23 if the equipment specified includes variable speed capability.
12. Driver unit support calculations and data if the driver is separately supported and if the analysis under the requirements of Paragraph 1.05 Rotor Critical Speed Analysis and System Design has been required by the terms of these specifications.
13. Shaft deflection calculations for volute type pumps: provide calculations to demonstrate compliance with Paragraph 1.04 Component Design Criteria, per the methodology set forth as required by Paragraph 1.05 Rotor Critical Speed Analysis and System Design.
14. Detail drawings of the pump and driver unit foundation demonstrating conformance to this Section and Section 43 05 13. Submittal shall include drawings depicting type, size, number, projection, and arrangement of anchor bolts, dimensional drawings of the sole and baseplates, dimensional drawings for the concrete supports for both the pump and motor, if applicable. Drawings shall

also depict all other pertinent information, including: location of equipment pads and reinforcement; equipment drains; expansion joint locations; elevation of top of grout and grout thickness; elevation of top of baseplate; soleplate; or mounting block; size and location of electrical conduits; and any other equipment mounting features embedded in equipment pads.

15. Limiting nozzle loading criteria, if different from that established by ANSI/HI 9.6.2.
16. The qualifications of the independent testing laboratory and individual personnel proposed by the Contractor to perform field vibration testing, analysis and reporting in accordance with the requirements of Paragraph 3.06.
17. The qualifications of the personnel proposed by the Contractor to perform field alignment procedures in accordance with the requirements of Paragraph 3.04.

B. The following are applicable for pumps meeting specified applicability criteria:

1. Qualifications of the design professional, and firm name, proposed to perform the mass elastic design analyses specified under Paragraph 1.05 Rotor Critical Speed Analysis and System Design if the subject analyses are required by the terms of these specifications.
2. Notarized certification attesting that the firm proposed to perform the mass elastic design analyses specified under Paragraph 1.05 Rotor Critical Speed Analysis and System Design has no contractual arrangements with the proposed pump manufacturer.
3. Descriptive material outlining the methodology and software to be used in the analyses required under Paragraph 1.05 Rotor Critical Speed Analysis and System Design.
4. "Executive Summary" report of the mass elastic design analyses for pumps as specified in Paragraph 1.05 Rotor Critical Speed Analysis and System Design.
5. The proposed instrumentation setup for the in-situ torsional vibration test specified under Paragraph 1.05 Rotor Critical Speed Analysis and System Design.
6. Model graphic outputs specified in Paragraph 1.07 Confirmation of Passage Geometry.

PART 2 PRODUCTS

2.1 MATERIALS

A. General:

1. Where this section and sections referencing this section are silent with respect to materials of construction on any component, material selection shall follow the requirements of Table H.1, ANSI/API 610, Materials Class I-1, with the exception that shafts for all pumps shall be 12 percent chromium stainless steel. Materials specified are considered the minimum acceptable for the purposes of durability, strength, and resistance to erosion and corrosion. The Contractor may

propose alternative materials for the purpose of providing greater strength or to meet required stress limitations. However, alternative materials must provide at least the same qualities as those specified for the purpose.

B. Pumps:

1. Finish for Surfaces in Contact with Pumped Fluid:
   a. All pump components in contact with the pumped fluid shall conform to the following requirements.
   b. Surfaces to be machine-finished shall be indicated on the shop drawings by symbols which conform to ANSI B46.1, Surface Texture, Surface Roughness, Waviness and Lay. Machine surfaces shall be finished to at least the following tolerances (SI units):
      1) Nominal Roughness:

Surface	Grade, Ref: ANSI B46.1 (SI units)
General Machine Work	3.2 or better
Flange Faces	3.2
Journal Surfaces at Sleeve Bearings	0.4
Hydraulic Surfaces	
Impeller	4.5 or better
Impeller Bowl and Diffuser	3.2 or better
All other wetted surfaces	6.3 or better

   c. Flaws such as scratches, ridges, holes, peaks, cracks or checks which will make the part unsuitable will be cause for rejection. Machine finished surfaces shall be thoroughly cleaned and coated with protective layer of rust preventive. Small pieces, unassembled pipe or finished bolts, shall be oiled and wrapped with moisture resistant paper.
2. Materials:
   a. Unless otherwise specified, wetted cast iron parts for pumps for solids bearing liquid services shall have 2 to 3 percent nickel added to the cast iron.
   b. Stainless steel impellers shall be provided for the first stage of all custom engineered pumps, pumps intended for pumping screened or unscreened wastewater and elsewhere when specified. Stainless steel impellers shall be cast duplex stainless steel conforming to ASTM A995, Grades 2A, 3A, or 6A, with Charpy impact energies greater than 40 ft-lbs at -40°C per ASTM A923 method B.

c. Materials for all shaft sleeves for packed boxes, fretting seals and interstage seals shall conform to ANSI/API 610, Annex H; 12 percent chromium hardened; or hard-faced 316 austenitic stainless steel. Materials for seal glands for packed boxes and shaft sleeves shall be AISI 316 stainless steel. Fastener parts of all types in wetted areas shall conform to ANSI/API 610, Materials Class S-5 requirements. Regardless of the seal construction, all seal chambers shall be adequately sized to accommodate specified mechanical seals.

C. Flywheels:

1. Where flywheel assemblies are to be provided with the pumping equipment, pump pressure containing parts shall be of ductile iron conforming to ASTM A571. Materials of construction for the flywheels shall be as follows:

Frame:	Steel, ASTM A-36, welded and stress relieved.
Shaft:	Alloy Steel, ASTM A322, Grade 4142 HT, ST, BHN 375-388 for shafts 3.5 inches in diameter and less; Stainless steel, ASTM A564, Type 630 HT, Condition H1150 for shafts larger than 3.5 inches in diameter.
Rotor :	Steel, ASTM A36, or cast steel, ASTM A27 for flywheels 3 feet in diameter or less; Cast steel, ASTM A148 for flywheels greater in diameter than 3 feet. All stress relieved after machining.

2.2 GENERAL QUALITY

A. Details of manufacture and assembly of equipment furnished under this section and referencing sections shall follow the requirements of ANSI/API 610 with respect to the following features (paragraph references, ANSI/API 610):

1. Alignment aids (Paragraph 6.1.24).
2. Removal of rotating element (Paragraph 6.1.25).
3. Jackscrews for assistance in alignment on all baseplates and equipment supports (Paragraph 9.3.8.3.2).
4. Castings (Paragraph 6.12.2).

B. All components or subassemblies weighing 50 pounds or more shall have at least one lifting eye or a provision for threading in a lifting eye. Components 250 pounds or greater shall have lifting eyes or provisions for at least two lifting eyes. Components 1000 pounds or greater shall have at least 3 lifting eyes or provisions for inserting lifting eyes.

2.3 BASEPLATES AND SOLE PLATES

A. Unless otherwise noted in the detailed specification, all pumps shall be furnished by the pump manufacturer with baseplates or soleplates conforming to the requirements

of Section 43 05 13. Baseplates and sole plates shall be designed to be installed in the housekeeping curb shown and shall be machined flat and co-planar to within 0.002 inch per foot in all directions on the face mating with the pump and motor or driver support. Sole plates shall have the words "THIS SIDE DOWN" permanently affixed to the underside using welding rod material or stamped prior to milling. Alternative marking methods, using heavy scribing or machining, are acceptable provided that they may be observed following blasting in preparation for coating.

2.4 WEARING RINGS

A. Where specified, pumps shall be fitted with both stationary and rotating wearing rings. Except for the difference in hardness between stationary and rotating rings, wearing rings shall be of stainless steel and shall conform to the requirements of ANSI/API 610, paragraph 6.7 and material class S-8 (Table H.1, Annex H). Maximum wearing ring clearances shall not exceed 150 percent of the values stated in Table 6, ANSI/API 610. Minimum wearing ring hardness on the rotating ring shall be 350 Brinnel Hardness Number (BHN), with the stationary ring not less than 100 hardness points greater.

B. L-form wearing rings are not acceptable for wastewater, sewage, stormwater, thickener overflow, mixed sludge, digester circulation, digested sludge, waste activated sludge, return activated sludge or primary effluent pumping service.

2.5 BALANCE

A. Balancing for pumps with suction nozzle sizes 6 inches in diameter and greater and all associated components shall conform to the requirements set forth in ANSI/API 610, paragraph 6.9.4.1 (equivalent to ISO 1940 or ANSI 2.19 Grade 2.5), unless other portions of this project manual impose more restrictive requirements.

B. For separately balanced components, perform a residual unbalance inspection after rotor assembly per ANSI/API 610 requirements, as described in Annex J of that document. Provide copies of worksheets and demonstrate that tolerances are in compliance (i.e. rotor has passed) in addition to other reporting requirements of this paragraph.

C. All balance logs, certified correct and signed by an officer of the manufacturing corporation and notarized, shall be furnished as Product Data in accordance with Paragraph 2.10.

2.6 DRIVE UNIT SUPPORTS FOR SEPARATELY SUPPORTED MACHINES AND INTERMEDIATE SHAFT SUPPORTS

A. Supports for separately mounted vertical pump drivers and intermediate shaft bearings shall be composite structures of fabricated steel, ASTM A36. Unless otherwise specified, the supports shall be designed to span an opening in the floor sufficient to allow removal for the complete pump. Rolled steel beams shall be

provided to stiffen the support and a fabricated steel driver unit support pedestal shall be mounted on the support plate. The support pedestal top plate and all portions of the support plate assembly intended to join with surfaces in the installation structure shall be milled flat and parallel to 0.002 inches per foot. Pedestals shall be provided with access provisions to adjust or assemble/disassemble couplings. The support shall be designed to be supported on a sole plate or sole plates embedded in a house keeping pad at the edges of the floor opening or as indicated. Other details for the driver unit support shall be as indicated.

2.7 FLYWHEEL ASSEMBLIES

A. When a flywheel assembly is specified, the moment of inertia (WR^2) of the rotating element for each complete motor/pump set, including entrained water, pump rotor, shafting, couplings, and motor rotor shall be adjusted to provide the value specified in the detailed specification by providing a flywheel.

B. The flywheel shall consist of cast or fabricated steel weight in the form of a torus with supporting struts, keyed and locked on a shaft supported by bearings at each end of the shaft. Flywheels with diameters greater than three feet shall be double keyed to the shafts. If cast construction is used, the struts and weight shall be cast as a unit. The flywheel shall be designed and fabricated for a coefficient of fluctuation no larger than 0.05. A factor of safety of 5 shall be used for the ratio of operating speed to maximum safe operating speed. The lateral critical frequency of the flywheel assembly shall be shall be higher than the maximum safe operating speed by a factor of 1.5.

C. If the weight is to be fabricated steel, it shall be machined from a single billet to the diameter and shape required. All flywheels (cast and fabricated alike) shall be stress relieved before balancing. The size of the weight and the distance of the torus centroid from the center of the shaft shall be sufficient to achieve the overall rotating moment of inertia (WK^2) specified for the pump rotating system. Cantilevered designs employing only one set of bearings will not be permitted in stand-alone flywheel assemblies. Flywheels mounted on the motor shaft and using the bearings of a custom designed drive motor may be of the cantilever type. The flywheel assembly shall be included in the lateral, torsional and rotordynamic analyses specified under Paragraph 1.05 Rotor Critical Speed Analysis and System Design.

D. Bearings shall be selected in accordance with ABMA 9 or 11 for an L-10 life of not less than 100,000 hours. Input and output bearings shall be held in place by rigid fabricated steel struts. The entire rotating assembly shall be balanced in accordance with Paragraph 2.05. Bearing seals as specified in Paragraph 1.04 shall be provided for all flywheel assembly bearings.

E. The flywheel assembly shall be furnished with a fabricated steel enclosure designed to provide protection against accidental entry of tools or other objects and to provide enclosure protection in accordance with OSHA requirements. The flywheel enclosure

shall have an outside width of at least that of the motor, but not greater than 110 percent of the motor's width. The housing shall match the quality of the motor enclosure and shall be equipped with at least two lifting eyes. A mounting pad shall be located on the upper portion of the flywheel housing to permit installation of the vibration detector specified in Division 40 or the referencing section. The flywheel bearing housings shall be supported independently by a rigid frame to maintain alignment.

F. Where horizontal flywheels are required, the flywheel assembly shall be mounted on a baseplate common with the pump and motor. Frames for horizontally mounted flywheel assemblies shall be fitted with mounting pads for bolting to the pumping unit baseplate. Sufficient space shall be provided on each pad to permit dowelling to the baseplate after final alignment. End plates shall be similar to those provided for the motor and shall provide complete closure to prevent incidental access to the flywheel. The flywheel input shaft shall be direct connected to the motor output shaft by means of a flexible coupling, and the output shaft shall be designed to accommodate the shaft spacer coupling specified.

G. Where vertical flywheel assemblies are shown supporting the electric motor, the frame shall be designed to support the weight of the motor in accordance with the design requirements of this section. The flywheel assembly frame shall be extended to carry a support plate which shall be rabbeted to provide self-aligning features with the motor base. The frame extension shall have access openings to permit assembly/disassembly of the motor output shaft coupling. The lower flywheel assembly end plate shall be finished flat for mating with the support pedestal on the driver unit support, if so mounted..

H. Where vertical flywheel assemblies are mounted separately from the pump and motor, the lower end plate shall be finished flat. The input shaft shall be keyed for the specified flexible coupling and shaft guards shall be provided. Access opening shall be provided as specified herein for coupling assembly/disassembly.

2.8 MACHINING

A. All machined surfaces shall have a 90 micro inch Ra finish without any grooves, surface imperfections or machining marks of any sort. Mating surfaces shall be coplanar within a maximum of 0.001 inches. Surfaces that are in contact with a gasket such as flanges and casing joints shall have the customary concentric grooves pattern to increase leak path. Bearing housings and seals shall all have collinear centerlines within less than 0.001 inch total difference. Shafts shall have a 64 micro inch Ra finish.

2.9 PRODUCT DATA

A. The following information shall be provided in accordance with Section 01 33 00.

1. Performance guarantee as specified in Paragraph 1.06 Performance Confirmation.

2. Equipment anchor calculations specified in Paragraph 1.04 Component Design Criteria.
3. Operation and maintenance information specified in Section 01 78 23.
4. Motor Product Data as specified in Sections 26 19 00 and 26 20 00.
5. Bearing L-10 life calculations.
6. Critical speed calculations demonstrating compliance with Paragraph 1.05 Rotor Critical Speed Analysis and System Design shall be provided if a lateral rotordynamic analysis is required. Otherwise, critical speed calculations demonstrating compliance with Paragraph 1.04 Critical Speeds and Natural Frequencies shall be provided.
7. Nozzle loading information required under Paragraph 3.01.
8. Motor balance logs, certified and notarized as specified in Paragraph 1.04 Electric Motors.
9. Certified balance logs and worksheets, as specified in Paragraph 2.05.
10. Installation Certification Section 43 05 11-Form A as specified in Paragraph 3.01.
11. Training Certification Section 43 05 11-Form B as specified in Paragraph 3.08.
12. If factory tests are specified in the detail specification section, certification of satisfactory testing of each unit as specified. The certified material shall include copies of test logs and resulting performance curves. The results of pressure pulse tests shall also be included.
13. Documentation of field alignment data.

B. The following are applicable for pumps meeting specified applicability criteria:

1. "Final Report" of mass elastic systems analyses for pumps as specified in Paragraph 1.05 Rotor Critical Speed Analysis and System Design.
2. Results of motor rotor, frame and assembly bump tests, certified as specified under Paragraph 1.04 Electric Motors, along with the design professional's "Supplemental Report" as specified under Paragraph 1.05 Rotor Critical Speed Analysis and System Design.
3. Pump inlet well installation acceptance certification, as specified in Paragraph 3.03, if applicable.
4. Results of field vibration and pressure pulse tests as specified under Paragraph 3.06.

PART 3 EXECUTION

3.1 GENERAL

A. With the exception of submersible pumps, all pump inlet and discharge nozzles shall be connected to field piping using equipment connection fittings as shown and specified. Restraining rods on equipment connection fittings shall be designed specifically to restrain the unbalanced hydraulic thrust developed by the pump when

operating at full speed against a closed valve. All restraining rod nuts shall be torqued to assure that any moment or shear transmitted to the pump nozzles is within the values permitted under ANSI/HI 9.6.2 or that permitted by the equipment manufacturer, whichever is greatest. Where ANSI/HI 9.6.2 is silent with respect to any particular aspect of allowable nozzle loads, the Contractor shall follow the written requirements provided by the equipment manufacturer. All pumps furnished under specification sections containing the words 'Custom Engineered' in the title shall be installed under the presence of a factory authorized installation specialist or specialists. Under no circumstances shall any installation procedures take place without the installation specialists present. Equipment installation procedures shall conform to the requirements of Section 43 05 13. Upon completion of installation work, the Contractor shall submit a complete, properly signed certification Form 43 05 11-A.

3.2 SOLE PLATES

A. Sole plates, if provided pursuant to this section, or any section referencing this section, or where required by the equipment manufacturer's recommendation, shall be leveled in the presence of a factory authorized installation specialist to a maximum tolerance of 0.002 inches/foot in all directions. Where the equipment manufacturer requires more stringent tolerances, those tolerances shall prevail.

3.3 ALIGNMENT

A. Journeymen millwrights shall perform alignment of equipment furnished under this section and any referencing section. Carpenters, laborers or any other trades are specifically excluded from performing this work. In locations where such trades are not available, the Contractor shall retain the services of a firm specializing in this type of work to perform the setting and alignment work. The Contractor shall submit the qualifications of the proposed firm to the Construction Manager for acceptance prior to performing the work. The Construction Manager shall personally witness final alignment procedures for each item of equipment as a condition precedent to beginning any field testing work. Alignment techniques shall conform to the requirements of Section 43 20 05.

3.4 FIELD TESTING

A. Field testing shall conform to the requirements of Section 01 91 14. For all pumps furnished under specification sections containing the words 'Custom Engineered' in the title , the testing procedure shall be a plan developed jointly by the Contractor and the equipment manufacturer to demonstrate performance of each item of equipment at all specified operating conditions.

B. Field testing may include vibration and torsional vibration testing, as applicable.

3.5 FIELD VIBRATION AND PRESSURE PULSE TESTS

A. Qualifications:

1. The Contractor shall retain the services of an independent testing laboratory to conduct the testing work specified under this paragraph. The work shall be directed by a professional mechanical engineer, registered to practice in any one of the 50 states making up the United States of America. The engineer (hereinafter termed "professional vibration analysis specialist") shall be a graduate of a college holding ABET accreditation in mechanical engineering and shall have been engaged in the practice of providing the type of monitoring services required under this paragraph for rotating machinery. The professional vibration analyst's qualifications and references, certified and notarized, shall be submitted for review and acceptance by the Construction Manager not less than 6 weeks prior to the date scheduled for the field vibration test work specified herein. The Construction Manager shall review the required documentation and references and indicate acceptance or rejection of the proposed analyst's qualifications within 14 days of submission. If the analyst proposed by the Contractor is rejected, the Contractor shall propose an alternative choice with appropriate documentation.
2. The independent testing laboratory's testing team (comprised of the professional vibration analysis specialist and any technicians required to complete the specified tasks) shall be fully equipped to provide continuous pressure, velocity and displacement values for all rotating equipment installed under the requirements of this section. Vibration testing equipment shall include sufficient calibrated pressure and flow monitoring devices to determine pump operating conditions as well as vibration levels. Pressure pulse tests shall be conducted on all pumps where the words "Custom Engineered" appear in the specification title or where specified in the individual pump specification sections.

B. Vibration Tests:

1. RMS vibration velocity on any component when the pump is operating at any specified continuous duty operating condition shall not exceed the limits established for the appropriate machine by HI 9.6.4. Field vibration for custom engineered vertical pumps and motors shall not exceed 2.5 mils peak to peak RMS when the pump is operated at any capacity condition within 85 percent and 115 percent of the pump's Best Efficiency Point capacity at full speed, when measured at the top of the pump motor. When operating at any combination of conditions outside the PACL for any pump, regardless of type, limiting values shall be 25 percent greater than the above limits.

2. Vibration test reports shall be submitted as Product Data, directly to the Construction Manager, and shall bear the signature of the responsible professional vibration analysis specialist. Vibration spectra shall be of sufficient resolution for legibility of magnitude and frequency data to be properly reviewed by the Construction Manager. Cascade diagrams are not sufficient for variable speed drive application unless supported by the required data in a format suitable for more detailed analyses. Separate spectra shall be provided at the maximum and minimum operating speeds and any potential resonant frequencies.

C. Pressure Pulse Tests:

1. Pressure pulse testing shall be performed on all dry pit centrifugal pumps provided under specifications containing the term 'Custom Engineered' in the specification section title or where specified in individual pump specification sections. Pressure pulse testing equipment shall include sufficient calibrated transducers to measure both static and dynamic pressures simultaneously at the pump discharge and suction; the latter if a centrifugal pump. The transducers shall be suitable for narrow band spectrum analysis and shall be mounted less than one pipe diameter away from the pipe wall, with suction and discharge gauge taps at acceptable mounting locations. Operating pressure capability of the sensors shall selected on the basis that the peak rating shall be less than four times the expected maximum pressure at the measurement location, with total accuracy (combined non-linearity, non-repeatability, and hysteresis as defined by IEC 61298-2) less than one percent of full scale. Sensors at pump inlets shall be capable of compound pressure output. Output from the sensors shall be recorded by vibration data acquisition equipment, with manual notation of either static or dynamic pressure unacceptable. A frequency range from DC to 20 times the maximum operating speed of the pump shall be used for dynamic pressure measurements. A lower frequency range for static measurements may be used if desired. Pressure data shall be obtained from steady operating conditions during testing, and for presentation purposes shall be the result of 16 full averages at the maximum frequency range. Static pressures must be corrected for elevation and velocity head.
2. Pressure pulse test procedures shall consist of operating the pump at the speed required to meet each individual specified operating condition and manipulating the position of the discharge valve to record simultaneous flow, head, vibration and pressure pulse data beginning with a wide open discharge valve at full speed and increasing head by 5 percent increments until the magnitude of the pressure pulses at the pump inlet and discharge increase by not less than 30 percent at which time the test run for that speed shall be terminated. This procedure shall be repeated for each of the operating speeds required for each specified operating condition.
3. Reporting shall consist of description of the measurement system and must include both frequency and pressure range of the sensors. A National Institute of Standards of Technology-traceable calibration curve for each sensor, obtained in

the last calendar year, shall be provided as part of the report appendix. Dynamic pressures shall be displayed in a spectral format, with any discrete peaks identified with harmonic order relative to pump speed and flow. Any significant non-integer dynamic pressure peak, defined as a peak with amplitude equal to or greater than 25% of the largest discrete peak, shall be marked in the spectrum and a source postulated in the discussion of the data.

3.6 FIELD TORSIONAL VIBRATION TESTING

A. Where required by these specifications, field torsional vibration tests shall be performed under the direct supervision of the design professional responsible for the mass elastic system design on an installed pumping unit. The Contractor shall submit the qualifications and experience of this design professional to the engineer for review and approval.

3.7 TRAINING

A. Training shall conform to the requirements of Section 01 79 00 and shall include separate training sessions for each operator shift maintained by the Owner and a separate session for maintenance personnel. The training session for maintenance personnel shall include a comprehensive presentation, employing cut-away models or comparable graphics, and documentation on the step-by-step disassembly and subsequent reassembly of a pumping unit. Upon completion of all training requirements, the Contractor shall submit certified Form 43 05 11-B.

END OF SECTION

SECTION 43 23 15
CUSTOM ENGINEERED TWO-STAGE VERTICAL NON-CLOG, VARIABLE SPEED PUMPS

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:

1. This section specifies vertical two stage, motor driven variable-speed non-clog centrifugal Pumping Units for pumping fluids containing screened municipal and industrial wastewater solids. Each Pumping Unit shall consist of paired identical pumps, with each pump motor and flywheel driven by a common variable frequency drive. The first stage pump shall be comprised of an inlet elbow, pump, intermediate shafting and couplings, electric motor and flywheel, motor support frame, all furnished by the pump manufacturer. The first stage pump motor and flywheel shall be mounted on a removable steel frame which, in turn, will be supported on concrete housekeeping bases cast in the floor above in the pump room. The pumps and motor and flywheel support frames shall be grouted in place and anchored in accordance with the requirements of these specifications and details. The motor and flywheel assembly shall be aligned and dowelled in place on the motor and flywheel support frame in accordance with the requirements of these specifications.

   The second stage pump will be fitted with a concentric reducer, a fabricated steel motor and flywheel support which shall straddle the second stage pump and be supported by the pump room floor. The second stage pump motor and flywheel shall be direct connected to the pump through intermediate couplings, all furnished by the pump manufacturer. The motor and flywheel assembly shall be aligned and dowelled in place on the motor and flywheel support frame in accordance with the requirements of these specifications.

   The pump manufacturer shall also furnish the variable speed drive controller, and all specified appurtenances and spare parts.

   The pump manufacturer shall be responsible for providing the Turbo Free elbow on the suction of the first stage pump and inter stage piping from the discharge of the first stage pump to the suction of the second stage pump. Since the turbo free elbow may be proprietary to a pump manufacturer, other pump manufacturers that meet the qualifications and requirements of the project specifications can submit alternate design for engineer's review and approval. However, all costs associated for any redesign, and any additional

cost impacts on the project as a result of this alternate design shall be fully paid for by the pump manufacturer submitting the alternate design.

The first stage pump shall include a shaft removal system to remove the intermediate shaft without removing the pump, flywheel, or motor to allow for pump maintenance.

Due to size and the difficulty for removing the motor, the second stage pump shall include a pump removal system to allow for maintenance on the pump without removing the motor pedestal, flywheel, or motor. The pump manufacturer will submit to the engineer for review and approval of this pump removal system.

Equipment furnished under this section shall conform to the requirements of this section and to the requirements set forth in Section 43 23 03. All components specified herein shall be furnished as complete compatible assemblies by the pump manufacturer.

In operation, both pumps consisting of a functional pair as a Pumping Unit will start, operate at variable speed, responding to commands from the station wet well control system and shut down simultaneously. Under no circumstances will the individual pumps making up each functional pair be required to operate independently of the other.

1.2 REFERENCES

A. The following is a list of standards which may be referenced in this section:

8. See additional references in Section 43 23 03.

1.3 DEFINITIONS

A. Terminology pertaining to pumping unit performance and construction shall conform to the ratings and nomenclature of the Hydraulic Institute Standards.

1.4 QUALITY ASSURANCE

A. Unit Responsibility:

1. The Contractor shall assign unit responsibility, as specified in Section 43 05 11-1.02 Unit Responsibility, to the manufacturer of the Custom Engineered Vertical Variable Speed Non-clog Variable Speed Centrifugal Pumps Paired as Two Stage Pumping Units provided under this section. This manufacturer is the unit responsibility manufacturer and has unit responsibility, as specified in Section 43 05 11-1.02 Unit Responsibility, for both the equipment assembly specified in this section and for the Adjustable Frequency Drive specified in Section 26 19 23, and all other equipment assembly components specified elsewhere but referenced in this section. A completed, signed, and notarized Certificate of Unit Responsibility shall be provided.
2. The equipment shall be protected during shipment and storage as specified in Section 01 61 00.

1.5 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
    a. Make, model, weight, and horsepower of each pump assembly.
    b. Complete pump and motor catalog information, descriptive literature, specifications, and identification of materials of construction.
    c. Plan and section dimensional outline drawings of the pumps and motors identifying all components, anchor bolts, external connections, and appurtenances.
        1) Include all components identified with quantity, part name and corresponding materials of construction complete with ASTM designation on sectional drawings.

d. Performance data curves showing head, capacity, horsepower demand, net positive suction head required (NPSH3), and pump efficiency over entire operating range of pump, from shutoff to maximum capacity.
   1) Include the pump's preferred operating range (POR) and the manufacturer's defined maximum allowable operating range (AOR) for continuous steady state service on performance curves.
   2) Indicate separately head, capacity, horsepower demand, NPSH3, and overall efficiency required at the AOR's minimum and maximum continuous stable flow conditions and at the Rated Conditions and at Secondary Conditions (if applicable).
e. For variable speed motors, provide performance data curves for 50, 60, 70, 80, and 90 percent of nominal speed.
f. Certified detail structural, mechanical, electrical drawings showing equipment dimensions, arrangement, assembly, including locations and type of connections and weights of major equipment and components.
g. Lateral and torsional critical speed analysis.
h. Structural response frequency analysis.
i. Detail extension shaft drawings with dimensional information, materials of construction, and complete certified torsional analyses and lateral critical calculations of the complete drive train assembly.
j. Power and control wiring diagrams, including terminals and numbers.
k. Complete motor nameplate data, as defined by NEMA, motor manufacturer, and including any motor modifications.
l. Factory finish system.
m. Bearing life calculation confirming compliance with L10 bearing life requirement.
n. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:

1. Seismic anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.
2. Manufacturer's design analyst qualifications.
3. Special shipping, storage and protection, and handling instructions.
4. Manufacturer's printed installation instructions.

5. Manufacturer's Certificate of Compliance, in accordance with Section 01 61 00, Common Product Requirements that factory finish system is identical to requirements specified herein.
6. Factory Functional, Performance Test Reports, and Log.
7. Field, Vibration, Performance Test Reports, and Log.
8. Extension shaft alignment report.
9. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers' Field Services.
10. Suggested spare parts list to maintain equipment in service for a period of 5 years. Include a list of special tools required for checking, testing, parts replacement, and maintenance with current price information.
11. List special tools, materials, and supplies furnished with equipment for use prior to and during startup and for future maintenance.
12. Operation and Maintenance Data as specified in Section 01 78 23, Operation and Maintenance Data.
13. Submittals shall conform to the requirements of Section 43 23 03. Sections to be marked-up and submitted in accordance with Section 43 23 03 requirements include:
    a. This Section.
    b. Section 43 05 11 – General Requirements for Equipment.
    c. Section 43 05 13 – Rigid Equipment Mounts.
    d. Section 43 20 05 – Machine Alignment.
    e. Section 43 23 03 – General Requirements for Centrifugal and Axial Flow Pumping Equipment.
    f. Section 26 19 23 – Medium Voltage Adjustable Frequency Drive System.

1.6 EXTRA MATERIALS

A. Furnish for each of the five (5) sets of pumps:

1. Complete set(s) bearings, for 5 pumps.
2. Complete set(s) gaskets and O-ring seals, for 5 pumps.
3. Complete set(s) of shaft sleeves, for 5 pumps.
4. Complete set(s) keys, dowels, pins, etc., for 5 pumps.
5. Complete mechanical seal(s), for 5 pumps.
6. Impeller and lock screw kit, for 5 pumps.
7. Impeller shaft, for 5 pumps.
8. Casing wear rings, for 5 pumps.
9. One complete set of any special tools required to dismantle pump.
10. Spare parts for the variable-speed, adjustable frequency drive shall be as specified in Section 26 19 23. Spare parts shall be tagged and stored as specified in Section 43 05 11-2.12.

PART 2 PRODUCTS

2.1 GENERAL

A. Provide a complete, coordinated, and fully functional operating system.

B. Coordinate pump requirements with motor manufacturer and be responsible for pump and motor requirements, including pump base, elbow, flywheel, intermediate shaft, motor and drive (VFD).

C. Where adjustable speed drives are required, furnish a coordinated operating system complete with pump, motor, and adjustable speed controller. See Section 26 19 23, Medium Voltage Adjustable Frequency Drive System.

D. Pumps supplied under this section shall be a standard product of manufacturer and to have proven reliability.

E. Provide a complete lateral and torsional critical speed analysis of each pump-coupling-motor rotating assembly including extension shaft assembly, and structural analysis of complete pump and motor assembly performed by a qualified third party; Dynatech, Mechanical Solutions and Engineering Dynamics, NBE or approved equal.

1. Analyst Qualifications: Experienced in performing analyses for pump and motor units of comparable size and complexity.
2. Prepare a written report for each completed analysis documenting analysis and calculation procedures.
3. Submit results of each analysis for review and acceptance prior to pump and motor fabrication.
4. Critical speed analysis shall meet the requirements of Section 43 23 03.

F. Rotor Lateral Analysis:

1. Identify lateral critical speeds for both pump and motor shafts and extension shaft assembly.
2. Include both dry and wet impeller cases.
3. Provide a Campbell Diagram demonstrating that a critical speed does not occur below 1.25 times the maximum rated speed of the pump and motor and does not occur between 0.75 times the blade pass frequency associated with the minimum operating speed of the pump and 1.25 times the blade pass frequency associated with the maximum specified speed of the pump.
4. Calculate the damped vibration response to unbalance for the shafts and compare to applicable specified requirements to verify acceptable vibration amplitudes.

G. Torsional Analysis:

1. Calculate system torsional natural frequencies, corresponding mode shapes, and steady-state and transient torsional response.
2. Include extension shaft assembly in analysis.
3. Provide an interference diagram demonstrating compliance with API 610.
4. Forced Response Analysis:
    a. Perform a forced response analysis for all critical speeds determined to occur below 1.20 times the maximum rated operating speed.
    b. Expected excitation frequencies for steady-state operation include as a minimum, but not limited to, electrical line frequency, two times electrical line frequency, current modulating frequencies produced by the variable frequency drive, mechanical running speed (one times shaft speed), two times mechanical running speed (two times shaft speed), and blade pass frequency.
    c. Confirm that calculated steady-state and transient dynamic torsional shaft stresses and coupling torques are below allowable levels, such that the motor shaft, pump shaft, and associated drive train components are capable of an unlimited number of startup and shutdown cycles associated with 0 rpm up to the maximum rated speed.
    d. Determine allowable stresses (endurance limits) for the pump and motor shafts in accordance with ASME B106.1 (Design of Transmission Shafting) or MIL STD 167, whichever is lower.
    e. Include a factor of safety of at least two in the allowable stress levels and demonstrate stresses on a Modified Goodman Diagram.
    f. Confirm that dynamic torque in the couplings is in accordance with coupling manufacturer's requirements.

H. Structural Response Frequency Analysis:

1. Perform a structural response frequency analysis for the pump and motor assembly.
2. At a minimum, model the motor, pump, and fabricated support, including any other critical components based upon mounting details shown on Drawings.
3. Confirm that the minimum structural natural frequency of the complete pump and motor assembly is a minimum of 1.25 times the maximum rated pump and motor speed, and does not occur between 0.75 times the blade pass frequency associated with the minimum speed of the pump and 1.25 times the blade pass frequency associated with the maximum specified speed of the pump.

4. Verification of calculated natural frequencies of the pump and motor assembly shall be performed by pump manufacturer's selected third party analyst under 2.01E above, when unit is fully installed at the Project Site.

2.2 PERFORMANCE

A. The pumping equipment shall be suitable for pumping raw sewage and passing a 4.0" diameter sphere.

B. Pumps shall be vertical centrifugal, non-clog sewage pumps, complete with variable frequency driven motors, specifically designed, constructed, and installed for pumping raw sewage. Pumps shall comply with all conditions listed in the following table:

Design Conditions Location/I.D.	**Pumps P-01 through P-10**
Drive Type	Variable Speed
No. Required	5 pumping units with 2 pumps per unit
Design Point (full speed) [1,6] Condition A	
Capacity for One Pumping Unit (gpm)	6,549
Total Head (ft)	494
Min Bowl Eff (%)	79
Design Point (full speed)[2,6] Condition B	
Capacity for One Pumping Unit (gpm)	7300
Total Head (ft)	475
Min Bowl Eff (%)	80%
Third Design Point (full speed)[3,6] Condition C	
Capacity for One Pumping Unit (gpm)	9600
Total Head (ft)	409
Min Bowl Eff (%)	78
NPSH3 @ Cond C, 1190 rpm (ft)	30
Reduced Speed Design Point[4,6] Condition D	
Capacity for One Pumping Unit (gpm)	8000
Total Head (ft)	400

Design Conditions Location/I.D.	**Pumps P-01 through P-10**
Speed (rpm) (approximate)	1130
Reduced Speed Design Point (6) Condition E	
Capacity for One Pumping Unit (gpm)	5500
Total Head (ft)	390
Speed (rpm)	1047
Max Shutoff head – full speed (ft)	610
Min Shutoff head – full speed (ft)	580
Maximum Brake Horsepower (each motor)	750
Number of Motors per Pumping Unit	2
Max Oper. Speed (rpm)	1190
Min Discharge Nozzle Size/Class	14"/250-lb
Min Suction Nozzle Size/Class	16"/250-lb
Motor Voltage	4160 V
Nominal Motor Horsepower	750 Hp
Winding Temperature Device(5)	2 RTDs per winding phase
Bearing Temperature Device	1 RTD for pump bearing/1RTD for motor bearing
Vibration Switch	Yes

(1) Condition A shall be taken as the rated, continuous-duty operating condition for each pumping unit ("pumping unit" consists of two pumps connected in series, operating as a single unit). Performance at the rated condition shall be guaranteed in accordance with Section 43 23 03. Condition A has been selected to obtain the rated pumping capacity for the installation with 4 pumping units operating in parallel, discharging to the pumping station's discharge system against expected maximum system head. It is not intended that the pumps be selected for maximum efficiency at Condition A. Pumping units furnished under this section shall be selected to achieve Condition A performance, and shall operate continuously without objectionable vibration or cavitation at the head specified under Condition A. Condition A shall reside within the pumps' POR.

(2) Condition B head is presented to indicate operating conditions when four pumping units are operating in parallel operating at maximum speed against minimum anticipated system head, assuming a hypothetical head-capacity curve. Condition B shall not be used for pump selection. Pumping units with head-capacity curves steeper than that assumed for the purposes of identifying Condition B will produce somewhat less flow at somewhat lower head and vice versa for pumps with flatter

pump head-capacity curves. Condition B represents the minimum anticipated total head with 4 pumping units operating at full speed and delivering to the discharge system. Condition B shall reside in the selected pumps' POR. Proposed pump selections meeting this discharge head requirement by operating the equipment at less than full speed will be rejected.

(3) Condition C is the anticipated continuous duty maximum speed condition when one pumping unit is in service. Pumps furnished under this specification shall be capable of sustained (24 hours per day) operation at this condition within the requirements set forth in Section 43 23 03. Condition C shall reside in the selected pump's AOR.

(4) Condition D represents the expected momentary (startup/shutdown) condition. Pumps furnished under this specification will operate for no more than 5 seconds at this condition when initiating or terminating a service cycle. The maximum anticipated number of service cycles is 12 per day.

(5) See Electrical Drawings and Specifications

(6) Total head in the above tabulation is the algebraic difference between the discharge head and suction head as defined in ANSI/HI 1.1 through 1.6. Net positive suction head available (NPSHA) in the above tabulation is referred to the pump discharge piping at centerline elevation (project datum) as shown and is calculated in accordance with ANSI/HI 1.3 for average barometric pressure and maximum temperature conditions. NPSHA at the pump impeller eye can be determined by adjusting the given value by proposed pump dimensions and the indicated requirements for pump installation details. An allowance of five feet has been included for the presence of volatile constituents in the pumped fluid. Required NPSHA margin shall be as specified in Section 43 23 03. Total head is the head developed by the 2-stage pumping unit.

(7) Maximum expected surge pressure is 300 psig.

C. Pumping system vibration shall not exceed the acceptable field vibration limits given in the standards of the Hydraulic Institute.

D. The pump head capacity curve shall be sloped in one continuous curve with no points of reverse slope inflection capable of causing hunting at the pump operational speed.

E. All pump components shall be designed to safely withstand forces resulting from flow reversals, up to 125 percent of maximum speed, during shutdowns caused by power failures and/or motor or drive failures.

F. All pumps shall have a motor with sufficient horsepower to run the pump over the entire pump curve at full speed without overloading the motor and without use of the motor service factor.

G. The pumps will be started and stopped with a closed discharge valve. Upon starting, the pumping unit will be required to accelerate approximately 2,000 tons of liquid in the force main system.

H. Owing to the nature of this application, the wet well conforms to the Hydraulic Institute definition of a confined trench type wet well. Since physical constraints prevent the use of a self-cleaning trench type wet well and the presence of a screening facility will limit the size of solid material entering the wet well for the Morena Pumping Station, the station wet well level control system will automatically rotate the sequence of lead/follow, 2nd follow and 3rd follow units on a daily basis to limit the accumulation of solids in the wet well trench.

2.3 EQUIPMENT

A. Pump:

1. Each pump shall be of the vertical dry pit, bottom suction volute casing, enclosed impeller non-clog or non-clog mixed-flow volute type. The pumps shall be designed so that the impeller, back head, frame, and pump shaft can be removed as a complete unit without disturbing the connecting piping or casing, the first stage pump and motor/flywheel assembly shall be each be supported on separate bases mounted on separate floors. The second stage pump and motor/flywheel assembly shall be supported on separate bases mounted on the same floor.
2. Heavy-duty, solids handling, non-clog, dry pit design.
3. Configuration: See Supplements.
4. See Drawings for pump orientation and rotation.
5. Continuously rising head-capacity curve from runout to shutoff.
6. Designed to operate continuously at any point on specified operating range of performance curve without cavitation, overheating, or excessive vibration.
7. Motor nameplate horsepower rating not to be exceeded by pump brake horsepower required at any point on nominal pump performance curve.
8. Each pump should be capable of passing a minimum solids sphere of 4-inches.

9. Equipment List:

Item	Equipment No.
First Stage, Pumping Unit 1	P-01
Second Stage, Pumping Unit 1	P-02
First Stage, Pumping Unit 2	P-03
Second Stage, Pumping Unit 2	P-04
First Stage, Pumping Unit 3	P-05
Second Stage, Pumping Unit 3	P-06
First Stage, Pumping Unit 4	P-07
Second stage, Pumping Unit 4	P-08
First Stage, Pumping Unit 5	P-09
Second Stage, Pumping Unit 5	P-10

B. Casing:

1. Back pullout design allowing for removal of rotating element without disturbing piping connections.
2. Heavy wall, ductile iron, A-395, Gr. 65-42-12, one-piece volute construction with integral flanged discharge flange and smooth fluid passages. Casing shall have a nominal thickness of 7/8 of an inch. Provide drilled and tapped volute priming and drain connections.
3. Provide handhole for cleanout purposes at volute centerline located to provide access to interior of pump.
4. Flanges:
   a. Conform to ASME B16.1, Class 250-pound, flat face standard.
   b. Provide 1/2-inch gauge connection drilled and tapped in discharge flange.
5. Diffusion vanes or stationary guides are not allowed.
6. Each volute casing shall be of one-piece construction and shall be designed to permit the removal of all rotating internal parts without disturbing the suction and discharge piping connections. The discharge nozzle shall have a 1-inch minimum drain with a valve, and a minimum 1/2-inch tap for gage connection. The casing shall be designed for support on individual concrete piers extending from the floor elevation indicated to the underside of the casing. The casing shall include 4 cast

in feet that will mount to a fabricated pump base. Sole plates or adjusting blocks conforming to the requirements of Section 43 05 13 shall be provided to mate with pump base. The design of the support system shall provide convenient access to the inlet elbow gage taps, drain valve, and hand hole cover. A hand hole (6-inch minimum) with cover shall be provided on the discharge nozzle. The inner contours of the hand hole cover shall match the contours of the waterway. The hand hole cover shall be fitted with a lifting eye. Casing shall be provided with 1/2-inch minimum vent with a valve fitted to the top of the discharge nozzle.

C. Suction Cover (Front Head):

1. Single-piece construction designed to provide even flow to impeller eye.
2. Flanged connection conforming to ASME B16.1, Class 250-pound, flat face standard.
3. Material: ductile iron A 395, Gr.65-45-12.
4. Machine register fitted to casing.

D. Suction Elbow – First Stage Pump:

1. The first stage pump shall have a turbo free suction elbow.
2. ASME B16.1, Class 250-pound flat face standard, flanged suction elbow with contoured handhole cleanout and cover.
3. Suction flange shall be 24-inches and discharge flange shall be 16-inches.
4. Provide 1/2-inch gauge connection.
5. Material: ductile iron, A 395, Gr. 65-45-12.
6. General: The pump shall be furnished with suction cover and a turbo free elbow cast separately from each other. The arrangement provided shall be sufficient to characterize the incoming flow to provide uniform approach velocities in the entering flow at the leading edges of the impeller vanes.

   A handhole (minimum 6-inch diameter) with a bolted cover shall be provided in the inlet piece or elbow. Handhole inner contours shall match the contours of the inlet piece. The handhole cover shall be fitted with a lifting eye. A 1-inch-diameter drain with a valve shall be provided in the inlet piece.

E. Stuffing Box Cover (Back Head):

1. Single-piece construction designed with integral stuffing box suitable for use of mechanical seal.

2. Machine register fitted to casing.
3. Material: ductile iron, A395, Gr. 65-45-12cast iron conforming to ASTM A48 CL30
4. The back head shall be drilled and tapped for the installation of 3/8-inch seal flushing water connections and a 3/4-inch flushing water drain. Drain location and back-head design shall assure the continuous and complete removal of excess flushing water. The design of the back head shall be such that there shall be no standing pools of water so that shaft seal leakage drains readily to the back Head drain.

F. Bearing Frame and Bearings:

1. Removable, single-piece construction.
2. Machined for accurate bearing alignment and completely enclosing shaft between bearings.
3. Provide with retainer covers on inboard and outboard ends of frame equipped with lip-type grease seals to prevent entrance of contaminants.
4. Single or double row bearings at inboard and outboard ends designed to take radial, weight, and thrust loads of pump and associated shafting loads. Bearings to be designed for an L10 life per ABMA with minimum of 100,000 hours at any point in the POR.
5. Provide jacking screws for adjustment of impeller.
6. Grease packed at factory and provided with grease fittings for bearing lubrication.
7. The bearing support frame shall be rigidly bolted to the pump casing. Each frame shall be provided with three struts to distribute loads from the radial and thrust bearings into the casing. Cantilevered bearing frame designs will not be acceptable. The frame shall be designed to carry both radial and thrust bearings. Large openings shall be provided adjacent to the shaft seal area. The frame shall be designed for captured bearing positioning and shall not require any field axial adjustment. The frame shall be capable of running submerged.

G. Impeller:

1. Single-piece construction.
2. Wear ring securely fastened to impeller with recessed stainless steel screws. Impeller wear ring to be a minimum of 50 Brinell softer than suction head wear ring.
3. Impeller back vanes not allowed.
4. Wear rings shall meet requirements of Section 43 23 03.
5. Impellers shall be duplex cast stainless steel (refer to Section 43 23 03) single-stage, single-suction, three vanes, enclosed non-clog or non-clog

mixed-flow type, designed to pass solids sizes as specified and stringy material. The impeller shall be keyed to the shaft and held firmly in place by a stainless steel threaded nut. The method of attaching the impeller to the shaft shall be such that the impeller cannot unscrew or loosen by torque from either forward or reverse direction. The finished impeller with its wearing ring attached shall be statically and dynamically balanced.

6. To reduce deflection for the shaft, the impeller hub shall extend through the stuffing box. The shaft sleeve shall be provided on the exterior or the hub.

H. Pump Shaft:

1. 17-4-PH stainless steel, accurately machined over entire length and precision ground at bearing locations.
2. Designed to transmit full motor horsepower with a liberal safety factor to carry maximum loads imposed and to meet pump vibration requirements.
3. Provide keyways at both ends.
4. Provide renewable, hooked shaft sleeve positively secured to shaft to prevent leakage.
5. Minimum shaft diameters shall be as follows:
   a. At impeller: 4.175 in.
   b. Between Bearings: 6.75 in.
   c. At coupling: 2.785 in.

I. Mechanical Seal

1. Pumps shall be furnished with mechanical seals. Mechanical seals shall not require a wearing sleeve for the shaft, and shall be as specified in Section 43 05 11-2.04. There shall be no reduction in shaft size through the seal area. Provide silicon carbide seal, Type CURC manufactured by AES, or approved equal. Meet requirements of Section 43 05 11.

J. Pump Base:

1. Fabricated carbon steel, rugged, heavy duty, with ample strength for support of entire pump and imposed static and operational loads.

K. Coupling – Second Stage Pump:

1. Designed to provide flexible connection between pump and motor.
2. Flexible coupling to be designed to carry maximum horsepower of motor, including service factor, and additional forces imposed by rotating assembly.

3. Flexible coupling selection to take into account torsional analysis of complete pump and motor drive system.
4. Coupling shall be spacer type to allow for removal of the second stage pump without removing the motor support.
5. Provide fabricated coupling guard to comply with OSHA safety standards.

L. Flywheel and Motor Support:

1. Scope: The pump manufacturer shall engage the professional services of a registered structural engineer licensed to practice structural engineering s in the State of California to design and supervise the construction and installation of the components needed to provide rigid support frames for the first and second stage flywheel assemblies. The frames shall be designed to support the weight of the motor/flywheel assembly and sustain the lateral loads imposed by Seismic Zone 4 without sustaining any distortion or any detectable damage.
2. Materials and General Requirements: Motor and flywheel supports shall be fabricated from welded steel shapes steel and shall be designed to mount on cast concrete housekeeping pads in accordance with the requirements for Rigid Machine Mounts, Section 43 05 13 and the requirements set forth in paragraph 43 23 03-2.06. All support structure surfaces except those intended for mating with soleplate surfaces shall be finished with powder fused epoxy coating, finished color black.
   The first stage motor and flywheel support shall be designed to span the opening shown and shall be mounted on a sole plate cast into the housekeeping pad in accordance with Section 43 05 13, Rigid Machine Mounts. The support shall be comprised of a steel cover late stiffened with rolled steel shapes welded to the underside to provide no detectable deflection when a load equal to 150 percent of the weight of the motor and flywheel is applied to the mounting pads for the support frame. Access opening shall provide convenient and safe entrée to all intermediate coupling maintenance and disassembly points. As well as any flywheel bearing maintenance points.

   Second Stage Motor and Flywheel Support: The motor and flywheel support for the second stage pumps shall be a fabricated steel shroud designed to straddle the second stage pump and to transfer the weight, operational-related and seismic-related forces to the pump room floor.
3. A fabricated steel support/pedestal as shown on the drawings shall be of adequate height to allow service access to the couplings between the motor shaft and the flywheel shaft, and between the flywheel shaft and the pump shaft, and designed to carry weight of motor without undue

vibration to pump assembly. The flywheel/motor pedestal shall be included in mass elastic design analysis.

4. Provide with shaft guard to comply with OSHA safety standards.
5. Flywheel: Moment of Inertia shall be 2000 lb-ft^2 for the rotating element for each complete motor/pump set, including entrained water, pump rotor, shafting, couplings, and motor rotor shall be adjusted to provide this value.
   (1) Materials of construction as follows:
   Frame: Steel ASTM A-36, welded and stress relieved.
   Shaft: Alloy Steel, ASTM A322, Grade 4142 HT, Stainless, 375-388 BHN for sahfts 3.5 inches in diameter and less. Stainless ASTM A564 Type 630 HT Condition H1150 for shafts larger than 3.5 inches in diameter.
   Rotor: Steel ASTM A36, or cast steel, ASTM A27 for flywheels 3 feet in diameter or less.; Cast steel ASTM A148 for flywheels greater larger the 3 feet in diameter. All stress relieved after machining.

M. Extension Shaft Assembly (1st Stage Pumps Only):

1. Each pump shall be provided with intermediate shafting which consists of one full or semi floating disc pack composite shafting assembly. Disc pack intermediate shaft shall be constructed of composite tubing of graphite and/or B glass fibers in an epoxy matrix. The resin shall be corrosion-resistant epoxy thermoset plastic. The shaft shall be selected with a factor of safety of not less than 2 based upon ultimate stress.
2. The intermediate shaft assembly shall be designed to operate below its critical speed.
3. Shaft Deflection is not applicable for intermediate shafting.
4. Constructed of sufficient diameter and properties to transmit 1.25 times full motor horsepower including service factor.
5. Provide shaft guard over the entire length of the shaft and conform to OSHA safety requirements; complete with banded openings to allow access to shaft lubrication fittings.

N. Motor

1. Premium efficiency, vertical solid shaft motor
2. Inverter duty rated per NEMA MG1 Part 31 with 1.00 Service Factor
3. 4160-Volt/3-Phase/60 Hz
4. Class F insulation
5. 80˚C temperature rise at 1.0 Service Factor
6. Variable torque
7. Enclosure type: Weather Protected Type 2

8. 7 installed RTDs per motor (2 per phase plus 1 for the motor thrust bearing)
9. Nominal horsepower: 750 Hp
10. Max Weight: 10,700 lbs.
11. Nominal Motor Speed: 1200 rpm
12. Meet all requirements of Sections 43 23 03 and 43 05 21, including motor cooling requirements.
13. Maximum motor height: 84 inches (including shaft extension).
14. Manufacturer: TECO-Westinghouse, General Electric, WEG, or approved equal.
15. Motor shall have the following minimum NEMA nominal efficiencies:
    a. 100% load: 95.1 eff.
    b. 75% load: 95.36 eff.
    c. 50% load: 94.9 eff.

16. Motors shall have stator moisture protection by means of vacuum impregnation of epoxy. Windings shall be copper.
17. Space heater, 120 volt, single phase, shall be placed in each end-turn of the windings.
18. Bearings shall be selected to have ABMA rated (minimum) life of ten years when operated continuously at rated speed of motor and at total load consisting of the weight of the motor rotor plus any intermediate shaft weight. Thrust bearings shall be of the angular contact ball or spherical roller type.
19. Motors shall be supplied with a lifting hook and suitable base.
20. Motor conduit boxes shall be of cast-iron or fabricated steel, neoprene gasketed and bolted, and oversized to provide adequate space for connections. The motor leads shall be permanently marked in agreement with connection diagrams.
    a. Power conductor termination box shall not exceed 18” depth and 24” width.
    b. Low voltage termination boxes shall not exceed 9” depth and 12” width.
21. Each RTD detector shall have its leads wired to a terminal block located in a motor auxiliary terminal box.

2.4 ACCESSORIES

A. Lifting Lugs: Provide suitably attached for equipment assemblies and components weighing over 100 pounds.

B. Equipment Identification Plates: Provide 16-gauge stainless steel identification plate securely mounted on each separate equipment component and control panel in a readily visible location. Plate shall bear 3/8-inch

high engraved die-stamped block type black enamel filled equipment identification number and letters indicated in this Specification and as shown.

C. Anchor Bolts: Type 316 stainless steel, sized by equipment manufacturer, 1/2-inch minimum diameter, and as specified in Section 05 50 00, Metal Fabrications. Coat in accordance with Section 09 90 00, Painting and Coating.

D. 1st Stage Pump Intermediate Shaft Removal System: The intermediate shaft dimensions and weights require that the system to remove and handle the intermediate shafts be custom designed. The shafts shall be movable without moving or disassembling the motors to which they are connected. The shaft removal system shall be designed to handle the intermediate shafts provided with the pumping unit.

1. The shaft removal system shall include the following components
   a. A trolley installed within the floor slot below each of the motors that are supplied with this project. To accommodate the trolley, the floor slot width may be modified within the limits established on the drawings. The trolley shall be sized to suspend the full weight of the intermediate shaft and slide to an area where the shaft can be removed with the overhead crane.
   b. For each trolley/slot, provide deck plates to cover the slot to provide a walking surface and personnel fall protection. The deck plates shall be designed to support maintenance personnel while decoupling the shaft. The deck plate shall have lifting lugs or similar attachments to allow removal from the floor slot so that the shaft can be moved within the slot.
   c. Provide a removable railing and safety chain for personnel protection when removing the deck plates.

E. 2nd Stage Pump Removal System: The second stage pump removal system shall be designed to allow removal of the pump from its installed location without removing the motor base, flywheel, or motor. The pump manufacturer shall design a system to raise and lower the pump on a track with wheels. Once the pump is raised on the track, it shall be easily moved to where the bridge crane can access the pump. The entire system shall allow removal and reinstallation of the pump.

2.5 FACTORY FINISHING

A. Manufacturer shall furnish the pump complete assembly with prime and finish coat in accordance with Section 09 90 00, Painting and Coating.

2.6 SOURCE QUALITY CONTROL

A. Factory Tests and Adjustments:

1. Factory testing shall be in accordance with the standards of the Hydraulic Institute, latest edition.
   a. Pump Test Acceptance Grade: 1U
2. Test all pumps identical to that furnished. Use actual motor to be provided for factory tests. One project motor may be used for all factory performance testing.
3. Factory tests shall include the following:
   a. Hydrostatic testing of pump pressure containing components, to include as a minimum, pump volute, suction cover, and stuffing box cover. Test pressure to be the greater of 150 percent of rated condition or 125 percent of pressure at rated speed with discharge valve closed. Test for 10 minutes**.**
   b. Performance testing of fully assembled pump, per Hydraulic Institute Standard 14.6. Performance testing to be at rated speed**.**
   c. Dynamically balance impeller to ISO 1940 Grade G2.5 or better prior to final assembly.
   d. Vibration testing of fully assembled pump with the Project motor at full rated speed.
      1) Due to the temporary setup in the factory, vibration readings taken during the factory performance test are for reference only. Vibration readings in the field will be guaranteed to HI standards.
   e. Include **c**omplete test records, performance curves, certified correct by an authorized representative of the pump manufacturer of each test performed.
   f. Motor Test: See Section 26 19 00, Medium-Voltage AC Induction Motors.
   g. Make necessary adjustments, realignments, and retest to bring pumps into compliance.
   h. Witnessing of factory testing shall meet the requirements of Spec Section 43 23 03.
   i. The Owner and Engineer believe the following manufacturers are capable of producing equipment and/or products, which will satisfy the requirements of this section. This statement, however, shall not be construed as an endorsement of a manufacturer's products, nor shall it be construed that named manufacturers' standard equipment or products will comply with the requirements of this section.
      1) Candidate manufacturers include Fairbanks Nijhuis, or approved equal.

2) Intermediate shaft manufacturers include Johnson Power, or or approved equal.

j. The current design is based on the Fairbanks Nijhuis pumps. Alternate qualified pump manufacturers that can meet the requirements of these specifications and can demonstrate that they have similar pumps proposed for this project within 10% of the flow and TDH requirements can be considered for this project. However, any redesign costs and additional project costs shall be the responsibility of the or equal pump manufacturer.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's printed instructions.

B. Level base by means of steel wedges (steel plates and steel shims). Wedge taper not greater than 1/4 inch per foot. Use double wedges to provide level bearing surface for pump and driver base. Accomplish wedging so there is no change of level or springing of baseplate when anchor bolts are tightened.

C. Adjust pump assemblies such that driving units are properly aligned, plumb, and level with driven units and all interconnecting shafts and couplings. Do not compensate for misalignment by use of flexible couplings.

D. Connect suction and discharge piping without imposing strain to pump flanges.

E. Conform to requirements of Section 43 23 03.

3.2 FIELD FINISHING

A. Equipment as specified in Section 09 90 00, Painting and Coating**.**

3.3 FIELD QUALITY CONTROL

A. Functional Tests:

1. Conduct on each pump, system, and subsystem as specified in Section 01 91 14, Testing, Integration, and Startup.
2. Alignment:
   a. Test complete assemblies for correct rotation, proper alignment and connection, and quiet operation.

b. Shafting manufacturer's authorized representative shall verify installation alignment and prepare and submit a report confirming compliance**.**

3. Flow Output: Measure using plant instrumentation and storage volumes**.**
4. Operating Temperatures and Vibration: Monitor bearing areas on pump and motor and on extension shafting for abnormally high temperatures or vibrations**.**
5. Vibration Test:
   a. Test with units installed and in normal operation, and discharging to connected piping systems at rates at 20 percent speed increments over the anticipated operating speed range of the pump and with actual building structures and foundations provided.
      1) Confirm vibration is below 90 percent of limits specified in HIS 9.6.4.
   b. If units exhibit vibration in excess of the limits specified, adjust or modify as necessary to bring units into compliance. Units that cannot be adjusted or modified to conform as specified shall be replaced**.**
   c. Provide instrumentation in current calibration to measure pump vibration at locations outlined in the Hydraulic Standards.
   d. Prepare test report, including test records for each pump.
6. Performance Test: Conduct on each pump as specified in Section 01 91 14, Testing, Integration, and Startup.
7. Test in accordance with Hydraulic Institute Standard 1.6, Centrifugal Pump Test.
8. Perform under simulated operating conditions at full rated speed and at a reduced speed as approved by Engineer**.**
9. Test for a continuous 3-hour period without malfunction**.**
10. Test Records and Report: Prepare and submit a complete test report along with the test records in accordance with Hydraulic Institute Standard 14.6**.**
11. Use of plant instrumentation is allowed for tests. Provide additional instrumentation required to obtain required test data for conformance of factory test results**.**

3.4 MANUFACTURER'S SERVICES

A. Manufacturer's Representative: Present at Site or classroom designated by Owner, for minimum person-days listed below, travel time excluded:

1. Ten (10) person-days for installation assistance and inspection.
2. Ten (10) person-days for functional performance testing and completion of Manufacturer's Certificate of Proper Installation.
3. Two (2) person-days for pre-startup classroom or Site training.

4. Two (2) person-days for facility startup.
5. Two (2) person-days for post-startup training of Owner's personnel**.** Training shall not commence until an accepted detailed lesson plan for each training activity has been reviewed by Owner.

B. See Section 01 43 33, Manufacturers' Field Services and Section 01 91 14, Testing, Integration, and Startup.

END OF SECTION

SECTION 43 42 00
OXYGEN TANK AND VAPORIZERS

PART 1 GENERAL

1.1 DESCRIPTION

A. This Section covers the work necessary by the Supplier to design and furnish, complete, the liquid oxygen (LOX) system including the tank and vaporizers to convert LOX to gaseous oxygen (OX).

B. The Supplier shall be responsible for furnishing a complete system and for coordination, proper sizing, and performance of all specified components. The system shall include, but not be limited to, the following:

1. One liquid oxygen storage tank.
2. Two ambient vaporizers.
3. Related valving, piping, and appurtenances as described herein.
4. All proper labels and signs, including those for safety.
5. Process instrumentation and control as described in these Specifications and as shown on the P&ID in the Contract Documents.

C. The Supplier shall provide all equipment; tank mounted valves, piping, and fittings; non-tank mounted piping and valves; and accessories required as shown on the P&ID and specified herein.

1.2 GENERAL

A. The equipment specified herein shall be fabricated, shop tested, fully assembled units requiring a minimum of field installation labor.

B. Like items of equipment provided hereunder shall be the end products of one Supplier to achieve standardization for appearance, operation, maintenance, spare parts, and Supplier’s services.

1.3 SUBMITTALS

A. Complete submittals in accordance with the requirements of Section 01 33 00, Submittal Procedures. B. Action submittals:

1. Submit materials of construction, complete Supplier's specifications, including dimensions and weight of equipment, and paint system data.

2. Submit proposed layout of equipment and piping.
3. Submit electrical requirements and power and control wiring diagrams.
4. Submit shop drawings, cut sheets, and catalog information, as required by Section 01 88 15, Anchorage and Bracing.
5. Submit dimensions of area required for servicing equipment and clearance requirements.
6. Submit list of special tools and materials for maintenance.
7. Submit O&M Manual, including LOX tank purging procedures, per Section 01 78 23, Operation, Maintenance, and Asset Data.
8. Submit Factory Testing plans, Factory Testing certification, Functional Testing plan, and Functional Testing report. C. Informational submittals:

1. Submit support and anchorage calculations as required by this specification and Section 01 88 15, Anchorage and Bracing. D. Quality Control Submittals:

1. Provide Supplier's Certification of Proper Installation.
2. Special shipping, storage, protection, and handling instructions.
3. Supplier's printed installation instructions.

1.4 QUALITY ASSURANCE

A. The oxygen system shall be designed and installed in accordance with NFPA 53 and NFPA 55 and industry standards as set forth by the Compressed Gas Association.

B. All equipment, piping, valves, instrumentation, and accessories in oxygen service shall be cleaned in compliance with the Compressed Gas Association (CGA) Pamphlet G4.1, "Cleaning Equipment for Oxygen Service," latest edition. For items cleaned prior to shipment, they shall be properly packaged for protection from contamination. Provide directions for storage at the site prior to installation. Precleaned items shall not require further cleaning after installation only if they meet the requirements of the CGA.

1.5 PROJECT CONDITIONS

A. Environmental Requirements:

1. Exposure: Outdoors, no shading.
2. Temperature: Maximum 104 degrees F; minimum minus 3 degrees F.

3. Elevation 16 feet above sea level.

1.6 DELIVERY, STORAGE AND HANDLING

A. Delivery, storage, and handling shall be in accordance with the LOX tank Supplier's written instructions.

B. All equipment shall be protected against any damage during transportation and handling.

C. Finished iron or steel surfaces not painted, before delivery to the job site, shall be properly protected to prevent rust and corrosion.

D. The finished surfaces of all exposed flanges shall be protected by blank flanges, strongly built and securely bolted thereto.

E. Factory assembled parts and components shall not be dismantled for shipment unless permission is received in writing.

1.7 SYSTEM DESCRIPTION

A. General: The oxygen system described herein shall consist of one liquid oxygen storage tank, two ambient vaporizers, and related piping, valving, and appurtenances.

B. The LOX storage tank shall have a nominal storage capacity of 13,000 gallons. The oxygen system shall be designed to continuously provide oxygen at a rate of approximately 20,000 pounds per day.

C. System components shall be designed for oxygen service and shall be in accordance with the Compressed Gas Association and NFPA 53 and 55 requirements.

PART 2 PRODUCTS

2.1 GENERAL

A. Piping, tank, and equipment shall be protected with suitable pressure relief valves as required to prevent excessive pressure buildup due to trapped liquid oxygen or vapor. Pressure relief valves shall be provided in every location in which gas could be trapped between two isolating devices. As a minimum, pressure relief valves shall be provided at all locations indicated on the P&IDs. All pressure relief valve exhausts shall be piped downward, terminating at an elevation no closer than 18 inches above the concrete pad.

B. All materials, where applicable, shall be suitable for oxygen gas and cryogenic liquid use.

2.2 COMPONENTS

A. Liquid Oxygen Storage Tank:

1. Design Criteria: The design of the liquid oxygen storage tank shall be based on the following conditions: a. Number of Tanks: One.
   b. Tank Style: Horizontal.
   c. Gross Capacity of Each Tank: 13,000 gallons.
   d. Normal Operating Pressure: 250 to 300 psig.
   e. Maximum Allowable Working Pressure: 275 psig.
   f. Design Temperature: Plus 110 degrees F to minus 320 degrees F.
2. The LOX storage tanks shall be products of:
   a. Chart Industries.
   b. Or equal.
3. Tank shall be horizontal, double walled construction with a minimum capacity as described above.
4. Inner vessel shall be 9 percent nickel steel SA-353/553 or SA240 Type 04 stainless steel cold stretched with vacuum perlite insulation and shall be built and stamped in accordance with ASME Pressure Vessel Code, Section VIII, Division I for maximum allowable working pressure.
5. Outer vessel shall be carbon steel. Factory prepare, prime, and finish coat per System 5 of Section 09 90 00.01, Painting and Coating for Equipment. Color as selected by Owner.
6. Tank piping shall be copper or Type 316 welded stainless steel in accordance with Section 40 27 00, Process Piping – General. The following piping, with labels, systems shall be provided as a minimum:
   a. Top and bottom fill lines.
   b. Safety relief line for inner vessel.
   c. Top and bottom gauge lines for pressure and level indication.
   d. Full trycock line.
   e. Liquid product withdrawal line.
   f. Economizer return line.
   g. Auxiliary vapor line.
   h. Pressure building coil line.
   i. Insulation space evacuation and gauge line.
7. Tank fill system shall include a standard Compressed Gas Association oxygen hose connector, check valve, pressure relief valve, and drain valve. Fill system shall be for connections to commercial highway transport.

8. Inner and outer vessels and the piping systems shall include safety valves and rupture discs to protect the equipment from excessive pressure.
9. Pressure Safety Devices: Piping, tank, and equipment shall be protected with suitable pressure safety valves (PSVs), for the intended fluid service, as required to prevent excessive pressure buildup due to trapped liquid oxygen or vapor. Provide dual automatic primary relief devices by pressure safety valves. Pressure safety valves shall be Herose GMBH, or equal. Provide secondary relief systems by rupture discs and a manual vent valve. Rupture discs shall be BS & B Safety Systems, or equal. Internal vessel pressure relief shall consist of both automatic primary and secondary relief devices and manual tank vent valves. External vessel pressure relief shall consist of an automatic relief device. Thermal relief valves shall be as manufactured by Engineered Controls International, Series B-9400, or equal.
10. Backpressure Valve: Provide backpressure valve, as recommended by supplier, within pressure relief circuit to limit loss of oxygen to atmosphere during extended periods between tank fill cycles.
11. Pressure Building System: The tank shall be equipped with a pressure building system, including a pressure building regulator and isolation valve, to automatically maintain a minimum set pressure required for the Supersaturated Oxygen System. The setting on the pressure building system shall be accessible at the tank to the Operator for setting adjustment as required.
12. Internal Economizer Circuit and OX Recovery System: Each tank shall be equipped with an internal economizer system that allows excess OX which accumulates in the head space of the tank during periods of low product use to be consumed prior to automatic blow-off. A special pressure regulator and internal tank piping and valves shall be provided to allow excess OX to flow into the LOX use pipeline prior to the LOX pipeline exiting the actual tank. The system shall be provided with a pressure regulator located in between the dual tank walls and designed to automatically set the economizer circuit to regulate at 5 to 10 psig higher than that of the pressure building circuit.
13. Insulation and Vacuum Requirements: The insulation shall be perlite packing, Super-Fiber, or composite insulation in the annular ring, and a high vacuum, such that the tank boil-off rate shall not exceed 0.35 percent of the tank capacity by weight per day for summer ambient temperature conditions of 104 degrees F.
14. Anchoring: The liquid oxygen storage tank shall be provided with all required support framing and lugs for fastening the tank to a concrete pad. Mounting base, legs, and support framing for the storage tank shall

be welded to the tank. The tank and anchors shall be designed in accordance with Section 01 88 15, Anchorage and Bracing.

15. NFPA Label: Each tank shall be provided with hazardous material signal arrangements painted on both ends and both sides following field painting. Each signal arrangement shall be 5-inch by 5-inch diamond shaped background painted white. The health signal shall be painted blue, the flammability signal shall be painted red, and the reactivity signal shall be painted yellow. All signals shall be 2 inches high. In the diamond shaped signal arrangement, the health signal shall be identified at the top, the reactivity signal shall be identified at the right, and the bottom shall be used to identify special hazards. The following numerical gradings shall be given to the signals: Health – "3," Flammability – "0," Reactivity – "0," and "OXY" shall be identified as a special hazard. B. Ambient Vaporizers:

1. Design Criteria: The design of the ambient vaporizers shall be based on the following conditions:
   a. Number of Vaporizers: Two.
   b. Maximum Hourly Gas Flow Requirement for Each Vaporizer:
      1) Summer Conditions: 11,700 scfh continuous at minimum ambient temperature of 70 degrees F.
   c. Minimum Period of Operation for Continuous Vaporization Cycle: 8 hours.
   d. Maximum Working Pressure (Approximate): 150 psig.
2. Ambient vaporizers shall be rated for a capacity as described above, 600 psi working pressure. Internal tubing shall be aluminum with wide gap aluminum fins to reduce ice bridging.
3. The vaporizers shall be the products of:
   a. Thermax.
   b. Or equal.
4. The vaporizers shall be capable of receiving liquid oxygen from the storage vessel and continuously converting it to gaseous form of supply to the ozone system at the required system pressure. Further oxygen compression shall not be provided.
5. Vaporizers shall be equipped with both external and internal fins. The linear gap between outside finned elements shall be no less than 5 inches in order to allow for maximum ice build-up. All critical pressure joints shall be manufactured with full penetration welds. No weld surface cracks due to thermal expansion and contraction of vaporizer elements will be allowed. The materials of construction shall be suitable for outside installation for the design conditions, LOX and

OX compatible, and shall be factory cleaned for oxygen service and sealed.

6. Flanged Connections: All inlet and outlet connections shall be ANSI flanges with minimum 300 psig rating. All flange connections where aluminum and stainless steel flanges are mated together shall be equipped with a suitable dielectric corrosion inhibiting flange kit. This flange kit shall be constructed of material suitable for the intended service (either LOX or OX) and shall not allow direct contact of aluminum metal to stainless steel metal on any part of the flange and bolt kit.
7. Ambient vaporizers shall be complete with piping connections and support legs suitable for anchor bolt attachment to an equipment pad. The vaporizers and anchors shall be designed in accordance with Section 01 88 15, Anchorage and Bracing.

C. Piping: As shown on the P&ID and as specified below:

1. The Supplier shall design and furnish all LOX and OX piping from the tank fill connection to the flanged OX connection near the edge of the concrete equipment pad.
2. Piping shall be copper or Type 316 welded stainless steel and shall conform to the requirements of Section 40 27 00, Process Piping – General.
3. A general layout of the LOX piping has been provided on the Drawings to ensure sufficient space is available on the tank pad. Supplier may revise layout currently shown. All piping shall be run in the vertical and horizontal planes. Piping shall be arranged and supported to ensure that undue stresses from thermal expansion are not transmitted to equipment components.

D. Valves: Valves shall be supplied as shown on the P&ID and described in this Section. Valves shall be Supplier's standard, appropriate for pure oxygen service. Valves shall be installed in accordance with Supplier's written instructions. Valves shall be firmly supported to avoid undue stresses on the pipe.

1. Isolation Valves for Liquid Oxygen Service: Valves shall be globe or ball style valves. Ball valves shall have appropriate upstream vent-tap on ball to prevent trapping of LOX or OX fluid. Valve bodies, bonnets, and plugs shall be brass or bronze or stainless steel, with stainless steel stems and PTFE or other approved packing for the intended fluid application. Valves in use in LOX piping and on LOX service shall be suitable for cryogenic use and shall have extended stems. All valves shall be cleaned for oxygen service. Valves shall be as manufactured by The Wm. Powell Company, Goddard Valve Corporation, or approved equal.

E. Instrumentation: As shown on the P&ID and as specified below.

1. General:
   a. Field instruments shall use Profibus digital field technology.
   b. Field instruments shall be FDT/DTM certified.
   c. HART 4 to 20 mA dc instruments with certified FDT/DTM are an acceptable substitution where Profibus fieldbus technology is not available.
2. Furnish and install the following field instrumentation on the tank for monitoring and control of the LOX tank. Instrumentation shall be suitable for cryogenic operation and shall be Endress+Hauser, or equal. a. Liquid Oxygen Storage Tank Level.
   b. Liquid Oxygen Storage Tank Inner Pressure.
   c. Liquid Oxygen Storage Tank Evacuated Space Vacuum.
   d. Vaporizer 1&2 Discharge Temperature.
   e. Gaseous Oxygen Temperature.
   f. Gaseous Oxygen Pressure. F. Accessories:

1. Identification Plates: Mount 16-gauge stainless steel plates in readily visible locations on each separate component of equipment.
2. Lifting Lugs: Provide on equipment and equipment components over 100 pounds.
3. All required safety and material identification signage for the tank, equipment, and piping. Signage shall be of appropriate size and materials for installed location.

2.3 FACTORY TESTS

A. The complete cost of all factory tests and factory cleaning procedures shall be the responsibility of the Supplier.

B. Hydrostatic Factory Test Prior to Shipment: A factory hydrostatic test shall be conducted at a minimum of 175 psig and held for not less than 1 hour. Any leaks discovered during the test shall be repaired and the unit retested until there is no leakage. The test may be witnessed, so the Supplier shall provide minimum 3 weeks notice of testing.

C. Functional Test: Each item of equipment supplied shall be factory tested by the Supplier prior to shipment, utilizing liquid nitrogen or liquid oxygen, to demonstrate that the unit and all subsystems function as specified and intended. All deficiencies discovered during the factory tests shall be corrected and retested prior to shipment.

D. Certification: The Supplier shall provide a certified test report stating that the equipment has been subject to a hydrostatic and/or functional factory tests and were appropriately cleaned and sealed for oxygen service and each unit complies with the specification requirements.

PART 3 EXECUTION

3.1 INSTALLATION

A. The oxygen system equipment shall be installed in accordance with Supplier's recommendations.

3.2 OXYGEN SERVICE

A. All skid-mounted piping, valves, instruments, controls, equipment, and associated appurtenances to be used with oxygen shall be cleaned for use in oxygen service in accordance with the Compressed Gas Association and marked and certified “Cleaned for Oxygen Service” before shipping to the job site.

B. Greases and lubricants shall be oxidation resistant, DuPont “Krytox,” or equal.

3.3 INSPECTION AND TESTING

A. Perform functional testing for all supplied equipment including checking for proper rotation, alignment, speed, excessive vibration, and noisy operation. Check instruments for proper installation, calibration, and adjustment. This activity shall

also include any necessary tuning of equipment to ensure that it is ready for reliable and safe operation. Once ready for operation, test under

actual startup conditions to determine that the operation is satisfactory, that the pressure building system and economizer system are operating properly, and that the liquid oxygen boil-off rate is satisfactory.

B. The initial tank fill will be supplied by the OWNER to test the liquid oxygen system and complete all startup services.

C. The liquid oxygen storage tanks and vaporizers shall be tested under actual startup and operating conditions.

D. Field touch-up per manufacturer's instructions and per System No. 4 of Section 09 90 00.01, Painting and Coating for Equipment.

3.4 TRAINING

A. After successful completion of required Functional Testing, Supplier shall provide field and classroom training to Owner's operations and maintenance staff.

1. Pre-Startup Training: Two person-day.
2. Post-Startup Training: Two person-day.

3.5 SUPPLIER'S SERVICES

A. A Supplier's representative for the equipment specified herein shall be present as required at the jobsite and/or classroom for installation assistance, inspection, certification of the installation, functional testing, performance testing, and post-startup training.

END OF SECTION

SECTION 43 42 56.04
SUBMERSIBLE SUMP AND SCUM PUMPS

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards that may be referenced in this section:

1. American Bearing Manufacturers Association (ABMA):
   a. 9, Load Ratings and Fatigue Life for Ball Bearings.
   b. 11, Load Rating and Fatigue Life for Roller Bearings.
2. American Society of Mechanical Engineers (ASME): B16.1, Gray Iron Pipe Flanges and Flanged Fittings, Class 25, 125, and 150.
3. ASTM International (ASTM):
   a. A48, Standard Specification for Gray Iron Castings.
   b. A576, Standard Specification for Steel Bars, Carbon, Hot-Wrought, Special Quality.
4. Hydraulic Institute Standards (HIS):
   a. 11.6, Submersible Pump Test.
   b. 14.6, Rotodynamic Pumps for Hydraulic Performance Acceptance Tests.
5. National Electrical Manufacturers Association (NEMA).
6. National Fire Protection Association (NFPA):
   a. 70, National Electrical Code.
   b. 497, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas.
7. Underwriters Laboratories Inc. (UL).

1.2 DEFINITIONS

A. Terminology pertaining to pumping unit performance and construction shall conform to ratings and nomenclature of Hydraulic Institute Standards.

1.3 SUBMITTALS

A. Action Submittals:

1. Make, model, weight, and horsepower of each equipment assembly.
2. Complete catalog information, descriptive literature, specifications, and identification of materials of construction, including cable seal details.
3. Performance data curves showing head, capacity, horsepower demand, and pump efficiency over entire operating range of pump, from shutoff to maximum capacity. Indicate separately head, capacity, horsepower

demand, overall efficiency, and minimum submergence required at guarantee point.

4. For variable speed motors, provide variable speed curves for every 50 rpm over the operational range.
5. Power and control wiring diagrams, including terminals and numbers.
6. Motor data, in accordance with the requirements of Section 26 20 00, Low-Voltage AC Induction Motors.
7. Adjustable frequency drive data, in accordance with the requirements of Section 26 19 23, Low-Voltage Adjustable Frequency Drive System.
8. Factory-finish system.
9. L-10 bearing life calculations per ABMA.
10. If required, wiring for motor protection module.
11. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Seismic Anchorage and Bracing.

B. Informational Submittals:

1. Seismic anchorage and bracing calculations as required by Section 01 88 15, Seismic Anchorage and Bracing.
2. Special shipping, storage and protection, and handling instructions.
3. Manufacturer's printed installation instructions.
4. Factory and Field Performance Test Reports and Manufacturer's Certificate of Compliance, in accordance with Section D: 01 61 00, Common Product Requirements.
5. Suggested spare parts list to maintain equipment in service for period of one (1) year. Include list of special tools required for checking, testing, parts replacement, and maintenance with current price information.
6. List special tools, materials, and supplies furnished with equipment for use prior to and during startup and for future maintenance.
7. Operation and Maintenance Data as specified in Section 01 78 23, Operation and Maintenance Data.
8. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers' Field Services**.**

1.4 EXTRA MATERIALS

A. Furnish for each pump:

1. One set mechanical seals.
2. One complete set of special tools required to dismantle pump.

PART 2 PRODUCTS

2.1 GENERAL

A. Submersible, vertical shaft, centrifugal non-clog type, for pumping wastewater and runoff (Pumps P-11, P-12, P-13, and P-14).

B. Designed for continuous operation under submerged or partially submerged conditions, and intermittent operation when totally dry without damage to pump or motor.

C. Pump and Electrical Driver: Meet requirements for class, group, and division location in accordance with NFPA 70.

D. Where adjustable speed drives are required, furnish a coordinated operating system complete with pump, drive, and speed controller.

E. Pumps furnished under this section to be provided by a single manufacturer.

2.2 COMPONENTS

A. Equipment consists of pump complete with motor, control system, guide rail, anchoring brackets, base elbow, power cable, and pump lifting cable and control panel and level switches.

B. Characteristics:

1. Motor and rotating parts shall be removable from motor end of pump.
2. Mating surfaces to be watertight and fitted with nitrile O-rings.
3. Pumps fitted with dynamically balanced nonclog impellers designed to pass course solids and stringy materials.

C. Lifting Arrangement:

1. Stainless steel chain, 2 feet minimum, and one "grip-eye."
2. Attach chain permanently to pump and access platform with stainless steel wire rope.
3. "Grip-eye" capable of being threaded over and engaging links of stainless steel chain so pump and motor may be lifted with "grip-eye" and independent hoist.

D. Sliding Guide Bracket:

1. Integral part of pump unit.

2. Pump unit to be guided by no less than two guide bars, or equivalent cable system, and pressed tightly against discharge connection elbow with metal-to-metal contact or through use of profile-type gasket, provided gasket is attached to pump's flange and can be easily accessed for inspection when pump is lifted out of wetwell.
3. Pump metal parts that come into contact with guide rail or cable system shall be made of nonsparking materials.

2.3 MOTOR

A. Oil chamber between seals shall be equipped with drain and inspection plug. Plug shall have positive antileak seal and shall be easily accessible from outside.

B. Motor nameplate horsepower not to be exceeded at head-capacity point on pump curve.

C. Pump motor and sensor cables shall be suitable for submersible pump application and cable sizing shall conform to NFPA 70 specifications for pump motors. Cables shall be of sufficient length to reach junction boxes without strain or splicing.

D. Motor Protection Module: If required, provide pump with a motor protection module for remote mounting. Contract Drawings are based on first named submersible pump manufacturer and motor protection module. If pump and motor protection module other than first named manufacturer is provided, provide revised wiring for the motor protection module.

E. Cable Entry System:

1. Junction chamber and motor separated by stator lead sealing gland or terminal board that prevents foreign material entering through pump top.
2. Utilize cable with factory-installed sealing gland with nonshrink epoxy seal system.
3. O-ring compression seal between sealing gland and cable entry point shall also be acceptable

2.4 CONTROL PANEL

A. NEMA 4X enclosure.

B. Free standing, post mounted.

C. Features:

1. Main circuit breaker disconnect interlocked with panel door.
2. Combination circuit breaker type, NEMA rated motor starters.
3. Fused control power transformer, 120V ac.
4. Alternator and pump lead-lag controls.
5. ON/OFF/AUTO switches.
6. Running lights.
7. High level indication.
8. Normally closed, dry, 5 amps at 120V ac contacts for remote indication of:
    a. High level alarm.
    b. Pump failure (temperature or moisture alarm).
9. Terminal strip for interfacing with external wiring.
10. High temperature indication.
11. Moisture alarm indication.
12. Alarm (high temperature, moisture, or high level) beacon located on top of panel.
13. Lightning protection.
14. Intrinsically safe relays as required for UL validation.
15. Alarm silence button.
16. Document pocket located inside panel with pump and panel operation and maintenance manual, and separate laminated pump curve.
17. 110-volt, duplex GFI outlet, weather-protected, and accessible from outside of panel.
18. Run hour meter.
19. 100 watts minimum, condensation heater with thermostat.
20. UL listing mark.

D. Prewired and factory tested.

E. Mount control switches, indicating lights, and switches on hinged front panel.

F. Single Feed: 480 volts, three-phase.

2.5 ACCESSORIES

A. Level Switches:

1. Low Low Level: Pumps off.
2. Low Level: First pump on.
3. High Level: Second pump on.
4. High High Level: Alarm.

B. Equipment Identification Plate: 316 stainless steel with 1/4-inch die-stamped equipment tag number securely mounted in readily visible location.

C. Anchor Bolts: Type 316 stainless steel, sized by equipment manufacturer, and as specified in Section 05 50 00, Metal Fabrications. Coat in accordance with Section 09 90 00, Painting and Coating.

D. Sidewalk Door: Size as shown on Drawing or if not shown, sized by equipment manufacturer. As specified in Section 05 50 00, Metal Fabrications, with the following additional requirements:

1. Gasketed and odor tight.
2. Channel drain is not required.

2.6 FACTORY FINISHING

A. Prepare, and finish coat in accordance with Section 09 90 00, Painting and Coating.

B. Manufacturer's standard epoxy system for continuous submergence in corrosive water.

2.7 SOURCE QUALITY CONTROL

A. Control Panel:

1. Factory Inspections: Inspect control panels for required construction, electrical connection, and intended function.
2. Factory Tests and Adjustments: Test all control panels actually furnished.

B. Pump:

1. Factory Performance Test:
   a. In accordance with HIS 11.6, for submersible pump tests.
   b. Include test data sheets, curve test results, and performance test logs**.**
2. Conduct on each pump.
3. Perform under actual or approved simulated operating conditions.
   a. Throttle discharge valve to obtain pump data points on curve at 2/3, 1/3, and shutoff conditions.

C. Submersible Motor Functional Test: In accordance with HIS 11.6.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's printed instructions.

B. Mount the discharge elbow to the floor of the wetwell floor with stainless steel bolts.

C. Connect piping without imposing strain to flanges.

D. No portion of pump shall bear directly on floor of sump.

3.2 FIELD FINISHING

A. Equipment as specified in Section 09 90 00, Painting and Coating.

3.3 FIELD QUALITY CONTROL

A. Functional Test: Conduct on each pump.

1. Alignment: Test complete assemblies for correct rotation**,** proper alignment and connection, and quiet operation.
2. Operating Temperatures: Monitor bearing areas on pump and motor for abnormally high temperatures.
3. Test for continuous 3-hour period.
4. Test Report Requirements: In accordance with Hydraulic Institute Standards for submersible pump tests HIS 14.6 and 11.6.

B. Vibration Test:

1. Test with units installed and in normal operation, and discharging to connected piping systems at rates between low discharge head and high discharge head conditions specified**,** shall not develop vibration exceeding limits specified in HIS 11.6.
2. If units exhibit vibration in excess of limits specified, adjust as necessary. Units that cannot be adjusted or modified to conform as specified shall be replaced.

C. Pump Test:

1. General:
   a. Conduct on each pump provided.
   b. Conduct in accordance with HIS 11.6.
2. Routine Production Tests:
   a. Check impeller, motor rating and electrical connections for compliance to specification.
   b. Test motor and cable insulation for moisture content and insulation defects.

c. Prior to submergence, run pump dry to establish correct rotation and mechanical integrity.
d. Conduct abbreviated three-point operational performance test.
e. After operational performance test, perform insulation test again.

3. Factory Seven-Point Plotted, Performance Test:
   a. Level A for submersible pump tests.
   b. Include test data sheets, curve test results, and performance test logs**.**
   c. Perform under actual or approved simulated operating conditions.
4. Vibration test.
5. Hydrostatic test.

3.4 MANUFACTURER'S SERVICES

A. Manufacturer's Representative: Present at Site or classroom designated by Owner, for minimum person-days listed below, travel time excluded:

1. Two person-days for installation assistance and: inspection**.**
2. Two person-days for functional and performance testing and completion of Manufacturer's Certificate of Proper Installation.
3. Two person-days for prestartup classroom or Site training.
4. Two person-days for facility startup.
5. Two person-days for post-startup training of Owner's personnel. Training shall not commence until accepted detailed lesson plan for each training activity has been reviewed by Owner.

B. See Section 01 43 33, Manufacturers' Field Services and Section 01 91 14, Testing, Integration, and Startup.

3.5 PUMP SCHEDULE

PUMP NO.	CAPACITY (GPM)	TDH (FEET)	MAX. SPEED (RPM)	VOLATGE & PHASE	MAX. HP	MAX. SPHERE SIZE (INCHES)
P-11	300	28	1800	480 / 3	7.5	3
P-12	300	28	1800	480 / 3	7.5	3

SECTION 44 47 00
HIGH PURITY OXYGEN SYSTEM

PART 1 GENERAL

1.1 RELATED SECTIONS

A. Division 26 – Electrical

B. Division 40 – Process Integration

C. Division 43 – Process Gas and Liquid handling, Purification, and Storage Equipment

1.2 REFERENCE STANDARDS

A. The following is a list of standards which may be referenced in this section:

1. Occupational Safety and Health Administration (OSHA)
2. National Fire Protection Association (NFPA) 53
3. Compressed Gas Association (CGA) G-4.1
4. American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code (BPVC) Section VIII, Div. 1
5. ASME B16.1/B16.5 Pipe Flanges and Flanged Fittings.

1.3 SYSTEM DESCRIPTION

A. The Super Oxygenation System (System) shall be designed to elevate dissolved oxygen (D.O.) levels at the Morena force main to reduce dissolved sulfides and subsequent vapor phase hydrogen sulfide (H_2S) levels in the sewer collection system. The System will be designed to achieve a minimum oxygen transfer efficiency of greater than 90 percent. To achieve this goal, the System shall provide a large oxygen/water interface generated by an intense bubble swarm to achieve dissolution such that the gaseous oxygen is completely dissolved into the wastewater before being blended back into the force main flow.

B. The System shall contain no internal nozzles, mixers, or inner baffles that are prone to clogging and all openings shall be a minimum of 4 inches in diameter to pass raw wastewater. The SuperOxygenation System shall not be pressurized

above the operating discharge pressure of the force main being treated. No pure oxygen headspace shall be developed inside of the dissolution vessel. No devices may be placed within the force main to aid dissolution as said devices may become fouled and/or otherwise adversely affect force main flow characteristics.

C. The Supplier shall provide all labor, materials, equipment and incidentals as specified and indicated herein and as required to meet the specified performance requirements to furnish:

1. One complete SuperOxygenation System and appurtenances complete and operational. Components are to include:
   a. SuperOxygenation Cone (Speece Cone).
   b. PLC based Process Control Panel.
   c. Oxygen Control Panel.
   d. Two 40 HP Side stream pump.
2. All mechanical components shall be designed and constructed in accordance with the latest edition and revision of all applicable codes and regulations, including the following:
   a. ASTM
   b. ANSI
   c. ASME
3. Equipment Materials:
   a. All components of the System shall be compatible with the conditions and chemicals to which they will be subjected to during normal operation.
   b. Compounds with which the materials of construction must be compatible include, but are not limited to:
      1) Hydrogen sulfide.
      2) Sulfuric acid.

D. Unit Responsibility and Scope of Supply:

1. The products shall be the end product of one responsible System manufacturer or responsible System supplier.
2. The System manufacturer shall provide components suitable for the service conditions listed herein.
3. The Contractor shall be responsible for coordinating with System manufacturer for Contractor's Scope of Supply.

4. The Contractor shall be responsible to provide and install, but not limited to, the following:
    a. Interconnecting raw sewage piping including valves and accessories.
    b. Oxygen feed piping to the System, and accessories.
    c. Installation and assembly of all equipment and instrumentation components for a complete system including labor.
    d. Site preparation
    e. Utility requirements, including main electrical service and field wiring.

1.4 SYSTEM SUPPLIER

A. The Super Oxygenation system shall be furnished by a single System Supplier. The System Supplier shall have experience in similar installations with permanently installed and operating systems adding a similar amount of oxygen to what are required per these specifications.

B. The System Supplier shall be ECO Oxygen Technologies, LLC of Indianapolis, IN.

1.5 SUBMITTALS

A. Action Submittals:

1. Detailed mechanical and electrical drawings showing equipment dimensions, system fabrication, arrangement, assembly, including locations and type of connections and weights of major equipment and components.
2. Power and control wiring diagrams, including terminals and numbers.
3. Factory finish system.
4. External utility requirements such as air, water, power, drains, etc., for each component.
5. Control panel elevation drawings showing panel face layout, construction, and placement of operator interface devices and other elements.
6. Complete set of engineered drawings for system I/O and Process control.
7. Make, model, weight, and horsepower of each pump assembly.
8. Complete pump and motor catalog information, descriptive literature, specifications, and identification of materials of construction.
9. Performance data curves at nominal pump speed showing head, capacity, horsepower demand, NPSH required, and pump efficiency over entire operating range of pump, from shutoff to maximum capacity.

10. Complete motor nameplate data, as defined by NEMA, motor manufacturer, and including any motor modifications.
11. Installation Manual.
12. Manufacturer shall have experience in the installation of HPO facilities in similar applications under similar circumstances and of similar size.

B. Informational Submittals:

1. Manufacturer's Certificate of Compliance.
2. Warranty Certificate
3. Operation and Maintenance Manuals (3 hard copies, 1 electronic copy).
4. Manufacturer's Certificate of Proper Installation.
5. Equipment Testing and Field Startup Report.

1.6 QUALITY ASSURANCE

A. Qualifications:

1. The manufacturer must be able to provide the Owner with training as specified herein.

1.7 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. All materials and equipment shall be shipped, stored, handled and installed in such a manner as to not degrade quality, serviceability or appearance.

B. All exposed equipment openings shall be properly protected.

C. Appropriate measures shall be taken to prevent the entrance of moisture or water to equipment during shipment and storage onsite.

1. Control panels should be stored in an enclosed place, safe from the weather until installed.

1.8 PATENTS

A. The manufacturer shall warrant that the use of their system and its equipment, in the process for which the system has been expressly designed, will not infringe on

any U.S. or foreign patents or patents pending. In the event of any claim of infringement, the manufacturer shall defend and indemnify the Owner free from any liabilities associated with the use of the patented equipment or process.

B. The manufacturer hereby grants to the City, in perpetuity, a paid-up license to use any inventions covered by patent or patents pending owned, or controlled by the manufacturer in the operation of the facility being constructed in conjunction with the equipment supplied under this Contract, but without the right to grant sublicenses.

1.9 WARRANTY

A. The manufacturer shall guarantee that the SuperOxygenation system will perform in accordance with the specifications when operated within the specified design conditions.

B. The manufacturer shall guarantee all materials and equipment to be free from all defects due to faulty materials or workmanship for a period of one (1) year from the date of startup and shall be limited to the repair or replacement of the SuperOxygenation system.

1.10 PERFORMANCE GUARANTEE

A. SuperOxygenation System Supplier shall guarantee that the System shall provide a minimum oxygen transfer efficiency of 90% or greater.

1. One-time performance testing as described in the FIELD TESTING section shall be means of proving performance criteria is met.

1.11 PAYMENT

A. Payment for equipment shall be in accordance with System Supplier's payment terms.

PART 2 PRODUCTS

2.1 SERVICE CONDITIONS

A. The SuperOxygenation System shall be designed to operate under the following operating conditions:

Process Parameter	Value
Diameter of Force Main (inches)	48
Length of Force Main to be Treated (ft)	56,760
Total Dynamic Head at Maximum Flow Conditions (ft)	494
Static Head	389
Force Main Pump Operation	Continuous
Daily Average Flow (gpm)	21,910
Maximum Flow Rate (gpm)	26,180
Minimum Flow Rate (gpm)	5,000
Max Hydraulic Retention Time (hrs)	15
Existing Dissolved Sulfides (mg/L)	3
Site Elevation Above Sea Level (ft)	16
Max Temperature of Sewage (°C)	25
Oxygen Uptake Rate (OUR) (mg/L/hr)	15
Daily Oxygen Addition Required Based on Above Parameters (lbs O_2/day)	20,205

2.02 PERFORMANCE CRITERIA

A. The SuperOxygenation System shall be designed to achieve an oxygen transfer efficiency of greater than 90%.

1. The System Supplier shall submit performance data from a minimum of 10 permanently installed and operational systems that prove a minimum oxygen transfer efficiency of greater than 90% under actual operating conditions. Data from factory tests with clean water or data from temporary pilot tests is not acceptable.
2. To achieve the high oxygen transfer efficiency, the system shall provide a large oxygen/water interface generated by an intense bubble swarm to achieve oxygen dissolution such that the gaseous oxygen is completely dissolved into the wastewater before being blended back into the main flow.
3. Systems with a pressurized pure oxygen headspace shall not be considered.
4. Systems which insert venturis, nozzles, diffusers, mixers, or other such devices into the force main will not be considered.
5. Discharge D.O. levels shall be measured upon system start-up to confirm transfer efficiency.

B. The SuperOxygenation System should run continuously with a minimum amount of maintenance to guarantee reliable D.O. control. Therefore, the system shall contain no internal nozzles, mixers or inner baffles that are prone to clogging, and all openings shall be a minimum of 3 inches to avoid scaling and clogging. Additionally, no device such as a venturi, nozzle, mixer or diffuser shall be installed within the force main.

C. The SuperOxygenation System shall be operated at or near the existing pressure in the force main line to prevent the potential for oversaturation of dissolved oxygen and pure oxygen gas off-gassing. The SuperOxygenation System shall not be pressurized above the operating pressure of the force main. The side stream pump shall not be used to maintain a pressure differential across nozzles or venturis.

2.3 INJECTION CONE

A. The SuperOxygenation Injection cone shall be constructed of Type 304 stainless steel and fabricated to ASME standards for 300 psig pressure rated vessels.

B. Features:

1. Self-cleaning bottom discharge design.
2. Sight glasses.
3. Manway.
4. 10 inch flanged inlet and discharge ports.
5. 1 inch female NPT threaded oxygen port.
6. System discharge instrumentation ports.
7. Bead blast finish.
8. Free standing vessel with lower mounting flange/feet for anchoring.

C. SuperOxygenation System Dimensions and Parameters:

1. Model Number: ECO2-7-12-PC
2. Cone Diameter: 7 feet.
3. Cone Nominal Height: 18 feet.
4. Total head loss shall not exceed 15 feet through the SuperOxygenation System at design conditions.
5. Side Stream Flow Rate: 4,200 gpm.
6. Side Stream Pump Duty Head: 28feet.

2.4 SIDE STREAM PUMP

A. General:

1. Provide a complete, coordinated, and fully functional operating system.
2. Coordinate pump requirements with motor manufacturer and be responsible for pump and motor requirements.
3. Pumps supplied under this section to be a standard product of manufacturer and to have proven reliability.

B. Pump:

Furnish and install two vertical non-clog wastewater pump(s). Each pump shall be equipped with a 40 HP electric motor, connected for operation on 480 volts, 3 phase, and 60 hertz.

C. Performance Requirements:

1. Capacity: 4,200 gpm.

2. Total Dynamic Head: 28 feet of head.
3. Minimum Rated Pump Hydraulic Efficiency at Rated Capacity: 75 percent
4. Constant speed.
5. Motor Size: 40 Horsepower.

.

D. Pump Construction:

1. Major pump components shall be of grey cast iron, ASTM A-48, Class 35B, with smooth surfaces devoid of blow holes or other irregularities. The lifting handle shall be of stainless steel. All exposed nuts or bolts shall be of stainless steel construction. All metal surfaces coming into contact with raw sewage, other than stainless steel or brass, shall be protected by a factory applied spray coating of acrylic dispersion zinc phosphate primer with a polyester resin paint finish on the exterior of the pump.
2. Sealing design shall incorporate metal-to-metal contact between machined surfaces. Critical mating surfaces where watertight sealing is required shall be machined and fitted with Nitrile rubber O-rings. Fittings will be the result of controlled compression of rubber O-rings in two planes and O-ring contact of four sides without the requirement of a specific torque limit.
3. Rectangular cross sectioned gaskets requiring specific torque limits to achieve compression shall not be considered as adequate or equal. No secondary sealing compounds, elliptical O-rings, grease or other devices shall be used.

E. Cooling System:

1. Each unit shall be provided with an integral motor cooling system. A stainless steel motor cooling jacket shall encircle the stator housing, providing for dissipation of motor heat regardless of the type of pump installation. An impeller, integral to the cooling system and driven by the pump shaft, shall provide the necessary circulation of the cooling liquid through the jacket. The cooling liquid shall pass about the stator housing in the closed loop system in turbulent flow providing for superior heat transfer. The cooling system shall have one fill port and one drain port integral to the cooling jacket. The cooling system shall provide for continuous pump operation in liquid or ambient temperatures of up to 104°F (40°C). Operational restrictions at temperatures

below 104°F are not acceptable. Fans, blowers or auxiliary cooling systems that are mounted external to the pump motor are not acceptable.

F. Motor:

1. The pump motor shall be a NEMA B design, induction type with a squirrel cage rotor, shell type design, housed in an air filled, watertight chamber.
2. The stator windings shall be insulated with moisture resistant Class H insulation rated for 180°C (356°F). The stator shall be insulated by the trickle impregnation method using Class H monomer-free polyester resin resulting in a winding fill factor of at least 95%.
3. The motor shall be inverter duty rated in accordance with NEMA MG1, Part 31.
4. The stator shall be heat-shrink fitted into the cast iron stator housing. The use of multiple step dip and bake-type stator insulation process is not acceptable. The use of pins, bolts, screws or other fastening devices used to locate or hold the stator and that penetrate the stator housing are not acceptable.
5. The motor shall be designed for continuous duty while handling pumped media of up to 104°F.
6. The motor shall be capable of no less than 30 evenly spaced starts per hour.
7. The rotor bars and short circuit rings shall be made of aluminum.
8. Three thermal switches shall be embedded in the stator end coils, one per phase winding, to monitor the stator temperature. These thermal switches shall be used in conjunction with and supplemental to external motor overload protection and shall be connected to the motor control panel.
9. The junction chamber shall be sealed off from the stator housing and shall contain a terminal board for connection of power and pilot sensor cables using threaded compression type terminals. The use of wire nuts or crimp-type connectors is not acceptable. The motor and the pump shall be produced by the same manufacturer.
10. The motor service factor (combined effect of voltage, frequency and specific gravity) shall be 1.15. The motor shall have a voltage tolerance of +/- 10%.
11. The motor shall be designed for continuous operation in up to a 40°C ambient and shall have a NEMA Class B maximum operating temperature rise of 80°C. A motor performance chart shall be provided upon request exhibiting curves for motor torque, current, power factor, input/output kW and

efficiency. The chart shall also include data on motor starting and no-load characteristics.

12. Motor horsepower shall be sufficient so that the pump is non-overloading throughout its entire performance curve, from shut-off to run-out.

G. Bearings:

1. The integral pump/motor shaft shall rotate on two bearings. The motor bearings shall be sealed and permanently grease lubricated with high temperature grease.
2. The upper motor bearing shall be a two row angular contact ball bearing.
3. The lower bearing shall be a two row angular contact ball bearing to handle the thrust and radial forces.
4. The minimum L10 bearing life shall be 50,000 hours at any usable portion of the pump curve.

H. Mechanical Seals:

1. Each pump shall be provided with a positively driven dual, tandem mechanical shaft seal system consisting of two seal sets, each having an independent spring.
2. The lower primary seal, located between the pump and seal chamber, shall contain one stationary and one positively driven rotating corrosion and abrasion resistant tungsten-carbide ring.
3. The upper secondary seal, located between the seal chamber and the seal inspection chamber shall be a leakage-free seal.
4. The upper seal shall contain one stationary and one positively driven rotating corrosion and abrasion resistant tungsten-carbide seal ring. The rotating seal ring shall have small back-swept grooves laser inscribed upon its face to act as a pump as it rotates, returning any fluid that should enter the dry motor chamber back into the lubricant chamber.
5. All seal rings shall be individual solid sintered rings.
6. Each seal interface shall be held in place by its own spring system.
7. The seals shall not depend upon direction of rotation for sealing.
8. Mounting of the lower seal on the impeller hub is not acceptable.
9. Shaft seals without positively driven rotating members or conventional double mechanical seals containing either a common single or double spring acting between the upper and lower seal faces are not acceptable.
10. The seal springs shall be isolated from the pumped media to prevent materials from packing around them, limiting their performance.

11. Each pump shall be provided with a lubricant chamber for the shaft sealing system. The lubricant chamber shall be designed to prevent overfilling and shall provide capacity for lubricant expansion. The seal lubricant chamber shall have one drain and one inspection plug that are accessible from the exterior of the motor unit. The seal system shall not rely upon the pumped media for lubrication.
12. The area about the exterior of the lower mechanical seal in the cast iron housing shall have cast in an integral concentric spiral groove. This groove shall protect the seals by causing abrasive particulate entering the seal cavity to be forced out away from the seal due to centrifugal action.
13. A separate seal leakage chamber shall be provided so that any leakage that may occur past the upper, secondary mechanical seal will be captured prior to entry into the motor stator housing. Such seal leakage shall not contaminate the motor lower bearing. The leakage chamber shall be equipped with a float type switch that will signal if the chamber should reach 50% capacity.

I. Pump Shaft

1. The pump and motor shaft shall be a single piece unit. The pump shaft is an extension of the motor shaft. Shafts using mechanical couplings shall not be acceptable. The shaft shall be stainless steel – ASTM A479 S43100-T. Shaft sleeves will not be acceptable.

J. Impeller

1. The impeller shall be of Hard-Iron^{TM} (ASTM A-532 (Alloy III A) 25% chrome cast iron), dynamically balanced, semi-open, multi-vane, back swept, screw-shaped, non-clog design. The impeller leading edges shall be mechanically self-cleaned automatically upon each rotation as they pass across a spiral groove located on the volute suction. The screw-shaped leading edges of the gray iron impeller shall be hardened to Rc 60 and shall be capable of handling solids, fibrous materials, heavy sludge and other matter normally found in wastewater. The screw shape of the impeller inlet shall provide an inducing effect for the handling of up to 5% sludge and rag-laden wastewater. The impeller to volute clearance shall be readily adjustable by the means of a single trim screw. The impeller shall be locked to the shaft, held by an impeller bolt and shall be coated with alkyd resin primer.

K. Volute/Suction Cover

1. The pump volute shall be a single piece gray cast iron, ASTM A-48, Class 35B, non-concentric design with smooth passages of sufficient size to pass any solids that may enter the impeller. Minimum inlet and discharge size shall be as specified. The volute shall have a replaceable suction cover insert ring in which are cast spiral-shaped, sharp-edged groove(s). The spiral groove(s) shall provide trash release pathways and sharp edge(s) across which each impeller vane leading edge shall cross during rotation so to remain unobstructed. The insert ring shall be cast of Hard-Iron^{TM} (ASTM A-532 (Alloy III A) 25% chrome cast iron) and provide effective sealing between the multi-vane semi-open impeller and the volute housing.

L. Protection

1. Each pump motor stator shall incorporate three thermal switches, one per stator phase winding and be connected in series, to monitor the temperature of the motor. Should the thermal switches open, the motor shall stop and activate an alarm. A float switch shall be installed in the seal leakage chamber and will activate if leakage into the chamber reaches 50% chamber capacity, signaling the need to schedule an inspection.
2. The thermal switches and float switch shall be connected to a Mini CAS control and status monitoring unit. The Mini CAS unit shall be designed to be mounted in the pump control panel.

M. Manufacturer: Fairbanks Pentair or Approved Equal.

2.5 PIPING, VALVES, AND ACCESSORIES

A. By others as necessary and as shown on the drawings.

2.6 INSTRUMENTATION AND CONTROL

A. General:

1. Provide control panels, electrical components and wiring for a complete, functional system.
2. Provide all items not specifically specified which are required to implement the specified functions and the functions required for proper system operation.

3. Coordinate controls with existing SCADA system.

B. Process Control Panel: PLC driven automatic system control with sensing features. The system shall be designed for automatic flow control with full manual backup control of oxygen flow and side stream pump control. The oxygen feed rate shall be continuously adjusted to the actual process water flow rate. The control panel shall be rated for use on a 120 volt power supply and shall be housed in a NEMA Type 4X 304 stainless steel enclosure. The control panel shall contain an Allen-Bradley Programmable Logic Control (PLC), operator interface screen and have the capability to monitor system parameters for alarm indication and data logging and trending.

1. Instrumentation included with the system and controlled/monitored by the Process Control Panel:
   a. Oxygen mass flow controller.
   b. One (1) solenoid valve.
   c. One (1) actuated ball valve.
   d. Side stream flow meter.
   e. Side stream pressure sensor.
   f. Side stream temperature sensor.
2. PLC and I/O:
   a. Allen-Bradley MicroLogix Processor.
   b. Ethernet switch.
   c. MicroLogix fixed racks, power supplies, expansion analog and digital I/O.
   d. Trend recording: The PLC shall record the following data as a minimum:
      1) Oxygen addition, current day's total.
      2) Oxygen addition, previous day's total.
      3) Force main flow.
      4) Side stream flow.
      5) Side stream pressure.
      6) Side stream temperature.
3. Operator Interface:
   a. Panel Door-mounted HMI:
      1) Trending and logging.
      2) Ethernet communication capable (for remote connection).
4. Main Control Enclosure:
   a. Preassemble and wired, NEMA 4X 304 stainless steel construction.
   b. System Hand-Off-Auto switch.

c. Interposing I/O relays as necessary.
d. Disconnects and fusing for AC power distribution.
e. DC power supply and fusing for DC power distribution.
f. All necessary wireways, wiring, labels, and miscellaneous hardware for a complete control panel.

C. Oxygen Control Panel: NEMA 4X 304 stainless steel panel complete with oxygen mass flow controller, rotameter, solenoid valve, check valves, isolation valves and stainless steel tubing and fittings as required. Panel will be powered, monitored and controlled by the Process Control Panel.

D. Additional Components: The following additional components will be provided for mounting on the Injection Cone for redundant control and system isolation of the oxygen delivery piping:

1. Isolation valve
2. Check valve.
3. Actuated ball valve.

E. Inputs to Process Control Panel:

1. Force main flow rate.
2. Side stream pump signal(s).
3. System enable/permission to run.

F. Description of Operation:

1. The Super Oxygenation System shall operate by redirecting a side stream of raw wastewater from the force main and pumping it through the Injection Cone. Gaseous oxygen is fed into the Injection Cone by the Oxygen Control Panel as controlled by the Process Control Panel. The Injection Cone shall provide a large oxygen/water interface as generated by an intense bubble swarm to achieve rapid oxygen dissolution such that the gaseous oxygen is completely dissolved before being blended back into the force main. The Super Oxygenation System shall not have a pure oxygen headspace inside of the vessel.
2. The Process Control Panel PLC shall monitor the force main flow rate, side stream water flow rate, and water temperature and system pressure. Based on this data, the PLC shall calculate the amount of oxygen required to meet the

oxygen demand of the wastewater. The PLC shall be capable of adjusting the oxygen feed rate into the Injection Cone by means of the mass flow controller to match the calculated oxygen demand.

3. The Super Oxygenation System shall be capable of automatically adding variable amounts of oxygen as required by varying force main flow rates.
4. The PLC shall also monitor the side stream pump operation, side stream water flow rate, oxygen flow rate, and water temperature and system pressure. These parameters shall be checked against design inputs to ensure optimal system performance and provide for system shutdown and/or alarm notification if the operation is out of tolerance.

G. Alarms shall be capable of being transmitted to the owner in accordance with their requirements, specified herein under specifications Division 40.

PART 3 EXECUTION

3.1 GENERAL INSTALLATION

A. Manufacturer shall provide written instructions for installation of equipment by Contractor.

B. Anchor Bolts: Contractor shall provide all necessary anchor bolts and field install after receipt of equipment. All anchor bolts, nuts, washers, etc. shall be type 316 stainless steel.

3.2 PUMP INSTALLATION

A. Provide pump manufacturer's written instructions for pump installation by Contractor.

3.3 MANUFACTURER'S SERVICES

A. Manufacturer's Representative: Present at Site or classroom as designated by Owner, for minimum person-days listed below, travel time excluded:

1. Function Testing, Performance Testing, Training of Owner's Staff, and Completion of Manufacturer's Certificate of Proper Installation: 3 days and two trip.

B. Schedule with Owner's manufacturer's services/Contractor to avoid conflict with other onsite testing or other onsite activities.

C. Furnish trained, articulate personnel to perform manufacturer's services.

D. Establish training schedule to ensure adequate training of appropriate personnel as deemed necessary by Owner.

E. Training Lesson Plan: Provide the following:

1. Title and objectives.
2. Course description and outline of course content.
3. Recommended attendees and time required.
4. Format (e.g. lecture, hands-on).

3.4 FIELD TESTING

A. Prior to acceptance by Owner, an operational test of the SuperOxygenation system shall be conducted to determine if the installed equipment meets the purpose and intent of the Specifications. Tests shall demonstrate that all equipment is electrically, mechanically, and otherwise acceptable; it is safe and in optimum working condition; and conforms to the specified operating characteristics.

B. All equipment shall be tested to check for proper operation, proper alignment, faulty equipment, and for excessive vibration.

C. Any and all alterations, modifications, additions and/or work necessary to rectify defects or nonconformance with the Section of the Specifications shall be in such a manner as to provide for the satisfactory operation of the system, all at no additional cost to the Owner.

D. Upon completion of Field Testing, the Manufacturer shall provide a summary report documenting the results of the required field testing.

E. All labor, instruments, equipment, apparatus, fuel, temporary piping, water and electrical power required for testing shall be provided by the Contractor at no additional cost to the Owner.

END OF SECTION

SECTION 44 47 28.26
ACTIVATED CARBON ODOR CONTROL SYSTEMS

EQUIPMENT AND COMPONENT NUMBER(S)

1. Screening Facility Odor Control Scrubbers (OCS-01 and OCS-02).
2. Wet Well Odor Control Scrubbers (OCS-03 and OCS-04).

PART 1 GENERAL

1.1 WORK OF THIS SECTION

A. This Section covers the work necessary to provide two odor control systems as described herein.

1. Screening Facility Odor Control System: Two (2) Dual-bed carbon odor control scrubbers, two exhaust fans EF-01 and EF-02, activated carbon, control panels and all appurtenances as specified herein.
2. Wet Well Odor Control System: Two (2) dual-bed carbon odor control scrubbers, two exhaust fans EF-04 and EF-05, activated carbon, control panels and all appurtenances as specified herein.

1.2 GENERAL

A. Like items of equipment provided hereunder shall be the end products of one manufacturer in order to achieve standardization for operation, maintenance, spare parts, and manufacturers' services.

B. The design of the odor control systems as shown on the Drawings is based upon the equipment from the first-named manufacturer listed in this Specification. The Contractor shall be responsible for making all necessary changes to the facility design to accommodate the equipment, including but not limited to layout changes and interfaces connections to other work and equipment which are different than that shown on the Drawings. The Contractor shall be responsible for coordinating this work and the changes will be at the sole expense of the Contractor. At a minimum these changes may include:

1. Layout and mounting of the equipment, including concrete equipment pads.
2. Coordination of equipment elevations.
3. Rerouting of any piping required to meet the manufacturer's system requirements.
4. Additional utilities required to support manufacturer's system.

1.3 REFERENCES

A. The following is a list of standards which may be referenced in this Section:

1. American National Standards Institute (ANSI).
2. American Society of Mechanical Engineers (ASME).
3. ASTM International (ASTM):
    a. C582, Standard Specification for Contact Molded Reinforced Thermosetting Plastic (RTP) Laminates for Corrosion-Resistant Equipment.
    b. D2563, Standard Practice for Classifying Visual Defects in Glass-Reinforced Plastic Laminate Parts.
    c. D2583, Standard Test Method for Indentation hardness of Rigid Plastics by Means of a Barcol Impressor.
    d. D2584, Standard Test Method for Ignition Loss of Cured Reinforced Resins.
    e. D2854, Standard Test Method for Apparent Density of Activated Carbon.

    g. D3299, Standard Specification for Filament-Wound, Fiberglass Reinforced Thermoset Resin Chemical Resistant Tanks.
    h. D3802, Standard Test Method for Ball-Pan Hardness of Activated Carbon.
    i. D4097, Standard Specification for Contact Molded, Glass Fiber Reinforced Thermoset Resin Chemical Resistant Tanks
    j. D6646, Standard Test Methods for Determination of Accelerated Hydrogen Sulfide Breakthrough Capacity of Granular and Pelletized Activated Carbon.
    k. E84, Standard Test Method for Surface Burning Characteristics of Building Materials.
    l. E544, Standard Practices for Referencing Suprathreshold Odor Intensity.
    m. E679, Standard Practice for the Determination of Odor and Taste Thresholds by a Forced-Choice Ascending Concentration Series Method of Limits.
4. National Fire Protection Association (NFPA): 820; Fire Protection in Wastewater Treatment and Collection Systems.

1.4 DEFINITIONS

A. The following is a list of abbreviations which may be used in this Section:

1. D/T: Dilutions to Threshold.
2. FRP: Fiberglass Reinforced Plastic.
3. OU: Odor Units.

4. ppmv: Parts Per Million, volume.
5. ppbv: Parts Per Billion, volume.
6. PVC: Poly Vinyl Chloride.
7. WG: Water Gauge.
8. H2S: Hydrogen Sulfide.
9. PSI: Pounds per Square Inch.

1.5 SYSTEM DESCRIPTION

A. Unit Responsibility and Scope of Supply:

1. The Work requires that the odor control system manufacturer/supplier furnish all of the following items including:
   a. The carbon adsorption units (the vessels), fans, control panel, activated carbon media and associated media support system and media grounding hardware complete with all accessories and appurtenances.
2. The products shall be the end product of one responsible system supplier.
3. The system supplier shall provide media and components suitable for the service conditions listed herein.
4. The system supplier shall provide and guarantee the required hydrogen sulfide performance listed herein.
5. The system supplier shall furnish all components and accessories of the system to enhance compatibility, ease of operation and maintenance, and as necessary to place the equipment in operation in conformance with the specified performance, features, and functions.
6. The system supplier is responsible for the carbon vessel design including all layouts, structural calculations for floors and walls, reinforcing and vessel material sizing.
7. The Contractor shall be responsible for coordinating with the system supplier for Contractor's scope of supply.
8. The Contractor shall be responsible for, but not limited to, the following:
   a. Ductwork, piping and supports.
   b. Installation and assembly of all equipment components for a complete system, including labor.
   c. External drain piping from odor control system package.

B. Design Requirements:

1. Refer to Contract Drawings for additional information to supplement this Section.
2. Equipment Anchorage:

a. Provide structural design and anchorage Drawings and calculations.
b. Drawings and calculations shall be stamped by an engineer registered in the State of California.
c. Design shall comply with project design loads provided on the General Structural Notes on the Drawings and all applicable codes and standards.

3. Equipment Components:
   a. The stiffness of mechanical and electrical component attachments shall be designed such that the load path for the component performs its intended function.
   b. Equipment shall be demonstrated as functionally rugged. The equipment shall provide an ampleness of construction that renders equipment the ability to survive design ground motions without loss of function.
4. Equipment Materials:
   a. All components of the system shall be compatible with the conditions and chemicals to which they will be subjected to during normal operation.
   b. Compounds with which the materials of construction must be compatible include, but are not limited to:
      1) Hydrogen sulfide.
      2) Sulfuric acid.
      3) Ammonia.
      4) Dimethyl sulfide.
      5) Dimethyl disulfide.
      6) Methyl mercaptan.

1.6 SUBMITTALS

A. Procedures:

1. In accordance with Section 01 33 00, Submittal Procedures.
2. System supplier shall include project title and date of transmittal on each submittal.
3. System supplier shall identify and describe each deviation or variation from Contract Documents.
4. Resubmittals: Clearly identify each correction or change made.

B. Action Submittals: Submit Shop Drawings as follows:

1. Make, model and weight of each equipment assembly.
2. Manufacturer's catalog information, descriptive literature, specifications, and identification of materials of construction.

3. Complete design calculations for odor control system including annual utility calculations, media residence time calculations and component pressure drop calculations.
4. Equipment anchorage and support drawings and/or cut sheets indicating size, material, spacing, embedment and edge distances of anchors and other relevant information. Drawings should reflect the results of the calculations submitted below.
5. External utility requirements such as air, water, power, drain, etc., for each component.
6. Detailed mechanical and structural layout drawings showing system fabrication, dimensions, size and locations of connections to other work.
7. Vessel data indicating equipment number, pressure rating, resin type, diameter, straight shell lengths, and overall lengths.
8. Manufacturer's Information on the Carbon Media:
    a. Pressure drop data through media.
    b. Media physical characteristics demonstrating compliance with this specification.
9. Shop and Field Painting Systems: Include manufacturer's descriptive technical catalog literature and specifications.
10. Control panel details including electrical wiring diagrams
11. Detailed Performance Testing Plan meeting the requirements of Article Performance Testing.

C. Informational Submittals:

1. Manufacturer's Certificate of Compliance:
    a. Submit prior to shipment of product.
    b. Refer to Section 01 43 33, Manufacturers' Field Services.
2. Operation and Maintenance Data in accordance with Section 01 78 23, Operation and Maintenance Data.
3. Manufacturer's Certificate of Proper Installation:
    a. Submit a certificate for each installed system.
    b. Refer to Section 01 43 33, Manufacturers' Field Services.
4. Manufacturer's Training Program in accordance with Section 01 43 33, Manufacturers' Field Services.
5. Final Performance Test Report meeting the requirements of Article Performance Testing.
6. All deviations and/or exceptions to this Specification, detailed and explained with the reason for the deviation and the effect of the deviation on the operation and/or performance of the equipment.
7. Anchorage, Thrust Restrain, and Bracing for odor control equipment shall be in accordance with section 01 88 15. Support and anchorage calculations stamped by an Engineer licensed in the State of California. Anchorage, bracing and support design criteria and calculations shall conform to the manufacturer's requirements as well as design criteria

indicated on the Structural General Notes on the Drawings and any other referenced standards. Provide ICC-ES reports and special inspection requirements for anchors to be drilled and installed into completed concrete or masonry. Anchor calculations shall indicate edge distance, embedment, concrete thickness and strength, and other conditions assumed in the design calculations. All assumed field conditions shall be verified by the Contractor prior to installation of the anchors and bracing.

1.7 QUALITY ASSURANCE

A. Qualifications:

1. The manufacturer shall be recognized in the design, production and operation of activated carbon odor control systems in the United States.
2. The manufacturer's place of business shall be open for inspection.
3. The odor control system supplier shall have complete, ongoing service capability with factory trained personnel. The supplier shall have a service center/manufacturing facility located in southern California within 25 miles of the jobsite for quick response. The service center/manufacturing facility shall be staffed with at least five (5) full-time employees of the odor control system supplier. A manufacturer's sales representative office and sales representative personnel staffing shall not be acceptable. No exception to this requirement will be allowed.
4. The service center/manufacturing facility shall be able to provide the following services: Field H2S measurements, Airflow rate measurements, and provision of replacement parts and operational trouble-shooting.

1.8 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. In accordance with Section 01 61 00, Common Product Requirements.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Materials, equipment, components, and accessories specified in this Section shall be products of:

1. Integrity Municipal Systems, LLC
2. Or approved equal.

2.2 SERVICE CONDITIONS – GENERAL

A. The odor control systems shall be designed to remove odorous constituents from wastewater process air streams under the following operating conditions:

Process Parameter	Value
Duty	Continuous
Elevation Above Sea Level	16 feet
Location	As indicated on Drawings
Ambient Air Temperature	20 to 122 degrees F
Inlet Air Temperature	50 to 100 degrees F
Ambient Air RH	10 to 90%

2.3 SERVICE CONDITIONS – SCREENING FACILITY ODOR CONTROL (OCS-01 & OCS-02)

A. The screening facility odor control system shall be designed to remove odorous constituents from process air stream under the following operating conditions:

Process Parameter	Value
System Design Air Flow	27,000 cfm
Inlet Air RH	10 to 60%
Odorous Air Source Processes	Screening Facility channels & removal bins area
Design H2S Concentration at System Inlet	1.25 ppmv

B. The screening facility odor control carbon adsorber design shall conform to the following parameters:

Design Parameter	Value
Number of Treatment Stages	One
Number of Treatment Vessels	Two
Vessel Configuration	Dual bed, vertical flow

Design Parameter	Value
Normal Vessel Design Flow Rate	13,500 cfm
Maximum Vessel Design Flow Rate (During Maintenance of one Vessel)	16,200 cfm
Minimum Bed depth, per bed	3 ft
Unit Diameter	12'-0" – Basis of Design
Unit overall Height (with stack)	20'-6" – Basis of Design
Configuration	As indicated on Drawings
Total Vessel Air Pressure Drop	Maximum: 5.0 inches WG at vessel design flow rate
H2S Removal Required	Removal efficiency greater than 99 percent for inlet concentrations greater than 1 ppmv Outlet concentration less than 100 ppbv for inlet concentrations less than 1 ppmv

2.4 SERVICE CONDITIONS – WET WELL ODOR CONTROL SYSTEM (OCS-03 & OCS-04)

A. The wet well odor control system shall be designed to remove odorous constituents from process air stream under the following operating conditions:

Process Parameter	Value
Design Air Flow	9,000 cfm
Inlet Air RH	10 to 60%
Odorous Air Source Processes	Pump Station Wet Well
Design H2S Concentration at System Inlet	2.0 ppmv

B. The wet well odor control carbon adsorber design shall conform to the following parameters:

Design Parameter	Value
Number of Treatment Stages	One
Number of Treatment Units	Two
Vessel Configuration	Dual bed, vertical flow
Normal Vessel Design Flow Rate	4,500 cfm
Maximum Vessel Design Flow Rate (During Maintenance of one Vessel)	5,400 cfm
Minimum Bed Depth, per bed	3.0 feet
Unit Diameter	7'-0" – Basis of Design
Unit overall Height (with stack)	20'-6" – Basis of Design
Configuration	As indicated on Drawings
Total Vessel Air Pressure Drop	Maximum: 5.0 inches WG at design flow rate
H2S Removal Required	Removal efficiency greater than 99 percent for inlet concentrations greater than 1 ppmv Outlet concentration less than 100 ppbv for inlet concentrations less than 1 ppmv

2.5 CARBON VESSELS

A. General:

1. Freestanding dual bed, vertical flow tower configuration.
2. Designed to support the required bed depth of activated carbon media.
3. Manways, drains, etc., provided as needed for access to internals of the vessel and drainage of the vessel.
4. Designed to support the vessel stacks without the use of external supports or structure.
5. No exposed metal allowed inside the air plenum.
6. Vessel configuration, location and orientation as indicated on Drawings.
7. Vessel construction shall conform to the requirements of Article Vessel Construction.

B. Media Support:

1. Quantity: Sufficient to hold required bed depth of carbon media.
2. Opening size shall not allow passage of carbon media.
3. The support system shall consist of removable FRP grating with a polypropylene screen. The support system shall be designed to withstand a load of at least 150 lbs/ft2 with a minimum deflection of 6 mm under all conditions.

C. Media Grounding Rods:

1. Provide a Type 316 stainless steel grounding rod for the carbon bed to prevent static electricity from accumulating. Grounding rod shall be inserted a minimum of 12 inches into the bed.
2. Provide a predrilled and tapped copper grounding pad located on external vessel wall for connection to grounding system.

D. Vessel Stacks:

1. Provide a vertical stack accessory for each vessel outlet.
2. Each stack shall extend a minimum of five feet above the vessel.
3. Stack shall have a flange connection to the outlet. No guy wires or external support structure will be allowed.

2.6 VESSEL CONSTRUCTION

A. Material – FRP:

1. Vessel to be helically filament-wound in accordance with ASTM D2399.
2. Vessel to be designed for positive pressure service conditions.
3. A 10:1 safety factor shall be used for internal pressure loadings and a 5:1 safety factor shall be used for packing support.
4. Contact molded components and accessories shall be fabricated in accordance with ASTM D4097.
5. Visual defects shall be better than Level II on the inside of the vessel and better than Level III on the outside in accordance with ASTM D2563.
6. Other than nozzles, couplings, manways, and top and bottom heads, the towers shall be filament-wound in one piece, without joints.
7. Nozzles: Threaded or flanged, gusseted with conical type gusset. Gaskets to be 1/8-inch thick Hypalon or Viton® full-face gaskets of 40 to 50 durometer. Press-molded flanges are not acceptable.
8. Resin:

a. Resin shall be premium corrosion-resistant vinyl ester resin such as Ashland Chemical Hetron FR 992, Dow Chemical Derakane 510-A, or approved equal.
b. FRP fabrications shall not exceed a flame spread index of 25 when tested in accordance with ASTM E84 Tunnel Test.
c. Structural wall resin shall contain a minimum of 3 percent antimony trioxide to achieve the designed low flame spread index requirement.
d. Add ultraviolet absorbers to surfacing resin to improve weather resistance.
e. Color: Use no dyes, pigments, or colorants, except in the exterior gel coat. Gel coat color shall be white.
f. Curing System: Per manufacturer's recommendations.

9. Reinforcement:
   a. Veil: Chemical surfacing mat, Type C (chemical) glass, 10 mils thick, with a finish and a binder compatible with the lay-up resin.
   b. Corrosion Barrier: Resin-rich interior surface of nominal 100 mils using chopped strand mat backing the veil. Use no additive in the corrosion barrier.
   c. Chopped Stand Mat: Type E glass, minimum 1-1/2 ounces per square foot, with silane finish and styrene soluble binder.
   d. Continuous Roving Used in Chopper Gun for Spray-Up: Type E glass.
   e. Woven Roving: Type E glass, nominal 24 ounces per square yard, 4 by 5 weave, with silane type finish.
   f. Continuous Roving Used for Filament Winding: Type E glass with a silane type finish, with a nominal yield of at least 110 strand yards per pound.
10. Laminate:
   a. Laminate shall consist of an inner surface (corrosion barrier), an interior layer, and an exterior layer.
   b. Reinforce inner surface with a resin-rich surfacing veil of 10 to 20 mils thick.
   c. The resin content of the inner surface shall be minimum of 80 percent by weight.
   d. Construct interior layer of resin reinforced with at least two plies of chopped strand mat. Thickness of interior layer shall be at least 100 mils.
   e. Glass content of combined inner surface and interior layer shall be 27 percent plus or minus 5 percent.
   f. The exterior or structural layer shall be filament-wound. Filament winding shall be with continuous strand roving to provide a glass content of 50 to 80 percent.

B. Workmanship:

1. Finished tank wall shall be free, as commercially practicable, of visual defects such as foreign inclusions, air bubbles, pinholes, pimples, crazing, cracking and delaminations that will impair the serviceability of the vessel.
2. All cut edges where openings are cut into the tanks shall be trimmed smooth.

C. Dimensions and Tolerances:

1. The minimum required wall thickness for the cylinder straight shell must be sufficient to support its own weight in an upright position without any external support.
2. Flat areas shall be provided to allow locating large fittings on the cylinder straight shell.
3. All dimensions will be taken with the tank in the vertical position, unfilled.
4. Tank dimensions will represent the exterior measurements.
5. The tolerance for the outside diameter, including out of roundness, shall be per ASTM D1998.
6. The tolerance for fitting placements shall be plus or minus 0.5 inch in elevation and 2 degrees radial at ambient temperature.

D. Tank Access:

1. Provide sealed carbon media access, constructed of same material as vessel.
2. Bolts shall be Type 316 stainless steel material.
3. The gaskets shall be Hypalon, EPDM or Viton® materials.

E. Marking: Identify each tank with the fabricator's name, maximum temperature, design pressure/vacuum, minimum thickness, vessel number, vessel name, and date of manufacture.

2.7 ACTIVATED CARBON MEDIA

A. Activated carbon shall be high H2S capacity, pelletized, derived from high grade bituminous coal, vapor phase type suitable for control of sewage treatment plant odors. The carbon shall have the following performance specifications:

Iodine Number, mgi2/g	1050 min
Maximum moisture content, percent by weight (per ASTM D2867)	15

Apparent density, poured, minimum (per ASTM D2854)	0.48 g/cc
Maximum head loss through bed at 30 fpm linear velocity, in. water/ft bed depth	0.5
H2S breakthrough capacity, minimum (per ASTM D6646)	0.3 g H2S removal/cc carbon
Mean Particle Diameter	4.0mm
Butane Activity	26 min
Hardness No.	95 min

B. Manufacturers and Products:

1. Integrity Municipal Systems LLC
2. Approved Equal.

2.8 ACCESSORIES

A. Lifting Lugs: For equipment weighing over 70 pounds.

B. Provide Type 316 stainless steel anchor bolts, as specified in Section 05 50 00, Metal Fabrications.

C. Equipment Identification Plates: Furnish 16-gauge Type 316 stainless steel or FRP laminated identification plate securely mounted on each separate equipment component and control panel in a readily visible location. Plate shall bear 3/8-inch high engraved block type black enamel filled equipment name, model number, and performance data.

D. Each vessel shall have one (1) 1 in diameter air outlet sample probes per bed with piping extending to within operator reach. The sample probes shall be blocked off with a ball valve constructed of PVC. An air inlet sample probe shall be provided at the vessel inlet.

E. Differential Pressure Gauge: A Series 2000 differential pressure gauge as manufactured by Dwyer Instruments shall be provided to continuously monitor the pressure drop across each carbon bed. The differential pressure gauge shall be isolated with isolation valves and shall be mounted on the vessel.

2.9 SOURCE QUALITY CONTROL

A. Factory Test: Perform manufacturer's standard tests on equipment.

2.10 EXHAUST FANS

A. Fan shall have fiberglass reinforced plastic centrifugal backward inclined impeller. Wheel shall be statically and dynamically balanced. Resin shall be suitable for exposure to the specific service conditions. Shaft shall be 316SS. Shaft seal shall be Teflon or Neoprene.

B. Bearings shall be heavy duty, self-aligning grease lubricated ball type with minimum of 100,000 hour B-10 life. OSHA approved weather cover or guards shall be provided.

C. Fan shall be supplied with a TEFC inverter-duty motor with 1.15 service factor suitable for three-phase, 60 Hz, 480 volt service. The fan shall be belt driven.

D. Fan housing shall be constructed of fiberglass and reinforced with rigid bracing to increase structural integrity. The fan shall include graphite impregnation for grounding. The fan inlet shall be slip type and the fan outlet shall have a flanged connection. The fan inlet shall be connected to the inlet ductwork via a flexible boot with stainless-steel straps.

E. Performance. The fan shall be tested and rated in accordance with AMCA and shall bear the AMCA seal.

F. The fan shall be New York Blower, Hartzell or equal. The fan shall be designed for the following performance:

Model Number	**EF-01/EF-02**	**EF-04/EF-05**
Maximum Airflow Rate, cfm	16,200	5,400
Normal Airflow Rate, cfm	13,500	4,500
S.P. up to System Inlet, in W.C	2.0	2.0
Total Pressure Drop, in W.C	7.0	7.0
Motor, HP	30	10

2.11 ELECTRICAL CONTROL PANEL

A. Each carbon adsorber system shall be provided with an electrical control panel that houses all required controls for the entire system. The electrical control panel shall be shipped loose for installation by the contractor next to each odor control system.

B. The control panel enclosure shall be rated NEMA 4X and shall be made of FRP. The control panel shall be factory tested prior to shipment.

C. The control panel shall provide electrical control for the entire system with as a minimum the following switches, alarms and accessories:

1. "Hand-Off" switch for exhaust fan
2. "Exhaust Fan Running" indicator light
3. Exhaust fan VFD (Allen_Bradley Model 523)
4. Power disconnect switch
5. Control transformer (step down from 480V to 120V)

D. The power supply shall be 480V, 3 hp, 60 Hz.

2.12 INTERCONNECTING DUCTWORK AND DAMPER

A. The odor control system manufacturer shall provide the required FRP transition piece between the fan outlet and the adsorber vessel inlet. The vessel inlet shall include a volume control damper with lockable louver for flow adjustment.

2.13 PORTABLE H2S ANALYZERS

A. The odor control system manufacturer shall provide two (2) portable H2S analyzer to allow the end-user to take H2S measurements. One analyzer shall be for high H2S concentrations and the second one for low H2S concentrations.

B. The analyzers shall be Interscan 4000 Series Compact Portable Analyzers including a 3.5" digit LCD readout display, an integral sample pump and plug-in charger, an H2S sensor, a user-adjustable single alarm level activating audible and visual alarm, 0-100 mV output, a carrying case with shoulder strap and a 12 inch Teflon sample probe.

C. The high range analyzer shall have a 0-200 ppm sensor with resolution of 0.1 ppm and minimum detectability up to 2 ppm. The low range analyzer shall have a 0-2 ppm sensor with resolution of 0.01 ppm and minimum detectability up to 0.02 ppm.

D. A spare sensor shall be provided for each H2S analyzer.

PART 3 EXECUTION

3.1 GENERAL

A. Packaged Equipment: When any system is provided as prepackaged equipment, coordination shall include space and structural requirements, clearances, utility connections, signals, outputs and features required by the manufacturer, including safety interlocks.

3.2 INSTALLATION

A. In accordance with manufacturer's written instructions.

B. Anchor Bolts: Anchor and brace per Contractor's anchorage and bracing design calculations.

3.3 FIELD FINISHING AND CORROSION PROTECTION

A. Field touchup as determined by manufacturer.

3.4 PERFORMANCE TESTING

A. General:

1. To demonstrate that the odor control systems furnished hereunder are installed and perform in accordance with the provisions of this Specification, the manufacturer shall conduct a performance test in accordance with an approved testing protocol.
2. The performance test shall not commence until a Performance Testing Plan has been submitted and approved, and the functional testing has been completed. The detailed Performance Testing Plan shall include as a minimum:
    a. Test equipment and apparatus.
    b. Calibration and setup procedures.
    c. The specific testing methodology to be used.
    d. The sampling and analysis procedures.
3. The manufacturer shall provide, install, and maintain, if required, all temporary metering or analytical equipment necessary to measure the various performance parameters.
4. The manufacturer shall inform the Engineer at least 14 days prior to the start of any performance testing. The Engineer shall have the right to

observe, sample, and make any parallel determinations during the performance test.

5. Within 30 days after the conclusion of the test period, the manufacturer shall submit a Performance Test Report, including:
   a. Narrative of the testing activities.
   b. All laboratory and field test data, a copy of the original sampling log, photographs showing locations of flow and pressure measurements, tabular summary of velocity, airflow rates, pressures, H2S data, and calculated results.
   c. The conclusions of the test with regard to the performance criteria.
   d. Description of all deviations to the Performance Testing Plan.

B. Performance Tests:

1. Conduct performance test on the system under actual operating conditions as described in this section.
2. Test under actual loading condition for 8 continuous hours.

C. Test Conditions:

1. The performance test shall be conducted while the sources being controlled are fully operational.
2. All testing, adjusting, and balancing of the entire odor control system shall have been completed and approved.
3. The test shall be conducted over an 8-hour period.
4. The actual sample day shall be chosen for low wind speeds and no rain.

D. Sampling and Data Measurement: During the test period, as a minimum, the following data and measurements shall be taken at the frequency indicated:

1. System Airflow Rate:
   a. Every 8 hours.
   b. Measurement of airflows will be performed using an anemometer or pitot tube instrument previously approved by Engineer.
2. Differential Pressures:
   a. Vessel Differential Pressure in Inches of WC: Every 4 hours.
3. Hydrogen Sulfide Concentrations:
   a. Vessel Inlet: Every 4 hours.
   b. Vessel Outlet: Every 4 hours.
   c. Hydrogen sulfide sampling shall be completed using an approved analyzer with a detection limit of 1 ppbv and operated in compliance with the manufacturer's instructions.
4. Sampling Log: A sampling log shall be maintained that will include:
   a. Date, time, location, sampler, and results of each sample.
   b. A description of each photograph taken.

c. Weather conditions for the sampling day.
d. A qualitative description of the operation of the treatment processes.
e. A description of any exceptions from the sampling plan.

E. Analysis:

1. Vessel Pressure Drop: Pressure differential measurements shall demonstrate that differential pressure (pressure drop) across the vessel does not exceed pressure limits specified.
2. Hydrogen Sulfide Sampling and Analysis:
   a. Individual performance results will then be calculated by Percent Removal equals (Inlet - Outlet)/Inlet. Individual removal rates shall demonstrate that the minimum removal efficiencies or minimum outlet concentrations are achieved as specified.

F. Retesting: In the event the system fails to meet the performance requirements, the manufacturer shall immediately make the necessary modifications, adjustments, and/or facility expansions to meet these requirements. The steps taken by the manufacturer shall include, as necessary, design and construction of additional capacity, upgrades to the system, and replacement of the media, all at no additional cost to the Owner.

1. Additional performance tests will be conducted by manufacturer until the performance requirements are met, at no additional cost to the Owner.
2. If after two retests the performance requirements are still not met, the Owner will have the option, at the Owner's sole discretion, to accept the system as is or obtain a replacement at the expense of the manufacturer.
3. The maximum time between each retest will be 30 days.

3.5 FIELD QUALITY CONTROL

A. System Startup:

1. Performed by manufacturer.
2. Startup will commence following a visual inspection and check out of the system by the manufacturer's technical representative.

3.6 MANUFACTURER'S SERVICES

A. Provide manufacturer's representative at site in accordance with Section 01 43 33, Manufacturers' Field Services, for installation assistance, inspection and certification of proper installation, equipment testing, startup assistance, and training of Owner's personnel for specified component, subsystem, equipment, or system.

B. Manufacturer's Representative: Present at Site or classroom designated by Owners, for minimum person-days listed below, travel time excluded:

1. 2 person-day for installation assistance and inspection.
2. 3 person-day for functional testing and completion of Manufacturer's Certificate of Proper Installation.
3. 1 person-day for facility startup.
4. 1 person-day for post-startup training of Owner's personnel.

C. Provide manufacturer's factory engineer to perform monthly services at the jobsite during the warranty period. The services shall include a monthly site visit by a factory engineer from the local service center/manufacturing facility for equipment inspection and performance review. Only services conducted by a factory engineer are acceptable. Factory engineer shall have intimate familiarity with design and operation of identical carbon systems through documented experience in the odor control industry designing, testing and servicing odor control systems of the size, materials, and scope specified herein. Services conducted by a manufacturer's sales representative or agent are not acceptable.

D. Each month, all components of the system shall be checked by the factory engineer to verify proper operation and performance. The airflow rate shall be checked and the system's proper operation and performance shall be verified. A report shall be provided for the monthly visits.

END OF SECTION

SECTION 46 21 17
MECHANICAL AND MANUAL BAR SCREENS

PART 1 GENERAL

1.1 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Welding Society (AWS):
   a. D1.1, Structural Welding Code – Steel.
   b. QC 1, Standard for AWS Certification of Welding Inspectors.
2. National Electrical Manufacturers Association (NEMA):
   a. 250, Enclosures for Electrical Equipment (1,000 Volts Maximum).
   b. MG 1, Motors and Generators.
3. National Fire Protection Association (NFPA): 820, Standard for Fire Protection in Wastewater Treatment and Collection Facilities.
4. Underwriters Laboratories, Inc. (UL): 674, Standard for Safety for Electric Motors and Generators for Use in Hazardous (Classified) Locations.

1.2 UNIT RESPONSIBILITY

A. Unit Responsibility: The Work requires screens, complete with accessories and appurtenances (including, but not limited to, electric motors, shafting, safety guards, speed reducers, specified controls, and spare parts) be end product of one responsible system manufacturer or responsible system supplier. Unless otherwise indicated, obtain each system from responsible supplier of the equipment. Supplier shall furnish and coordinate components and accessories as necessary to place equipment in operation in conformance with specified performance, features, and functions indicated without altering or modifying Contractor's responsibilities under the Contract. Contractor is responsible to Owner to providing equipment systems as specified herein.

B. Design of the process for removing solids larger than 1.2 inches (30 mm) diameter from raw sewage into plant is based upon equipment from manufacturer herein listed and as shown on Drawings. Manufacturers other than named manufacturer will be responsible for coordinating layout changes and interface connections to other work and equipment which are different than that shown on Drawings. Contractor shall be responsible for coordinating this work and changes will be at sole expense of Contractor. At a minimum, these changes will include:

1. Layout of equipment within Screening Facility.
2. Coordination of equipment elevations and transitions of screenings from one piece of equipment to another.

3. Changes in electrical requirements due to differences in motor horsepower requirements or adjustable speed drive arrangements.
4. Instrumentation and control interface requirements.
5. Rerouting of piping required to meet manufacturer's system requirements.

C. Equipment specified herein shall be required to fit general overall dimensions shown on Drawings. Equipment provided under this section shall be suitable for use in a Class 1, Division 2, Group D environment.

1.3 SAFETY REQUIREMENTS

A. Equipment provided under this Contract shall be constructed with due regard to safety of operation, accessibility, and durability of parts, and shall comply with applicable safety regulations.

1.4 SUBMITTALS

A. Action Submittals:

1. Manufacturer's catalog information, descriptive literature, specifications, and identification of materials for construction.
2. Detailed structural, mechanical, and electrical drawings showing equipment fabrications and interface with other items.
3. Dimensions, size, configuration, and locations of connections to other work, including capture/containment system.
4. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.
5. Details of attachment and support in channel.
6. Gear output torque and rake weight lifting capacity calculations.
7. Complete motor nameplate data, as defined by NEMA, motor manufacturer, and motor modifications. See Section 26 20 00, Low Voltage AC Induction Motors, for submittal requirements.
8. Functional description of internal and external instrumentation and controls including list of parameters monitored, controlled, or alarmed.
9. Control panel elevation drawings showing fabrication and placement of operator interface devices and associated elements.
10. Power and control wiring diagrams, including terminals and numbers.
11. Shop painting systems, including manufacturer's descriptive technical catalog literature and specifications.
12. External utility requirements for air, water, power, drain, for each component.

B. Informational Submittals:

1. Seismic anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.

2. Manufacturer's Certificate of Compliance, in accordance with Section 01 61 00, Common Product Requirements of factory-applied coating system.
3. Welder/welding operator qualifications.
4. Welding inspector credentials.
5. Written factory test report of inspection.
6. Special shipping, storage and protection, and handling instructions.
7. Manufacturer's installation instructions.
8. Field functional test reports.
9. Operation and Maintenance Data: As specified in Section 01 78 23, Operation and Maintenance Data, including routine maintenance requirements prior to plant startup.
10. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers' Field Services.

1.5 QUALIFICATIONS

A. Welder/Welding Operator: In accordance with AWS D1.1/D1.1M.

B. Welding Inspector: Certified in accordance with AWS QC 1, and having prior experience with welding codes specified.

1.6 SPECIAL GUARANTEE

A. Provide manufacturer's extended guarantee or warranty, with Owner named as beneficiary, in writing, as special guarantee. Special guarantee shall provide for correction, or at option of Owner, removal and replacement of Work specified in this Specification section found defective during period of 5 years after date of Substantial Completion. Duties and obligations for correction or removal and replacement of defective Work as specified in General Conditions.

B. Delivery: In accordance with Section 01 61 00, Common Product Requirements.

PART 2 PRODUCTS

2.1 GENERAL

A. Furnish two (2) model ag-s-t 85, 6'-0" wide x 38'-6" discharge height, 30 mm Aqua guard® mechanical filter screen units, as supplied by Parkson Corporation, Vernon hills, IL, or approved equal. The Aqua guard® units will consist of a frame assembly, filter belt/screen assembly, drive assembly, rotating brush assembly, and discharge chute.

B. The automatic bar/filter screens will be designed to positively clean and remove debris up to 7 inches in diameter from the influent stream by means of high impact plastic filter elements designed to retain and elevate debris to the discharge point of the unit where the rotating brush assembly cleans the

elements.

C. The units shall be suitable for installation and operation in a channel measuring 6 feet wide and 11 feet deep. The angle of inclination shall be 85 degrees from horizontal. The opening from which the unit discharges screenings from its enclosure shall be at least 6 feet above the operating floor elevation at which the screen is supported. this is the available clearance for the container/compactor to collect the debris. The total discharge height of the screen, as measured from its base to the screenings discharge point, shall be 38'-6" feet. There shall be a 6-inch recess (notch) in the channel bottom to accommodate the base of the screen.

D. The screen shall be capable of passing a maximum peak flow of 37.7 mgd based on a nominal unit width of 6 feet, with a downstream water level of 4 feet. The head loss at the maximum flow of clean water shall not exceed 13 inches. The calculated head loss is based on the assumption of a clean screen, clean water, and steady state flow conditions.

E. The screen shall be capable of presenting a clean filtration surface to the influent stream at all times during continuous operation. it shall be capable of intermittent operation in order to form a mat of material to provide maximum trash removal. Additionally, in order to maximize the capture of paper, rags, and other flexible debris, which tends to drape over and adhere to the filtration surfaces, the screen shall have 0.547 square feet of contact surface area per square foot of wetted filtration belt frontal surface.

2.2 MANUFACTURERS

A. Where manufacturer's standard equipment name and/or model number is listed, equipment system shall be provided as modified to conform to performance, functions, features, and materials of construction as specified herein.

B. Equipment Layout: Layout depicted on Drawings is based upon first named manufacturers' products. Provide detailed drawings showing proposed variations from the Contract Documents including but not limited to affected equipment, access requirements, piping, or other auxiliary equipment to be provided per these Specifications.

C. Equipment and accessories specified in this section shall be products of:

1. Model ag-s-t 85, Aqua guard® mechanical filter screen units, as supplied by Parkson Corporation, Vernon hills, IL.
2. Or approved equal.

2.3 SERVICE CONDITIONS

A. Material Handled: Raw, unscreened sewage

B. Location:

1. Indoors.
2. Exposure: Variable concentrations of hydrogen sulfide, methane, and ammonia. Air inside equipment enclosure will be saturated with moisture.

C. Equipment Environment Application Rating: Class I, Division 2.

2.4 SCREEN EQUIPMENT

A. FRAME ASSEMBLY

1. The frame of the unit, which is stationary, shall be constructed from type 316 stainless steel with a minimum thickness of 5/8 inch. It supports and locates all of the operating components. The unit shall rest at the bottom of the channel, and be anchored at the operating floor elevation. No mounting or fastening of the unit frame shall be required to the sidewalls or bottom of the channel.
2. The "T" frame unit shall be supported at the operating floor elevation by welded supports on each side of the unit. The supports will be constructed from type 316 stainless steel. It will not be possible to pivot the screen from the channel, and an alternate method of bypassing the screen should be available. Routine service of the unit is possible with the screen in the channel.

3. Guide rails shall be mounted to each side on the inside surface of the frame to direct the filter belt during its ascension out of the channel. The guide rails shall be 1 inch thick and will be constructed from type 316 stainless steel. A center guide rail shall be supplied to direct the center chain of the filter belt during its ascension out of the channel. The guide rail shall be 1 inch thick and will be constructed from type 316 stainless steel.
4. At the top of the screen, circular chain guides shall gently direct the filter belt from its ascending path out of the channel towards the drive sprockets. These circular guides shall be constructed from type 316 stainless steel and shall be welded to a type 316 stainless steel shaft. In order to reduce the wear on both the chain and chain guides, the shaft shall be secured to bearings on each side of the frame and free to rotate.
5. Circular chain guides shall also be provided to direct the filter belt from the drive sprockets to the descending path into the channel. These circular guides shall be constructed from 3/4-inch thick type 316 stainless steel and shall be welded to a type 316 stainless shaft. In order to reduce the wear on both the chain and chain guides, the shaft shall be secured to bearings on each side of the frame and free to rotate.
6. Lower return guides shall be provided at the base of the screen to direct the filter belt during its 180-degree turn from the descending to ascending paths. The lower guide rails shall be constructed from type 316 stainless steel and shall be fixed in place as low as possible in the frame to optimize the submerged screen area. No submerged bearing or rotating guides are used that will require routine maintenance or that may become fouled by trash and debris.
7. Neoprene rubber seals with type 316 stainless steel backing plates shall be mounted along the upstream edges of the frame to seal the outer edge of the frame against the channel wall, and the area between the frame and filter belt side plates. Neoprene rubber seals with type 316 stainless steel backing plates shall be mounted to the upstream side of the screen to seal the area occupied by the center chain assembly
8. The bottom of the unit shall be sealed with two rows of nylon brushes, which allow the elements to pass through, but prevents trash from passing beneath the filter elements, ensuring capture of all solids and trash by the filter belt.
9. All shaft bearings shall be mounted externally to the side frame for ease of access and maintenance.
10. The portion of the screen above the intermediate level (elevation -4.00) shall be equipped with covers to help control the emission of odors and protect operators from contact with moving parts. The covers will also minimize misting and dripping. All enclosures shall be removable. There shall be hinged sections on the front and rear of the unit for access to the screen for periodic maintenance. The covers shall be fabricated from 14-gauge type 316 stainless steel.

B. FILTER BELT/SCREEN ASSEMBLY

1. The screen shall provide dual filtration of all materials in order to minimize compaction of captured debris and minimize the head loss through the screen. This shall be accomplished by recessing the horizontal fine filtration opening in the face of the screen. The coarse horizontal openings formed by the upper or forward shank/arm of the elements shall be 68 millimeters and shall be the first opening the flow stream contacts as it passes through the screen. The lower or recessed shank/arm of the elements shall create a two dimensional grid which limits the maximum vertical opening to 35 millimeters and the fine horizontal opening of 30 millimeters. This restricted opening profile is required to prevent long, thin materials from passing through the grid by aligning themselves so that the long axis is parallel with the vertical opening. The elements are arranged in a staggered fashion to form an endless belt and to create a range of motion that allows the recessed shank/arm of one row of elements to pass through the plane of the forward arm of the next row of elements it meshes with. Each filter element shall be a single molded component with a rake integral to its shape. The filter belt shall form a row of these rakes spaced every 8 inches, capable of lifting material of up to 7 inches in diameter out of the channel. The elements are secured to two separate filter shafts that pass through individual bosses in the elements.
2. The side plates (or end plates) are mounted next to the outermost elements of each filter row, and overlap to form a continuous moving sidewall for the filter belt. This moving wall prevents captured trash and debris from spilling over the sides of the filter belt. The side plates shall be constructed from a high strength phenolic resin.
3. The tension of the moving screen/filter belt assembly shall be completely supported by a stainless steel link chain. The chain must connect the filter shaft ends on both sides of the belt assembly so that the elements are free of tension, and support no weight of the assembly. The chain shall be of closed link design with 2 link sidebars, chain rollers and pins per link. The chain assembly shall have a minimum cross sectional area of 0.203 square inches at the weakest point of any individual link.
4. In order to ensure that the filter belt is adequately supported, an additional stainless steel link chain shall be provided at the center of the filter belt assembly. The chain shall be of closed link design with 2 link sidebars and pins per link. The chain assembly shall have a minimum cross sectional area of 0.203 square inches at the weakest point of any individual link sidebar.
5. Chains shall be supplied with hollow pins that allow for the removal and replacement of the filter shafts, side plates and filter elements without releasing the chain tension. The unit is designed to allow this function to take place at the operating floor elevation with the screen in the channel. Chain rollers shall have a diameter of 3 inches.

6. All chain components shall be corrosion resistant stainless steel. Sidebars shall be type 316 stainless steel. Pins, rollers, and bushings shall be type 17/4 stainless steel. 17/4 series components shall be heat treated to a minimum hardness of 39 on the Rockwell C Scale.
7. The filter shafts shall have a maximum diameter of 1-3/8 inch and be spaced on 8-inch centers in the direction of travel of the filter belt. The shafts shall be constructed from type 316 stainless steel.

C. DRIVE ASSEMBLY

1. The drive assembly consists of a gear reducer, motor, drive sprocket, driven sprocket, drive chain, drive chain idler, drive shaft, and take up bearings. The drive mechanism shall be protected from the trash stream to ensure that the screen runs smoothly without jamming. The driving force must be transmitted to clean, trash free components to avoid mis-tracking or binding, which could render the screen inoperable, requiring manual cleaning and realignment.
2. The gear reducer is to be of cycloid gear design by Sumitomo, mounted directly to the unit at the top of the frame and connected to the drive shaft with a with the drive chain, drive and driven sprockets. The reducer shall be designed in accordance with AGMA recommendations for Class II service based on the required horsepower for operation of the machine.
3. The motor shall be a squirrel cage induction motor, TEFC, 230/460 volt, 3- phase, 60 Hertz, 1800 RPM by Baldor. The motor shall be minimum 2 HP. Motor shall be rated for use in a Class 1, Division 1, Group D environment.
4. Overload protection shall be provided by an electrical overload device that senses motor current draw.
5. The filter belt drive shaft is located in the head of the unit and is supported at each end by the take up bearings. The filter belt sprockets that engage the filter belt chain rollers and transmit motion to the filter belt assembly are welded to the drive shaft. The drive shaft and sprockets shall be constructed from type 316 stainless steel. The stub ends shall be constructed from type AISI 4140.

D. ROTATING BRUSH ASSEMBLY

1. The filter belt assembly is cleaned via the interaction of the filter elements, the rotating brush assembly. No other mechanical devices capable of jamming (i.e. doctor blade) are required to remove the captured material.
2. The rotating brush assembly is supported by bearings on each side of the machine mounted externally to the machine frame. The brush is chain driven by the filter belt drive shaft.
3. The brush is comprised of three separate components, the brush shaft, the brush and the brush hubs. The shaft is made of type 316 stainless steel. The brush is composed of nylon bristles and secured to the shaft at each end by the brush hubs. The brush hubs are made of stainless steel.

4. The brush shall be orientated in a paddlewheel design with rows of bristles located at 90,180, 270, and 360 degrees. Between each of the bristles are bridge flaps to reduce wrapping of solids around the brush shaft. The brush diameter shall be 15 inches minimum.

E. DISCHARGE CHUTE

1. A discharge chute shall be provided integral to the machine, constructed from 14 gauge type 316 stainless steel and designed to direct the screenings to the collection equipment below.

F. LUBRICATION

1. Lubrication lines shall be extended from each bearing housing to central point's located on each side of the machine, accessible from the operating floor for ease of maintenance.

G. FASTENERS

1. All fasteners shall be type 316 stainless steel.

H. SURFACE FINISH

1. All structural members will be mechanically cleaned using Dupont Starblast. Sheet metal components such as covers or the discharge chute will be furnished with a 2B finish.
2. All other appurtenances including roller chain, brush sprockets, bearing housings, motor, reducer, etc. shall be supplied with the manufacturer's standard finish.

2.5 ELECTRICAL DEVICES AND CONTROLS

A. ELECTRICAL DEVICES: Interconnecting conduit and wiring will be the responsibility of the installing contractor. In addition to the drive motor, the following electrical devices will be furnished with each unit:

1. E-STOP STATION: A NEMA 7 local E-stop pushbutton will be mounted to the frame of the unit.
2. EXPLOSION PROOF ULTRASONIC LEVEL TRANSDUCER: A NEMA 4X Milltronics HydroRanger 200 ultrasonic level controller will be supplied with one (1) ST-H transducer, FM rated for Class 1, Division 1, Groups C and D. Provide integral transducer cable with a 1 inch NPT conduit connection of length required from transducer to transmitter. A type 316 stainless steel mounting bracket will be provided for each sensor.

B. CONTROLS: The following controls will be provided:

1. A 480 Volt primary control panel in a remotely located NEMA 4X type

316 stainless steel enclosure suitable for wall mounting. It will contain the following logic devices for proper operation of the equipment:

a. Programmable relay to perform necessary logic functions and monitor equipment mounted electrical devices.
b. Emergency Stop push button.
c. Hand-Off-Auto and Timer Enable/Disable selector switch for screen operation.
d. Control power and run indicating lights.
e. Motor current monitor and hour meter.
f. Fault indicating light and system reset pushbutton.
g. Run and fault auxiliary output contacts for customer use.

2. A step-down control transformer, motor starter and fused disconnect will be provided.

C. SEQUENCE OF OPERATION

1. Refer to the control panel drawing for project specific sequence of operations.

D. SPARE PARTS

1. The following spare parts will be provided for each unit
   a. Twenty (20) Filter elements.
   b. Ten (10) Side plates.
   c. Twenty (20) Snap rings 1-3/8" diameter.
   d. Ten (10) Snap rings 1-11/16" diameter.
   e. One (1) Rotating brush core replacement assembly.

E. ANCHOR BOLTS

1. Anchors are supplied by others. The anchorage of the screen is designed around the HILTI HY-200 Epoxy Anchoring system. Anchor size and embedment to be confirmed with structural calculation submittal.

2.6 MANUAL BAR RACK WITH TOP HINGE

A. Provide an aluminum manual bar rack with a top swivel as shown on the Drawings. All fixed and moving parts shall be fabricated of aluminum. Clear opening between bars shall be 1 inch. Bar thickness perpendicular to flow direction shall be 3/8-inch. Bar width parallel to flow direction shall be 1 inch. Top hinge shall be a solid shaft. Provide 316 stainless steel lifting hooks factory welded to each of the four corners. Range of travel for bar rack swivel shall be a minimum of 180 degrees.

2.7 SOURCE QUALITY CONTROL

A. Factory Inspections: Inspect control panels for required construction, electrical connection, and intended function.

B. Factory Tests and Adjustments:

1. Test each screen assembly including control panel, in its operating position, to ensure meshing of rakes and bar screen field, and operation of protective devices and override controls.
2. Run equipment and test for minimum of 1 hour in dry conditions and 5 hours in wet conditions. Testing shall be done in factory with unit oriented in its installed position.

PART 3 EXECUTION

3.1 INSTALLATION

A. In accordance with manufacturer's written instructions.

B. Anchor Bolts: Accurately place using templates provided by manufacturer and as specified in Section 05 50 00, Metal Fabrications.

3.2 FIELD FINISHING

A. Finish coat, following touchup of damage to primed areas, of non-stainless-steel ferrous metal, in accordance with and as specified in Section 09 90 00, Painting.

3.3 FIELD QUALITY CONTROL

A. Functional Test: Conduct on each mechanically cleaned bar screen assembly. Test shall include 6 hours continuous operation of each screen.

B. Field Tests:

1. Demonstrate screening systems are capable of meeting performance requirements. All installed screens shall be tested. Noticeable damage to equipment shall be considered a failure. Deflection greater than approved by Engineer shall be considered a failure.
   a. Screen Operation—Maximum Headloss: Demonstrate screen drive system is sufficient to move rakes with maximum allowable headloss as shown in performance criteria. Amperage draw shall be monitored to verify motor is within capacity.
   b. Headloss at Operating Condition: Demonstrate a headloss less than maximum while passing design flow.

3.4 MANUFACTURER'S SERVICES

A. Manufacturer's Representative: Present at Site or classroom designated by Owner for minimum person-days listed below, travel time excluded:

1. Two person-days for installation assistance and inspection.
2. Two person-day for functional and performance testing and completion of Manufacturer's Certificate of Proper Installation.
3. One person-day for prestartup classroom and field training.
4. Two person-days for facility startup.
5. Two person-day for post-startup training of Owner's personnel. Training shall not commence until an accepted detailed lesson plan for each training activity has been reviewed by Owner.

B. See Section 01 43 33, Manufacturers' Field Services, and Section 01 91 14, Testing, Integration, and Startup.

3.5 SUPPLEMENTS

A. The supplements listed below, following "End of Section," are part of this Specification.
   1. Screen Data Sheet.

END OF SECTION

SCREEN DATA SHEET

Project: Morena Pump Station and Conveyance System Project: Construction Package A

Owner: City of San Diego Public Utilities

Equipment Name: Mechanical Screen

Equipment Tag Number(s): ME-01 and ME-02

Type: Squirrel-cage induction meeting requirements of NEMA MG 1

Manufacturer: For multiple units of the same type of equipment, furnish motors and accessories of a single manufacturer

Hazardous Location: ☒ Furnish motors for hazardous (classified) locations that conform to UL 674 and have an applied UL listing mark

Motor Horsepower: _____ Guaranteed Minimum Efficiency at Full Load: See Section 26 20 00, Low-Voltage AC Induction Motors

Voltage: 460 Guaranteed Minimum Power Factor at Full Load: See Section 26 20 00, Low-Voltage AC Induction Motors

Phase: 3 Service Factor (@ rated max. amb. temp.): ☐ 1.0 ☒ 1.15

Frequency: 60 Enclosure Type: CISD TEFC

Synchronous Speed: _____ rpm Mounting Type: ☐ Horizontal ☐ Vertical

☐ Multispeed, Two-Speed:

_____ / _____ rpm

☒ Constant Speed

☐ Variable Torque

☐ Constant Torque

Winding: ☐ One ☐ Two

☐ Vertical Shaft: ☐ Solid ☐ Hollow

☐ Vertical Thrust Capacity (lb): Up _____ Down _____

☐ Adjustable Speed Drive: See Section 26 29 23, Low-Voltage Variable Frequency Drive System

Operating Speed Range: _____ to _____ % of Rated Speed

☐ Thermal Protection: _

☐ Space Heater: _____ volts, single phase Oversize

☐ main terminal (conduit) box for motors

☐ Terminal for connection of equipment grounding wire in each terminal box

Additional Motor Requirements: ☒ See Section 26 20 00, Low-Voltage AC Induction Motors

Special Features: _____

Rated for Class I, Division 1, Group D areas.

SUPPLEMENTARY SPECIAL PROVISIONS

APPENDICES

APPENDIX A

MITIGATION MEASURES

EXHIBIT C

MITIGATION MONITORING AND REPORTING PROGRAM
PURE WATER NORTH CITY PROJECT SITE DEVELOPMENT PERMIT
PROJECT NO. 499621/SCH NO. 2016081016

This Mitigation Monitoring and Reporting Program is designed to ensure compliance with Public Resources Code Section 21081.6 during implementation of mitigation measures. This program identifies at a minimum: the department responsible for the monitoring, what is to be monitored, how the monitoring shall be accomplished, the monitoring and reporting schedule, and completion requirements. A record of the Mitigation Monitoring and Reporting Program will be maintained at the offices of the Land Development Review Division, 1222 First Avenue, Fifth Floor, San Diego, CA, 92101. All mitigation measures contained in the Environmental Impact Report No. 499621 shall be made conditions of Pure Water North City Project Site Development Permit as may be further described below.

Mitigation Monitoring and Reporting Program (MMRP)

Section 21081.6 of the California Environmental Quality Act (CEQA) requires that a mitigation, monitoring, and reporting program (MMRP) be adopted upon certification of an Environmental Impact Report (EIR) to ensure that the mitigation measures are enforceable and implemented. It stipulates that "the public agency shall adopt a reporting or monitoring program for the changes made to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment. The reporting or monitoring program shall be designed to ensure compliance during project implementation."

This MMRP has been developed in compliance with Section 21081.6 of CEQA and identifies (1) mitigation measures to be implemented prior to, during, and after construction of the North City Project; (2) the individual/agency responsible for that implementation; and (3) criteria for completion or monitoring of the specific measures.

The Environmental Impact Report/Environmental Impact Statement (EIR/EIS), incorporated herein as referenced, focused on issues determined to be potentially significant by the City. Public Resources Code Section 21081.6 requires mitigation of only those impacts identified as significant or potentially significant. The environmental analysis resulted in the identification of mitigation measures that would reduce potentially significant impacts for the following issue areas: air quality; biological resources; health and safety/hazards; historical resources; noise; paleontological resources; public utilities; and transportation, circulation, and parking.

A. GENERAL REQUIREMENTS – PART I: Plan Check Phase (prior to permit issuance/NTP)

1. Prior to issuance of a Notice to Proceed (NTP) or any construction permits, including but not limited to, the first Demolition Plans/Permits, and Building Plans/Permits, the Assistant Deputy Director (ADD) Environmental Designee of the Land Development Review Division shall verify that all mitigation measures listed in this EIR/EIS have been included in entirety on the submitted construction documents and contract specifications, and included under the heading, "Environmental Mitigation Requirements." In addition, the requirements for a Preconstruction Meeting shall be noted on all construction documents.

2. The ED shall verify that the MMRP Conditions/Notes that apply ONLY to the construction phases of this project are included VERBATIM, under the heading, "**ENVIRONMENTAL/MITIGATION REQUIREMENTS**."

3. These notes must be shown within the first three (3) sheets of the construction documents in the format specified for engineering construction document templates as shown on the City website:

   http://www.sandiego.gov/development-services/industry/standtemp.shtml

4. The TITLE INDEX SHEET must also show on which pages the "Environmental/Mitigation Requirements" notes are provided.

B. GENERAL REQUIREMENTS – PART II: Post Plan Check (After permit issuance/Prior to start of construction)

1. **PRE- CONSTRUCTION MEETING IS REQUIRED TEN (10) WORKING DAYS PRIOR TO BEGINNING ANY WORK ON THIS PROJECT.** The PERMIT HOLDER/OWNER is responsible to arrange and perform this meeting by contacting the CITY RESIDENT ENGINEER (RE) of the Field Engineering Division and City staff from MITIGATION MONITORING COORDINATION (MMC). Attendees must also include the Permit holder's Representative(s), Job Site Superintendent and the following consultants:

   Qualified Monitoring Biologist
   Qualified Archaeologist/Archaeological Monitor
   Qualified Native American Monitor
   Qualified Paleontological Monitor

   Note: Failure of all responsible Permit Holder's representatives and consultants to attend shall require an additional meeting with all parties present.

CONTACT INFORMATION:

a) The PRIMARY POINT OF CONTACT is the **RE** at the **Field Engineering Division – (858) 627-3200**

b) For Clarification of ENVIRONMENTAL REQUIREMENTS, it is also required to call **RE and MMC at (858) 627-3360**

2. **MMRP COMPLIANCE:** This Project, Project Tracking System (PTS) No. 499621 and Environmental Document No. 49962 shall conform to the mitigation requirements contained in the associated Environmental Document and implemented to the satisfaction of the DSD's Environmental Designee (MMC) and the City Engineer (RE). The requirements may not be reduced or changed but may be annotated (i.e. to explain when and how compliance is being met and location of verifying proof, etc.). Additional clarifying information may also be added to other relevant plan sheets and/or specifications as appropriate (i.e., specific locations, times of monitoring, methodology, etc.

   Note: Permit Holder's Representatives must alert RE and MMC if there are any discrepancies in the plans or notes, or any changes due to field conditions. All conflicts must be approved by RE and MMC BEFORE the work is performed.

3. **OTHER AGENCY REQUIREMENTS:** Evidence of compliance with all other agency requirements or permits shall be submitted to the RE and MMC for review and acceptance prior to the beginning of work or within one week of the Permit Holder obtaining documentation of those permits or requirements. Evidence shall include copies of permits, letters of resolution or other documentation issued by the responsible agency.

   The owner/permittee shall provide evidence that all required regulatory permits, such as those required under Section 404 of the federal Clean Water Act, Section 1600 of the California Fish and Game Code, and the Porter-Cologne Water Quality Control Act, has been obtained.

4. **MONITORING EXHIBITS:** All consultants are required to submit, to RE and MMC, a monitoring exhibit on a 11x17 reduction of the appropriate construction plan, such as site plan, grading, landscape, etc., marked to clearly show the specific areas including the **LIMIT OF WORK**, scope of that discipline's work, and notes indicating when in the construction schedule that work will be performed. When necessary for clarification, a detailed methodology of how the work will be performed shall be included.

5. **OTHER SUBMITTALS AND INSPECTIONS:** The Permit Holder/Owner's representative shall submit all required documentation, verification letters, and requests for all associated inspections to the RE and MMC for approval per the following schedule:

Document Submittal/Inspection Checklist

Document Submittal/Inspection Checklist		
Issue Area	**Document Submittal**	**Associated Inspection/Approvals/Notes**
General	Consultant Qualification Letters	Prior to Preconstruction Meeting
General	Consultant Construction Monitoring Exhibits	Prior to or at Preconstruction Meeting
Biology	Biologist Limit of Work Verification	Limit of Work Inspection
Biology	Biology Reports	Biology/Habitat Restoration Inspection
Visual Quality	Retaining Wall Verification Letter	Retaining Wall Inspection
Paleontology	Geology	As graded Soils Report
Archaeology	Archaeology Reports	Archaeology/Historic Site Observation
Noise	Acoustical Reports	Noise Mitigation Features Inspection
Traffic	Traffic Reports	Traffic Features Site Observation

C. Specific MMRP Issue Area Conditions/Requirements

Air Quality

MM-AQ-1 The following best management practices shall be implemented during construction to comply with applicable San Diego Air Pollution Control District (SDAPCD) rules and regulations and to further reduce daily construction emissions:

- Best management practices that could be implemented during construction to reduce particulate emissions and reduce soil erosion and trackout include the following:
    - Cover or water, as needed, any on-site stockpiles of debris, dirt, or other dusty material.
    - Use adequate water and/or other dust palliatives on all disturbed areas in order to avoid particle blow-off. Due to current drought conditions, the contractor shall consider use of a SDAPCD-approved dust suppressant where feasible to reduce the amount of water to be used for dust control. Use of recycled water in place of potable water shall also be considered provided that the use is approved by the City of San Diego and other applicable regulatory agencies prior to initiation of construction activity.[1]

1 The use of recycled water for construction purposes requires approval of the City and other regulatory agencies on a case-by-case basis. The permit shall be obtained prior to beginning construction. Recycled water used for construction purposes may only be used for soil compaction during grading operations, dust control, and consolidation and compaction of backfill in trenches for non-potable water, sanitary sewer, storm drain, gas and electric pipelines. Equipment operators shall be instructed about the requirements contained herein and the potential health hazards involved with the use of recycled water. Water trucks, hoses, drop tanks, etc. shall be identified as containing non-potable water and not suitable for drinking. Determinations as to specific uses to be allowed shall be in accordance with the standards set forth in Title 22, Division 4 of the California Code of Regulations and with the intent of this ordinance to preserve the public health. The City may, at its discretion, set forth specific requirements as conditions to providing such services and/or require specific approval from the appropriate regulatory agencies (City of San Diego 2016a).

Use of recycled water shall be in compliance with all applicable City of San Diego Rules and Regulation for Recycled Water (City of San Diego 2016a), particularly for the protection of public health per the California Code of Regulations, Title 22, Division 4.

- Wash down or sweep paved streets as necessary to control trackout or fugitive dust.
- Cover or tarp all vehicles hauling dirt or spoils on public roads if sufficient freeboard is not available to prevent material blow-off during transport.
- Use gravel bags and catch basins during ground-disturbing operations.
- Maintain appropriate soil moisture, apply soil binders, and plant stabilizing vegetation.

MM-AQ-2 The following measures shall be adhered to during construction activities associated with the North City Project to reduce oxides of nitrogen (NO_x):

a. All diesel-fueled construction equipment shall be equipped with Tier 3 or better (i.e., Tier 4 Interim or Tier 4 Final) diesel engines.

b. The engine size of construction equipment shall be the minimum size suitable for the required job.

c. Construction equipment shall be maintained in accordance with the manufacturer's specifications.

MM-AQ-3 The City shall implement odor control systems at the NCWRP Expansion, Morena Pump Station, and Morena Wastewater Forcemain specifically designed to abate the potential odors of the facility. Odor control systems would be similar to those currently employed at City of San Diego wastewater treatment facilities to reduce odor impacts. The following odor control systems or equivalent measures shall be implemented to mitigate nuisance odors:

a. North City Water Reclamation Plant Expansion and the Morena Pump Station: NaOCl/NaOH Wet Scrubber plus carbon or Biofilter plus carbon.

b. Air/vacuum relief valves at high points along the wastewater forcemain: ferric chloride and/or High Purity Oxygen injection.

Alternatively, odors could be abated through the addition of chemicals such as iron chloride, nitrate, hydrogen peroxide, sodium hypochlorite, high purity oxygen, magnesium hydroxide, and/or caustic solutions to reduce the liquid phase concentration and thus, reduce the amount volatilized into the gas phase.

Biological Resources

Introduction to MM-BIO-6

Project construction within 500 feet of the San Diego River, Rose Creek, San Clemente Creek and any other sensitive riparian areas may have adverse indirect impacts on least Bell's vireo and southwestern willow flycatcher if construction occurs during the breeding season from March 15 through September 15 for least

Bell's vireo and May 1 through September 1 for southern willow flycatcher and the species are determined to be present.

MM-BIO-6 **Riparian Birds.** Prior to the preconstruction meeting, the Assistant Deputy Director (ADD) or MMC shall verify that MHPA boundaries and the Project requirements regarding the least Bell's vireo and southwestern willow flycatcher, as specified below, are shown on the construction plans.

No clearing, grubbing, grading, or other construction activities shall occur during the least Bell's vireo breeding season (March 15 to September 15) and southwestern willow flycatcher breeding season (May 1 to September 1), until the following requirements have been met to the satisfaction of the ADD/MMC:

1. A Qualified Biologist (possessing a valid Endangered Species Act Section 10(a)(1)(a) Recovery Permit) shall survey those habitat areas within the MHPA that would be subject to construction noise levels exceeding 60 decibels [dB(A)] hourly average for the presence of the least Bell's vireo and southwestern willow flycatcher. Surveys for least Bell's vireo and southwestern willow flycatcher shall be conducted pursuant to the protocol survey guidelines established by the USFWS within the breeding season prior to the commencement of any construction. If least Bell's vireo, and/or southwestern willow flycatcher are present, then the following conditions must be met:

    a. Between March 15 to September 15 for least Bell's vireo and May 1 to September 1 for southwestern willow flycatcher, no clearing, grubbing, or grading of occupied habitat shall be permitted. Areas restricted from such activities shall be staked or fenced under the supervision of a Qualified Biologist; and

    b. Between March 15 to September 15 for least Bell's vireo and/or May 1 to September 1 for southwestern willow flycatcher no construction activities shall occur within any portion of the site where construction activities would result in noise levels exceeding 60 dB(A) hourly average at the edge of occupied habitat. An analysis showing that noise generated by construction activities would not exceed 60 dB(A) hourly average at the edge of occupied habitat must be completed by a Qualified Acoustician (possessing current noise engineer license or registration with monitoring noise level experience with listed animal species) and approved by the ADD/MMC at least 2 weeks prior to the commencement of construction activities. Prior to the commencement of construction activities during the breeding season, areas restricted from such activities shall be staked or fenced under the supervision of a Qualified Biologist; or

    c. At least 2 weeks prior to the commencement of construction activities, under the direction of a Qualified Acoustician, attenuation measures (e.g., berms, walls) shall be implemented to ensure that noise levels resulting from construction activities would not exceed 60 dB(A) hourly average at the edge of habitat occupied by the least Bell's vireo, and/or southwestern willow flycatcher. Concurrent with the commencement of construction activities and the construction of necessary noise attenuation facilities, noise

monitoring shall be conducted at the edge of the occupied habitat area to ensure that levels do not exceed 60 dB(A) hourly average. If the noise attenuation techniques implemented are determined to be inadequate by the Qualified Acoustician or Biologist, then the associated construction activities shall cease until such time that adequate noise attenuation is achieved or until the end of the breeding season (August 16). Construction noise monitoring shall continue to be monitored at least twice weekly on varying days, or more frequently depending on the construction activity, to verify that noise levels at the edge of occupied habitat are maintained below 60 dB(A) hourly average or to the ambient noise level if it already exceeds 60 dB(A) hourly average. If not, other measures shall be implemented in consultation with the biologist and the ADD/MMC, as necessary, to reduce noise levels to below 60 dB(A) hourly average or to the ambient noise level if it already exceeds 60 dB(A) hourly average. Such measures may include, but are not limited to, limitations on the placement of construction equipment and the simultaneous use of equipment.

2. If least Bell's vireo and/or southwestern willow flycatcher are not detected during the protocol survey, the Qualified Biologist shall submit substantial evidence to the ADD/MMC and applicable resource agencies which demonstrates whether or not mitigation measures such as noise walls are necessary between March 15 to September 15 for least Bell's vireo and/or May 1 to September 1 for southwestern willow flycatcher adherence to the following is required:

   a. If this evidence indicates that the potential is high for least Bell's vireo and/or southwestern willow flycatcher to be present based on historical records or site conditions, then Condition 1(a) shall be adhered to as specified above.

   b. If this evidence concludes that no impacts to this species are anticipated, no mitigation measures would be necessary.

Introduction to MM-BIO-9

Mitigation measure MM-BIO-9 will be included in the design and construction documents for each Project component and will reduce the potential for short-term and long-term indirect impacts to sensitive vegetation communities. A biological monitor will be present during construction within or adjacent to sensitive resources and would ensure that the Project adheres to and implements the appropriate measures to protect sensitive resources.

MM-BIO-9 The following measures will be included in the design and construction documents for each Project component to reduce potential impacts to sensitive resources:

   a. **Qualified Biologist.** The owner/permittee shall provide a letter to the City's Mitigation Monitoring Coordination (MMC) section stating that a Project Biologist (Qualified Biologist) as defined in the City of San Diego Municipal Code, Land Development Code—Biology Guidelines (City of San Diego 2012), has been retained to implement the Project's biological monitoring program. The letter shall include the names and contact

information of all persons involved in the biological monitoring of the Project.

b. **Preconstruction Meeting.** The Qualified Biologist shall attend the preconstruction meeting, discuss the Project's biological monitoring program, and arrange to perform any follow up mitigation measures and reporting including site-specific monitoring, restoration or revegetation, and additional fauna/flora surveys/salvage.

c. **Documentation.** The Qualified Biologist shall submit all required documentation to MMC verifying that any special mitigation reports including but not limited to, maps, plans, surveys, survey timelines, or buffers are completed or scheduled per City Biology Guidelines, Multiple Species Conservation Program (MSCP), Environmentally Sensitive Lands Ordinance, project permit conditions; California Environmental Quality Act (CEQA); National Environmental Policy Act (NEPA); endangered species acts (federal Endangered Species Act and California Endangered Species Act); and/or other local, state or federal requirements.

d. **Biological Construction Mitigation/Monitoring Exhibit.** The Qualified Biologist shall present a Biological Construction Mitigation/Monitoring Exhibit (BCME), which includes the biological documents above. In addition, the BCME would include restoration/revegetation plans, plant salvage/relocation requirements (e.g., burrowing owl exclusions, etc.), avian or other wildlife surveys/survey schedules (including general avian nesting and U.S. Fish and Wildlife (USFWS) protocol), timing of surveys, wetland buffers, avian construction avoidance areas/noise buffers/barriers, other impact avoidance areas, and any subsequent requirements determined by the Qualified Biologist and the City Assistant Deputy Director (ADD)/MMC. The BCME shall include a site plan, written and graphic depiction of the Project's biological mitigation/monitoring program, and a schedule. The BCME shall be approved by MMC and referenced in the construction documents.

e. **Construction Fencing.** Prior to construction activities, the Qualified Biologist shall supervise the placement of orange construction fencing or equivalent along the limits of disturbance adjacent to sensitive biological habitats and verify compliance with any other project conditions as shown on the BCME. This phase shall include flagging plant specimens and delineating buffers to protect sensitive biological resources (e.g., habitats/flora and fauna species, including nesting birds) during construction. Appropriate steps/care should be taken to minimize attraction of nest predators to the site.

f. **On-site Education.** Prior to commencement of construction activities, the Qualified Biologist shall meet with the owner/permittee or designee and the construction crew and conduct an on-site educational session regarding the need to avoid impacts outside of the approved construction area and to protect sensitive flora and fauna (e.g., explain the avian and wetland buffers, flag system for removal of invasive species or retention of sensitive plants, and clarify acceptable access routes/methods and staging areas).

g. **Biological Monitoring.** During construction, a Qualified Biologist would be present to assist in the avoidance of impacts to native vegetation, jurisdictional aquatic resources, sensitive plants and wildlife, and nesting birds. Specific biological monitoring and or mitigation measures for sensitive wildlife, sensitive vegetation communities, and jurisdictional aquatic resources are described further in the mitigation measures.

j. **Best Management Practices/Erosion/Runoff.** The City will incorporate methods to control runoff, including a Stormwater Pollution Prevention Plan (SWPPP) to meet National Pollutant Discharge Elimination System (NPDES) regulations or batch discharge permit from the City. Implementation of stormwater regulations are expected to substantially control adverse edge effects (e.g., erosion, sedimentation, habitat conversion) during and following construction both adjacent and downstream from the study area. Typical construction Best Management Practices (BMPs) specifically related to reducing impacts from dust, erosion, and runoff generated by construction activities would be implemented. During construction, material stockpiles shall be placed such that they cause minimal interference with on-site drainage patterns. This will protect sensitive vegetation from being inundated with sediment-laden runoff. Dewatering shall be conducted in accordance with standard regulations of the Regional Water Quality Control Board (RWQCB). An NPDES permit, issued by RWQCB to discharge water from dewatering activities, shall be required prior to start of dewatering. This will minimize erosion, siltation, and pollution within sensitive communities. Design of drainage facilities shall incorporate long-term control of pollutants and stormwater flow to minimize pollution and hydrologic changes.

k. **Toxics/Project Staging Areas/Equipment Storage.** Projects that use chemicals or generate by-products such as pesticides, herbicides, and animal waste, and other substances that are potentially toxic or impactive to native habitats/flora/fauna (including water) shall incorporate measures to reduce impacts caused by the application and/or drainage of such materials into the MHPA. No trash, oil, parking, or other construction/development-related material/activities shall be allowed outside any approved construction limits. Where applicable, this requirement shall be incorporated into leases on publicly owned property when applications for renewal occur. Provide a note in/on the CDs that states: "All construction-related activity that may have potential for leakage or intrusion shall be monitored by the Qualified Biologist/Owners Representative or Resident Engineer to ensure there is no impact to the MHPA."

Health and Safety/Hazards

MM-HAZ-2 A Hazardous Materials Reporting Form shall be prepared, as determined necessary by the City of San Diego, and a Hazardous Materials Review conducted by the Development Services Department for each North City Project component in compliance with the City of San Diego's Information Bulletin 116.

MM-HAZ-3 A Spill Prevention and Emergency Response Plan shall be completed, as determined necessary by the City of San Diego, for each North City Project component which includes on-site storage of hazardous materials (i.e., Morena Pump Station, NCWRP Expansion, North City Renewable Energy Facility, NCPWF, and Dechlorination Facility) prior to the commencement of operation. Other safety programs, including a worker safety program, fire response program, a plant safety program, and the facility's standard operating procedures, shall be developed addressing hazardous materials storage locations, emergency response procedures, employee training requirements, hazard recognition, fire safety, first aid/emergency medical procedures, hazard communication training, and release reporting requirements.

MM-HAZ-4 In the event that hazardous substances are encountered during construction, construction activities in the area shall immediately cease. All applicable procedures outlined in the City of San Diego "WHITEBOOK" Part 1 – General Provisions (A), Section 7-22, Encountering or Releasing Hazardous Substances shall be followed (City of San Diego 2015). In the case that groundwater contaminated with petroleum is encountered, the requirements of Section 7-8.6.6 of the "WHITEBOOK" shall be followed.

These procedures and requirements include, but are not limited to:

(1) Comply with all applicable federal, state, and local laws and regulations and notification requirements.

(2) Follow the guidelines of the current edition of the County of San Diego Department of Environmental Health (DEH) SAM Manual in the event that contaminated soil is encountered.

(3) Immediately notify the Engineer, who in turn shall contact the City's Environmental Services Department, Hazardous Materials Management Program.

(4) In areas of known petroleum-contaminated soil, monitoring for the presence of contamination shall be the contractor's responsibility, and an operational Photo Ionization Device shall be used at all times.

(5) All suspected contaminated soil shall be stockpiled at a location approved by the Engineer and the HMMP on a relatively impervious surface.

(6) Contaminated soil shall be disposed of dependent on classification and as approved by the Hazardous Substances Management Plan.

Historical Resources

The mitigation measures (MMs) provided in this section have been designed to fulfill the requirements of Section 106 of the National Historic Preservation Act, the CEQA Guidelines, and the City of San Diego Historic Resource Guidelines. The City of San Diego will be the lead agency implementing cultural resource mitigation measures and will provide information to the Bureau of Reclamation for their ongoing Section 106 oversight and consultation obligations.

MM-HIS-3 To reduce potential impacts to unknown archaeological resources and/or grave sites during construction of all Project components (i.e., Components Common to the Project Alternatives, Miramar Reservoir Alternative, and San Vicente Reservoir Alternative) the following measures shall be implemented:

I. Prior to Permit Issuance or Bid Opening/Bid Award

A. Entitlements Plan Check

1. Prior to permit issuance or bid opening/bid award, whichever is applicable, the Assistant Deputy Director (ADD) environmental designee shall verify that the requirements for archaeological monitoring and Native American monitoring have been noted on the applicable construction documents through the plan check process.

B. Letters of Qualification have been submitted to ADD

1. Prior to bid award, the applicant shall submit a letter of verification to Mitigation Monitoring Coordinator (MMC) identifying the Principal Investigator (PI) for the Project and the names of all persons involved in the archaeological monitoring program, as defined in the City Historical Resources Guidelines (HRG). If applicable, individuals involved in the archaeological monitoring program must have completed the 40-hour HAZWOPER training with certification documentation.

2. MMC will provide a letter to the applicant confirming the qualifications of the PI and all persons involved in the archaeological monitoring of the Project meet the qualifications established in the City Historical Resources Guidelines.

3. Prior to the start of work, the applicant must obtain written approval from MMC for any personnel changes associated with the monitoring program.

II. Prior to Start of Construction

A. Verification of Records Search

1. The PI shall provide verification to MMC that a site-specific records search (0.25-mile radius) has been completed. Verification includes, but is not limited to a copy of a confirmation letter from South Coastal Information Center, or, if the search was in-house, a letter of verification from the PI stating that the search was completed.

2. The letter shall introduce any pertinent information concerning expectations and probabilities of discovery during trenching and/or grading activities.

3. The PI may submit a detailed letter to MMC requesting a reduction to the 0.25-mile radius.

B. PI Shall Attend Preconstruction Meetings

1. Prior to beginning any work that requires monitoring, the applicant shall arrange a Preconstruction Meeting that shall include the PI, Native American consultant/monitor (where Native American resources may be impacted), Construction Manager (CM), Grading Contractor, Resident Engineer (RE), Building Inspector (BI), if appropriate, and MMC. The qualified archaeologist and Native American monitor shall attend any grading/excavation related Preconstruction Meetings to make comments and/or suggestions concerning the archaeological monitoring program with the CM and/or Grading Contractor.

   a. If the PI is unable to attend the Preconstruction Meeting, the applicant shall schedule a focused Preconstruction Meeting with MMC, the PI, RE, CM, if appropriate, prior to the start of any work that requires monitoring.

2. Acknowledgment of Responsibility for Curation (Capital Improvement Program or Other Public Projects)

   The applicant shall submit a letter to MMC acknowledging their responsibility for the cost of curation associated with all phases of the archaeological monitoring program.

3. Identify Areas to be Monitored

   a. Prior to the start of any work that requires monitoring, the PI shall submit an Archaeological Monitoring Exhibit (AME) (with verification that the AME has been reviewed and approved by the Native American consultant/monitor when Native American resources may be impacted) based on the appropriate construction documents (reduced to 11×17) to MMC identifying the areas to be monitored, including the delineation of grading/excavation limits.

b. The AME shall be based on the results of a site-specific records search as well as information regarding the age of existing pipelines, laterals and associated appurtenances, and/or any known soil conditions (native or formation).

c. MMC shall notify the PI that the AME has been approved.

4. When Monitoring Will Occur

a. Prior to the start of any work, the PI shall also submit a construction schedule to MMC through the RE indicating when and where monitoring will occur.

b. The PI may submit a detailed letter to MMC prior to the start of work or during construction requesting a modification to the monitoring program. This request shall be based on relevant information such as review of final construction documents which indicate conditions such as age of existing pipe to be replaced, depth of excavation and/or site graded to bedrock, etc., which may reduce or increase the potential for resources to be present.

5. Approval of AME and Construction Schedule

After approval of the AME by MMC, the PI shall submit to MMC written authorization of the AME and Construction Schedule from the CM.

III. During Construction

A. Monitor Shall be Present During Grading/Excavation/Trenching

1. The Archaeological Monitor shall be present full-time during all soil-disturbing and grading/excavation/trenching activities that could result in impacts to archaeological resources as identified on the AME. **The CM is responsible for notifying the RE, PI, and MMC of changes to any construction activities such as in the case of a potential safety concern within the area being monitored. In certain circumstances Occupational Safety and Health Administration safety requirements may necessitate modification of the AME.**

2. The Native American consultant/monitor shall determine the extent of their presence during soil-disturbing and grading/excavation/trenching activities based on the AME and provide that information to the PI and MMC. If prehistoric resources are encountered during the Native American consultant/monitor's absence, work shall stop, and the Discovery Notification Process detailed in Section III.B–III.C and IV.A–IV.D shall commence.

3. The PI may submit a detailed letter to MMC during construction requesting a modification to the monitoring program when a field condition such as modern disturbance post-dating the previous grading/trenching activities, presence of fossil formations, or when native soils are encountered that may reduce or increase the potential for resources to be present.

4. The archaeological and Native American consultant/monitor shall document field activity via the Consultant Site Visit Records. The Consultant Site Visit Records shall be emailed by the CM to the RE the first day of monitoring, the last day of monitoring, monthly (Notification of Monitoring Completion), and in the case of ANY discoveries. The RE shall forward copies to MMC.

B. Discovery Notification Process

1. In the event of a discovery, the Archaeological Monitor shall direct the contractor to temporarily divert all soil-disturbing activities, including but not limited to digging, trenching, excavating, or grading activities in the area of discovery and in the area reasonably suspected to overlay adjacent resources and immediately notify the RE or CM, as appropriate.

2. The Archaeological Monitor shall immediately notify the PI (unless monitor is the PI) of the discovery.

3. The PI shall immediately notify MMC by phone of the discovery, and shall also submit written documentation to MMC within 24 hours by email with photos of the resource in context, if possible.

4. No soil shall be exported off site until a determination can be made regarding the significance of the resource specifically if Native American resources are encountered.

C. Determination of Significance

1. The PI and Native American consultant/monitor, where Native American resources are discovered shall evaluate

the significance of the resource. If Human Remains are involved, follow protocol in Section IV below.

a. The PI shall immediately notify MMC by phone to discuss significance determination and shall also submit a letter to MMC indicating whether additional mitigation is required.

b. If the resource is significant, the PI shall submit an Archaeological Data Recovery Program (ADRP) and obtain written approval of the program from MMC, CM, and RE. The ADRP and any mitigation must be approved by MMC, RE, and/or CM before ground-disturbing activities in the area of discovery will be allowed to resume. **Note: If a unique archaeological site is also an historical resource as defined in CEQA Guidelines Section 15064.5, then the limits on the amount(s) that a Project applicant may be required to pay to cover mitigation costs as indicated in CEQA Section 21083.2 shall not apply.**

   (1) Note: For pipeline trenching and other linear projects in the public Right-of-Way, the PI shall implement the Discovery Process for Pipeline Trenching projects identified below under "D."

c. If the resource is not significant, the PI shall submit a letter to MMC indicating that artifacts will be collected, curated, and documented in the Final Monitoring Report. The letter shall also indicate that that no further work is required.

   (1) Note: For pipeline trenching and other linear projects in the public right-of-way, if the deposit is limited in size, both in length and depth; the information value is limited and is not associated with any other resource; and there are no unique features/artifacts associated with the deposit, the discovery should be considered not significant.

   (2) Note: For pipeline trenching and other linear projects in the public right-of-way, if significance cannot be determined, the Final Monitoring Report and Site Record (DPR Form 523A/B) shall identify the discovery as potentially significant.

D. Discovery Process for Significant Resources – Pipeline Trenching and Other Linear Projects in the Public Right-of-Way

The following procedure constitutes adequate mitigation of a significant discovery encountered during pipeline trenching activities or for other linear project types within the public right-of-way, including but not limited to excavation for jacking pits, receiving pits, laterals, and manholes to reduce impacts to below a level of significance:

1. Procedures for documentation, curation, and reporting

a. One hundred percent (100%) of the artifacts within the trench alignment and width shall be documented in situ, to include photographic records, plan view of the trench and profiles of side walls, recovered, photographed after cleaning and analyzed and curated. The remainder of the deposit within the limits of excavation (trench walls) shall be left intact.

b. The PI shall prepare a Draft Monitoring Report and submit to MMC via the RE as indicated in Section VI-A.

c. The PI shall be responsible for recording (on the appropriate State of California Department of Parks and Recreation forms DPR 523 A/B) the resource(s) encountered during the Archaeological Monitoring Program in accordance with the City's HRG. The DPR forms shall be submitted to the South Coastal Information Center for either a Primary Record or SDI Number and included in the Final Monitoring Report.

d. The Final Monitoring Report shall include a recommendation for monitoring of any future work in the vicinity of the resource.

IV. Discovery of Human Remains

If human remains are discovered, work shall halt in that area, and no soil shall be exported off site until a determination can be made regarding the provenance of the human remains; and the following procedures as set forth in CEQA Guidelines Section 15064.5(e), the California Public Resources Code Section 5097.98, and the California Health and Safety Code Section 7050.5, shall be undertaken:

A. Notification

1. Archaeological Monitor shall notify the RE or CM as appropriate, MMC, and the PI, if the monitor is not qualified as a PI. MMC will

notify the appropriate Senior Planner in the Environmental Analysis Section of the Development Services Department to assist with the discovery notification process.

2. The PI shall notify the Medical Examiner after consultation with the RE, either in person or via telephone.

B. Isolate discovery site

1. Work shall be directed away from the location of the discovery and any nearby area reasonably suspected to overlay adjacent human remains until a determination can be made by the Medical Examiner in consultation with the PI concerning the provenience of the remains.

2. The Medical Examiner, in consultation with the PI, will determine the need for a field examination to determine the provenience.

3. If a field examination is not warranted, the Medical Examiner will determine with input from the PI, if the remains are or are most likely to be of Native American origin.

C. If human remains are determined to be Native American

1. The Medical Examiner will notify the Native American Heritage Commission (NAHC) within 24 hours. By law, only the Medical Examiner can make this call.

2. NAHC will immediately identify the person or persons determined to be the Most Likely Descendant (MLD) and provide contact information.

3. The MLD will contact the PI within 24 hours or sooner after the Medical Examiner has completed coordination, to begin the consultation process in accordance with CEQA Guidelines Section 15064.5(e) and the California Public Resources and Health and Safety Codes.

4. The MLD will have 48 hours to make recommendations to the property owner or representative, for the treatment or disposition with proper dignity, of the human remains and associated grave goods.

5. Disposition of Native American human remains will be determined between the MLD and the PI, and, if:

a. The NAHC is unable to identify the MLD, OR the MLD failed to make a recommendation within 48 hours after being notified by the Commission, OR

b. The landowner or authorized representative rejects the recommendation of the MLD and mediation in accordance with California Public Resources Code Section 5097.94(k), by the NAHC fails to provide measures acceptable to the landowner, THEN

c. To protect these sites, the landowner shall do one or more of the following:

(1) Record the site with the NAHC,

(2) Record an open space or conservation easement, or

(3) Record a document with the County.

d. Upon the discovery of multiple Native American human remains during a ground-disturbing land development activity, the landowner may agree that additional conferral with descendants is necessary to consider culturally appropriate treatment of multiple Native American human remains. Culturally appropriate treatment of such a discovery may be ascertained from review of the site utilizing cultural and archaeological standards. Where the parties are unable to agree on the appropriate treatment measures, the human remains and items associated and buried with Native American human remains shall be reinterred with appropriate dignity, pursuant to Section 5.c.

D. If human remains are not Native American

1. The PI shall contact the Medical Examiner and notify them of the historic era context of the burial.

2. The Medical Examiner will determine the appropriate course of action with the PI and City staff (California Public Resources Code, Section 5097.98).

3. If the remains are of historic origin, they shall be appropriately removed and conveyed to the San Diego Museum of Man for analysis. The decision for internment of the human remains shall be made in consultation with MMC, Environmental Analysis Section, the applicant/landowner, any known descendant group, and the San Diego Museum of Man.

V. Night and/or Weekend Work

A. If night and/or weekend work is included in the contract

1. When night and/or weekend work is included in the contract package, the extent and timing shall be presented and discussed at the Preconstruction Meeting.

2. The following procedures shall be followed.

a. No Discoveries

In the event that no discoveries were encountered during night and/or weekend work, the PI shall record the information on the Consultant Site Visit Record and submit to MMC by email by 8 a.m. of the next business day.

b. Discoveries

All discoveries shall be processed and documented using the existing procedures detailed in Sections III – During Construction, and IV – Discovery of Human Remains. Discovery of human remains shall always be treated as a significant discovery.

c. Potentially Significant Discoveries

If the PI determines that a potentially significant discovery has been made, the procedures detailed under Section III – During Construction and IV – Discovery of Human Remains shall be followed.

d. The PI shall immediately contact the RE and MMC, or by 8 a.m. of the next business day to report and discuss the findings as indicated in Section III-B, unless other specific arrangements have been made.

B. If night and/or weekend work becomes necessary during the course of construction

1. The CM shall notify the RE, as appropriate, a minimum of 24 hours before the work is to begin.

2. The RE, or CM, as appropriate, shall notify MMC immediately.

C. All other procedures described above shall apply, as appropriate.

VI. Post Construction

A. Submittal of Draft Monitoring Report

1. The PI shall submit two copies of the Draft Monitoring Report (even if negative), prepared in accordance with the HRG (Appendix C/D) that describes the results, analysis, and conclusions of all phases of the Archaeological Monitoring Program (with appropriate graphics) to MMC via the RE for review and approval within 90 days following the completion of monitoring. **It should be noted that if the PI is unable to submit the Draft Monitoring Report within the allotted 90-day time frame as a result of delays with analysis, special study results or other complex issues, a schedule shall be submitted to MMC establishing agreed due dates and the provision for submittal of monthly status reports until this measure can be met.**

   a. For significant archaeological resources encountered during monitoring, the ADRP or Pipeline Trenching Discovery Process shall be included in the Draft Monitoring Report.

   b. Recording Sites with State of California Department of Parks and Recreation

      The PI shall be responsible for recording (on the appropriate State of California Department of Parks and Recreation forms DPR 523 A/B) any significant or potentially significant resources encountered during the Archaeological Monitoring Program in accordance with the City's HRG, and submittal of such forms to the South Coastal Information Center with the Final Monitoring Report.

2. MMC shall return the Draft Monitoring Report to the PI via the RE for revision or for preparation of the Final Report.

3. The PI shall submit revised Draft Monitoring Report to MMC via the RE for approval.

4. MMC shall provide written verification to the PI of the approved report.

5. MMC shall notify the RE or CM, as appropriate, of receipt of all Draft Monitoring Report submittals and approvals.

B. Handling of Artifacts

1. The PI shall be responsible for ensuring that all cultural remains collected are cleaned and catalogued

2. The PI shall be responsible for ensuring that all artifacts are analyzed to identify function and chronology as they relate to the history of the area; that faunal material is identified as to species; and that specialty studies are completed, as appropriate.

C. Curation of artifacts: Accession Agreement and Acceptance Verification

1. The PI shall be responsible for ensuring that all artifacts associated with the survey, testing and/or data recovery for this project are permanently curated with an appropriate institution. This shall be completed in consultation with MMC and the Native American representative, as applicable.

2. When applicable to the situation, the PI shall include written verification from the Native American consultant/monitor indicating that Native American resources were treated in accordance with state law and/or applicable agreements. If the resources were reinterred, verification shall be provided to show what protective measures were taken to ensure no further disturbance occurs in accordance with Section IV – Discovery of Human Remains, Subsection C.

3. The PI shall submit the Accession Agreement and catalogue record(s) to the RE or CM, as appropriate for donor signature with a copy submitted to MMC.

4. The RE or CM, as appropriate shall obtain signature on the Accession Agreement and shall return to PI with copy submitted to MMC.

5. The PI shall include the Acceptance Verification from the curation institution in the Final Monitoring Report submitted to the RE or CM and MMC.

D. Final Monitoring Report(s)

1. The PI shall submit one copy of the approved Final Monitoring Report to the RE or CM as appropriate, and one copy to MMC (even if negative), within 90 days after notification from MMC of the approved report.

2. The RE shall in no case issue the Notice of Completion until receiving a copy of the approved Final Monitoring Report from MMC which includes the Acceptance Verification from the curation institution.

Noise

MM-NOI-4 A noise and vibration study shall be conducted during the final design phase for the NCPWF Influent Pump Station, Morena Pump Station, North City Pump Station, North City Renewable Energy Facility (both Project Alternatives), and the Mission Trails Booster Station (San Vicente Reservoir Alternative only). Pump station machinery and/or generators shall be housed within concrete structures with acoustically absorptive treatments where necessary, and additional measures such as sound enclosures, separate rooms for high noise equipment, etc. shall be incorporated into the final project design as necessary to assure that noise and vibration produced by operation of the facility shall not exceed the applicable limits in the municipal code.

Paleontological Resources

MM-PALEO-1 If construction of a project would occur within a formation with a moderate to high resource potential, monitoring during construction would be required, and a paleontological resources mitigation program consisting of the following components shall be implemented:

I. Prior to Permit Issuance or Bid Opening/Bid Award

A. Entitlements Plan Check

1. Prior to permit issuance or Bid Opening/Bid Award, whichever is applicable, the Assistant Deputy Director (ADD) Environmental designee shall verify that the requirements for Paleontological Monitoring have been noted on the appropriate construction documents.

B. Letters of Qualification have been submitted to ADD

1. Prior to Bid Award, the applicant shall submit a letter of verification to Mitigation Monitoring Coordinator (MMC) identifying the Principal Investigator (PI) for the Project and the names of all persons involved in the paleontological monitoring program, as defined in the City of San Diego Paleontology Guidelines.

2. MMC will provide a letter to the applicant confirming the qualifications of the PI and all persons involved in the paleontological monitoring of the Project.

3. Prior to the start of work, the applicant shall obtain approval from MMC for any personnel changes associated with the monitoring program.

II. Prior to Start of Construction

A. Verification of Records Search

1. The PI shall provide verification to MMC that a site-specific records search has been completed. Verification includes, but is not limited

to, a copy of a confirmation letter from San Diego Natural History Museum, other institution or, if the search was in-house, a letter of verification from the PI stating that the search was completed.

2. The letter shall introduce any pertinent information concerning expectations and probabilities of discovery during trenching and/or grading activities.

B. PI Shall Attend Precon Meetings

1. Prior to beginning any work that requires monitoring, the applicant shall arrange a Precon Meeting that shall include the PI, Construction Manager (CM), Grading Contractor, Resident Engineer (RE), Building Inspector (BI), if appropriate, and MMC. The qualified paleontologist shall attend any grading/excavation related Precon Meetings to make comments and/or suggestions concerning the Paleontological Monitoring program with the Construction Manager and/or Grading Contractor.

a. If the PI is unable to attend the Precon Meeting, the applicant shall schedule a focused Precon Meeting with MMC, the PI, RE, CM or BI, if appropriate, prior to the start of any work that requires monitoring.

2. Acknowledgement of Responsibility for Curation (CIP or Other Public Projects)

The applicant shall submit a letter to MMC acknowledging their responsibility for the cost of curation associated with all phases of the paleontological monitoring program.

3. Identify Areas to be Monitored

a. Prior to the start of any work that requires monitoring, the PI shall submit a Paleontological Monitoring Exhibit (PME) based on the appropriate construction documents (reduced to 11x17) to MMC for approval identifying the areas to be monitored including the delineation of grading/excavation limits. Monitoring shall begin at depths below 10 feet from existing grade or as determined by the PI in consultation with MMC. The determination shall be based on site-specific records search data which supports monitoring at depths less than 10 feet.

b. The PME shall be based on the results of a site-specific records search as well as information regarding existing known soil conditions (native or formation).

c. MMC shall notify the PI that the PME has been approved.

4. When Monitoring Will Occur

a. Prior to the start of any work, the PI shall also submit a construction schedule to MMC through the RE indicating when and where monitoring will occur.

b. The PI may submit a detailed letter to MMC prior to the start of work or during construction requesting a modification to the monitoring program. This request shall be based on relevant information such as review of final construction documents which indicate conditions such as depth of excavation and/or site graded to bedrock, presence or absence of fossil resources, etc., which may reduce or increase the potential for resources to be present.

5. Approval of PME and Construction Schedule

After approval of the PME by MMC, the PI shall submit to MMC written authorization of the PME and Construction Schedule from the CM.

III. During Construction

A. Monitor Shall be Present During Grading/Excavation/Trenching

1. The monitor shall be present full-time during grading/excavation/trenching activities including, but not limited to mainline, laterals, jacking and receiving pits, services and all other appurtenances associated with underground utilities as identified on the PME that could result in impacts to formations with high and/or moderate resource sensitivity. The Construction Manager is responsible for notifying the RE, PI, and MMC of changes to any construction activities such as in the case of a potential safety concern within the area being monitored. In certain circumstances Occupational Safety and Health Administration safety requirements may necessitate modification of the PME.

2. The PI may submit a detailed letter to MMC during construction requesting a modification to the monitoring program when a field condition such as trenching activities that do not encounter formational soils as previously assumed, and/or when unique/unusual fossils are encountered, which may reduce or increase the potential for resources to be present.

3. The monitor shall document field activity via the Consultant Site Visit Record (CSVR). The CSVR shall be emailed by the CM to the RE the first day of monitoring, the last day of monitoring, monthly (Notification of Monitoring Completion), and in the case of ANY discoveries. The RE shall forward copies to MMC.

B. Discovery Notification Process

1. In the event of a discovery, the Paleontological Monitor shall direct the contractor to temporarily divert trenching

activities in the area of discovery and immediately notify the RE or CM, as appropriate.

2. The Monitor shall immediately notify the PI (unless Monitor is the PI) of the discovery.

3. The PI shall immediately notify MMC by phone of the discovery, and shall also submit written documentation to MMC within 24 hours by email with photos of the resource in context, if possible.

C. Determination of Significance

1. The PI shall evaluate the significance of the resource.

a. The PI shall immediately notify MMC by phone to discuss significance determination and shall also submit a letter to MMC indicating whether additional mitigation is required. The determination of significance for fossil discoveries shall be at the discretion of the PI.

b. If the resource is significant, the PI shall submit a Paleontological Recovery Program (PRP) and obtain written approval of the program from MMC, MC and/or RE. PRP and any mitigation must be approved by MMC, RE, and/or CM before ground-disturbing activities in the area of discovery will be allowed to resume.

(1) Note: For pipeline trenching projects only, the PI shall implement the Discovery Process for Pipeline Trenching projects identified below under "D."

c. If resource is not significant (e.g., small pieces of broken common shell fragments or other scattered common fossils) the PI shall notify the RE, or CM as appropriate, that a non-significant discovery has been made. The Paleontologist shall continue to monitor the area without notification to MMC unless a significant resource is encountered.

d. The PI shall submit a letter to MMC indicating that fossil resources will be collected, curated, and documented in the Final Monitoring Report. The letter shall also indicate that no further work is required.

(1) Note: For Pipeline Trenching Projects Only. If the fossil discovery is limited in size, both in length and depth; the information value is limited and

there are no unique fossil features associated with the discovery area, then the discovery should be considered not significant.

(2) Note, for Pipeline Trenching Projects Only: If significance cannot be determined, the Final Monitoring Report and Site Record shall identify the discovery as Potentially Significant.

D. Discovery Process for Significant Resources - Pipeline Trenching Projects

The following procedure constitutes adequate mitigation of a significant discovery encountered during pipeline trenching activities including but not limited to excavation for jacking pits, receiving pits, laterals, and manholes to reduce impacts to below a level of significance.

1. Procedures for documentation, curation, and reporting

a. One hundred percent (100%) of the fossil resources within the trench alignment and width shall be documented in-situ photographically, drawn in plan view (trench and profiles of side walls), recovered from the trench and photographed after cleaning, then analyzed and curated consistent with Society of Invertebrate Paleontology Standards. The remainder of the deposit within the limits of excavation (trench walls) shall be left intact and so documented.

b. The PI shall prepare a Draft Monitoring Report and submit to MMC via the RE as indicated in Section VI-A.

c. The PI shall be responsible for recording (on the appropriate forms for the San Diego Natural History Museum) the resource(s) encountered during the Paleontological Monitoring Program in accordance with the City's Paleontological Guidelines (PG). The forms shall be submitted to the San Diego Natural History Museum and included in the Final Monitoring Report.

d. The Final Monitoring Report shall include a recommendation for monitoring of any future work in the vicinity of the resource.

IV. Night and/or Weekend Work

A. If night and/or weekend work is included in the contract

1. When night and/or weekend work is included in the contract package, the extent and timing shall be presented and discussed at the precon meeting.

2. The following procedures shall be followed.

a. No Discoveries

In the event that no discoveries were encountered during night and/or weekend work, the PI shall record the information on the CSVR and submit to MMC via the RE by email by 8AM on the next business day.

b. Discoveries

All discoveries shall be processed and documented using the existing procedures detailed in Sections III - During Construction.

c. Potentially Significant Discoveries

If the PI determines that a potentially significant discovery has been made, the procedures detailed under Section III - During Construction shall be followed.

d. The PI shall immediately contact the RE and MMC, or by 8:00 a.m. on the next business day to report and discuss the findings as indicated in Section III-B, unless other specific arrangements have been made.

B. If night and/or weekend work becomes necessary during the course of construction

1. The Construction Manager shall notify the RE, as appropriate, a minimum of 24 hours before the work is to begin.

2. The RE, or CM, as appropriate, shall notify MMC immediately.

C. All other procedures described above shall apply, as appropriate.

V. Post Construction

A. Preparation and Submittal of Draft Monitoring Report

1. The PI shall submit two copies of the Draft Monitoring Report (even if negative), prepared in accordance with the PG, which describes the

results, analysis, and conclusions of all phases of the Paleontological Monitoring Program (with appropriate graphics) to MMC via the RE for review and approval within 90 days following the completion of monitoring.

a. For significant paleontological resources encountered during monitoring, the Paleontological Recovery Program or Pipeline Trenching Discovery Process shall be included in the Draft Monitoring Report.

b. Recording Sites with the San Diego Natural History Museum

The PI shall be responsible for recording (on the appropriate forms) any significant or potentially significant fossil resources encountered during the Paleontological Monitoring Program in accordance with the City's PG, and submittal of such forms to the San Diego Natural History Museum with the Final Monitoring Report.

2. MMC shall return the Draft Monitoring Report to the PI via the RE for revision or for preparation of the Final Report.

3. The PI shall submit revised Draft Monitoring Report to MMC via the RE for approval.

4. MMC shall provide written verification to the PI of the approved report.

5. MMC shall notify the RE or CM, as appropriate, of receipt of all Draft Monitoring Report submittals and approvals.

B. Handling of Fossil Remains

1. The PI shall be responsible for ensuring that all fossil remains collected are cleaned and catalogued.

C. Curation of Fossil Remains: Deed of Gift and Acceptance Verification

1. The PI shall be responsible for ensuring that all fossil remains associated with the monitoring for this project are permanently curated with an appropriate institution.

2. The PI shall submit the Deed of Gift and catalogue record(s) to the RE or CM, as appropriate for donor signature with a copy submitted to MMC.

3. The RE or CM, as appropriate shall obtain signature on the Deed of Gift and shall return to PI with copy submitted to MMC.

4. The PI shall include the Acceptance Verification from the curation institution in the Final Monitoring Report submitted to the RE or CM and MMC.

D. Final Monitoring Report(s)

1. The PI shall submit two copies of the Final Monitoring Report to MMC (even if negative), within 90 days after notification from MMC of the approved report.

2. The RE shall, in no case, issue the Notice of Completion until receiving a copy of the approved Final Monitoring Report from MMC which includes the Acceptance Verification from the curation institution.

APPENDIX B

FIRE HYDRANT METER PROGRAM

CITY OF SAN DIEGO CALIFORNIA DEPARTMENT INSTRUCTIONS	NUMBER **DI** 55.27	DEPARTMENT Water Department
SUBJECT **FIRE HYDRANT METER PROGRAM (FORMERLY: CONSTRUCTION METER PROGRAM)**	**PAGE** 1 **OF** 10	**EFFECTIVE DATE** October 15, 2002
	SUPERSEDES **DI** 55.27	**DATED** April 21, 2000

1. **PURPOSE**

1.1 To establish a Departmental policy and procedure for issuance, proper usage and charges for fire hydrant meters.

2. **AUTHORITY**

2.1 All authorities and references shall be current versions and revisions.

2.2 San Diego Municipal Code (NC) Chapter VI, Article 7, Sections 67.14 and 67.15

2.3 Code of Federal Regulations, Safe Drinking Water Act of 1986

2.4 California Code of Regulations, Titles 17 and 22

2.5 California State Penal Code, Section 498B.0

2.6 State of California Water Code, Section 110, 500-6, and 520-23

2.7 Water Department Director

Reference

2.8 State of California Guidance Manual for Cross Connection Programs

2.9 American Water Works Association Manual M-14, Recommended Practice for Backflow Prevention

2.10 American Water Works Association Standards for Water Meters

2.11 U.S.C. Foundation for Cross Connection Control and Hydraulic Research Manual

3. **DEFINITIONS**

3.1 **Fire Hydrant Meter:** A portable water meter which is connected to a fire hydrant for the purpose of temporary use. (These meters are sometimes referred to as Construction Meters.)

3.2 **Temporary Water Use:** Water provided to the customer for no longer than twelve (12) months.

3.3 **Backflow Preventor:** A Reduced Pressure Principal Assembly connected to the outlet side of a Fire Hydrant Meter.

4. POLICY

4.1 The Water Department shall collect a deposit from every customer requiring a fire hydrant meter and appurtenances prior to providing the meter and appurtenances (see Section 7.1 regarding the Fees and Deposit Schedule). The deposit is refundable upon the termination of use and return of equipment and appurtenances in good working condition.

4.2 Fire hydrant meters will have a 2 ½" swivel connection between the meter and fire hydrant. The meter shall not be connected to the 4" port on the hydrant. All Fire Hydrant Meters issued shall have a Reduced Pressure Principle Assembly (RP) as part of the installation. Spanner wrenches are the only tool allowed to turn on water at the fire hydrant.

4.3 The use of private hydrant meters on City hydrants is prohibited, with exceptions as noted below. All private fire hydrant meters are to be phased out of the City of San Diego. All customers who wish to continue to use their own fire hydrant meters must adhere to the following conditions:

a. Meters shall meet all City specifications and American Water Works Association (AWWA) standards.

b. Customers currently using private fire hydrant meters in the City of San Diego water system will be allowed to continue using the meter under the following conditions:

1. The customer must submit a current certificate of accuracy and calibration results for private meters and private backflows annually to the City of San Diego, Water Department, Meter Shop.

2. The meter must be properly identifiable with a clearly labeled serial number on the body of the fire hydrant meter. The serial number shall be plainly stamped on the register lid and the main casing. Serial numbers shall be visible from the top of the meter casing and the numbers shall be stamped on the top of the inlet casing flange.

3. All meters shall be locked to the fire hydrant by the Water Department, Meter Section (see Section 4.7).

4. All meters shall be read by the Water Department, Meter Section (see Section 4.7).

5. All meters shall be relocated by the Water Department, Meter Section (see Section 4.7).

6. These meters shall be tested on the anniversary of the original test date and proof of testing will be submitted to the Water Department, Meter Shop, on a yearly basis. If not tested, the meter will not be allowed for use in the City of San Diego.

7. All private fire hydrant meters shall have backflow devices attached when installed.

8. The customer must maintain and repair their own private meters and private backflows.

9. The customer must provide current test and calibration results to the Water Department, Meter Shop after any repairs.

10. When private meters are damaged beyond repair, these private meters will be replaced by City owned fire hydrant meters.

11. When a private meter malfunctions, the customer will be notified and the meter will be removed by the City and returned to the customer for repairs. Testing and calibration results shall be given to the City prior to any re-installation.

12. The register shall be hermetically sealed straight reading and shall be readable from the inlet side. Registration shall be in hundred cubic feet.

13. The outlet shall have a 2 ½ "National Standards Tested (NST) fire hydrant male coupling.

14. Private fire hydrant meters shall not be transferable from one contracting company to another (i.e. if a company goes out of business or is bought out by another company).

4.4 All fire hydrant meters and appurtenances shall be installed, relocated and removed by the City of San Diego, Water Department. All City owned fire hydrant meters and appurtenances shall be maintained by the City of San Diego, Water Department, Meter Services.

4.5 If any fire hydrant meter is used in violation of this Department Instruction, the violation will be reported to the Code Compliance Section for investigation and appropriate action. Any customer using a fire hydrant meter in violation of the requirements set forth above is subject to fines or penalties pursuant to the Municipal Code, Section 67.15 and Section 67.37.

4.6 **Conditions and Processes for Issuance of a Fire Hydrant Meter**

Process for Issuance

a. Fire hydrant meters shall only be used for the following purposes:

1. Temporary irrigation purposes not to exceed one year.

2. Construction and maintenance related activities (see Tab 2).

b. No customer inside or outside the boundaries of the City of San Diego Water Department shall resell any portion of the water delivered through a fire hydrant by the City of San Diego Water Department.

c. The City of San Diego allows for the issuance of a temporary fire hydrant meter for a period not to exceed 12 months (365 days). An extension can only be granted in writing from the Water Department Director for up to 90 additional days. A written request for an extension by the consumer must be submitted at least 30 days prior to the 12 month period ending. No extension shall be granted to any customer with a delinquent account with the Water Department. No further extensions shall be granted.

d. Any customer requesting the issuance of a fire hydrant meter shall file an application with the Meter Section. The customer must complete a "Fire Hydrant Meter Application" (Tab 1) which includes the name of the company, the party responsible for payment, Social Security number and/or California ID, requested location of the meter (a detailed map signifying an exact location), local contact person, local phone number, a contractor's license (or a business license), description of specific water use, duration of use at the site and full name and address of the person responsible for payment.

e. At the time of the application the customer will pay their fees according to the schedule set forth in the Rate Book of Fees and Charges, located in the City Clerk's Office. All fees must be paid by check, money order or cashiers check, made payable to the City Treasurer. Cash will not be accepted.

f. No fire hydrant meters shall be furnished or relocated for any customer with a delinquent account with the Water Department.

g. After the fees have been paid and an account has been created, the

meter shall be installed within 48 hours (by the second business day). For an additional fee, at overtime rates, meters can be installed within 24 hours (within one business day).

4.7 **Relocation of Existing Fire Hydrant Meters**

a. The customer shall call the Fire Hydrant Meter Hotline (herein referred to as "Hotline"), a minimum of 24 hours in advance, to request the relocation of a meter. A fee will be charged to the existing account, which must be current before a work order is generated for the meter's relocation.

b. The customer will supply in writing the address where the meter is to be relocated (map page, cross street, etc). The customer must update the original Fire Hydrant Meter Application with any changes as it applies to the new location.

c. Fire hydrant meters shall be read on a monthly basis. While fire hydrant meters and backflow devices are in service, commodity, base fee and damage charges, if applicable, will be billed to the customer on a monthly basis. If the account becomes delinquent, the meter will be removed.

4.8 **Disconnection of Fire Hydrant Meter**

a. After ten (10) months a "Notice of Discontinuation of Service" (Tab 3) will be issued to the site and the address of record to notify the customer of the date of discontinuance of service. An extension can only be granted in writing from the Water Department Director for up to 90 additional days (as stated in Section 4.6C) and a copy of the extension shall be forwarded to the Meter Shop Supervisor. If an extension has not been approved, the meter will be removed after twelve (12) months of use.

b. Upon completion of the project the customer will notify the Meter Services office via the Hotline to request the removal of the fire hydrant meter and appurtenances. A work order will be generated

for removal of the meter.

c. Meter Section staff will remove the meter and backflow prevention assembly and return it to the Meter Shop. Once returned to the Meter Shop the meter and backflow will be tested for accuracy and functionality.

d. Meter Section Staff will contact and notify Customer Services of the final read and any charges resulting from damages to the meter and backflow or its appurtenance. These charges will be added on the customer's final bill and will be sent to the address of record. Any customer who has an outstanding balance will not receive additional meters.

e. Outstanding balances due may be deducted from deposits and any balances refunded to the customer. Any outstanding balances will be turned over to the City Treasurer for collection. Outstanding balances may also be transferred to any other existing accounts.

5. EXCEPTIONS

5.1 Any request for exceptions to this policy shall be presented, in writing, to the Customer Support Deputy Director, or his/her designee for consideration.

6. MOBILE METER

6.1 Mobile meters will be allowed on a case by case basis. All mobile meters will be protected by an approved backflow assembly and the minimum requirement will be a Reduced Pressure Principal Assembly. The two types of Mobile Meters are vehicle mounted and floating meters. Each style of meters has separate guidelines that shall be followed for the customer to retain service and are described below:

a) **Vehicle Mounted Meters**: Customer applies for and receives a City owned Fire Hydrant Meter from the Meter Shop. The customer mounts the meter on the vehicle and brings it to the Meter Shop for

inspection. After installation is approved by the Meter Shop the vehicle and meter shall be brought to the Meter Shop on a monthly basis for meter reading and on a quarterly basis for testing of the backflow assembly. Meters mounted at the owner's expense shall have the one year contract expiration waived and shall have meter or backflow changed if either fails.

b) **Floating Meters**: Floating Meters are meters that are not mounted to a vehicle. **(Note: All floating meters shall have an approved backflow assembly attached.)** The customer shall submit an application and a letter explaining the need for a floating meter to the Meter Shop. The Fire Hydrant Meter Administrator, after a thorough review of the needs of the customer, (i.e. number of jobsites per day, City contract work, lack of mounting area on work vehicle, etc.), may issue a floating meter. At the time of issue, it will be necessary for the customer to complete and sign the "Floating Fire Hydrant Meter Agreement" which states the following:

    1) The meter will be brought to the Meter Shop at 2797 Caminito Chollas, San Diego on the third week of each month for the monthly read by Meter Shop personnel.

    2) Every other month the meter will be read and the backflow will be tested. This date will be determined by the start date of the agreement.

If any of the conditions stated above are not met the Meter Shop has the right to cancel the contract for floating meter use and close the account associated with the meter. The Meter Shop will also exercise the right to refuse the issuance of another floating meter to the company in question.

Any Fire Hydrant Meter using reclaimed water shall not be allowed use again with any potable water supply. The customer shall incur the cost of replacing the meter and backflow device in this instance.

7. FEE AND DEPOSIT SCHEDULES

7.1 **Fees and Deposit Schedules:** The fees and deposits, as listed in the Rate Book of Fees and Charges, on file with the Office of the City Clerk, are based on actual reimbursement of costs of services performed, equipment and materials. Theses deposits and fees will be amended, as needed, based on actual costs. Deposits, will be refunded at the end of the use of the fire hydrant meter, upon return of equipment in good working condition and all outstanding balances on account are paid. Deposits can also be used to cover outstanding balances.

All fees for equipment, installation, testing, relocation and other costs related to this program are subject to change without prior notification. The Mayor and Council will be notified of any future changes.

8. UNAUTHORIZED USE OF WATER FROM A HYDRANT

8.1 Use of water from any fire hydrant without a properly issued and installed fire hydrant meter is theft of City property. Customers who use water for unauthorized purposes or without a City of San Diego issued meter will be prosecuted.

8.2 If any unauthorized connection, disconnection or relocation of a fire hydrant meter, or other connection device is made by anyone other than authorized Water Department personnel, the person making the connection will be prosecuted for a violation of San Diego Municipal Code, Section 67.15. In the case of a second offense, the customer's fire hydrant meter shall be confiscated and/or the deposit will be forfeited.

8.3 Unauthorized water use shall be billed to the responsible party. Water use charges shall be based on meter readings, or estimates when meter readings are not available.

8.4 In case of unauthorized water use, the customer shall be billed for all applicable charges as if proper authorization for the water use had been obtained, including but not limited to bi-monthly service charges, installation charges and removal charges.

8.5 If damage occurs to Water Department property (i.e. fire hydrant meter, backflow, various appurtenances), the cost of repairs or replacements will be charged to the customer of record (applicant).

SAMPLE CERTIFICATION LETTER FOR AMERICAN IRON AND STEEL (AIS) COMPLIANCE

SAMPLE CERTIFICATION LETTER

The following information is provided as a sample letter of **step** certification for AIS compliance. Documentation must be provided on company letterhead.

Date

Company Name

Company Address

City, State Zip

Subject: American Iron and Steel Step Certification for Project (XXXXXXXXXX)

I, (company representative), certify that the (melting, bending, coating, galvanizing, cutting, etc.) process for (manufacturing or fabricating) the following products and/or materials shipped or provided for the subject project is in full compliance with the American Iron and Steel requirement as mandated in EPA's State Revolving Fund Programs.

Item, Products and/or Materials:

1. Xxxx
2. Xxxx
3. Xxxx

Such process took place at the following location:

_____

If any of the above compliance statements change while providing material to this project we will immediately notify the prime contractor and the engineer.

Signed by company representative

APPENDIX H

MONTHLY DRINKING WATER DISCHARGE MONITORING FORM

DRINKING WATER DISCHARGE MONITORING FORM

(Use for All Discharges to the Storm Drain)

All discharge activities related to this project comply with the State Water Resources Control Board ORDER WQ 2014-0194-DWQ, STATEWIDE GENERAL NPDES PERMIT FOR DRINKING WATER SYSTEMS DISCHARGES as referenced by (http://www.waterboards.ca.gov/water_issues/programs/npdes/docs/drinkingwater/final_statewide_wqo2014_0194_dwq.pdf), and as follows:

Project Name:		**WBS No.:**		**Watershed No.**	
Qualified Person Conducting Tests:		**signature**			

BMPs MUST BE IN PLACE PRIOR TO ANY SCHEDULED DISCHARGE

By signing, I certify that all of the statements and conditions for drinking water discharge events are correct.

Event #1

Discharge Location[1]	Catergory[2] (Select one)	Notification[3] (Select all that apply)	BMPs in Place[4] (Select all that apply)	Volume[5] (gal)	Sampling[6] (take samples at 10 mins, 50-60 mins & last 10 mins)				Exceedence[7]			Notes
					Measure	Unit	Time	Result	Limit	*No*	*Yes*	Report exceedence to RE & complete page 2 of 2
Inlet Location	☐ Superchlorinated (Chlorine added for disinfection)	☐ TSW (All Categories)	☐ Sweep flow path (gutter, street, etc.)	**Total**	*Chlorine*	mg/L			0.1 mg/L= Exceedance			
	☐ Large Volume (≥ 325,850 gal)	☐ PUD (All Categories)	☐ Dechlorination (diffusers, chemicals, etc.)	**Reused** (if any)								
Start Date: Time:	☐ Well Dev/Rehab (Not Typical)	☐ Water Board (Large Volume Only)	☐ Inlet Protection		*Turbidity*	NTU			20 NTU= Exceedance 225 NTU= Exceedance for Ocean			
			☐ Erosion Controls									
End Date: Time:	☐ Small Volume/Other (No Sampling Required)	☐ County (≥100,000 gal & within ¼ mile of ocean/bay; or if enters the County's MS4)	☐ Sediment Controls		*pH*	Unit			Range 6.5 to 8.5			

Event #2

Discharge Location[1]	Catergory[2] (Select one)	Notification[3] (Select all that apply)	BMPs in Place[4] (Select all that apply)	Volume[5] (gal)	Sampling[6] (take samples at 10 mins, 50-60 mins & last 10 mins)				Exceedence[7]			Notes
					Measure	Unit	Time	Result	Limit	*No*	*Yes*	Report exceedence to RE & complete page 2 of 2

Submit completed Form to RE

Receiving Water Monitoring

(Complete only if limits exceed on Page 1 of 2)

Event #1		
1) Go to the location where the discharge enters the receiving water.		
☐ Accessible ☐ Unable to Determine ☐ No Safe Access		
2) If accessible, take photos and complete the visual monitoring below. If unable to determine, stop here. If no safe access, stop here.		
3) Visual Monitoring: Is the discharge into the receiving water…		
…causing erosion	☐ Yes	☐ No
…carrying floating or suspended matter	☐ Yes	☐ No
…causing discoloration	☐ Yes	☐ No
…causing and impact to the aquatic life present	☐ Yes	☐ No
…observed with visible film	☐ Yes	☐ No
…observed with an sheen or coating	☐ Yes	☐ No
…causing potential nuisance conditions	☐ Yes	☐ No
3) If all answers are NO, stop here.		
4) If any answers are YES, Notify the RE immediately for further action		

Event #2		
1) Go to the location where the discharge enters the receiving water.		
☐ Accessible ☐ Unable to Determine ☐ No Safe Access		
2) If accessible, take photos and complete the visual monitoring below. If unable to determine, stop here. If no safe access, stop here.		
3) Visual Monitoring: Is the discharge into the receiving water…		
…causing erosion	☐ Yes	☐ No
…carrying floating or suspended matter	☐ Yes	☐ No
…causing discoloration	☐ Yes	☐ No
…causing and impact to the aquatic life present	☐ Yes	☐ No
…observed with visible film	☐ Yes	☐ No
…observed with an sheen or coating	☐ Yes	☐ No
…causing potential nuisance conditions	☐ Yes	☐ No
3) If all answers are NO, stop here.		
4) If any answers are YES, Notify the RE immediately for further action		

Instructional Notes

1) Log the location of the inlet or discharge point. For example: Albatross St & 5th Av. Log the start date and time and the end date and time of the discharge.
2) Log the discharge category. "Superchlorinated" are discharges where additional chlorine is added in order to adequately disinfect and sanitize drinking water system facilities. This does NOT include potable water containing residual chlorine from the water treatment process. "Large Volume" discharges are greater than 325,850 gallons of total volume for one event. "Well Dev/Rehab" are discharges of potable ground water from a well. This is not typical. If none of these categories apply, then select "Small Volume/Other."
3) Notifications of the location, date, time, category, and estimated volume of discharge must be made to the contacts and per the requirements below:

Contact	When to Notify	Email
TSW	3 days prior to all discharges	SWPPP@SanDiego.gov
PUD	3 days prior to all discharges	CompReports@SanDiego.gov Rdavenport@SanDiego.gov
San Diego Water Board	3 days prior to Large Volume discharges	SanDiego@WaterBoards.ca.gov Ben.Neill@WaterBoards.ca.gov
County of San Diego	3 days prior if 100,000 gal and within 1/4 mile of ocean/bay	DEH: Joseph.Palmer@SDCounty.ca.gov Dominique.Edwards@SDCounty.ca.gov
	3 days prior if enter county MS4 or unincorporated County	WPP:Nicholas.DeValle@SDCounty.ca.gov LUEG.Watersheds@sdcounty.ca.gov

4) At a minimum, sweep gutters prior to starting discharge and use dechlorination BMPs. The contractor and RE must monitor and determine if BMPs need to be removed or modified. For example if inlet protection is causing flooding at a storm drain inlet, contractor may elect to remove BMPs. Document any modification to BMPs in the notes
5) Total volume must be logged for all discharges. If discharge water is reused for other purposes such as watering a golf course, log that volume under "Reused"
6) Sampling is required for categories per the following table:

Category	Measure	Sample Frequency
Superchlorinated	Chlorine, Turbidity, pH	first 10 min, 50-60 min, last 10 min
Large Volume	Chlorine Turbidity	first 10 min, 50-60 min, last 10 min
Well Dev/Rehab	Chlorine Turbidity	first 10 min, 50-60 min, last 10 min
Small Volume/Other	None required	N/A

7) Effluent limitations must be monitored not to exceed per the following table:

Measure	Method	Limit
Chlorine	Field Measure	0.10 mg/L-Cl
Turbidity	Visual Estimate	20 NTU for inland waters 225 NTU for ocean 100 NTU for wells
pH	Field Meausre	6.5 - 8.5

INCIDENT/RELEASE ASSESSMENT FORM [1]

If you have an emergency, Call 911

Handlers of hazardous materials are required to report releases. The following is a tool to be used for assessing if a release is reportable. Additionally, a non-reportable release incident form is provided to document why a release is not reported (see back).

Questions for Incident Assessment:	YES	NO
1. Was anyone killed or injured, or did they require medical care or admitted to a hospital for observation?	❒	❒
2. Did anyone, other than employees in the immediate area of the release, evacuate?	❒	❒
3. Did the release cause off-site damage to public or private property?	❒	❒
4. Is the release greater than or equal to a reportable quantity (RQ)?	❒	❒
5. Was there an uncontrolled or unpermitted release to the air?	❒	❒
6. Did an uncontrolled or unpermitted release escape secondary containment, or extend into any sewers, storm water conveyance systems, utility vaults and conduits, wetlands, waterways, public roads, or off site?	❒	❒
7. Will control, containment, decontamination, and/or clean up require the assistance of federal, state, county, or municipal response elements?	❒	❒
8. Was the release or threatened release involving an unknown material or contains an unknown hazardous constituent?	❒	❒
9. Is the incident a threatened release (a condition creating a substantial probability of harm that requires immediate action to prevent, reduce, or mitigate damages to persons, property, or the environment)?	❒	❒
10. Is there an increased potential for secondary effects including fire, explosion, line rupture, equipment failure, or other outcomes that may endanger or cause exposure to employees, the general public, or the environment?	❒	❒

If the answer is YES to any of the above questions – report the release to the California Office of Emergency Services at 800-852-7550 and the local CUPA daytime: (619) 338-2284, after hours: (858) 565-5255. Note: other state and federal agencies may require notification depending on the circumstances.

Call 911 in an emergency

If all answers are NO, complete a Non Reportable Release Incident Form (page 2 of 2) and keep readily available. Documenting why a "no" response was made to each question will serve useful in the event questions are asked in the future, and to justify not reporting to an outside regulatory agency.

If in doubt, report the release.

[1] This document is a guide for accessing when hazardous materials release reporting is required by Chapter 6.95 of the California Health and Safety Code. It does not replace good judgment, Chapter 6.95, or other state or federal release reporting requirements.

NON REPORTABLE RELEASE INCIDENT FORM

EMERGENCY RELEASE FOLLOW-UP NOTICE
REPORTING FORM INSTRUCTIONS

GENERAL INFORMATION:

Chapter 6.95 of Division 20 of the California Health and Safety Code requires that written emergency release follow-up notices prepared pursuant to 42 U.S.C. § 11004, be submitted using this reporting form. Non-permitted releases of reportable quantities of Extremely Hazardous Substances (listed in 40 CFR 355, appendix A) or of chemicals that require release reporting under section 103(a) of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 [42 U.S.C. § 9603(a)] must be reported on the form, as soon as practicable, but no later than 30 days, following a release. The written follow-up report is required in addition to the verbal notification.

BASIC INSTRUCTIONS:

- The form, when filled out, reports follow-up information required by 42 U.S.C § 11004. Ensure that all information requested by the form is provided as completely as possible.
- If the incident involves reportable releases of more than one chemical, prepare one report form for each chemical released.
- If the incident involves a series of separate releases of chemical(s) at different times, the releases should be reported on separate reporting forms.

SPECIFIC INSTRUCTIONS:

Block A: Enter the name of the business and the name and phone number of a contact person who can provide detailed facility information concerning the release.

Block B: Enter the date of the incident and the time that verbal notification was made to OES. The OES control number is provided to the caller by OES at the time verbal notification is made. Enter this control number in the space provided.

Block C: Provide information pertaining to the location where the release occurred. Include the street address, the city or community, the county and the zip code.

Block D: Provide information concerning the specific chemical that was released. Include the chemical or trade name and the Chemical Abstract Service (CAS) number. Check all categories that apply. Provide best available information on quantity, time and duration of the release.

Block E: Indicate all actions taken to respond to and contain the release as specified in 42 U.S.C. § 11004(c).

Block F: Check the categories that apply to the health effects that occurred or could result from the release. Provide an explanation or description of the effects in the space provided. Use Block H for additional comments/information if necessary to meet requirements specified in 42 U.S.C. § 11004(c).

Block G: Include information on the type of medical attention required for exposure to the chemical released. Indicate when and how this information was made available to individuals exposed and to medical personnel, if appropriate for the incident, as specified in 42 U.S.C. § 11004(c).

Block H: List any additional pertinent information.

Block I: Print or type the name of the facility representative submitting the report. Include the official signature and the date that the form was prepared.

MAIL THE COMPLETED REPORT TO:

State Emergency Response Commission (SERC)
Attn: Section 304 Reports
Hazardous Materials Unit
3650 Schriever Avenue
Mather, CA 95655

NOTE: Authority cited: Sections 25503, 25503.1 and 25507.1, Health and Safety Code. Reference: Sections 25503(b)(4), 25503.1, 25507.1, 25518 and 25520, Health and Safety Code.

APPENDIX K

SAMPLE OF PUBLIC NOTICE

The City of SAN DIEGO

CONSTRUCTION NOTICE

PROJECT TITLE

Work on your street will begin within one week to replace the existing water mains servicing your community.

The work will consist of:

- Saw-cutting and trench work on Ingulf Street from Morena Boulevard to Galveston Street to install new water mains, water laterals and fire hydrants.
- Streets where trenching takes place will be resurfaced and curb ramps will be upgraded to facilitate access for persons with disabilities where required.
- This work is anticipated to be complete in your community by December 2016.

How your neighborhood may be impacted:

- Water service to some properties during construction will be provided by a two-inch highline pipe that will run along the curb. To report a highline leak call 619-515-3525.
- Temporary water service disruptions are planned. If planned disruptions impact your property, you will receive advance notice.
- Parking restrictions will exist because of the presence of construction equipment and materials.
- "No Parking" signs will be displayed 72 hours in advance of the work.
- Cars parked in violation of signs will be TOWED.

Hours and Days of Operation:
Monday through Friday X:XX AM to X:XX PM.

City of San Diego Contractor:
Company Name, XXX-XXX-XXXX

To contact the City of San Diego: SD Public Works
619-533-4207 | engineering@sandiego.gov | sandiego.gov/CIP

This information is available in alternative formats upon request.

APPENDIX L

ADVANCED METERING INFRASTRUCTURE (AMI) DEVICE PROTECTION

Protecting AMI Devices in Meter Boxes and on Street Lights

The Public Utilities Department (PUD) has begun the installation of the Advanced Metering Infrastructure (AMI) technology as a new tool to enhance water meter reading accuracy and efficiency, customer service and billing, and to be used by individual accounts to better manage the efficient use of water. **All AMI devices shall be protected per Section 402-2, "Protection", of the 2018 Whitebook.**

AMI technology allows water meters to be read electronically rather than through direct visual inspection by PUD field staff. This will assist PUD staff and customers in managing unusual consumption patterns which could indicate leaks or meter tampering on a customer's property.

Three of the main components of an AMI system are the:

A. Endpoints, see Photo 1:

Photo 1

B. AMI Antenna attached to Endpoint (antenna not always required), see Photo 2:

Photo 2

Network Devices, see Photo 3:

Photo 3

AMI endpoints transmit meter information to the AMI system and will soon be on the vast majority of meters in San Diego. These AMI devices provide interval consumption data to the PUD's Customer Support Division. If these devices are damaged or communication is interrupted, this Division will be alerted of the situation. The endpoints are installed in water meter boxes, coffins, and vaults adjacent to the meter. A separate flat round antenna may also be installed through the meter box lid. This antenna is connected to the endpoint via cable. The following proper installation shall be implemented when removing the lid to avoid damaging the antenna, cable, and/or endpoint. Photo 4 below demonstrates a diagram of the connection:

Photo 4

The AMI device ERT/Endpoint/Transmitter shall be positioned and installed as discussed in this Appendix. If the ERT/Endpoint/Transmitter is disturbed, it shall be re-installed and returned to its original installation with the end points pointed upwards as shown below in Photo 5.

The PUD's code compliance staff will issue citations and invoices to you for any damaged AMI devices that are not re-installed as discussed in the Contract Document
Photo 5 below shows a typical installation of an AMI endpoint on a water meter.

Photo 5

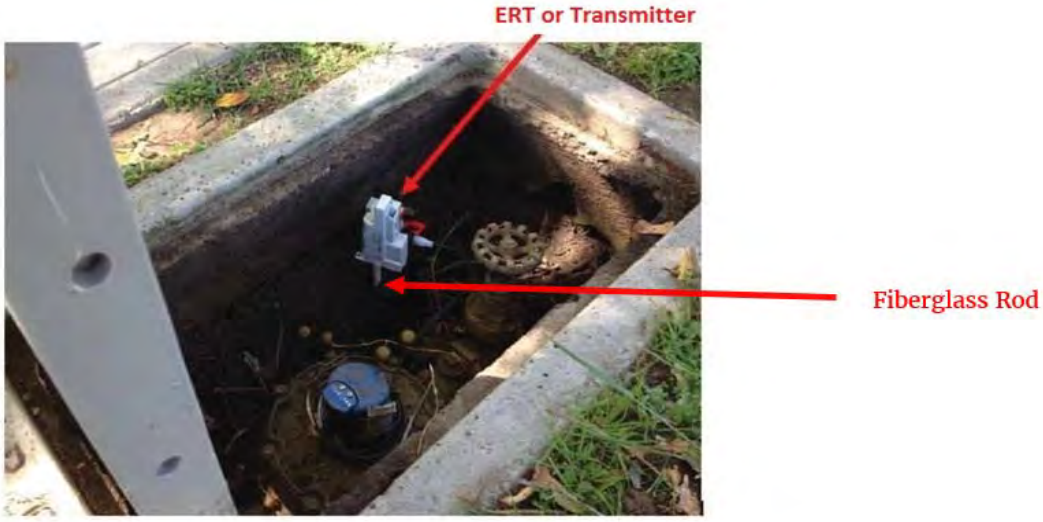

Photo 6 below is an example of disturbance that shall be avoided:

Photo 6

You are responsible when working in and around meter boxes. If you encounter these endpoints, use proper care and do not disconnect them from the registers on top of the water meter. If the lid has an antenna drilled through, do not change or tamper with the lid and inform the Resident Engineer immediately about the location of that lid. Refer to Photo 7 below:

Photo 7

Another component of the AMI system are the Network Devices. The Network Devices are strategically placed units (mainly on street light poles) that collect interval meter reading data from multiple meters for transmission to the Department Control Computer. **If you come across any of these devices on street lights that will be removed or replaced (refer to Photos 8 and 9 below), notify AMI Project Manager Arwa Sayed at (619) 362-0121 immediately.**

Photo 8 shows an installed network device on a street light. On the back of each Network Device is a sticker with contact information. See Photo 9. **Call PUD Water Emergency Repairs at 619-515-3525 if your work will impact these street lights.** These are assets that belong to the City of San Diego and you shall be responsible for any costs of disruption of this network.

Photo 8

Photo 9

If you encounter any bad installations, disconnected/broken/buried endpoints, or inadvertently damage any AMI devices or cables, notify the Resident Engineer immediately. The Resident Engineer will then immediately contact the AMI Project Manager, Arwa Sayed, at (619) 362-0121.

APPENDIX M

NONDISCLOSURE AGREEMENT

NONDISCLOSURE AGREEMENT
REGARDING
[Permanent Security Measures/Morena Pump Station]

This Nondisclosure Agreement ("Agreement") is made as of [date] by and between [name] [legal form of entity] ("Consultant") and the City of San Diego, a municipal corporation ("City") (collectively "parties"0.

1. **Purpose.** This Agreement is intended to allow the Consultant to view certain Confidential Information (defined herein) of the City who will be involved with the construction and providing support for the installation of the permanent security measures as proposed for the Morena Pump Station, while ensuring that the Confidential Information is protected against unauthorized use or disclosure.

2. **Confidential Information.** "Confidential Information" means the project security plans (SEC-01 through SEC-12) and specifications (Division 28) of buildings and other improvements of the City's Public Utilities Department's ("Department") infrastructure. Consultant's access to the Confidential Information will be provided through the Department's document management system.

3. **Nondisclosure of Confidential Information.**

(a) Consultant agrees it shall not use the Confidential Information for any purpose other than that stated in Section 1. Consultant shall restrict access to the Confidential Information to only those employees who are necessary to perform the purpose stated in Section 1. Consultant shall not disclose or permit disclosure of the Confidential Information to third parties (including subconsultants and agents) or to employees of Consultant who are not required to have the information for the purpose stated in Section 1. Consultant shall advise its employees who have access to the Confidential Information of the confidentiality obligations in this Agreement. Consultant shall take all reasonable measures to protect the secrecy and use of the Confidential Information and to prevent its disclosure to or use by persons not authorized by this Agreement and to prevent it from falling into the public domain. Such measures shall include, but not be limited to, the highest degree of care that Consultant exercises to protect its own confidential or proprietary information, which shall be no less than reasonable care. Consultant shall notify the City in writing of any actual or suspected misuse, misappropriation or unauthorized disclosure of Confidential Information that comes to Consultant's attention.

(b) Consultant shall not have liability to the City with regard to any Confidential Information that the Consultant can prove:

(i) was in the public domain at the time it was disclosed or has entered the public domain through no fault of the Consultant;

(ii) was known to the Consultant without restriction at the time of disclosure, as demonstrated by files in existence at the time of disclosure;

(iii) is disclosed with the prior written approval of the City;

(iv) becomes known to the Consultant, without restriction, from a source other than the City without breach of this Agreement by the Consultant and otherwise not in violation of City's rights;

(v) is disclosed generally to third parties by the City without restrictions similar to those contained in this Agreement; or

(vi) is disclosed pursuant to the order or requirement of a court, administrative agency, or other governmental body; provided, however, that the Consultant shall give prompt notice of such court order or requirement to the City to enable the City to seek a protective order or otherwise prevent or restrict such disclosure.

4. **Remedies; Indemnification.** The Consultant agrees that its obligations set forth in this Agreement are necessary and reasonable in order to protect the City and its business. The Consultant agrees that due to the unique nature of the Confidential Information, monetary damages would be inadequate to compensate the City for any breach by the Consultant of its covenants and agreements set forth in this Agreement. Accordingly, the Consultant agrees and acknowledges that any such violation or threatened violation shall cause irreparable injury to the City and that, in addition to any other remedies that may be available, in law, in equity or otherwise, the City shall be entitled (a) to obtain injunctive relief against the threatened breach of this Agreement or the continuation of any such breach by the Consultant, without the necessity of proving actual damages, and (b) to be indemnified by the Consultant from any loss or harm, including but not limited to attorney's fees, arising out of or in connection with any breach or enforcement of the Consultant's obligations under this Agreement or the unauthorized use or disclosure of the disclosing party's Confidential Information.

5. **Return of Materials.** All copies of the Confidential Information shall be promptly returned to the City by the Consultant at the conclusion of its services or within ten (10) days after the written request of the City.

6. **No Rights Granted.** Nothing in this Agreement shall be construed as granting the Consultant any rights in or to the Confidential Information other than the limited right to review such Confidential Information solely for the purpose stated in Section 1.

7. **No Publicity.** Consultant shall not, without the prior consent of the City, disclose to any other person the fact that Confidential Information has been and/or may be disclosed under this Agreement, or any of the terms, conditions, status or other facts with respect thereto, except as required by law and then only with prior notice as soon as possible to the City.

8. **Term.** Consultant's confidentiality and nondisclosure obligations shall survive into perpetuity.

9. **Successors and Assigns.** The terms and conditions of this Agreement shall inure to the benefit of and be binding upon the respective successors and assigns of the parties, provided that access to the Confidential Information and any Confidential Information in Consultant's possession may not be assigned without the prior written consent of the City unless the assignee is the successor entity to the assignor upon the dissolution of the assignor in its present form. Nothing in this Agreement, express or implied, is intended to

confer upon any party other than the parties hereto or their respective successors and assigns any rights, remedies, obligations, or liabilities under or by reason of this Agreement, except as expressly provided in this Agreement.

10. **Severability.** If one or more provisions of this Agreement are held to be unenforceable under applicable law, the parties agree to renegotiate such provision in good faith. In the event that the parties cannot reach a mutually agreeable and enforceable replacement for such provision, then (a) such provision shall be excluded from this Agreement, (b) the balance of the Agreement shall be interpreted as if such provision were so excluded and (c) the balance of the Agreement shall be enforceable in accordance with its terms.

11. **Governing Law; Jurisdiction.** This Agreement and all acts and transactions pursuant hereto and the rights and obligations of the parties hereto shall be governed, construed and interpreted in accordance with the laws of the State of California, without giving effect to principles of conflicts of law. Each of the parties hereto consents to the exclusive jurisdiction and venue of the courts of San Diego County, California.

12. **Amendment and Waiver.** No amendment of this Agreement is valid or effective unless made in writing and consented to by the Consultant and City. Any amendment or waiver effected in accordance with this Section shall be binding upon the parties and their respective successors and assigns. Failure to enforce any provision of this Agreement by a party shall not constitute a waiver of any term hereof by such party.

13. **Counterparts.** This Agreement may be executed in two or more counterparts, each of which shall be deemed an original and all of which together shall constitute one instrument.

14. **Entire Agreement.** This Agreement is the product of both of the parties hereto, and constitutes the entire agreement between such parties pertaining to the subject matter hereof, and merges all prior negotiations and drafts of the parties with regard to the transactions contemplated herein. Any and all other written or oral agreements existing between the parties hereto regarding such transactions are expressly canceled.

[REMAINDER OF THIS PAGE INTENTIONALLY LEFT BLANK]

IN WITNESS WHEREOF, the undersigned parties hereby execute this Nondisclosure Agreement Regarding [state nature of work/project scope of work ("a condition assessment of the City's buildings pursuant to its scope of work under Agreement XXXX")] as of the date first above written.

SWPPP CONSTRUCTION BMP MAINTENANCE LOG

SWPPP Construction BMP Maintenance Log

Examples of construction BMP maintenance activites include but are not limited to tasks listed below. The contractor is ultimately responsible for compliance with the Storm Water Standards Manual and/or the Construction General Permit, and for ensuring all BMPs function per manufacturer's specifications. Use the attached log to schedule and document maintenance activities. The log shall be kept with the project SWPPP document at all times.

Construction BMP Maintenance Acitivities

- Maintain stabilized construction entrances/exits
- Redress gravel/rock to full coverage and remove any sediment accumulation
- Remove and replace geotextile/compost blanket/plastic with holes or tears
- Redress and restabilize erosion or rilling greater than 1-inch deep
- Reapply hydraulic stabilization products to full coverage
- Remove and replace silt fence/fiber roll/gravel bags/etc. with holes or tears
- Reinstall or replace silt fence/fiber roll/etc. with sags
- Remove sediment accumulation from perimeter controls
- Remove sediment accumulation from storm drain inlet protection and check dams
- Remove sediment accumulation from energy dissipators
- Repair or remove any vehicle/equipment that leaks
- Remove any accumulation in drip pans or containment
- Empty concrete washouts when they reach 75% capacity
- Empty waste disposal containers when they reach 95% capacity

CONTRACT AGREEMENT

CONTRACT AGREEMENT

CONSTRUCTION CONTRACT

This Phase-Funded contract is made and entered into between **THE CITY OF SAN DIEGO**, a municipal corporation, herein called "City", and **Flatiron West, Inc**. herein called "Contractor" for construction of **Morena Pump Station**; Bid No. **K-21-1801-DBB-3-A;** in the total amount of **One Hundred Ten Million Three Hundred Eighty Six Thousand Three Hundred Fifty Dollars and Zero Cents ($110,386,350.00),** which is comprised of the Base Bid consisting of an amount not to exceed **$53,531,000.00** for Phase 1, not to exceed **$44,446,000.00** for Phase 2, not to exceed **$11,297,000.00** for Phase 3, and not to exceed **$1,112,350.00** for Phase 4. IN CONSIDERATION of the payments to be made hereunder and the mutual undertakings of the parties hereto, City and Contractor agree as follows:

1. The following are incorporated into this contract as though fully set forth herein:

   (a) The attached Faithful Performance and Payment Bonds.

   (b) The attached Proposal included in the Bid documents by the Contractor.

   (c) Reference Standards listed in the Instruction to Bidders and the Supplementary Special Provisions (SSP).

   (d) Phased Funding Schedule Agreement.

   (e) That certain documents entitled **Morena Pump Station**, on file in the office of the City Clerks Department as Document No. **B-15141** as well as all matters referenced therein.

2. The Contractor shall perform and be bound by all the terms and conditions of this contract and in strict conformity therewith shall perform and complete in a good and workmanlike manner **Morena Pump Station**, Bid Number **K-21-1801-DBB-3-A,** San Diego, California.

3. For such performances, the City shall pay to Contractor the amounts set forth at the times and in the manner and with such additions or deductions as are provided for in this contract, and the Contractor shall accept such payment in full satisfaction of all claims incident to such performances

4. No claim or suit whatsoever shall be made or brought by Contractor against any officer, agent, or employee of the City for or on account of anything done or omitted to be done in connection with this contract, nor shall any such officer, agent, or employee be liable hereunder.

5. This contract is effective as of the date that the Mayor or designee signs the agreement.

IN WITNESS WHEREOF, this Agreement is signed by the City of San Diego, acting by and through its Mayor or designee, pursuant to Resolution No. **R - 312062** authorizing such execution.

ATTACHMENT H

ESCROW BID DOCUMENTS

1. ESCROW BID DOCUMENTS

1.1. Definition and Purpose

The Escrow Bid Documents (EBD) are a compilation of all the documentary information generated in preparation of bid prices for this project. EBDs will be used to assist in the negotiation of price adjustments and variations and in the settlement of disputes, claims and other controversies. They will not be used for pre-award evaluation of the Contractor's anticipated methods of construction or to assess the Contractor's qualifications for performing the Work.

1.2. General

1.2.1. All bidders shall submit a copy of the EBD within 4 working days of the bid opening.

1.2.2. The successful bidder agrees, as a condition of award of the Contract, that the Escrow Bid Documents constitute the only complete documentary information used in preparation of his bid. No other bid preparation information shall be considered in resolving disputes.

1.2.3. Nothing in the Escrow Bid Documents shall change or modify the terms or conditions of the Contract.

1.3. Ownership

1.3.1. The EBDs are and shall always remain the property of the Contractor subject only to joint review by the City and the Contractor, except as provided for herein.

1.3.2. The City stipulates and expressly acknowledges that the EBDs, as defined herein, constitute trade secrets. This acknowledgment is based on the City's express understanding that the information contained in the EBDs is not known outside the Contractor's business, is known only to a limited extent and only by a limited number of employees of the Contractor, is safeguarded while in the Contractor's possession, and is extremely valuable to competitors by virtue of its reflecting the Contractor's contemplated techniques of construction.

1.3.3. The City acknowledges that EBDs and the information contained therein are made available to the City only because such action is an express prerequisite to award of the Contract. The City acknowledges that the EBDs include a compilation of information used in the Contractor's business, intended to give the Contractor an opportunity to obtain an advantage over competitors who do not know of or use the contents of the documentation. The City agrees to safeguard the EBDs and all information contained therein to the fullest extent permitted by law.

1.3.4. The City agrees to safeguard the EBDs and all information contained therein from any California Public Act Request to the fullest extent permitted by law.

1.4. Format and Contents

1.4.1. Bidders may submit EBDs in their usual cost estimating format. It is not intended that extra work is required in preparing the bid but to ensure that the EBDs will be adequate to enable complete and proper understanding and proper interpretation for their intended use. The EBDs shall be in the English language only.

1.4.2. The EBDs shall clearly itemize the estimated costs of performing the work of each item contained in the Bid Schedule. Items should be separated into sub-items as required to present a complete and detailed cost estimate and allow a detailed cost review. The EBDs shall include all quantity take-offs, crews, equipment, calculations of rates of production and progress, copies of quotations from sub-contractors and suppliers, and memoranda, narratives, consultants reports, add/deduct sheets and all other information used by the Contractor to arrive at the prices contained in the bid. Estimated costs shall be broken down into the Contractor's usual estimate categories such as direct labor, repair labor, equipment operation, equipment ownership, expendable materials, permanent material and subcontract costs as appropriate. Plant and equipment and indirect costs should be detailed in the Contractor's usual format. The Contractor's allocation of plant and equipment, indirect costs, contingencies, mark-up and other items to each bid item shall be clearly indicated.

1.4.3. The EBDs shall clearly show in calculations, text, or both, the relationship between baseline indications presented in the Contract Documents and assumptions that form the basis for the Contractor's means, methods, equipment selection, rates of production, and costs.

1.4.4. All costs shall be identified. For bid items where the extended amount is less than $10,000, estimated unit costs are acceptable without a detailed cost estimate, provided that labor, equipment, materials and subcontracts, as applicable, are included and provided that indirect costs, contingencies, and mark-up, as applicable, are allocated.

1.4.5. Bid Documents provided by the City should not be included in the EBDs unless needed to comply with the above requirements.

1.5. Submittal

1.5.1. All bidders shall submit their EBDs within 4 working days of the bid opening. The EBDs shall be submitted in a sealed container (e.g., sealed envelope, box or carton sealed with tape, locked strongbox, etc.), and the container shall be clearly marked on the outside with the Bidder's name, date of submittal, project name, Contract Number and the words "Escrow Bid Documents". The EBDs shall be submitted to:

Engineering & Capital Projects Department, Contracts Division
525 B Street, Suite 750 (7th Floor)
San Diego, California, 92101
Attention: Brittany Friedenreich

1.5.2. The EBDs shall be signed by an individual authorized by the bidder to execute the bid, stating that the material in the Escrow Bid Documentation constitutes all the documentary information used in the preparation of the bid and that he or she has personally examined the contents of the EBDs submission and has found that the documents are complete:

"ESCROW BID DOCUMENT CERTIFICATION"

THE UNDERSIGNED HEREBY CERTIFIES THAT THE BID DOCUMENTATION CONTAINED HEREIN CONSTITUTES ALL THE INFORMATION USED IN PREPARATION OF THE BID AND

THAT I HAVE PERSONALLY EXAMINED THESE CONTENTS AND HAVE FOUND THAT THIS BID DOCUMENTATION IS COMPLETE.

SIGNATURE: _____

NAME: _____
(Print)

TITLE: _____

FIRM: _____

DATE: _____

1.5.3. Prior to award of the contract, the EBDs of the apparent low bidder will be examined, organized and inventoried by representatives of the City, and members of the Contractor's staff who are knowledgeable in how the bid was prepared. This examination is to ensure that the EBDs are authentic, legible, and complete (as defined in 1.4). It will not include review of and will not constitute approval of proposed construction methods, estimating assumptions, or interpretations of the contract documents. Examination will not alter any condition(s) or term(s) of the Contract.

1.5.4. If the Contract is not awarded to the apparent low bidder, the EBDs of the next apparent low bidder to be considered for award shall be processed, as described above.

1.5.5. The City may reject the bid as non-responsive and ineligible for further consideration if the necessary EBDs are not submitted.

1.5.6. If the bidder's proposal is based on subcontracting any part of the Work, each subcontractor whose total subcontract price exceeds five percent of the total contract price proposed by the bidder, shall provide separate EBDs to be included with those of the bidder. These documents will be opened and examined in the same manner and at the same time as the examination described above for the apparent successful bidder. The failure to submit subcontractor EBDs may render contractor's bid non-responsive.

1.5.7. If the Contractor wishes to substitute a subcontractor for a portion of the Work which exceeds five percent of the total contract price proposed by the bidder after award, the City retains the right to require the Contractor to submit EBDs from the subcontractor before the subcontract is approved. This section is not intended to and shall not be interpreted as a waiver by the City of any of the requirements or provisions of public contract code section 4100 et seq. known as the Subletting and Subcontracting Fair Practices Act.

1.6. Storage

1.6.1. Absent a request from the Contractor to place the EBDs in possession of a third-party escrow agent, the EBDs will be stored by the City of San Diego, Public Works Department, Contracts Division. Upon written request from the Contractor, the EBDs shall be placed in escrow with a mutually agreeable institution for the life of the Contract, unless examination is required, which shall be conducted in accordance with this section. The cost of storage by third-party escrow agent will be borne by the Contractor.

1.7. Examination

1.7.1. The EBDs shall be examined by both the City and the Contractor, at any time deemed necessary by either the City or the Contractor, to assist in the negotiation of price adjustments and change orders, or the settlement of disputes.

1.7.2. Examination of the EBDs is subject to the following conditions:

1.7.2.1. As trade secrets, the EBDs are proprietary and confidential as described above

1.7.2.2. The City and the Contractor shall each designate, in writing to the other party a minimum of ten days prior to examination, representatives who are authorized to examine the EBDs. No other person shall have access to examine the EBDs.

1.7.2.3. Examination of the EBDs will take place only in the presence of duly designated representatives of both the City and the Contractor.

1.7.2.4. As escrow bid documents shall be examined by both the City and the Contractor to assist in the negotiation of price adjustments and change orders or the settlement of disputes as either party sees fit.

1.8. Final Disposition

1.8.1. The EBDs will be returned to the awarded Contractor upon completion and final settlement of the Contract.

1.8.2. The EBDs submitted by unsuccessful bidders will be returned unopened, unless opened as provided for above, following execution of the Contract.

ATTACHMENT I

PROJECT LABOR AGREEMENT (PLA)

CITY OF SAN DIEGO

PROJECT LABOR AGREEMENT

FOR CONSTRUCTION OF PURE WATER PROGRAM PHASE I PROJECTS

Effective Date: June 16, 2020

CITY OF SAN DIEGO

PROJECT LABOR AGREEMENT

FOR CONSTRUCTION OF PURE WATER PROGRAM

PHASE I COVERED PROJECTS

This Project Labor Agreement (hereinafter, "PLA" or "Agreement") is entered into this 16th day of June, 2020 by and between the San Diego Building and Construction Trades Council (hereinafter "Council"), and the signatory Craft Unions (hereinafter, together with the Council, collectively, the "Union" or "Unions"), and the Contractors performing work on Covered Projects that are subject to this Agreement. The City of San Diego is not a signatory Party to this Agreement, but shall be considered a "negotiating party" and will be responsible for implementing and administering the Agreement as described herein together with the Council, Unions and Contractors.

ARTICLE 1

RECITALS

WHEREAS, the City desires the completion of the Pure Water Program Phase I Projects in a professional, safe, efficient, and economical manner, without undue delay or work stoppage; and

WHEREAS, the successful completion of the City's Pure Water Program Phase I Projects are of the utmost importance to the rate payers and the City; and

WHEREAS, the Parties have pledged their full commitment to work towards a mutually satisfactory completion of the Pure Water Program Phase I Projects; and

WHEREAS, large numbers of workers of various skills will be required in the performance of the construction work on the Pure Water Program Phase I Projects, including workers affiliated with and/or represented by the Unions; and

WHEREAS, it is recognized that on construction projects with multiple contractors and bargaining units on the job site at the same time over an extended period of time, the potential for work disruption is substantial without an overriding commitment to maintain continuity of work; and

WHEREAS, the Parties agree that by establishing and stabilizing wages, hours, and working conditions for the workers employed on the Pure Water Program Phase I Projects, a

satisfactory, continuous, and harmonious relationship will exist among labor and management that will lead to the efficient and economical completion of Covered Projects; and

WHEREAS, in recognition of the special needs of the Project Work and to maintain a spirit of harmony, labor-management relations, peace, and stability during the term of this PLA, the Parties agree to establish effective and binding methods for the settlement of all misunderstandings, disputes and grievances without any strikes, slowdowns, work interruptions, or disruption of Project Work, and the Contractors agree not to engage in any lockout.

WHEREAS, the City places high priority upon the development of comprehensive programs for the recruitment, training, and employment of City Residents and Targeted Workers, and also recognizes the ability of local Apprenticeship Programs to provide meaningful and sustainable careers in the building and construction industry. The Parties will encourage City Residents and Targeted Workers to participate in Project Work through programs and procedures jointly developed to prepare and encourage such individuals for entrance into Apprenticeship Programs and formal employment on the Project Work through the referral programs sponsored and/or supported by the Parties to this PLA.; and

WHEREAS, the Project Work will provide opportunities for Disadvantaged Business Enterprises to participate as Contractors, subcontractors, or suppliers, and the Parties therefore agree that they will cooperate with all efforts of the City, the Project Labor Coordinator, and other organizations retained by the City for this purpose, to encourage and assist the participation of Disadvantaged Business Enterprises in the Project Work. Specifically, all Parties understand that the City has established and quantified goals which place a strong emphasis on the utilization of Disadvantaged Business Enterprises on the Project. Each Party agrees that it shall participate in outreach programs and provide education, and assistance to businesses not familiar with working on projects of this scope. Further, the Parties shall ensure that the provisions of this PLA do not inadvertently establish impediments to participation of such Disadvantaged Business Enterprises, City Residents and Targeted Workers.

WHEREAS, it is further understood that the City is a real party in interest to this Agreement and shall actively administer and enforce the obligations of this PLA to ensure that the benefits of this Agreement flow to all signatory Parties, craft persons working under it, and the rate payers and residents of the City. The City will send a letter to the Council to signify that the City will be performing its obligation under this Agreement and will designate a “Project Labor Coordinator,” either from its own staff and/or an independent contractor acting on behalf of the City, to monitor and enforce compliance with this PLA. In addition, this letter will state that the City will include and incorporate this Agreement into each Covered Project's construction documents. The Project Labor Coordinator, as the authorized representative of the City, will assist with the development and implementation of the programs referenced in this PLA, all of which are critical to fulfilling the intent and purposes of the Parties and this PLA.

NOW, THEREFORE, IT IS AGREED BETWEEN AND AMONG THE PARTIES AS FOLLOWS:

ARTICLE 2

DEFINITIONS

Capitalized terms utilized in this PLA which are not otherwise defined herein shall have the meanings ascribed to said terms below.

"Agreement" means this Project Labor Agreement (PLA).

"Applicable Prevailing Determination" means the prevailing wage determinations applicable to Project Work pursuant to the State of California Labor Code.

"Apprentice" means an apprentice properly registered in an Apprenticeship Program for the entire time they are employed on a Covered Project.

"Apprenticeship Program" as used in this PLA shall be defined as an apprenticeship program certified by the State of California.

"City" means the City of San Diego and its departments delivering the Covered Projects.

"City Resident" means a City of San Diego permanent resident at the time of initial employment on a Covered Project or a Veteran residing anywhere.

"Contractor" means any contractor to whom the City awards a Construction Contract for Project Work and all subcontractors utilized by such Contractors for Project Work. The term "Contractor" includes any individual, firm, partnership, corporation, owner operator, or combination thereof, including joint ventures, that has entered into a contract with the City for Project Work, or any subcontractor who has signed a contract with a Contractor or another subcontractor for Project Work.

"Core Employees" are defined in Article 4, Section 4.6 (e).

"Council" means the San Diego County Building & Construction Trades Council.

"Covered Contract" means a contract awarded to a Contractor by the City for a Pure Water Program Phase I Project identified in Appendix A.

"Covered Project" or "Project Work" means a Pure Water Program Phase I Project that is identified in Appendix A and is limited to the construction site of work.

"Disadvantaged Business Enterprise" means a firm that has been certified via the Department of Transportation, but also includes: Minority Business Enterprises or Woman Business Enterprises certified by the Department of Transportation or the California Public Utilities Commission; and Small Local Business Enterprises or Emerging Local Business Enterprises certified by the City.

"Prime Contractor" means the prime Contractor awarded a Covered Contract in privity directly with the City.

"Project Labor Coordinator" means the designee of the City, either from its own staff and/or an independent entity acting on behalf of the City, to monitor compliance with this Agreement and assist with developing, implementing and administering the requirements, policies and programs referenced herein.

"Schedule A's" means the local master labor agreements of the Unions.

"Targeted Worker" means any individual qualifying for one (1) or more of the following Targeted Worker categories:

(a) Is a Veteran, or is the eligible spouse of a "Veteran of the United States armed forces, under Section 2(a) of the Jobs for Veterans Act (38 United States Code [U.S.C.] 4215[a]);

(b) At initial time of employment on a Covered Project, is an Apprentice with less than ten (10) percent of the work hours required for graduation to become a Journeyperson;

(c) Has no high school diploma or general education diploma (GED);

(d) Is homeless or has been homeless within the last year;

(e) Is a former foster youth;

(f) Is a custodial single parent;

(g) Is experiencing protracted unemployment (receiving unemployment benefits for at least three [3] months);

(h) Is a current recipient of government cash or food assistance benefits;

(i) Has a documented income at or below 100 percent of the Federal Poverty Level;

(j) Is formerly incarcerated with a history of involvement with the criminal justice system.

"Union" or "Unions" means any labor organization signatory to this Agreement acting in their own behalf and on behalf of their respective affiliates and member organizations whose names are subscribed hereto and who have, through their officers, executed this Agreement.

"Veteran" means a veteran or the eligible spouse of a veteran of the United States armed forces, under Section 2(a) of the Jobs for Veterans Act (38 U.S.C. 4215[a]);

ARTICLE 3

SCOPE OF THE AGREEMENT

Section 3.1 This PLA is limited to covering all onsite construction work within the scope of each Covered Contract.

Section 3.2 Exclusions. Items specifically excluded from the scope of this PLA include the following:

(a) Work of non-manual employees including but not limited to, superintendents, supervisors, staff engineers, quality control and quality assurance personnel, timekeepers, mail carriers, clerks, office workers, messengers, guards, safety personnel, emergency medical and first aid technicians, and other professional, engineering, administrative, supervisory, and management employees; and

(b) All offsite manufacturing, fabrication, deliveries, maintenance, and handling of materials, equipment, or machinery, and the offsite hauling of materials of any kind to or from the Covered Project site. However, any lay down or storage areas for equipment or material and manufacturing (i.e. prefabrication) sites dedicated solely for the project, and the movement of materials or goods between locations on a Covered Project site are within the scope of the PLA. On-site fabrication work includes work done for the Project in temporary yards or areas near the Project. On-site construction shall also include the site of any batch plant constructed solely to supply materials to the Project; and

(c) All employees of the City, Project Labor Coordinator, design teams (including, but not limited to, architects, engineers, and master planners), or any other consultants for the City (including, but not limited to, project managers and

construction managers and their employees where not engaged in Project Work) and their subconsultants, and other employees of professional service organizations, not performing manual labor within the scope of this PLA. Notwithstanding the foregoing, however, this exclusion shall not apply to the classifications for Surveyors and/or Building/Construction Inspectors and/or Field Soils and Material Testers (Inspectors) unless they are City employees. This inclusion applies to the scope of work defined in the State of California Wage Determination for Surveyors and/or Building/Construction Inspectors and/or Field Soils and Material Testers (Inspectors). This shall also specifically include such work where it is referred to by utilization of such terms as "quality control" or "quality assurance." Every Inspector performing under these classifications on Covered Projects pursuant to a professional services agreement, a contract entered into directly with the City, or a contract with a Contractor shall be bound to all applicable requirements of this Agreement; and

(d) Any work performed on or near or leading to or into a site of work covered by this PLA and undertaken by state, county, city, or other governmental bodies, or their contractors (other than work within the scope of this PLA undertaken by contractors to the City); or by private utilities, or their contractors; and

(e) Work performed by employees of a manufacturer or vendor on the manufacturer's or vendor's equipment, if required by the warranty agreement in order to maintain the warranty or guarantee, and provided that the warranty agreement is the manufacturer's or vendor's usual and customary warranty agreement for such equipment and is consistent with industry practice; and

(f) Specialized or technical work requiring specialized training, unique skills, or a level of specific technical experience which employees represented by the Union do not possess. At least ten (10) working days notice shall be given to the Council before any work is performed pursuant to this exemption.; and

(g) Laboratory work for testing; and

(h) Non-construction support services contracted by the City, Project Labor Coordinator, or Contractor in connection with this Project.

Section 3.3 Awarding of Contracts.

(a) The City has the absolute right to bid or award Covered Contracts regardless of delivery method to any Contractor notwithstanding the existence or non-existence of any agreements between such Contractor and any Union Parties,

provided only that such Contractor is willing, ready, and able to execute and comply with this PLA should such Contractor be awarded work covered by this PLA.

(b) It is agreed that all Contractors who have been awarded a contract for Project Work shall be required to accept and be bound by the terms and conditions of this PLA. Contractors shall evidence their acceptance of this Agreement by executing a Letter of Assent as set forth in Attachment A hereto. The Prime Contractor must sign and submit the Letter of Assent as a condition of award prior to the execution of a Covered Contract. No Contractor shall commence Project Work without first providing a copy of the signed Letter of Assent to the Project Labor Coordinator.

(c) The City and Prime Contractors agree that to the extent permitted by law and consistent with the economy and efficiency of construction and operation, it will use its best efforts to purchase materials, equipment, and supplies that will not create labor strife. Under all circumstances, however, the City and Prime Contractors shall retain the absolute right to select the lowest responsive and responsible bidder for the award of contracts on all Covered Projects.

Section 3.4 Coverage Exception. The Parties agree and understand that this PLA shall not apply to any work that would otherwise be covered Project Work if a governmental agency or granting authority partially or fully funding such work determines that it will not fund the Project Work if it is covered by this PLA. The City agrees that it will make every effort to establish the inclusion of this PLA with any governmental agency or granting authority funding a Covered Project.

Section 3.5 Schedule A's.

(a) The provisions of this PLA, including the Schedule A's (which are the local Master Labor Agreements of the signatory Unions having jurisdiction over the work on the Project, as such may be changed from time to time consistent with Section 21.3, and which are incorporated herein by reference), shall apply to the work covered by this PLA, notwithstanding the provisions of any other local, area and/or national agreement that may conflict with or differ from the terms of this PLA. Where a subject covered by the provisions of this PLA is also covered by a Schedule A, the provisions of this PLA shall prevail. Where a subject is covered by a provision of a Schedule A and not covered by this PLA, the provisions of the Schedule A shall prevail. Any dispute as to the applicable source between this PLA and any Schedule A shall be resolved under the procedures established in Article 10.

(b) It is understood that this PLA, together with the referenced Schedule A's, constitutes a self-contained, stand-alone agreement and, by virtue of having become bound to this PLA, the Contractor will not be obligated to sign any other local, area, or national collective bargaining agreement as a condition of performing work within the scope of this PLA (provided, however, that the Contractor may be required to sign a uniformly applied non-discriminatory Participation or Subscription Agreement at the request of the trustees or administrator of a trust fund established pursuant to Section 302 of the Labor Management Relations Act, and to which such Contractor may be bound to make contributions under this PLA, provided that such Participation or Subscription Agreement does not purport to bind the Contractor beyond the terms and conditions of this PLA and/or expand its obligation to make contributions pursuant thereto). It shall be the responsibility of the Prime Contractor to have each of its Contractors of any tier sign the documents with the appropriate Union prior to the Contractor beginning Project Work.

Section 3.6 The Parties agree that this PLA will be made available to, and will fully apply to, any successful bidder for Project Work, without regard to whether that successful bidder performs work at other sites on either a Union or non-Union basis. This PLA shall not apply to any work of any Contractor other than that on Project Work specifically covered by this PLA.

Section 3.7 Binding Signatories Only. This PLA and Letter of Assent shall only be binding on the signatory Parties hereto, and shall not apply to the parents, affiliates, subsidiaries, or other ventures of any such Party.

Section 3.8 Other City Work. Nothing contained herein shall be interpreted to prohibit, restrict, or interfere with the performance of any other operation, work, or function not covered by this PLA, which may be performed by City employees or contracted for by the City for its own account, on its property, or in and around a project site.

Section 3.9 Separate Liability. It is understood that the liability of the Contractor(s) and the liability of the separate Unions under this PLA shall be several and not joint. The Unions agree that this PLA does not have the effect of creating any joint employment status between or among the City or Project Labor Coordinator and/or any Contractor.

Section 3.10 Completed Project Work. As areas of Project Work are accepted by the City, this PLA shall have no further force or effect on such items or areas except where the Contractor is directed by the City or its representatives to engage in repairs, modification and/or check-out functions required by its contract(s) with the City.

Section 3.11 Except for all work performed under the NTL Articles of Agreement, the National Stack/Chimney Agreement, and the National Cooling Tower Agreement, all instrument calibrations work and loop checking shall be performed under the terms of the UA/IBEW Joint National Agreement for Instrument and Control Systems Technicians, and the National Agreement of the International Union of Elevator Constructors, with the exception of Article 7 (Work Stoppages and Lockouts), Article 8 (Work Assignments and Jurisdictional Disputes) and Article 10 (Settlement of Grievances and Disputes) of this PLA, which shall apply to such work.

ARTICLE 4

UNION RECOGNITION AND EMPLOYMENT

Section 4.1 Recognition. The Contractor recognizes the Unions as the exclusive bargaining representative for the employees engaged in Project Work. Such recognition does not extend beyond the period when the employee is engaged in Project Work.

Section 4.2 Contractor Selection of Employees. The Contractor shall have the right to determine the competency of all employees, the number of employees required, the duties of such employees within their craft jurisdiction, and shall have the sole responsibility for selecting employees to be laid off, consistent with this Article. The Contractor shall also have the right to reject any applicant referred by a Union for any reason, subject to any reporting time requirements of the applicable Schedule A; provided, however, that such right is exercised in good faith and not for the purpose of avoiding the Contractor's commitment to employ qualified workers through the procedures endorsed in this PLA.

Section 4.3 Referral Procedures.

(a) For signatory Unions to this Agreement having a job referral system contained in a Schedule A, the Contractor agrees to comply with such system and it shall be used exclusively by such Contractor, except as modified by this PLA. Such job referral system will be operated in a nondiscriminatory manner and in full compliance with federal, state, and local laws and regulations that require equal employment opportunities and non-discrimination. All of the foregoing hiring procedures, including related practices affecting apprenticeship, shall be operated so as to consider the goals of the City to encourage employment of City Residents, Targeted Workers, and utilization of Disadvantaged Business Enterprises on the Project Work, and to facilitate the ability of all Contractors to meet their employment needs.

(b) The local Unions will exert their best efforts to recruit and refer sufficient numbers of skilled craft workers to fulfill the labor requirements of the Contractor, including specific employment obligations to which the Contractor may be legally and/or contractually obligated; and to refer Apprentices as requested to develop a larger, skilled workforce. The Unions will work with the Project Labor Coordinator and others designated by the City, to identify and refer competent craft persons as needed for Project Work, and to identify individuals, particularly City Residents and Targeted Workers, for entrance into Apprenticeship Programs, or participation in other identified programs and procedures to assist individuals in qualifying and becoming eligible for such Apprenticeship Programs, all maintained to increase the available supply of skilled craft personnel for Project Work and future construction work to be undertaken by the City.

(c) The Union shall not knowingly refer an employee currently employed by a Contractor on Project Work to any other Contractor.

Section 4.4 Non-Discrimination in Referral, Employment, and Contracting. The Unions and Contractors agree that they will not discriminate against any employee or applicant for employment on the basis of race, color, religion, gender, national origin, age, Union status, sex, sexual orientation, marital status, political affiliation, or disability. Further, it is recognized that the City has certain policies, programs, and goals for the utilization of Disadvantaged Business Enterprises. The Parties shall jointly endeavor to assure that these commitments are fully met, and that any provisions of this PLA that may appear to interfere with Disadvantaged Business Enterprises successfully bidding for work on Covered Projects shall be carefully reviewed, and adjustments made as may be appropriate and agreed upon among the Parties, to ensure full compliance with the spirit and letter of the City's policies and commitment to its goals for the significant utilization of Disadvantaged Business Enterprises as Contractors, vendors or suppliers on Project Work.

Section 4.5 Employment of City Residents and Targeted Workers.

(a) In recognition of the City's mission to serve the City and its residents, the Unions and Contractors agree that, to the extent allowed by law, and as long as they possess the requisite skills and qualifications, residents of the City of San Diego, hereafter “City Residents”, shall be first referred for Project Work. A “City Resident” is defined as a City of San Diego permanent resident at the time of initial employment on a Covered Project or a Veteran residing anywhere. The

list of qualifying zip codes for City Residents is included within Attachment B-1, Workforce Dispatch Request Form.

(b) The Contractors and Unions agree to work together to achieve a goal of at least thirty-five (35) percent of the total construction craft hours worked on each Covered Project be performed by City Residents.

(c) The Contractors and Unions agree to work together to achieve a goal of at least ten (10) percent of the total construction craft hours worked on each Covered Project be performed by Targeted Workers. Hours worked by Targeted Workers who are also City Residents may be applied to the City Resident participation goal.

(d) Professional services agreements entered into by the City for covered surveying or inspection services, which are separate and apart from the Construction Contract for a Covered Project, are exempt from the foregoing City Resident and Targeted Worker hiring goals.

(e) To facilitate the dispatch of City Residents, as well as all Contractor requests for referral and dispatch of workers from the applicable Union referral system, all Contractors are required to utilize the Workforce Dispatch Request Form for Covered Projects, a sample of which is attached as Attachment B-1.

(f) The Project Labor Coordinator shall work with the Unions and Contractors in the administration, monitoring, and the reporting of the foregoing City Resident and Targeted Worker hiring goals.

(g) The Parties recognize that the Pure Water Program Phase I Projects have multiple funding sources. If a particular funding source applied by the City to a Covered Project does not allow geographic preference for hiring local craft workers, the foregoing City Resident participation requirement will not be applicable to that Covered Project. The City reserves the right to apply Pure Water Program Phase I funding as it chooses and will make every effort to fund the Covered Projects to encourage inclusivity of City Residents.

Section 4.6 Core Employees. This Section only applies to Contractors who are not directly signatory to an applicable Schedule A.

(a) Disadvantaged Business Enterprise. The Parties recognize the City's interest in promoting competition and inclusion of Disadvantaged Business Enterprises, which may not be signatory to a current Schedule A. In order to promote participation and attract Disadvantaged Business Enterprises to work

under this Agreement, and subject to the limitations set forth below, each Contractor that is a Disadvantaged Business Enterprise may first employ three (3) of its core employees per craft on each Covered Project prior to employing an employee through the appropriate Union hiring hall. The next (fourth) employee shall be hired from the appropriate Union hiring hall and thereafter, such Contractor may employ, as needed, two (2) additional Core Employees in an alternating manner with Union referrals, up to a total of five (5) Core Employees. Thereafter, all additional employees in the affected trade or craft shall be requested and referred from the appropriate Union hiring hall.

The foregoing Core Employee hiring procedure for Disadvantaged Business Enterprises is subject to the following limitations:

(1) Disadvantaged Business Enterprises with an individual subcontract value of $500,000 or less and;

(2) Disadvantaged Business Enterprises are limited to utilizing the foregoing Core Employee hiring procedure to one (1) subcontract per Covered Project and;

(3) The total value of all subcontracts utilizing the foregoing Core Employee hiring procedure shall not exceed ten (10) percent of the total value of each Covered Project; and

(4) In order to assist the Project Labor Coordinator monitor compliance with this Section, each Prime Contractor will be responsible for tracking, reporting and providing notice to the Project Labor Coordinator describing each Disadvantaged Business Enterprise subcontract that qualifies for the foregoing hiring procedure prior to work commencing.

(b) Employers who do not qualify for the hiring procedure set forth in Section 4.6(a), and who are not otherwise signatory to a current Schedule A, may employ, as needed, first, a Core Employee, then an employee through a referral from the appropriate Union hiring hall, then a second Core Employee, then a second employee through the referral system, and so on until a maximum of three (3) Core Employees are employed per craft on each Covered Project. Thereafter, all additional employees in the affected trade or craft shall be requested and referred from the appropriate Union hiring hall in accordance with this Article. Contractors employing more than fifty (50) craft workers at the same time in a specific trade on a Covered Project may hire an additional two (2) Core Employees.

(c) Section 4.6 only applies to Contractors who are not directly signatory to a current Schedule A for the craft worker in its employ and is not intended to limit the transfer provisions of the Schedule A of any trade. As part of this process, and in order to facilitate the contract administration procedures, as well as appropriate fringe benefit fund coverage, all Contractors shall require their Core Employees and any other persons employed other than through the referral process, to register with the appropriate Union hiring hall, if any, prior to their first day of employment working under the Construction Contract at the project site.

(d) Prior to each Contractor performing any work on a Covered Project, each Contractor shall provide a list of Core Employees to the Project Labor Coordinator and the Council. After submitting the Core Employee list prior to commencing work, Contractors shall not make any changes or substitutions to the Core Employee list for the duration of the Covered Project. Failure to submit the Core Employee list prior to work commencing will prohibit the Contractor from using any Core Employees for 30 calendar days after the list is provided to the Project Labor Coordinator and Council.

(e) Upon request by any Party to this Agreement, the Contractor hiring any Core Employee shall provide satisfactory proof (i.e., payroll records, quarterly tax records, and such other documentation) evidencing the Core Employee's qualification as a Core Employee to the Project Labor Coordinator and the Council.

(f) Core Employees must meet the following eligibility requirements to qualify for employment on Covered Projects:

(1) A Core Employee must be either a journeyperson or Apprentice and appear on the Contractor's active payroll for at least ninety (90) of the last one-hundred-eighty (180) working days prior to being designated as a Core Employee. The date a Core Employee is designated is the date the Core Employee list is submitted to the Project Labor Coordinator and Council prior to the Contractor commencing work; and

(2) A Core Employee must possess any license required by state or federal law for the Project Work to be performed; and

(3) A Core Employee must have the ability to safely perform the basic functions of the applicable trade.

(g) In addition to the core employee provisions set forth herein, all Contractors may avail themselves of any opportunity provided for in the applicable Schedule A's to call for specific employees by name.

(h) During any layoffs or reductions in workforce, Contractors shall layoff employees in an order and manner consistent with the Core Employee hiring procedures and maintain the required Core Employee-to-Union referral ratios required by this Section for the duration of each Covered Project.

Section 4.7 Time for Referral. If any Union's registration and referral system does not fulfill the requirements for specific classifications of covered employees (including City Residents) requested by any Contractor within forty-eight (48) hours (excluding Saturdays, Sundays, and holidays), that Contractor may employ Core Employees without reference to the ratio requirements in Section 4.6 or use employment sources other than the Union registration and referral services, and may employ applicants from any other available source. The Contractor should promptly inform the Union of any applicants hired from other sources, and such applicants shall register with the appropriate hiring hall, if any.

Section 4.8 Lack of Referral Procedure. If a signatory local Union does not have a job referral system as set forth in Section 4.3 above, the Contractors shall give the Union equal opportunity to refer applicants. The Contractors shall notify the Union of employees so hired, as set forth in Section 4.7.

Section 4.9 Union Membership. Employees are not required to become or remain union members as a condition of performing Covered Work under this Agreement. Employers shall make and transmit all deductions for union dues, fees, and assessments that have been authorized by employees in writing in accordance with the applicable Schedule A. Nothing in this Section 4.9 is intended to supersede the requirements of the applicable Schedule A's as to those Employers otherwise signatory to such Schedule A and as to the employees of those Employers who are performing Covered Work.

Section 4.10 Foremen. The selection and number of craft foremen and/or general foremen shall be the responsibility of the Contractor, consistent with the Schedule A's. All foremen shall take orders exclusively from the designated Contractor representatives. Craft foremen shall be designated as working foreman at the request of the Contractors.

Section 4.11 Skilled and Trained Workforce. All Contractors performing Project Work are required to provide the City with an enforceable commitment that a skilled and

trained workforce will be used to complete the construction contract or project, in accordance with City Council Resolution Number R-312062.

ARTICLE 5

UNION ACCESS AND STEWARDS

Section 5.1 Access to Project Sites. Authorized representatives of the Union shall have access to Project Work, provided that they do not interfere with the work of employees and further provided that such representatives fully comply with posted visitor, security, and safety rules.

Section 5.2 Stewards.

(a) Each signatory local Union shall have the right to dispatch a working journeyperson as a steward for each shift, and shall notify the Contractor in writing of the identity of the designated steward or stewards prior to the assumption of such person's duties as steward. Such designated steward or stewards shall not exercise any supervisory functions. There will be no non-working stewards. Stewards will receive the regular rate of pay for their respective crafts.

(b) In addition to his/her work as an employee, the steward should have the right to receive, but not to solicit, complaints or grievances and to discuss and assist in the adjustment of the same with the employee's appropriate supervisor. Each steward should be concerned only with the employees of the steward's Contractor and not with the employees of any other Contractor. The Contractor will not discriminate against the steward in the proper performance of his/her Union duties.

(c) When a Contractor has multiple, non-contiguous work locations at one site, the Contractor may request and the Union shall appoint such additional working stewards as the Contractor requests to provide independent coverage of one or more such locations. In such cases, a steward may not service more than one work location without the approval of the Contractor.

(d) The stewards shall not have the right to determine when overtime shall be worked or who shall work overtime.

Section 5.3 Steward Layoff/Discharge. The Contractor agrees to notify the appropriate Union twenty-four (24) hours before the layoff of a steward, except in the case of

disciplinary discharge for just cause. If the steward is protected against such layoff by the provisions of the applicable Schedule A, such provisions shall be recognized when the steward possesses the necessary qualifications to perform the remaining work. In any case in which the steward is discharged or disciplined for just cause, the appropriate Union will be notified immediately by the Contractor, and such discharge or discipline shall not become final (subject to any later filed grievance) until twenty-four (24) hours after such notice has been given.

Section 5.4 Employees on Non-Project Work. On work where the personnel of the City may be working in close proximity to the construction activities covered by this PLA, the Union agrees that the Union representatives, stewards, and individual workers will not interfere with the City personnel, or with personnel employed by any other employer not a Party to this PLA.

ARTICLE 6

WAGES AND BENEFITS

Section 6.1 Wages. At a minimum, all employees covered by this PLA shall be classified in accordance with work performed and paid the hourly wage rates for those classifications in compliance with the Applicable Prevailing Wage Determination established pursuant to the California Labor Code by the California Department of Industrial Relations.

Section 6.2 Benefits.

(a) Subject to the exception set forth below for Disadvantaged Business Enterprises, otherwise, for all employees performing Project Work, Contractors shall pay all fringe benefits and other required employer contributions to the established Union employee benefit funds in the amounts required by the applicable Schedule A. In addition, the Contractors and Unions agree that only such bona fide employee benefits that accrue to the direct benefit of the employees (such as pension and annuity, health and welfare, vacation, apprenticeship, and training funds) shall be included in this requirement and required to be paid by the Contractor on Covered Projects. These Contractor contributions shall not exceed the contribution amounts set forth in the Applicable Prevailing Wage Determination.

Union Benefit Fund Contributions for Disadvantaged Business Enterprises. Disadvantaged Business Enterprises are exempt from paying fringe benefits and

other required employer contributions on behalf of their Core Employees to the Union employee benefit funds, subject to the following exemption limitations:

(1) The exemption is only applicable to Disadvantaged Business Enterprises with an individual subcontract value of $500,000 or less and;

(2) Disadvantaged Business Enterprises are limited to utilizing this exemption for one subcontract per Covered Project and;

(3) The total value of all subcontracts utilizing this exemption shall not exceed ten (10) percent of the total value of each Covered Project; and

(4) Disadvantaged Business Enterprises utilizing this exemption are still required to pay all fringe benefits and other required employer contributions to the established Union employee benefit funds for all employees other than their Core Employees, and must comply with the applicable prevailing wage requirements, including the payment of fringe benefits, for all employees performing Project Work; and

(5) In order to assist the Project Labor Coordinator monitor utilization of this exemption, each Prime Contractor will be responsible for tracking, reporting and providing notice to the Project Labor Coordinator about each Disadvantaged Business Enterprise subcontract that qualifies and intends to utilize this exemption prior to work commencing.

(b) Where applicable, the Contractor adopts and agrees to be bound by the written terms of the applicable, legally established, Union trust agreement(s) specifying the detailed basis how payments will be made into, and benefits paid out of, such trust funds for its employees. The Contractor authorizes the Parties to such trust funds to appoint trustees and successors' trustees to administer the trust funds and hereby ratifies and accepts the trustees so appointed as if made by the Contractor. The Contractor obligations to the applicable Union benefit fund(s) and trust agreement(s) are limited to work performed on a Covered Project. The applicable Union benefit funds and trust agreement(s) to each Contractor are determined by the pre-job conference and Union work assignment process described in Articles 8 and 16.

(c) Each Contractor is required to certify to the Project Labor Coordinator that it has paid all benefit contributions due and owing to the appropriate Union trust(s) and benefit funds prior to the receipt of its final payment and/or retention. Further, upon timely notification by a Union to the Project Labor Coordinator, the Project Labor Coordinator shall work with any Contractor who is delinquent in

payments to assure that proper benefit contributions are made, to the extent of requesting the City or the prime Contractor to withhold payments otherwise due such Contractor, until such contributions have been made or otherwise guaranteed.

(d) Notwithstanding any other provisions, this Agreement is an agreement under Section 8(f) of the National Labor Relations Act (NLRA), which covers work performed in the building and construction industry. In addition, the work performed under this Agreement qualifies for the Construction Industry Exemption under the Employee Retirement and Income Security Act of 1974 ("ERISA"), as amended as well. If any Union Pension Trust Fund ("Fund") covered by the terms and conditions of this Agreement does not qualify for the Construction Industry Exemption authorized by Section 4203 (B)(1)(i), of the Employee Retirement Income Security Act of 1974 ("ERISA") as amended, 29 U.S.C. 1383(b)(1)(i), or has not taken the necessary steps to amend the Fund documents to qualify for the Construction Industry Exemption as authorized by Section 4203(B)(1)(ii) of ERISA, as amended, 29 U.S.C. 1383(b)(1)(B)(ii); and to recognize the work performed under this Agreement to qualify for the Construction Industry Exemption, the Contractors signatory to this Agreement will not be obligated to make pension fund contributions to that Fund. In such an event, the Contractor shall pay all required amounts otherwise allocated for payment toward the non-exempt Fund to the employees' wages or other bona fide retirement plan program pursuant to applicable prevailing wage requirements.

Section 6.3 Wage Premiums. Wage premiums, including, but not limited to, pay based on height of work, shift premiums, hazard pay, scaffold pay, and special skills shall not be applicable to work under this PLA, except to the extent provided for in any applicable prevailing wage determination.

Section 6.4 Compliance with Prevailing Wage Laws. All complaints regarding possible prevailing wage violations may be referred to the Project Labor Coordinator or Labor Compliance Program, if any, for processing, investigation and resolution, and if not resolved within thirty (30) calendar days, may be referred by any Party to the State Labor Commissioner. To facilitate compliance with applicable prevailing wage laws, the City and each Contractor agree to provide copies of certified payroll reports, redacted only to the extent required by law, to the Unions (or to any Labor Management Cooperation Committee in which a Union or its affiliate participates) within ten (10) days of their request.

ARTICLE 7

WORK STOPPAGES AND LOCKOUTS

Section 7.1 No Work Stoppages or Disruptive Activity. The Council and the Unions signatory hereto agree that they, nor their respective officers, or agents or representatives, shall incite or encourage, condone or participate in any strike, walk-out, slowdown, picketing, observation of picket lines, or other activity of any nature or kind whatsoever, for any cause or dispute whatsoever with respect to or any way related to Project Work, or which interferes with or otherwise disrupts Project Work, or with respect to or related to the City or Contractors or subcontractors, including, but not limited to, economic strikes, unfair labor practice strikes, safety strikes, sympathy strikes, and jurisdictional strikes whether or not the underlying dispute is arbitrable. Any such actions by the Council, or Unions, or their members, agents, representatives, or the employees they represent shall constitute a material violation of this PLA. The Council and the Union shall take all steps necessary to obtain compliance with this Article.

Section 7.2 Employee Violations. The Contractor may discharge any employee violating Section 7.1 above, and any such employee will not be eligible for rehire under this PLA.

Section 7.3 Standing to Enforce. The City, the Project Labor Coordinator, or any Contractor affected by an alleged violation of Section 7.1 shall have standing and the right to enforce the obligations established therein.

Section 7.4 Expiration of Schedule A's. If a collective bargaining agreement between a signatory Contractor and one or more of the Union(s) expires before the Contractor completes the performance of a Covered Contract for a Covered Project, and the Union or the Contractor gives notice of demand for a new or modified collective bargaining agreement, the Unions agree that they will not strike the Contractor on any Covered Project, and the Union and the Contractor agree that the expired collective bargaining agreement will continue in full force and effect for the Project Work until a new or modified collective bargaining agreement is reached between the Union and the Contractor. If the new or modified collective bargaining agreement reached between the Union and the Contractor provides that any terms of the collective bargaining agreement shall be retroactive, the Contractor agrees to comply, consistent with the terms of this PLA and the Prevailing Wage Statute, with any retroactive terms of the new or modified collective bargaining agreement which are applicable to employees of said Contractor that are employed on a Covered Project within seven (7) days at

no cost to the City. All employees shall continue to work and to perform all their obligations with respect to Project Work despite the expiration of a Schedule A agreement. Should a Contractor engaged in Project Work enter into an interim agreement with the Unions for work being performed elsewhere after the expiration, and before the renewal of a local collective bargaining agreement forming the basis for Schedule A, such interim agreement shall be utilized by that Contractor for Project Work, subject to the provisions of Section 21.3.

Section 7.5 No Lock Outs. Contractors shall not cause, incite, encourage, condone or participate in any lock-out of employees with respect to Project Work during the term of this PLA. The term "lock-out" refers only to a Contractor's exclusion of employees in order to secure collective bargaining advantage, and does not refer to the discharge, termination, or layoff of employees by the Contractor for any reason in the exercise of rights pursuant to any provision of this PLA, or any other agreement, nor does "lock-out" include the City's decision to stop, suspend, or discontinue any Project Work or any portion thereof for any reason.

Section 7.6 Best Efforts to End Violations.

(a) If a Contractor contends that there is any violation of this Article, it shall, at least twenty-four (24) hours prior to invoking the procedures of Section 7.7, provide written notification to the Council of the involved Union(s) and to the Project Labor Coordinator, setting forth the facts which the Contractor contends violates this Article. The Council and the leadership of the involved Union(s) will immediately instruct, order, and use their best efforts to cause the cessation of any violation of the Article.

(b) If the Union contends that any Contractor has violated this Article, it will notify the Contractor and the Project Labor Coordinator, setting forth the facts which the Union contends violate this Article, at least twenty-four (24) hours prior to invoking the procedures of Section 7.7. The Project Labor Coordinator shall promptly order the involved Contractor(s) to cease any violation of the Article.

Section 7.7 Expedited Enforcement Procedure. Any Party, including the City, which is an intended beneficiary of this Article, or the Project Labor Coordinator, may institute the following procedures, in lieu of or in addition to any other action at law or equity, when a breach of this Article is alleged.

(a) The Party invoking this procedure shall notify Thomas Pagan, who has been selected by the negotiating Parties, and whom the Parties agree shall be the permanent arbitrator under this procedure, or Barry Winograd, as the alternate

arbitrator under this procedure. If the permanent arbitrator is unavailable at any time, the alternate will be contacted. If neither is available, then a selection shall be made from the list of arbitrators as set forth in Article 10. Notice to the arbitrator shall be by the most expeditious means available, with notices to the Parties alleged to be in violation, and to the Project Labor Coordinator and Council. For purposes of this Article, written notice may be given by email, facsimile, hand delivery, or overnight mail and will be deemed effective upon receipt.

(b) Upon receipt of said notice, the arbitrator named above or his/her alternate shall sit and hold a hearing within twenty-four (24) hours if it is contended that the violation still exists, but not sooner than twenty-four (24) hours after notice has been dispatched to the Council of the involved Union(s) and/or Contractor as required by Section 7.6, above.

(c) The arbitrator shall notify the Parties of the place and time chosen for this hearing. Said hearing shall be completed in one session, which, with appropriate recesses at the arbitrator's discretion, shall not exceed twenty-four (24) hours unless otherwise agreed upon by all Parties. A failure of any Party or Parties to attend said hearings shall not delay the hearing of evidence or the issuance of any award by the arbitrator.

(d) The sole issue at the hearing shall be whether or not a violation of this Article has in fact occurred. The arbitrator shall have no authority to consider any matter in justification, explanation, or mitigation of such violation or to award damages, (except for damages as set forth in Section 7.8 below) which issue is reserved for court proceedings, if any. The award shall be issued in writing within three (3) hours after the close of the hearing and may be issued without an opinion. If any Party desires a written opinion, one shall be issued within fifteen (15) days, but its issuance shall not delay compliance with, or enforcement of, the award. The arbitrator may order cessation of the violation of the Article and other appropriate relief, and such award shall be served on all Parties by hand or registered mail upon issuance.

(e) Such award shall be final and binding on all Parties and may be enforced by any court of competent jurisdiction upon the filing of this PLA and all other relevant documents referred to herein above in the following manner. Written notice of the filing of such enforcement proceedings shall be given to the other Party. In any judicial proceeding to obtain a temporary order enforcing the arbitrator's award as issued under Section 7.7(d) of this Article, all Parties waive the right to a hearing and agree that such proceedings may be ex parte. Such

agreement does not waive any Party's right to participate in a hearing for a final order of enforcement. The court's order or orders enforcing the arbitrator's award shall be served on all Parties by hand or by delivery to their address as shown on this PLA (for a Union), as shown on their business contract for work under this PLA (for a Contractor) and to the representing Union (for an employee), by certified mail by the Party or Parties first alleging the violation.

(f) Any rights created by statute or law governing arbitration proceedings inconsistent with the above procedure or which interfere with compliance hereto are hereby waived by the Parties to whom they accrue.

(g) The fees and expenses of the arbitrator shall be equally divided between the Party or Parties initiating this procedure and the respondent Party or Parties.

Section 7.8 Liquidated Damages.

(a) If the arbitrator determines in accordance with Section 7.7 above that a work stoppage has occurred, the respondent Union(s) shall, within eight (8) hours of receipt of the Award, direct all the employees they represent on the project to immediately return to work. If the craft(s) involved do not return to work by the beginning of the next regularly scheduled shift following such eight (8) hour period after receipt of the arbitrator's Award, and the respondent Union(s) have not complied with their obligations to immediately instruct, order, and use their best efforts to cause a cessation of the violation and return the employees they represent to work, then the non-complying Union(s) shall each pay a sum as liquidated damages to the City, and each will pay an additional sum per shift, as set forth in (c), below, for each shift thereafter on which the craft(s) has not returned to work.

(b) If the arbitrator determines in accordance with Section 7.7 above that a lock out has occurred, the respondent Contractor(s) shall, within eight (8) hours after receipt of the award, return all the affected employees to work on the Project, or otherwise correct the violations found by the arbitrator. If the respondent Contractor(s) do not take such action by the beginning of the next regular scheduled shift following the eight (8) hour period, each non-complying respondent Contractor shall pay or give as liquidated damages, to the affected Union(s) (to be apportioned among the affected employees and the benefit funds to which contributions are made on their behalf, as designated by the arbitrator) and each shall pay an additional sum per shift, as set forth in (c), below, for each shift thereafter in which compliance by the respondent Contractor(s) has not been completed.

(c) The Parties agree that project delays caused by violations of this Article will cause the City to sustain damages. They agree that it would be impractical or extremely difficult to fix the amount of such damages. Therefore, the Parties agree that, in the event of a breach of either of these provisions, the Party in breach shall pay to the City the sum of not less than $10,000.00 and no more than $20,000.00 per shift from the time the arbitrator determines that a delay has occurred until the arbitrator determines that the project is again on construction schedule. The payment, when made, shall constitute a damages remedy of the City for the delay specified, but shall not prevent the City from seeking an injunctive or other monetary relief, including termination of this PLA. Payment of these sums as liquidated damages is not intended as a forfeiture or penalty within the meaning of California Civil Code sections 3275 or 3369, but instead, is intended to constitute liquidated damages to the City pursuant to section 1671 of the California Civil Code.

ARTICLE 8

WORK ASSIGNMENTS AND JURISDICTIONAL DISPUTES

Section 8.1 No Jobsite Disruption. There will be no strikes, work stoppages, picketing, sympathy strikes, slowdowns, or other interferences with the work because of jurisdictional disputes between Unions. The assignment of work will be solely the responsibility of the Contractor performing the work involved; and such work assignments will be in accordance with the Plan for Settlement of Jurisdictional Disputes in the Construction Industry (the "Plan") or any successor Plan.

Section 8.2 All jurisdictional disputes on this project shall be settled and adjusted according to the present Plan established by the Building and Construction Trades Department or any other plan or method of procedure that may be adopted by the Building and Construction Trades Department. Decisions rendered shall be final and binding and conclusive on the Contractors and Unions parties to this PLA.

All jurisdictional disputes shall be resolved without the occurrence of any of the activities prohibited in Article 7 (Work Stoppages and Lockouts), and the Contractor's assignment shall be adhered to until the dispute is resolved. Individuals violating this section shall be subject to immediate discharge.

Section 8.2.1 If a dispute arising under this Article involves the Southwest Regional Council of Carpenters or any of its subordinate bodies, an arbitrator shall be chosen by the procedures specified in Article V, Section 5, of the Plan from a list composed of Thomas Pagan, Thomas Angelo, Robert Hirsch, and John Kagel, and the

arbitrator's hearing on the dispute shall be held at the offices of the Council within fourteen (14) days of the selection of the arbitrator. All other procedures shall be as specified in the Plan.

Section 8.3 Failure to Comply. If any Union or Contractor fails to immediately and fully comply with the final decision rendered by the Plan, affected Union(s) or Contractor(s) may seek legal redress for such conduct, including, but not limited to, injunctive relief and/or damages.

Section 8.4 Pre-job Conference. It is required that a pre-job conference be held not later than fourteen (14) calendar days prior to the start of work by each Contractor for the Covered Project in accordance with the procedure described in Article 16.

ARTICLE 9

MANAGEMENT RIGHTS

Section 9.1 Contractor and City Rights. The Contractors and the City have the sole and exclusive right and authority to oversee and manage construction operations on Project Work without any limitations unless expressly limited by a specific provision of this PLA. In addition to the following and other rights of the Contractors enumerated in this PLA, the Contractors expressly reserve their management rights and all the rights conferred upon them by law. The Contractor's rights include, but are not limited to, the right to:

(a) Plan, direct, and control operations of all work; and

(b) Hire, promote, transfer, and layoff their own employees, respectively, as deemed appropriate to satisfy work and/or skill requirements; and

(c) Promulgate and require all employees to observe reasonable job rules and security and safety regulations; and

(d) Discharge, suspend, or discipline their own employees for just cause; and

(e) Utilize, in accordance with City approval, any work methods, procedures, or techniques, and select, use, and install any types or kinds of materials, apparatus, or equipment, regardless of source of manufacture or construction; and

(f) Assign and schedule work at their discretion; and

(g) Assign overtime, determine when it will be worked and the number and identity of employees engaged in such work, subject to such provisions in the applicable Schedule A(s) requiring such assignments be equalized or otherwise made in a nondiscriminatory manner.

Section 9.2 Specific City Rights. In addition to the following and other rights of the City enumerated in this PLA, the City expressly reserves its management rights and all the rights conferred on it by law and contract. The City's rights (and those of the Project Labor Coordinator on its behalf) include, but are not limited to the right to:

(a) Inspect any construction site or facility to ensure that the Contractor follows the applicable safety and other work requirements; and

(b) At its sole option, terminate, delay, and/or suspend any and all portions of the Project Work at any time; prohibit some or all work on certain days or during certain hours of the day to accommodate the ongoing operations of the City and/or to mitigate the effect of ongoing Project Work on businesses and residents in the neighborhood of the Project sites; and/or require any other operational or schedule changes it deems necessary, in its sole judgment, to meet Project deadlines and remain a good neighbor to those in the area of the Covered Projects. (In order to permit the Contractors and Unions to make appropriate scheduling plans, the City will provide the Project Labor Coordinator, and the affected Contractor[s] and Union[s] with reasonable notice of any changes it requires pursuant to this section); and

(c) Approve any work methods, procedures, and techniques used by Contractors whether or not these methods, procedures, or techniques are part of industry practices or customs; and

(d) Investigate and process complaints or disagreements, through its Project Labor Coordinator.

Section 9.3 Use of Materials. There should be no limitations or restrictions by the Union upon a Contractor's choice of materials or design, nor, regardless of source or location, upon the full use and utilization of equipment, machinery, packaging, precast, prefabricated, prefinished, or preassembled materials, tools, or other labor-saving devices, subject to the application of the California Public Contract and Labor Codes. Generally, the onsite installation or application of such items shall be performed by the craft having jurisdiction over such work.

Section 9.4 Special Equipment, Warranties, and Guaranties.

(a) It is recognized that certain equipment of a highly technical and specialized nature may be installed at Covered Project sites. The nature of the equipment, together with the requirements for manufacturer's warranties, may dictate that it be prefabricated, pre-piped, and/or pre-wired and that it be installed under the supervision and direction of the City's and/or manufacturer's personnel. The Unions agree that such equipment is to be installed without incident.

(b) The Parties recognize that the Contractor will initiate from time to time the use of new technology, equipment, machinery, tools, and other labor-savings devices and methods of performing Project Work. The Unions agree that they will not restrict the implementation of such devices or work methods. The Unions will accept and will not refuse to handle, install, or work with any standardized and/or catalogue parts, assemblies, accessories, prefabricated items, preassembled items, partially assembled items, or materials whatever their source of manufacture or construction.

(c) If any disagreement between the Contractor and the Unions concerning the methods of implementation or installation of any equipment, device, or item, or method of work arises, or whether a particular part or pre-assembled item is a standardized or catalog part or item, the work will proceed as directed by the Contractor, and the Parties shall immediately consult over the matter. If the disagreement is not resolved, the affected Union(s) shall have the right to proceed through the procedures set forth in Article 10.

ARTICLE 10

SETTLEMENT OF GRIEVANCES AND DISPUTES

Section 10.1 Cooperation and Harmony on Site.

(a) This PLA is intended to establish and foster continued close cooperation between management and labor. The Council shall assign a representative to this Project for the purpose of assisting the local Unions, and working with the Project Labor Coordinator, together with the Contractors, to complete construction of the Project Work economically, efficiently, continuously, and without any interruption, delays, or work stoppages.

(b) The Project Labor Coordinator, the Contractors, Unions, and employees collectively and individually, realize the importance to all Parties of maintaining continuous and uninterrupted performance of Project Work, and agree to resolve

disputes in accordance with the grievance provisions set forth in this Article or, as appropriate, those of Article 7 or 8.

(c) The Project Labor Coordinator shall observe the processing of grievances under this Article and Articles 7 and 8, including the scheduling and arrangements of facilities for meetings, selection of the arbitrator from the agreed-upon panel to hear the case, and any other administrative matters necessary to facilitate the timely resolution of any dispute; provided, however, it is the responsibility of the principal Parties to any pending grievance to ensure the time limits and deadlines are met.

Section 10.2 Processing Grievances. Any questions arising out of and during the term of this PLA involving its interpretation and application, which includes applicable provisions of the Schedule A's, but not alleged violations of Articles 7 or 8, shall be considered a grievance and subject to resolution under the following procedures.

Step 1. (a) Employee Grievances. When any employee subject to the provisions of this PLA feels aggrieved by an alleged violation of this PLA, the employee shall, through his local Union business representative or job steward, within ten (10) working days after the occurrence of the violation, give notice to the work site representative of the involved Contractor stating the provision(s) alleged to have been violated, the details of the alleged violation and the remedy sought to resolve the matter. A grievance shall be considered null and void if notice of the grievance is not given within the ten (10) day period. A business representative of the local Union or the job steward and the work site representative of the involved Contractor shall meet and endeavor to adjust the matter within ten (10) working days after timely notice has been given. If they fail to resolve the matter within the prescribed period, the grieving Party may, within ten (10) working days thereafter, pursue Step 2 of this grievance procedure provided the grievance is reduced to writing, setting forth the relevant information, including a short description thereof, the date on which the alleged violation occurred, and the provision(s) of the applicable agreement alleged to have been violated. Grievances and disputes settled at Step 1 shall be non-precedential except as to the Parties directly involved.

(b) Union or Contractor Grievances. Should the Union(s) or any Contractor have a dispute with the other Party(ies) and, if after conferring within ten (10) working days after the disputing Party knew or should have known of the facts or occurrence giving rise to the dispute, a settlement is not reached within five (5) working days, the dispute shall be reduced to writing and processed to Step 2 in

the same manner as outlined in Step 1(a) above for the adjustment of an employee complaint.

Step 2. The business manager of the involved local Union or his designee, together with the site representative of the involved Contractor, and the labor relations representative of the Project Labor Coordinator shall meet within seven (7) working days of the referral of the dispute to this second step to arrive at a satisfactory settlement thereof. If the Parties fail to reach an agreement, the dispute may be appealed in writing in accordance with the provisions of Step 3 within seven (7) calendar days after the initial meeting at Step 2.

Step 3. (a) If the grievance shall have been submitted but not resolved under Step 2, either the Union or Contractor Party may request in writing to the Project Labor Coordinator (with copy[ies] to the other Party[ies]) within seven (7) calendar days after the initial Step 2 meeting, that the grievance be submitted to an arbitrator selected from the agreed-upon list below, on a rotational basis in the order listed. Those arbitrators are: (1) Thomas Pagan; (2) David Hart; (3) Edna Francis; (4) Mike Rappaport; (5) Michael Prihar; (6) Fred Horowitz; and (7) Sara Adler. The decision of the arbitrator shall be final and binding on all Parties, and the fee and expenses of such arbitrations shall be borne equally by the involved Contractor(s) and the involved Union(s).

(b) Failure of the grieving Party to adhere to the time limits established herein shall render the grievance null and void. The time limits established herein may be extended only by written consent of the Parties involved at the particular step where the extension is agreed upon. The arbitrator shall have the authority to make decisions only on issues presented and shall not have the authority to change, amend, add to, or detract from any of the provisions of this PLA.

Section 10.3 Limit on Use of Procedures. Procedures contained in this Article shall not be applicable to any alleged violation of Article 7 or 8, with a single exception that any employee discharged for violation of Section 7.2 may resort to the procedures of this Article to determine only if he/she was, in fact, engaged in that violation.

Section 10.4 Notice. The Project Labor Coordinator (and the City, in the case of any grievance regarding the Scope of this PLA), shall be notified by the involved Contractor of all actions at Steps 2 and 3, and further, the Project Labor Coordinator shall, upon its own request, be permitted to participate fully in all proceedings at such steps.

ARTICLE 11

COMPLIANCE

Section 11.1 Compliance with All Laws. The Council and all Unions, Contractors, and their employees shall comply with all applicable federal and state laws, ordinances, and regulations including, but not limited to, those relating to safety and health, employment, and applications for employment. All employees shall comply with the safety regulations established by the City, the Project Labor Coordinator, and the Contractor. Employees must promptly report any injuries or accidents to a supervisor.

Section 11.2 Monitoring Compliance. The Parties agree that the City shall require, and that the Project Labor Coordinator and Council shall monitor, compliance by all Contractors with all federal and state laws and regulations that, from time to time may apply to Project Work. It shall be the responsibility of both the Council and the Project Labor Coordinator (on behalf of the City) to investigate or monitor compliance with these various laws and regulations. The Council may recommend to the Project Labor Coordinator and/or the City procedures to encourage compliance with these laws and regulations.

Section 11.3 Prevailing Wage Compliance. The Council or Union may refer all complaints regarding any potential prevailing wage violation to the Project Labor Coordinator, who may process, investigate, and resolve such complaints. The Council or Union, as appropriate, shall be advised in a timely manner with regard to the facts and resolution, if any, of any complaint. It is understood that this Section does not restrict any individual rights as established under the State Labor Code, including the rights of an individual to file a complaint with the State Labor Commissioner.

Section 11.4 Violations of Law. Based upon a finding of violation by the City of a federal and state law, and upon notice to the Contractor that it is in such violation, the City, in the absence of the Contractor remedying such violation, shall take such action as it is permitted by law or contract to encourage the Contractor to come into compliance, including, but not limited to, assessing fines and penalties and/or removing the offending Contractor from Project Work.

ARTICLE 12

SAFETY AND PROTECTION OF PERSON AND PROPERTY

Section 12.1 Safety.

(a) It shall be the responsibility of each Contractor to ensure safe working conditions and employee compliance with all applicable safety laws and regulations and any safety rules contained herein or established by the City, the Project Labor Coordinator, or the Contractor. It is understood that employees have an individual obligation to use diligent care to perform their work in a safe manner and to protect themselves and the property of the Contractor and the City.

(b) All Parties and Contractor employees shall be bound by the safety, security, and visitor rules established by the Contractor, the Project Labor Coordinator, and the City. These rules will be published and posted. An employee's failure to satisfy his/her obligations under this Section will subject him/her to discipline, up to and including discharge.

Section 12.2 Drug and Alcohol Testing Policy. The Parties agree to adopt the Drug and Alcohol Testing Policy attached hereto as Attachment C, which is the exclusive Drug and Alcohol Testing Policy for Covered Projects.

Section 12.3 Inspection. The inspection of shipments of equipment, machinery, and construction materials of every kind shall be performed at the discretion of the Contractor by individuals of its choice.

ARTICLE 13

TRAVEL AND SUBSISTENCE

Section 13.1 Travel expenses, travel time, subsistence allowances and/or zone rates, and parking reimbursements shall not be applicable to work under this PLA, except to the extent provided for in any applicable prevailing wage determination. Parking for employees covered by this PLA shall be provided by the Contractor(s) according to the provision of the Schedule A(s) existing on the Effective Date of this PLA and upon presentation of proof of any expense incurred.

ARTICLE 14

APPRENTICES

Section 14.1 Importance of Training. The Parties recognize the need to maintain continuing support of the programs designed to develop adequate numbers of competent workers in the construction industry, the obligation to capitalize on the availability of the local work force in the area served by the City, and the opportunities to provide continuing work on Covered Projects for City Residents and Targeted Workers. To these ends, and consistent with any laws or regulations, the Parties will facilitate, encourage, and assist City Residents and Targeted Workers commence and progress in Apprenticeship Programs and/or apprenticeship readiness programs in the construction industry leading to participation in such Apprenticeship Programs. The City, the Project Labor Coordinator, other City consultants, the Contractors, and the Council and Unions, will work cooperatively to identify, or establish and maintain, effective programs and procedures for persons interested in entering the construction industry and which will help prepare them for the entry into Apprenticeship Programs. Apprentices, if utilized, must be enrolled in a California Apprenticeship Council-approved Apprenticeship Program.

Section 14.2 Use of Apprentices.

(a) The Unions and Contractors agree to cooperate in referring and employing Apprentices up to the maximum percentage allowed by the State Labor Code and the standards of each State-Approved Apprenticeship Program. The minimum ratios for Apprentice to journeyperson hours worked shall be in compliance, at a minimum, with the applicable provisions of the State Labor Code relating to utilization of Apprentices. The City, unless otherwise required by law, shall encourage such utilization, and, both as to Apprentices and the overall supply of experienced workers, the Project Labor Coordinator will work with the Council, Apprenticeship Programs, and Contractors to assure appropriate and maximum utilization of Apprentices and the continuing availability of both Apprentices and journey persons.

(b) The Parties agree that all Contractors will comply with all applicable laws and regulations in the request for dispatch and employment of Apprentices.

(c) The Parties agree that Apprentices will not be dispatched to Contractors working under this PLA unless there is a journeymen or other Contractor employee working on the Project where the Apprentice is to be employed who is

qualified to assist and oversee the Apprentice's progress through the program in which he/she is participating.

ARTICLE 15

LEGAL ACTION

Section 15.1 Legal Action. The City, Council and Unions recognize the substantial legal costs (including all attorney's fees and associated disbursements) that might accrue with regard to any legal challenge over the adoption by the City of this PLA, and related to claims directly challenging the legality of this PLA, or a particular section or language that has been adopted herein. In the event of a legal challenge, the Council, on behalf of itself and affiliated Unions, agrees to seek to intervene in the legal action and actively participate in the litigation or other action to defend the legality of this PLA, or a particular section or language herein. The failure of the Council to seek to intervene in the legal action and actively participate to defend the legality of this PLA will constitute a material breach of this PLA. In the event the Council is denied leave to intervene in the legal action, the Council shall have its counsel coordinate with the City's counsel, at the Council's own expense, regarding how the Council can best support the City's legal position.

ARTICLE 16

PRE-JOB CONFERENCE

Section 16.1 Each Contractor is required to conduct a pre-job conference with the Unions not later than fourteen (14) calendar days prior to commencing work. The purpose of the conference will be to, among other things, convey craft manpower needs, the schedule of work for the Covered Project, project work rules, and propose preliminary Union work assignments. The Project Labor Coordinator may work with the Prime Contractor and Council to facilitate the scheduling of all pre-job conferences, but ensuring each Contractor conducts a pre-job conference in accordance with this Agreement is the responsibility of the Prime Contractor. All preliminary Union work assignments shall be disclosed by each Contractor at a pre-job conference. Should there be work within the scope of a Construction Contract for a Covered Project that was not previously assigned at a pre-job conference, or additional work be added to the scope of the Covered Project, the Contractor(s) performing such work will conduct a separate pre-job conference.

Any Union in disagreement with a proposed assignment shall notify the affected Contractor of its position in writing, with a copy sent to the Project Labor Coordinator, within seven (7) calendar days after the pre-job conference occurred. Within seven (7) calendar days after the period allowed for Union notices of disagreement with the Employer's proposed assignments, but prior to the commencement of any work, the Employer shall make final assignments in writing with copies sent to the Project Labor Coordinator and Council.

ARTICLE 17

LABOR/MANAGEMENT AND COOPERATION

Section 17.1 Joint Committee. The Parties to this PLA will form a joint committee consisting of three (3) representatives selected by the Council and three (3) representatives selected by the Project Labor Coordinator, to be chaired jointly by a representative of the Project Labor Coordinator and the Council. The purpose of the Committee shall be to promote harmonious and stable labor management relations on this Project, to ensure effective and constructive communication between labor and management Parties, to advance the proficiency of work in the industry, and to evaluate and ensure an adequate supply of skilled labor for all Project Work. Representatives of the City may participate upon its request, and all Parties will be invited to attend.

Section 17.2 Functions of Joint Committee. The Committee shall meet on a schedule to be determined by the Committee or at the call of the joint chairs, to discuss the administration of the PLA, the progress of the project, general labor management problems that may arise, and any other matters consistent with this PLA. Substantive grievances or disputes arising under Articles 7, 8, or 10 shall not be reviewed or discussed by this Committee, but shall be processed pursuant to the provisions of the appropriate Article.

The Project Labor Coordinator shall be responsible for scheduling of the meetings and the preparation of the agenda topics for the meetings, with input from the Unions, the Contractors, and the City. Notice of the date, time and place of meetings, shall be given to the Committee members at least three (3) days prior to the meeting. The City shall be notified of the meetings and invited to send a representative(s) to participate.

The Project Labor Coordinator shall prepare quarterly reports on Apprentice utilization and the training and employment of City Residents, and a schedule of Project work and estimated number of craft workers needed. The Committee, or

an appropriate subcommittee, may review such reports and make any recommendations for improvement, if necessary, including increasing the availability of skilled trades, and the employment of local residents or other individuals who should be assisted with appropriate training to qualify for Apprenticeship Programs.

Section 17.3 Subcommittees. The Committee may form subcommittees to consider and advise the full Committee with regard to safety and health issues affecting the Project and other similar issues affecting the overall Project, including any workers' compensation program initiated under this PLA.

ARTICLE 18

SAVINGS AND SEPARABILITY

Section 18.1 Savings Clause. It is not the intention of the City, the Project Labor Coordinator, Contractor, or the Union Parties to violate any laws governing the subject manner of this PLA. The Parties hereto agree that in the event any provision of this PLA is finally held or determined to be illegal or void as being in contravention of any applicable law or regulation, the remainder of the PLA shall remain in full force and effect unless the part or parts so found to be void are wholly inseparable from the remaining portions of this PLA. Further, the Parties agree that if and when any provision(s) of this PLA is finally held or determined to be illegal or void by a court of competent jurisdiction, the Parties will promptly enter into negotiations concerning the substantive effect of such decision for the purposes of achieving conformity with the requirements of any applicable laws and the intent of the Parties hereto. If the legality of this PLA is challenged and any form of injunctive relief is granted by any court, suspending temporarily or permanently the implementation of this PLA, then the Parties agree that all Project Work that would otherwise be covered by this PLA should be continued to be bid and constructed without application of this PLA so that there is no delay or interference with the ongoing planning, bidding, and construction of any Project Work.

Section 18.2 Effect of Injunctions or Other Court Orders. The Parties recognize the right of the City to withdraw, at its absolute discretion, the utilization of the PLA as part of any bid specification should a court of competent jurisdiction issue any order, or any applicable statute that could result, temporarily or permanently, in delay of the bidding, awarding, and/or construction on the Project.

ARTICLE 19

WAIVER

Section 19.1 Waiver. A waiver of or a failure to assert any provisions of this PLA by any or all of the Parties hereto shall not constitute a waiver of such provision for the future. Any such waiver shall not constitute a modification of the PLA or change in the terms and conditions of the PLA and shall not relieve, excuse or release any of the Parties from any of their rights, duties, or obligations hereunder.

ARTICLE 20

AMENDMENTS

Section 20.1 Amendments. The provisions of this PLA can be renegotiated, supplemented, rescinded, or otherwise altered only by mutual agreement in writing, hereafter signed by the Parties.

ARTICLE 21

DURATION OF THE PLA

Section 21.1 Duration. This Agreement shall be effective on June 16, 2020, provided that the Council has signed the Agreement. The Agreement shall continue in full force and effect until all of the work within the scope of a Covered Contract is completed and accepted by the City.

Section 21.2 Turnover and Final Acceptance of Completed Work.

(a) Construction of any phase, portion, section, or segment of Project Work shall be deemed complete when such phase, portion, section or segment has been turned over to the City by the Contractor and the City has accepted such phase, portion, section, or segment. As areas and systems of the Project are inspected and construction-tested and/or approved and accepted by the City or third parties with approval of the City, the PLA shall have no further force or effect on such items or areas, except when the Contractor is directed by the City to engage in repairs or modifications required by its Contract(s) with the City.

(b) Notice of each final acceptance received by the Contractor will be provided to the Council with the description of what portion, segment, etc. has

been accepted. Final acceptance may be subject to a "punch" list, and in such case, the PLA will continue to apply to each such item on the list until it is completed to the satisfaction of the City and Notice of Acceptance is given by the City or its representative to the Contractor.

Section 21.3 Continuation of Schedule A's. Schedule A's incorporated as part of this PLA shall continue in full force and effect, as previously stated, until the Contractor and Union Parties to the collective bargaining agreement(s), which are the basis for such Schedule A's, notify the Project Labor Coordinator of the mutually agreed upon changes in such agreements and their effective date(s).

The Parties agree to recognize and implement all applicable changes on their effective dates, except as otherwise provided by this PLA; provided, however, that any such provisions negotiated in said collective bargaining agreements will not apply to work covered by this PLA if such provisions are less favorable to the Contractor under the PLA than those uniformly required of Contractors for construction work normally covered by those agreements; nor shall any provision be recognized or applied if it may be construed to apply exclusively or predominantly to work covered by this PLA. Any disagreement between the Parties over the incorporation into a Schedule A of any such provision agreed upon in a negotiation of the local collective bargaining agreement that is the basis for a Schedule A shall be resolved under the procedures established in Article 10.

Section 21.4 Final Termination. Final termination of all obligations, rights, and liabilities, and disagreements shall occur upon receipt by the Council of a Notice from the City saying that no work remains within the scope of the PLA.

Section 21.5 Pure Water Program Phase II Projects. The City and the Unions intend to have this Agreement or a succeeding Agreement include all construction projects in Pure Water Program Phase II. The Pure Water Program Phase II Projects are in the early development stage and cannot be specifically identified at this time to be included in the scope of this Agreement. Therefore, to reopen negotiations to include Pure Water Program Phase II Projects into this Agreement, the Council shall send written notice to the City's Project Labor Coordinator after the City has approved Pure Water Program Phase II Projects' Environmental Impact Report and no later than ninety (90) days after the City's final approval of the Environmental Impact Report.

ARTICLE 22

WORK AND ECONOMIC OPPORTUNITY

Section 22.1 The magnitude, duration, and complexity of the Pure Water Program Phase I Projects will require large numbers of skilled craft personnel and create significant economic opportunities for City Residents, Targeted Workers, Disadvantaged Business Enterprises and other businesses. It is therefore the understanding and intention of the Parties to use the opportunities provided by the extensive amount of work to collaborate and implement programs and procedures, which may include, for example, North America's Building Trades Unions Multi-Craft Core Curriculum (MC3) apprenticeship readiness programs, to prepare persons, especially City Residents and Targeted Workers, for entrance into Apprenticeship Programs to begin or continue their construction careers on Covered Projects. Further, the Parties agree to maximize the inclusion of Disadvantage Business Enterprises through outreach, training, and subcontracting for Covered Projects. With assistance from the Project Labor Coordinator, the City, the Contractors, the Unions and their affiliated regional and national organizations will work jointly to promptly develop and implement procedures for the identification of craft needs, the scheduling of work to facilitate the utilization of available craft workers, and the securing of services of craft workers in sufficient numbers to meet the high demands of the Project Work to be undertaken.

Section 22.2 The City, together with the Parties, supports the development of increased numbers of skilled construction workers who are City Residents and Targeted Workers to meet the labor needs of Covered Projects. Towards that end, the Parties, together with the City and its Project Labor Coordinator, agree to develop and implement a work opportunities program for City Residents and Targeted Workers to maximize construction career opportunities and create a construction career pipeline to becoming employed on Covered Projects. Further, the City together with the Parties, will create opportunities for Disadvantaged Business Enterprises consistent with the City's goals and inclusion programs for such businesses. In furtherance of the foregoing, the Council and Unions specifically agree to work with the City and the Project Labor Coordinator to:

(a) Collaborate with existing or newly created MC3 apprenticeship readiness programs in San Diego to offer opportunities for City Residents and Targeted Workers, including students, to enroll in free short-term construction apprenticeship readiness training to prepare them to enter into Apprenticeship Programs and become employed by a Contractor on a Covered Project. The

Project Labor Coordinator, with the assistance of the Parties, will assist with the recruitment, career placement, and tracking of such City Residents and Targeted Workers who graduate from these apprenticeship readiness programs; and

(b) The Parties will cooperate and collaborate with the City and Project Labor Coordinator to conduct outreach to and include City Residents and Targeted Workers from traditionally underrepresented segments of the City's population in the construction craft workforce for each Covered Project; and

(c) The Council will provide accurate data on a quarterly basis to the City and Project Labor Coordinator pertaining to their level of economic support provided to meet these objectives. Further, the Project Labor Coordinator shall produce detailed quarterly reports for the City and Council to measure and report the outcomes of the policies, requirements, and programs established in this Agreement; and

(d) The Unions will partner with the City and Project Labor Coordinator to conduct outreach and recruitment activities by establishing or continuing to maintain existing centers, programs, and events to facilitate the entry of City Residents and Targeted Workers into the building and construction trades. These programs shall serve as a resource for preliminary orientation, assessment of construction aptitude, referral to MC3 apprenticeship readiness programs or Apprenticeship Programs, referral to hiring halls, and provide tailored orientation and mentoring for women and Targeted Workers; and

(e) The Unions shall assist City Residents and Targeted Workers with contacting the Apprenticeship Programs for the crafts and trades they are interested in. The Unions shall assist City Residents and Targeted Workers who are seeking employment on Covered Projects and provide opportunities for Union membership by assessing their work experience and giving them credit for provable past experience in their relevant craft or trade, including experience gained working for non-Union Contractors. The Unions shall put on their rolls qualified bona fide City Residents and Targeted Workers for employment on Covered Projects.

Section 22.3 Joint Subcommittee on Work and Economic Opportunity. To carry out the intent and purpose of this Article, a subcommittee of the Labor Management Committee established pursuant to Article 17 shall be established, jointly chaired by a designee of the City and a designee of the Council, to oversee the effective development and implementation of the programs and policies described herein, and to work with representatives of each apprenticeship committee and representatives of the MC3 apprenticeship readiness programs to maximize

employment opportunities for City Residents and Targeted workers who reflect the diversity of the communities surrounding each Covered Project and who may not be previously qualified for the construction career opportunities created by the Covered Projects. The subcommittee will meet as necessary at the call of the joint chairs to promptly facilitate its purposes in an expeditious manner as soon as this PLA becomes effective. In addition to the joint chairs, the membership of the committee will consist of at least three (3) representatives of the signatory local Unions and three (3) representatives of Contractors (or organization to which the Contractors belong) signatory to this PLA and experienced in overseeing and participating in Apprenticeship Programs.

ARTICLE 23

HELMETS TO HARDHATS

Section 23.1 Veterans Entry into Building and Construction Trades. The Parties recognize a desire to facilitate the entry into the building and construction trades of Veterans who are interested in careers in the building and construction industry. The Contractors and Unions agree to utilize the services of the Center for Military Recruitment, Assessment and Veterans Employment (hereinafter "Center") and the Center's "Helmets to Hardhats" program to serve as a resource for preliminary orientation, assessment, and construction aptitude, referral to Apprenticeship Programs or hiring halls, counseling and mentoring, support network, employment opportunities, and other needs as identified by the Parties.

Section 23.2 Integrated Database. The Unions and Contractors agree to coordinate with the Center to create and maintain an integrated database of Veterans interested in working on this Covered Project and of apprenticeship and employment opportunities for this Covered Project.

In witness whereof, the Parties have caused this Project Labor Agreement for City of San Diego Pure Water Program Phase I Projects to be executed as of the date and year above stated.

Re: City of San Diego Project Labor Agreement for Pure Water Program Phase I Project

Dear Sir:

This is to confirm [Name of Company] agrees to be party to and bound by the City of San Diego Project Labor Agreement for Construction of Pure Water Program Phase I Projects, effective May 1, 2020, as such Agreement may from time to time be amended by the negotiating Parties or interpreted pursuant to its terms. Such obligation to be a Party and bound by this Agreement shall extend to all work covered by the Agreement undertaken by this Company on the Project pursuant to [City Contract No. _____ and Name of Covered Project], and this Company shall require all of its subcontractors of whatever tier to be similarly bound for all work within the scope of the Agreement by signing and furnishing to you an identical Letter of Assent prior to their commencement of work.

Sincerely,

[Name of Construction Company]

By:
[Name and Title of Authorized Executive]

[Copies of this Letter must be submitted to the Project Labor Coordinator and to the Council consistent with Article 3, Section 3.3(b)]

ATTACHMENT B-1 – WORKFORCE DISPATCH REQUEST FORM

The City of San Diego's Project Labor Agreement for Pure Water Program Phase I Projects establishes a goal of at least thirty-five percent (35%) of the total craft hours on each Covered Project be performed by City Residents. The Unions and Contractors agree that, to the extent allowed by law, and as long as they possess the requisite skills and qualifications, City Residents shall be first referred for Project Work. A "City Resident" is defined as a City of San Diego permanent resident at the time of initial employment on a Covered Project or a Veteran residing anywhere.

*The list of qualifying zip codes for City Residents includes: 92014, 92037, 92038, 92067, 92093, 92101, 92102, 92103, 92104, 92105, 92106, 92107, 92108, 92109, 92110, 92111, 92113, 921 14, 92115, 92116, 92117, 92119, 92120, 92121, 92122, 92123, 92124, 92126, 92127, 92128, 92129, 92130, 92131, 92132, 92134, 92137, 92138, 92139, 92145, 92154, 92166, 92167, 92169, 92171, 92173, 92177.

C O N T R A C T O R U S E O N L Y

Please complete and fax or email this form to the applicable union to request craft workers that fulfill the hiring requirements for this project. After faxing your request, please call the Local to verify receipt and substantiate their capacity to furnish workers as specified below. Please print your Fax or Email Transmission Verification Reports and keep copies for your records.

In accordance with the Project Labor Agreement, Article 4, Section 4.6 (f), a Core Employee must be either a journeyperson or Apprentice and appear on the Contractor's active payroll for at least ninety (90) of the last one-hundred-eighty (180) working days prior to being designated as a Core Employee; and must possess any license required by state or federal law for the Project Work to be performed; and must have the ability to safely perform the basic functions of the applicable.

Prior to each Contractor performing any work on a Covered Project, each Contractor shall provide a list of Core Employees to the Project Labor Coordinator and the Council. After submitting the Core Employee list prior to commencing work, Contractors shall not make any changes or substitutions to the Core Employee list for the duration of the Covered Project. Failure to submit the Core Employee list prior to work commencing will prohibit the Contractor from using any Core Employees for 30 calendar days after the list is provided to the Project Labor Coordinator and Council.

Please check all that apply:

☐ Our firm will not be self-performing any work on this project.
We will be subcontracting our work to: _____

☐ PLA Section 4.6 regarding Core Employees is not applicable to Contractors that are signatory to one or more Schedule As, which are the Master Labor Agreements of the Unions. If your company is signatory, please list the union and local number below. For crafts that you are not signatory, please complete the core employee list below.

Indicate Signatory Union Trade: _____ Local # _____
Indicate Signatory Union Trade: _____ Local # _____
Indicate Signatory Union Trade: _____ Local # _____

☐ We are not a union signatory contractor and will be using core employees on this project as indicated below:

ATTACHMENT C – DRUG AND ALCOHOL TESTING POLICY

The Parties recognize the problems that drug and alcohol abuse have created in the construction industry and the need to develop drug and alcohol abuse prevention programs. Accordingly, the Parties agree that in order to enhance the safety of the workplace and to maintain a drug and alcohol-free work environment, individual Contractors shall require applicants or employees to undergo drug and alcohol testing in accordance with this PLA and this policy, Attachment C – Drug and Alcohol Testing Policy, hereafter "Policy."

1. It is understood that the use, possession, transfer, or sale of illegal drugs, narcotics, or other unlawful substances, as well as being under the influence of alcohol and the possession of or consuming alcohol is absolutely prohibited while employees are on the Contractor's job premises or while working on any jobsite in connection with work performed under the PLA.

2. No Contractor may implement a drug and alcohol testing program that does not conform in all respects to the provisions of this Policy.

3. No Contractor may implement drug and alcohol testing at any jobsite unless written notice is given to the Union setting forth the location of the jobsite, a description of the project under construction, and the name and telephone number of the Prime Contractor's project manager. Said notice shall be provided at the pre-job conferences for each Covered Project. Failure to give such notice shall make any drug and alcohol testing engaged in by the Contractor a violation of the Agreement and subject to the Article 10 grievance procedure.

4. A Contractor who elects to implement drug and alcohol testing pursuant to this Policy shall require all craft employees on the Covered Project to be tested. With respect to individuals who become employed on the Covered Project subsequent to the proper implementation of a valid drug and alcohol testing program, such test shall be administered upon the commencement of employment on the project, whether by referral from a Union Dispatch Office, transfer from another project, or another method. Individuals who were employed on the project prior to proper implementation of a valid drug and alcohol testing program may only be subjected to testing for the reasons set forth in paragraphs 5(g)(l) through 5(g)(3) and paragraphs 6(a) through 6(e) of this Policy. Refusal to undergo such testing shall be considered sufficient grounds to deny employment on the project.

5. The following procedure shall apply to all drug and alcohol testing:

    a. The Contractor may request urine samples only. The applicant or employee shall not be observed when the urine specimen is given. An applicant or employee, at his or her sole option, shall, upon request, receive a blood test in lieu of a urine test. No employee of the Contractor shall draw blood from a bargaining unit employee, touch

or handle urine specimens, or in any way become involved in the chain of custody of urine or blood specimens. A Union Business Representative, subject to the approval of the individual applicant or employee, shall be permitted to accompany the applicant or employee to the collection facility to observe the collection, bottling, and sealing of the specimen.

b. A Contractor may request an applicant or employee promptly, within four (4) hours of the Contractor's request, perform an alcohol breathalyzer test at a certified laboratory only, and cutoff levels shall be those mandated by applicable state or federal law.

c. The testing shall be done by a laboratory approved by the Substance Abuse & Mental Health Services Administration (SAMHSA), which is chosen by the Contractor and the Union.

d. An initial test shall be performed using the Enzyme Multiplied Immunoassay Technique (EMIT). In the event a question or positive result arises from the initial test, a confirmation test must be utilized before action can be taken against the applicant or employee. The confirmation test will be by Gas Chromatography/Mass Spectrometry (GC/MS). Cutoff levels for both the initial test and confirmation test will be those established by SAMHSA and this Policy. Should these SAMHSA levels be changed during the course of the PLA or new testing procedures are approved, then these new regulations will be deemed as part of this existing PLA. Confirmed positive samples will be retained by the testing laboratory in secured long-term frozen storage for a minimum of one (1) year. Handling and transportation of each sample must be documented through strict chain-of-custody procedures.

e. In the event of a confirmed positive test result, the applicant or employee may request, within forty-eight (48) hours, a sample of his/her specimen from the testing laboratory for purposes of a second test to be performed at a second laboratory, designated by the Union and approved by SAMHSA. The retest must be performed within ten (10) days of the request. Chain of custody for this sample shall be maintained by the Contractor between the original testing laboratory and the Union's designated laboratory. Retesting shall be performed at the applicant's or employee's expense. In the event of conflicting test results, the Contractor may require a third test, at the Contractor's expense.

f. If, as a result of the above testing procedure, it is determined that an applicant or employee has tested positive, this shall be considered sufficient grounds to deny the applicant or employee his/her employment on the project.

g. No individual who tests negative for drugs and alcohol pursuant to the above procedure and becomes employed on the project shall again be subjected to drug and alcohol testing with the following exceptions:

    1) Employees who are involved in industrial accidents resulting in damage to plant, property, or equipment or injury to him/her or others may be tested for drugs or alcohol pursuant to the procedures stated hereinabove.

2) The Contractor may test employees following thirty (30) days' advance written notice to the employee(s) to be tested and to the applicable Union. Notice to the applicable Union shall be sent by certified mail to the affected Union with a copy to the Project Labor Coordinator. Such testing shall be pursuant to the procedures stated hereinabove.

3) The Contractor may test an employee where the Contractor has reasonable cause to believe that the employee is impaired from performing his/her job. Reasonable cause shall be defined as being aberrant or unusual behavior, the type of which is a recognized and accepted symptom of impairment (e.g., slurred speech, unusual lack of muscular coordination). Such behavior must be actually observed by at least two (2) persons, one (1) of whom shall be a supervisor who has been trained to recognize the symptoms of drug and alcohol abuse or impairment and the other of whom shall be the Job Steward. If the Job Steward is unavailable or there is no Job Steward on the Covered Project, the other person shall be a member of the applicable Union's bargaining unit. Testing shall be pursuant to the procedures stated hereinabove. Employees who are tested pursuant to the exceptions set forth in this paragraph and who test positive will be removed from the Contractor's payroll.

h. Applicants or employees who do not test positive shall be paid for all time lost while undergoing drug and alcohol testing. Payment shall be at the applicable wage and benefit rates set forth in the applicable Union's Master Labor Agreement. Applicants who have been dispatched from the Union and who are not put to work pending the results of a test will be paid waiting time until such time as they are put to work. It is understood that an applicant must pass the test as a condition of employment. Applicants who are put to work pending the results of a test will be considered probationary employees.

6. The Contractors will be allowed to conduct periodic jobsite drug and alcohol testing on the Project under the following conditions:

a. The entire jobsite must be tested, including any employee or subcontractor's employee who worked on that project three (3) working days before or after the date of the test;

b. Jobsite testing cannot commence sooner than fifteen (15) days after start of the work on the project;

c. Prior to start of periodic testing, a Business Representative will be allowed to conduct an educational period on company time to explain periodic jobsite testing program to affected employees;

d. Testing shall be conducted by an SAMHSA-certified laboratory, pursuant to the provisions set forth in paragraph 5 hereinabove.

e. Only two (2) periodic tests may be performed in a twelve (12)-month period.

7. It is understood that the unsafe use of prescribed medication, or where the use of prescribed medication impairs the employee's ability to perform work, is a basis for the Contractor to remove the employee from the jobsite.

8. Any grievance or dispute that may arise out of the application of this Policy shall be subject to the grievance and arbitration procedures set forth in the PLA.

9. The establishment or operation of this Policy shall not curtail any right of any employee found in any law, rule, or regulation. Should any part of this Policy be found unlawful by a court of competent jurisdiction or a public agency having jurisdiction over the Parties, the remaining portions of the Agreement shall be unaffected, and the Parties shall enter negotiations to replace the affected provision.

10. Present employees, if tested positive, shall have the prerogative for rehabilitation program at the employee’s expense. When such program has been successfully completed, the Contractor shall not discriminate in any way against the employee. If work for which the employee is qualified exists, he/she may be reinstated.

11. The Contractor agrees that results of urine and blood tests performed hereunder will be considered medical records held confidential to the extent permitted or required by law. Such records shall not be released to any persons or entities other than designated Contractor representatives and the applicable Union. Such release to the applicable Union shall only be allowed upon the signing of a written release by the employee, and the information contained therein shall not be used to discourage the employment of the individual applicant or employee on any subsequent occasion.

12. Employees who seek voluntary assistance for substance abuse may not be disciplined for seeking such assistance. Requests from employees for such assistance shall remain confidential and shall not be revealed to other employees or management personnel without the employee's consent. Employees enrolled in substance abuse programs will be subject to all Contractor rules, regulations, and job performance standards with the understanding that an employee enrolled in such a program is receiving treatment for an illness.

13. The Contractor shall indemnify and hold the Union harmless against any and all claims, demands, suits, or liabilities that may arise out of the application of this Policy.

14. This Policy shall constitute the only Policy in effect between the Parties concerning drug and alcohol abuse, prevention, and testing. Any modifications thereto must be accomplished pursuant to collective bargaining negotiations between the Parties.

SPECIMEN REPORTING CRITERIA

Initial Test Analyte	Initial Test Cutoff [1]	Confirmatory Test Analyte	Confirmatory Test Cutoff Concentration
Marijuana metabolites (THCA)[2]	50 ng/ml [3]	THCA	15 ng/ml
Cocaine metabolite (Benzoylecgonine)	150 ng/ml 3	Benzoylecgonine	100 ng/ml
Codeine/ Morphine	2000 ng/ml	Codeine Morphine	2000 ng/ml 2000 ng/ml
Hydrocodone/ Hydromorphone	300 ng/ml	Hydrocodone Hydromorphone	100 ng/ml 100 ng/ml
Alcohol	0.02%	Ethanol	0.02%
Oxycodone/ Oxymorphone	100 ng/ml	Oxycodone Oxymorphone	100 ng/ml 100 ng/ml
6-Acetylmorphine	10 ng/ml	6-Acetylmorphine	10 ng/ml
Phencyclidine	25 ng/ml	Phencyclidine	25 ng/ml
Amphetamine/ Methamphetamine	500 ng/ml	Amphetamine Methamphetamine	250 ng/ml 250 ng/ml
MDMA[4]/MDA[5]	500 ng/ml	MDMA MDA	250 ng/ml 250 ng/ml
Initial Test Analyte	Initial Test Cutoff	Confirmatory Test Analyte	Confirmatory Test Cutoff Concentration
Barbiturates	300 ng/ml	Barbiturates	200 ng/ml
Benzodiazepines	300 ng/ml	Benzodiazepines	300 ng/ml
Methadone[6]	300 ng/ml	Methadone	100 ng/ml
Methaqualone	300 ng/ml	Methaqualone	300 ng/ml
Propoxyphene	300 ng/ml	Propoxyphene	100 ng/ml

[1] For grouped analytes (i.e., two or more analytes that are in the same drug class and have the same initial test cutoff):

Immunoassay: The test must be calibrated with one analyte from the group identified as the target analyte. The cross-reactivity of the immunoassay to the other analyte(s) within the group must be 80 percent or greater; if not, separate immunoassays must be used for the analytes within the group.

Alternate technology: Either one analyte or all analytes from the group must be used for calibration, depending on the technology. At least one analyte within the group must have a concentration equal to or greater than the initial test cutoff or, alternatively, the sum of the analytes present (i.e., equal to or greater than the laboratory's validated limit of quantification) must be equal to or greater than the initial test cutoff.

[2] An immunoassay must be calibrated with the target analyte, 9-tetrahydrocannabinoJ-9- carboxylic acid (THCA).

[3] **Alternate technology (THCA and benzoylecgonine):** The confirmatory test cutoff must be used for an alternate technology initial test that is specific for the target analyte (i.e., 15 ng/ml for THCA, 100 ng/ ml for benzoylecgonine).

[4] Methylenedioxymethamphetamine (MDMA)

[5] Methylenedioxyamphetamine (MDA)

[6] Employees with a prescription for methadone who are using the medication as prescribed, and are not impaired and can safely perform their work, will not be considered to have violated this Policy.

MEMORANDUM OF UNDERSTANDING REGARDING
"QUICK" DRUG SCREENING TESTS PURSUANT TO
ATTACHMENT C – DRUG AND ALCOHOL TESTING POLICY

It is hereby agreed between the Parties hereto that a Contractor who has otherwise properly implemented drug and alcohol testing, as set forth in the Policy, shall have the right to offer an applicant or employee a "quick" drug screening test. This "quick" screen test shall consist either of the "ICUP" urine screen or similar test or an oral screen test. The applicant or employee shall have the absolute right to select either of the two "quick" screen tests, or to reject both and request a full drug test.

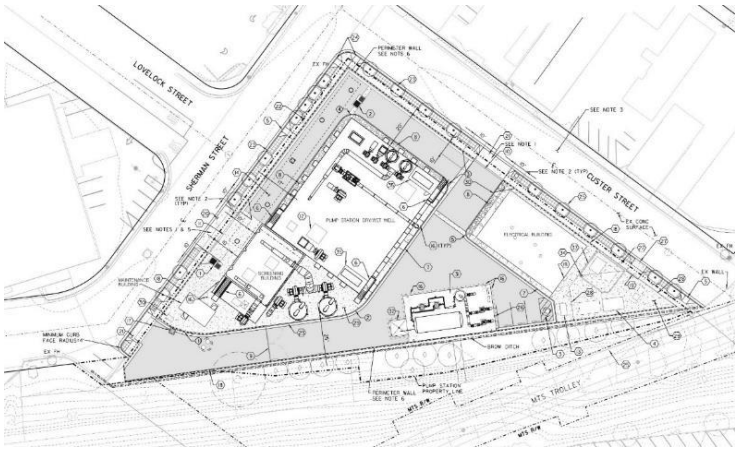
An applicant or employee who selects one of the "quick" screen tests, and who passes the test, shall be put to work immediately. An applicant or employee who fails the "quick" screen test, or who rejects the "quick" screen tests, shall be tested pursuant to the procedures set forth in the Policy. The sample used for the "quick" screen test shall be discarded immediately upon conclusion of the test. An applicant or employee shall not be deprived of any rights granted to them by the Policy as a result of any occurrence related to the "quick" screen test.

APPENDIX A – SAN DIEGO PURE WATER PROGRAM PHASE I COVERED PROJECTS

1. Morena PS/PL Construction Package 1: Morena Pump Station

- **Associated Pure Water Project:** Morena PS/PL Project
- **Summary:** The package is the construction of a new pump station that will transport approximately 32 mgd of wastewater to the NCWRP, where it will be treated before being sent to the NCPWF for further purification. Construction of the pump station will be on Sherman Street.
- **Summary of Major Construction Package Components**
  - 4+1 Dual Stage Sewer Pump Station
  - Screening Facility
  - High Purity Oxygen System
  - 48-inch to 60-inch diameter influent diversion sewers in Friars Road
  - 66-inch Overflow Sewer
  - Electrical and Instrumentation

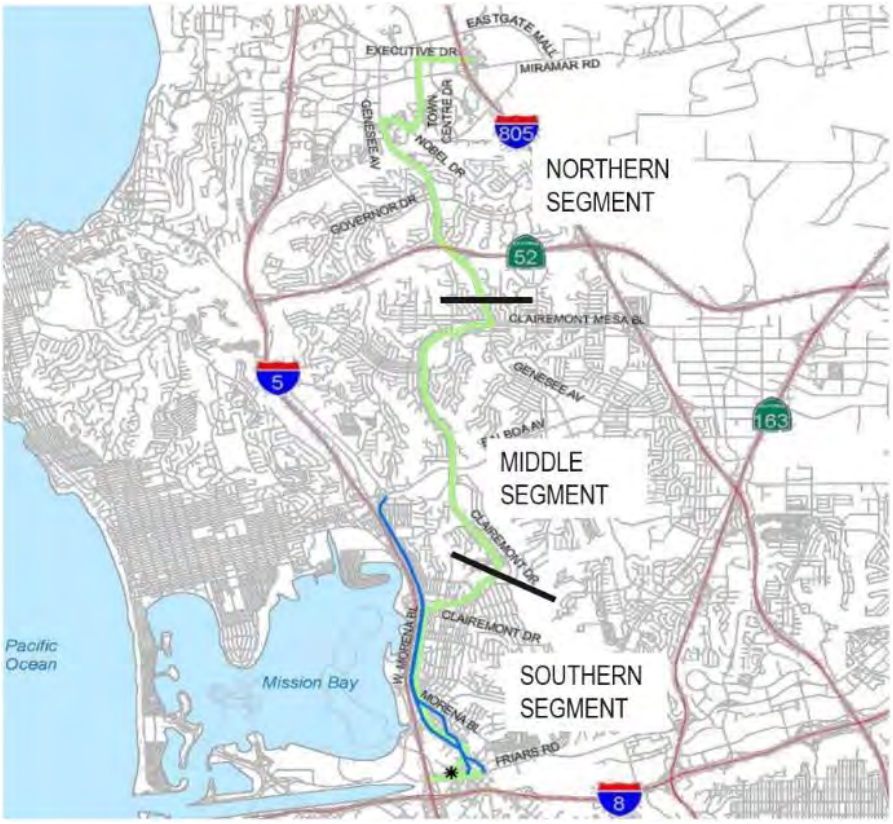
Morena Pump Station Rendering and Site Plan



2. Morena PS/PL Construction Package 2: Morena Northern Alignment and Tunnels

- **Associated Pure Water Project:** Morena PS/PL Project
- **Summary:** Two pipelines that will start at approximately Genesee Avenue/Highway 52, and will continue through University City to the NCWRP. Three short length tunnels are included in this section, each approximately 1000 feet; one at Highway 52, one at Rose Creek in University City and one at Interstate 805. One pipeline will transport wastewater to the NCWRP, while the other will transport salt and contaminants removed from the water at the NCPWF to the Point Loma Wastewater Treatment Plant.
- **Summary of Major Construction Package Components**
  - 4 miles of 48-inch force main
  - 4 miles of 36-inch brine/centrate pipeline
  - Tunnel crossing of I-805
  - Tunnel crossing of MTS/NCTD railroad at Rose Creek Canyon
  - Tunnel crossing at San Clemente Creek

Morena Conveyance Northern, Middle and Southern Segments Site Plan



3. Morena PS/PL Construction Package 3: Morena Middle Alignment

- **Associated Pure Water Project:** Morena PS/PL Project
- **Summary:** Two pipelines will start at Iroquois Avenue and will terminate at Genesee Avenue/Highway 52. One pipeline will transport wastewater to the NCWRP, while the other will transport salt and contaminants removed from the water at the NCPWF to the Point Loma Wastewater Treatment Plant.
- **Summary of Major Construction Package Components**
  - 3.6 miles of 48-inch welded steel force main
  - 3.6 miles of 36-inch brine/centrate high density polyethylene pipeline

4. Morena PS/PL Construction Package 4: Morena Southern Alignment

- **Associated Pure Water Project:** Morena PS/PL Project
- **Summary:** Two pipelines will start at Sherman Street, follow West Morena Boulevard and terminate at Iroquois Avenue. One pipeline will transport wastewater to the NCWRP, while the other will transport salt and contaminants removed from the water at the NCPWF to the Point Loma Wastewater Treatment Plant. A 36-inch diameter welded steel water transmission main will be constructed and a 16 inch steel water distribution main will be replaced by 16 inch PVC in this package.
- **Summary of Major Construction Package Components**
  - 3.2 miles of 48-inch force main
  - 3.2 miles of 30-inch brine/centrate pipeline
  - Brine/centrate pressure reducing station
  - 3.2 Miles of existing 16-inch steel water distribution main replacement with PVC
  - 3.3 miles of new 36-inch water transmission main

5. NCWRP Expansion Construction Package 1: NCWRP Flow Equalization Basin

- **Associated Pure Water Project:** NCWRP Expansion
- **Summary:** This package includes the construction of one concrete equalization tank that will balance high/low wastewater flows from primary effluent and will provide for consistent flow to the biological treatment basins.
- **Summary of Major Construction Package Components**
  - 2.35-million-gallon flow equalization basin
  - Grading, yard piping and stormwater basin
  - Electrical and instrumentation

NCWRP Equalization Basin Package 1 Rendering

6. NCWRP Construction Packages 2 and 3: NCWRP Expansion and NCPWF Influent Conveyance

- **Associated Pure Water Project:** NCWRP Expansion
- **Summary:** This package will increase the amount of recycled water that the plant produces to meet the needs of both the non-potable reuse recycled water system and the new NCPWF. Plant expansion includes the construction of a 42.5 mgd pump station that will convey water to the NCPWF across Eastgate Mall Road.
- **Summary of Major Construction Package Components**
  - Plant expansion from 30 mgd to 52 mgd
  - 42-mgd Influent Pump Station and pipeline to the NCPWF
  - New primary clarifies, new bioreactor basins and retrofit of existing basins, secondary clarifiers, new tertiary filter, chemical facilities, and yard piping
  - Equipment and electrical substation replacements
  - Electrical and instrumentation

NCWRP Expansion Rendering

7. NCPWF Construction Package 1: NCPWF and NCPW Pump Station

- **Associated Pure Water Project:** NCWPF
- **Summary:** A new Pure Water Facility will be built on Eastgate Mall across the street from the existing NCWRP to clean the recycled water further and produce 30 mgd of a safe, high-quality drinking water source. A new pump station will be constructed adjacent to the NCPWF on Eastgate Mall Road to pump an annual average of 30 mgd to Miramar Reservoir. The package includes widening a portion of Eastgate Mall Road.
- **Summary of Major Construction Package Components**
  - New 34-mgd Pure Water Facility, including:
    - Ozone Generation and Contactor
    - Biologically Active Carbon (BAC) Filters
    - Membrane Filtration (MF) System
    - Reverse Osmosis (RO)
    - Ultraviolet Disinfection and Advanced Oxidation (UV/AOP)
    - Chemical Feed Systems
    - Operations Building
    - 30-mgd Pump Station (3 + 1 vertical turbine pumps)
    - Electrical and instrumentation

NCPWF and NCPW Pump Station Rendering

8. NCPW PS/PL Construction Package 1: NCPW Pipeline and Dechlorination Facility

- **Associated Pure Water Project:** NCPW PS/PL
- **Summary:** This package includes infrastructure to convey 30 mgd of purified water produced by the NCPWF to Miramar Reservoir. The pipeline will start on Eastgate Mall, follow Miramar Road, continue through Scripps Ranch and end at Miramar Reservoir. The package includes the replacement of 6.4 miles of asbestos cement watermains with PVC.
- **Summary of Major Construction Package Components**
  - 8 Miles of 48-inch welded steel pipe transmission main (purified water pipeline)
  - Dechlorination Facility
  - Standpipe
  - 6.4 miles of watermain replacement of 6, 12 and 16-inch asbestos cement (AC) pipe with 16-inch polyvinylchloride (PVC) pipe.

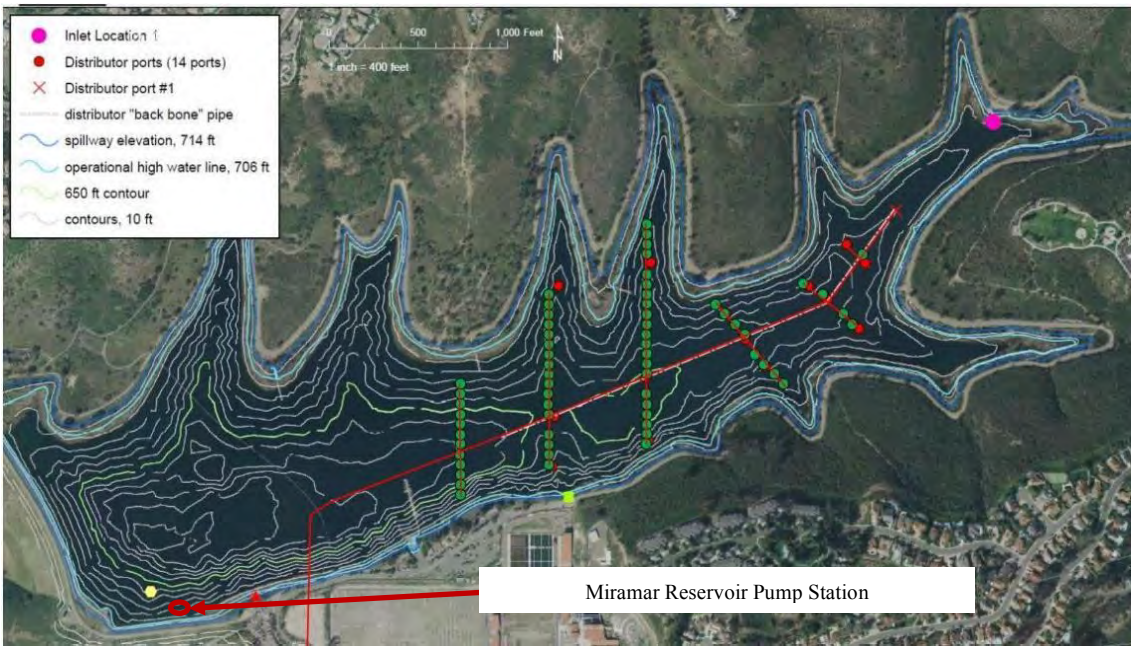
Pure Water Pipeline Alignment

Dechlorination Facility Rendering

9. NCPW PS/PL Construction Package 2: Subaqueous Pipeline and Miramar Reservoir Pump Station Improvements

- **Associated Pure Water Project:** NCPW PS/PL
- **Summary:** This package includes 0.9 miles of pipeline with duckbill outlets placed at the bottom of Miramar Reservoir together with the rehabilitation of a 100 mgd pump station that delivers raw water from Miramar Reservoir to the Miramar Water Treatment Plant.
- **Summary of Major Construction Package Components**
  - 54-inch to 8-inch Subaqueous pipe
  - 94 Dual duckbill valve outlet ports
  - Miramar Reservoir Pump Station Improvements
  - Electrical and instrumentation

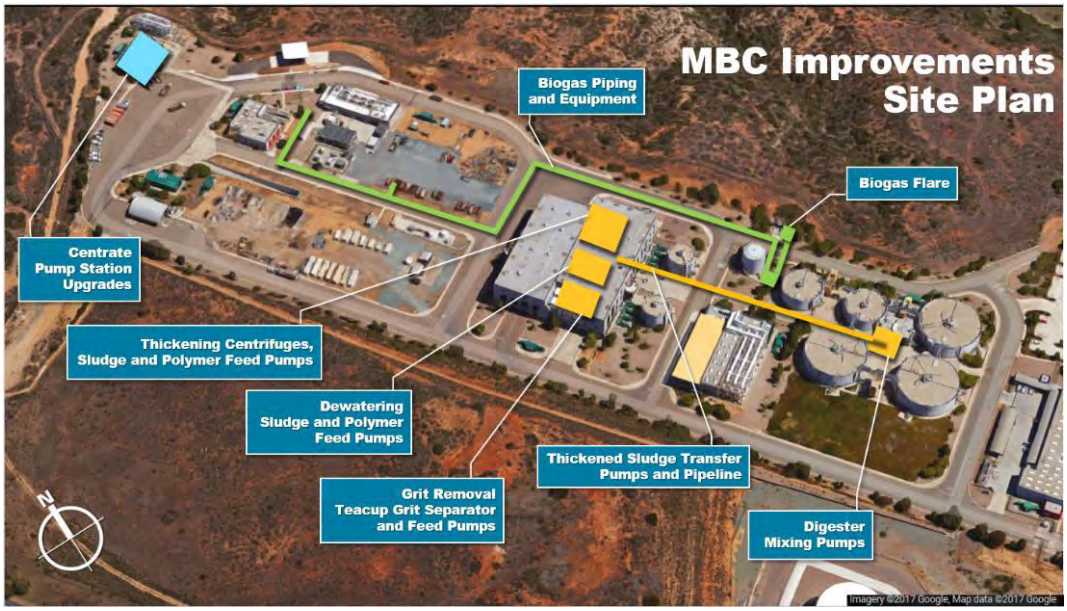
Subaqueous Pipeline Site Plan



10. MBC Construction Package 1: Metropolitan Biosolids Center Improvements

- **Associated Pure Water Project:** MBC Improvements
- **Summary:** This package will consist of improvements to the existing City biosolids center.
- **Summary of Major Construction Package Components**
  - Thickening centrifuges, sludge feed and polymer pumps, transfer pumps and supply pipeline
  - Digester mixing pump replacements, nozzles, overflow lines, biogas compressors, flare and biogas pipeline
  - Dewatering sludge feed pumps and polymer pumps
  - Centrate Pump Station pump and VFD replacements
  - Electrical and instrumentation

Metropolitan Biosolids Center Improvements Site Plan



APPENDIX B

MEMORANDUM OF UNDERSTANDING #1

PROJECT LABOR AGREEMENT SECTION 3.1

The City and the Parties agree that Project Work includes all onsite physical craft work that is part of startup and commissioning, including, but not limited to, system flushes and testing, loop checks, rework and modifications, and functional and operational testing up to and including the final running test. It is understood that the City's personnel and/or its representatives, together with the manufacturer's and/or vendor's representatives, and/or plant operating personnel may supervise and direct the startup, commissioning, rework, and modification activity, and that the onsite physical craft work is typically performed as part of a joint effort with these representatives and personnel. A manufacturer or its representatives may perform industry standard startup and commissioning work to satisfy its guarantee or warranty on a piece of equipment, and such work will be exempt from the Project Labor Agreement to the extent the work is excluded by Section 3.2(e) and/or Section 3.2(f).

MEMORANDUM OF UNDERSTANDING #2

NO DISCRIMINATION AND HARASSMENT

The City hereby provides notice that the City and its Contractors must not unlawfully discriminate, harass, or allow harassment against any employee or applicant for employment because of sex, race, color, ancestry, religious creed, national origin, sexual orientation, physical disability (including HIV and AIDS), mental disability, medical condition (cancer), age (over 40), marital status, denial of family care leave, or genetic information, gender, gender identity, gender expression, or military and veteran status. The City and Contractors will ensure that the evaluation and treatment of their employees and applicants for employment are free from such discrimination and harassment. The City and Contractors must comply with the provisions of the Fair Employment and Housing Act and the applicable regulations promulgated thereunder. (Govt. Code §12990, subs. (a)-(f) et seq.; Cal. Code Regs., tit. 2 §7285, et seq.) These terms will be incorporated into every contract and subcontract for the Covered Project.

CERTIFICATIONS AND FORMS

The Bidder, by submitting its electronic bid, agrees to and certifies under penalty of perjury under the laws of the State of California, that the certifications, forms and affidavits submitted as part of this bid are true and correct.

Bidder's General Information

To the City of San Diego:

Pursuant to "Notice Inviting Bids", specifications, and requirements on file with the City Clerk, and subject to all provisions of the Charter and Ordinances of the City of San Diego and applicable laws and regulations of the United States and the State of California, the undersigned hereby proposes to furnish to the City of San Diego, complete at the prices stated herein, the items or services hereinafter mentioned. The undersigned further warrants that this bid is not made in the interest of, or on behalf of, any undisclosed person, partnership, company, association, organization, or corporation; that the bid is genuine and not collusive or sham; that the bidder has not directly or indirectly induced or solicited any other bidder to put in a false or sham bid, and has not directly or indirectly colluded, conspired, connived, or agreed with any bidder or anyone else to put in a sham bid, or that anyone shall refrain from bidding; that the bidder has not in any manner, directly or indirectly, sought by agreement, communication, or conference with anyone to fix the bid price of the bidder or any other bidder, or to fix any overhead, profit, or cost element of the bid price, or of that of any other bidder, or to secure any advantage against the public body awarding the contract of anyone interested in the proposed contract; that all statements contained in the bid are true; and, further, that the bidder has not, directly or indirectly, submitted his or her bid price or any breakdown thereof, or the contents thereof, or divulged information or data relative thereto, or paid, and will not pay, any fee to any corporation, partnership, company, association, organization, bid depository, or to any member or agent thereof to effectuate a collusive or sham bid.

The undersigned bidder(s) further warrants that bidder(s) has thoroughly examined and understands the entire Contract Documents (plans and specifications) and the Bidding Documents therefore, and that by submitting said Bidding Documents as its bid proposal, bidder(s) acknowledges and is bound by the entire Contract Documents, including any addenda issued thereto, as such Contract Documents incorporated by reference in the Bidding Documents.

NON-COLLUSION AFFIDAVIT TO BE EXECUTED BY BIDDER AND SUBMITTED WITH BID UNDER 23 UNITED STATES CODE 112 AND PUBLIC CONTRACT CODE 7106

State of California

County of San Diego

The bidder, being first duly sworn, deposes and says that he or she is authorized by the party making the foregoing bid that the bid is not made in the interest of, or on behalf of, any undisclosed person, partnership, company, association, organization, or corporation; that the bid is genuine and not collusive or sham; that the bidder has not directly or indirectly induced or solicited any other bidder to put in a false or sham bid, and has not directly or indirectly colluded, conspired, connived, or agreed with any bidder or anyone else to put in a sham bid, or that anyone shall refrain from bidding; that the bidder has not in any manner, directly or indirectly, sought by agreement, communication, or conference with anyone to fix the bid price of the bidder or any other bidder, or to fix any overhead, profit, or cost element of the bid price, or of that of any other bidder, or to secure any advantage against the public body awarding the contract of anyone interested in the proposed contract; that all statements contained in the bid are true; and further, that the bidder has not, directly or indirectly, submitted his or her bid price or any breakdown thereof, or the contents thereof, or divulged information or data relative thereto, or paid, and will not pay, any fee to any corporation, partnership, company association, organization, bid depository, or to any member or agent thereof to effectuate a collusive or sham bid.

CONTRACTOR CERTIFICATION

DRUG-FREE WORKPLACE

I hereby certify that I am familiar with the requirements of San Diego City Council Policy No. 100-17 regarding Drug-Free Workplace as outlined in the WHITEBOOK, Section 7-13.3, "Drug-Free Workplace", of the project specifications, and that;

This company has in place a drug-free workplace program that complies with said policy. I further certify that each subcontract agreement for this project contains language which indicates the subcontractor's agreement to abide by the provisions of subdivisions a) through c) of the policy as outlined.

CONTRACTOR CERTIFICATION

AMERICAN WITH DISABILITIES ACT (ADA) COMPLIANCE CERTIFICATION

I hereby certify that I am familiar with the requirements of San Diego City Council Policy No. 100-4 regarding the American With Disabilities Act (ADA) outlined in the WHITEBOOK, Section 7-13.2, "American With Disabilities Act", of the project specifications, and that:

This company has in place workplace program that complies with said policy. I further certify that each subcontract agreement for this project contains language which indicates the subcontractor's agreement to abide by the provisions of the policy as outlined.

CONTRACTOR CERTIFICATION

CONTRACTOR STANDARDS – PLEDGE OF COMPLIANCE

I declare under penalty of perjury that I am authorized to make this certification on behalf of the company submitting this bid/proposal, that as Contractor, I am familiar with the requirements of City of San Diego Municipal Code § 22.3004 regarding Contractor Standards as outlined in the WHITEBOOK, Section 7-13.4, ("Contractor Standards"), of the project specifications, and that Contractor has complied with those requirements.

I further certify that each of the Contractor's subcontractors has completed a Pledge of Compliance attesting under penalty of perjury of having complied with City of San Diego Municipal Code § 22.3004.

.

CONTRACTOR CERTIFICATION

EQUAL BENEFITS ORDINANCE CERTIFICATION

I declare under penalty of perjury that I am familiar with the requirements of and in compliance with the City of San Diego Municipal Code § 22.4300 regarding Equal Benefits Ordinance.

CONTRACTOR CERTIFICATION

Equal Pay Ordinance Certification

Contractor shall comply with the Equal Pay Ordinance (EPO) codified in the San Diego Municipal Code (SDMC) at section 22.4801 through 22.4809, unless compliance is not required based on an exception listed in SDMC section 22.4804.

Contractor shall require all of its subcontractors to certify compliance with the EPO in their written subcontracts.

Contractor must post a notice informing its employees of their rights under the EPO in the workplace or job site.

By signing this Contract with the City of San Diego, Contractor acknowledges the EPO requirements and pledges ongoing compliance with the requirements of SDMC Division 48, section 22.4801 et seq., throughout the duration of this Contract.

AFFIDAVIT OF DISPOSAL

(To be submitted upon completion of Construction pursuant to the contracts Certificate of Completion)

WHEREAS, on the _____ DAY OF _____, 2_____ the undersigned entered into and executed a contract with the City of San Diego, a municipal corporation, for:

Morena Pump Station
(Project Title)

as particularly described in said contract and identified as Bid No. **K-21-1801-DBB-3-A**; SAP No. (WBS)**, B-15141** and **WHEREAS**, the specification of said contract requires the Contractor to affirm that "all brush, trash, debris, and surplus materials resulting from this project have been disposed of in a legal manner"; and **WHEREAS**, said contract has been completed and all surplus materials disposed of:

_____

_____

NOW, THEREFORE, in consideration of the final payment by the City of San Diego to said Contractor under the terms of said contract, the undersigned Contractor, does hereby affirm that all surplus materials as described in said contract have been disposed of at the following location(s)

_____

_____

and that they have been disposed of according to all applicable laws and regulations.

Dated this _____ DAY OF _____, _____.

By:_____
Contractor

ATTEST:

State of _____ County of _____

On this_____ DAY OF _____, 2_____, before the undersigned, a Notary Public in and for said County and State, duly commissioned and sworn, personally appeared_____ known to me to be the _____ Contractor named in the foregoing Release, and whose name is subscribed thereto, and acknowledged to me that said Contractor executed the said Release.

Notary Public in and for said County and State

LIST OF SUBCONTRACTORS

***** PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY *** TO BE SUBMITTED IN ELECTRONIC FORMAT ONLY *** SEE INSTRUCTIONS TO BIDDERS FOR FURTHER INFORMATION**

In accordance with the requirements of the "Subletting and Subcontracting Fair Practices Act", Section 4100, of the California Public Contract Code (PCC), the Bidder is to list below the name, address and license number of each Subcontractor who will perform work, labor, render services or specially fabricate and install a portion [type] of the work or improvement, in an amount of or in excess of 0.5% of the Contractor's total Bid. Failure to comply with this requirement may result in the Bid being rejected as non-responsive. The Contractor is to list only one Subcontractor for each portion of the Work. The Bidder's attention is directed to the Special Provisions - General; Paragraph 2-3 Subcontracts, which stipulates the percentage of the Work to be performed with the Bidder's own forces. The Bidder is to also list all SLBE, ELBE, DBE, DVBE, MBE, WBE, OBE, SDB, WoSB, HUBZone, and SDVOSB Subcontractors for which the Bidders are seeking recognition towards achieving any mandatory, voluntary, or both subcontracting participation percentages.

Completion of this form is a required part of your bid and must accompany your bid documents. Complete a separate form for each contractor, known subcontractor(s) and trades not currently awarded to a subcontractor. Duplicate this form as needed.

(a) Please provide copies of the following documents to support your insurance cost calculations:

Policy rate pages must be submitted with this worksheet. THERE WILL BE NO EXCEPTIONS.

AON Form-1	**INSURANCE COST WORKSHEET (Fixed Price Type Contracts)** Numbers reference attached instructions	**City of San Diego Pure Water OCIP** Project Name:

Complete a separate form for each contractor, known subcontractor and trade not currently awarded to a subcontractor. Duplicate this form as needed. Completion of this form is a required part of your bid and must accompany your bid documents.

A. Contractor Information

1. Enter your company's Federal ID number. This number can be found on filings made to the federal government such as your tax return.
2. Enter your company's name, mailing address and phone/fax number for your company's main office location in the space provided below.
3. Enter the name of the person AON should contact if questions arise. Include the mailing address, phone/fax and e-mail address if different than A-2.

B. Bid Information

1. Enter the Bid Package Number, Contract Number or Purchase Order Number that was included in The City of San Diego originating documentation.
2. Provide a brief description of the work you will be performing at the project site.
3. Identify the total amount of your bid. Include both labor and material.
4. Identify the amount of work that you anticipate will be self-performed. Include both labor and material.
5. Check the appropriate box that identifies if you contract directly with The City of San Diego or are a subcontractor.
6. If you are a subcontractor identify the entity with whom you are under contract.

C. Workers Compensation Insurance Information

1 a. Enter the two letter abbreviation for the state in which the work will be performed.
b. Enter each Workers Compensation class code that applies to your work identified in B2. (Most states use a 4 digit Number).
c. Enter the Workers Compensation class code description that applies to each class code identified in C1b.
d. Enter the Workers Compensation rate that applies to the specified class code.
e. Enter the estimated Work Hours required to complete the described work for each Workers Compensation class code.
f. Enter the estimated Payroll required to complete your work. Use only unburdened payroll and exclude the premium portion of any overtime pay.
g. Calculate the WC Premium by multiplying the Payroll (C1f) by the Rate (C1d) and dividing the result by 100. Repeat this calculation for each WC class code.

2. Total the estimated Work Hours for each class code. Be sure to include information from additional pages if used.
3. Total the estimated Payroll for each class code. Be sure to include information from additional pages if used.
4. Total the Workers Compensation Premium for each class code. Be sure to include information from additional pages if used.
5. Enter the amount of the Claim Retention/ Deductible your company has on their existing Worker's Compensation.
6. Enter you WC experience Modifier. This information can be located on your Workers Compensation policy or on your NCCI Bureau Rating Sheet.
7. Calculate the Modified Premium by multiplying the WC Premium (C4) by the Experience Modifier (C6).
8. Enter your Employer's Liability Insurance Rate. This information can be found in your Workers Compensation Policy,
9. Calculate your Employer's Liability Premium by multiplying the Modified Premium (C7) by the Employer's Liab. Rate (C8).
10. Identify the Modifiers that apply to your Workers Compensation Premium. This information can be located on your Workers Compensation Policy.
11. Enter the rate for each identified Modifier. The information can be located on your Workers Compensation Policy.
12. Calculate the Modified Premium Factor Amount by multiplying the Modified Premium (C7) by the Modified Premium Rate (C11) and dividing by 100. Be sure to identify if the Modification factor is an addition or reduction to your premium.
13. Total the Modified Premium Amounts by adding the numbers in column C12.
14. Calculate the Total Workers Compensation Premium by adding the Modified Premium (C7) to the Employer's Liab Premium (C9) and adding the Premium Modifications (C12).

D. General Liability & Umbrella/Excess Liability Insurance

1. Enter the general liability Rate. This number can be found on your General Liability Policy.
2. Identify the base the General Liability Rate applies to. If the base is other than Payroll or Revenue, enter the amount and the description in the space provided.
3. Identify the General Liability Rate factor by marking the box.
4. Identify the amount of your Claim Retention.
5. Calculate the General Liability Premium by multiplying the Bases (D2) by the Rate and dividing by the factor (D3).
6. Enter the Excess/Umbr Liability Rate. This number can be found on your Excess/Umbr Liability Policy.
7. Identify the base the Excess/Umbr Liab. Rate applies to. If the base is other than Payroll or Revenue, enter the amount and description in the space provided.
8. Identify the Excess/Umbr Liability Rate factor by marking the box.
9. Calculate the Excess/Umbr Liability Premium by multiplying the Bases (D7) by the Rate (D6) and dividing by the factor (100 or 1,000).

E. Builder's Risk / Installation Floater

1. Enter the Builder's Risk / Installation Floater Rate. Locate this information on your Property Policy or Builder's Risk Policy.
2. Identify the base factor that it applies to (100 or 1,000).
3. Calculate the Premium by multiplying the Proposed Contract Price (B3) by the Rate (E1) and dividing it by the Factor (E2).

F. Other Insurance Premiums

1. For each of the Insurance Lines of Coverage identified below, identify the Rate, Base and Factor. Calculate the Premium by multiplying the Base x Rate ÷ Factor. Total the Other Insurance Premiums in the space provided and carry that amount to the front page.

Line of Coverage	Rate	Base	Factor	Premium	Total Premium

G. Totals

1. Calculate the Total of all Insurance Premium by adding Workers Compensation (C14), General Liability (D5), Excess/Umbr Liability (D9), Builder's Risk/Installation Floater (E3), and Other Insurance Premiums (F1).
2. Identify the Overhead & Profit Percentage that was applied to this project during the tabulation of the Proposed Contract Price.
3. Calculate the Overhead & Profit Amount by Multiplying the Total of all Insurance Costs (G1) by your Overhead & Profit Percentage (G2).
4. Calculate the Total Initial Insurance Cost by adding the Overhead & Profit Amount (G3) with the Total of all Insurance Premium (G1).
5. Calculate your rate by Dividing the Total Initial Insurance Cost (G4) by the Estimated Payroll (C3) and multiplying by 100.

H. Signature Block

Note: Please provide copies of the following documents as part of your submittal:

- ☐ Rate Pages
- ☐ Workers Compensation declaration and rate pages
- ☐ General Liability declaration and rate pages
- ☐ Umbrella / Excess Liability declaration and rate pages
- ☐ 5 years actual loss experience for each line of coverage in which Contractor retains more than $5,000

Form-3	**Enrollment Application (Instructions)**	**City of San Diego Pure Water OCIP** Project Name:

This form must be completed and submitted by each successful Contractor and Subcontractor of any tier prior to Site mobilization for each contract awarded. The Contractor and Subcontractor will submit the completed form to Aon Risk Services. Upon receipt of this form, Aon will issue to the Contractor or Subcontractor a Certificate of Insurance evidencing coverage in the Controlled Insurance Program. The completed Certificate of Insurance and Workers Compensation insurance policy will be mailed to the Enrolled party.

A. Contractor Information

1 Enter your company's Federal ID number. This number can be found on filings made to the federal government such as your tax return.
2 Enter your company's name, mailing address and phone/fax number for your company's primary office location.
3 Enter the name of the person Aon should contact if questions arise. Include mailing address, phone/fax and email address, if different than A2.
4 Identify your company's legal structure by checking the box that applies. If the correct legal structure is not specifically listed, please check the "Other" box and specify in the space provided.

B. Contract Information

1 Enter the Contract Number or Purchase Order Number that was included in The City of San Diego's originating documentation.
2 Supply the Date this Contract was awarded to your organization.
3 Provide a brief description of the work you will be performing at the project site.
4 Identify the total amount of your contract. Include both labor and material.
5 Identify the amount of work that you anticipate will be self-performed. Include both labor and material.
6 Check the appropriate box that identifies if you contract directly with The City of San Diego or are a Subcontractor.
7 If you are a Subcontractor, identify the entity with whom you are under contract.
8 Enter the Date you anticipate starting work and then mark whether the date provided is actual or estimated.
9 Enter the Date you anticipate completing the described work and then mark whether the date provided is actual or estimated.

C. Contacts *(Requested Contact information is for specific functions. It is possible to have a single person fulfill multiple responsibilities.)*

1 Identify the name of the person and their title for each function. These individuals should be located, if at all possible, on-site.
2 Provide the phone number for each person identified above.
3 Provide the fax number for each person identified above.
4 Provide the email address for each person identified above, if applicable.
5 Identify the physical location where your payroll records are retained. Provide the Address, City, State, Zip Code, Telephone, Fax Number and Email Address of the person responsible for maintaining the payroll information.

D. Workers Compensation Information (Duplicate or attach additional sheets if necessary. You may create an electronic version of this document if all requested information is included.):

1 a Enter the two letter abbreviation for the state in which the work will be performed.
b Enter each Workers Compensation class code that applies to the work identified in B2. (Most states use a 4 digit Number)
c Enter the Workers Compensation class code description that applies to the work identified in D1b.
d Enter the estimated Work Hours required to complete the described work by Workers Compensation class code.
e Enter the estimated Payroll required to complete the described work for each Workers Compensation class code. Use only unburdened payroll and exclude the premium portions of any overtime pay.
2 Total all estimated Work Hours for each class code. Be sure to include information from additional pages if used.
3 Total all estimated Payroll for each class code. Be sure to include information from additional pages if used.

E. Current Off-Site Workers Compensation Information (Information relates to your corporation's existing coverage; identify each modification factor that applies.)

1 Enter the State that the Modification Information applies to.
2 Enter your Bureau File Number also referred to as your Risk Identification Number. This number can also be found on your Modification worksheets.
3 Enter the Bureau Rating Agency. In most states this is NCCI.
4 Provide your Company's Anniversary Rating Date. Information can be located on your bureau's WC Experience Modification worksheets.
5 Identify your insurance carrier for Workers Compensation Coverage.
6 Provide your Workers Compensation Policy Number.
7 Provide the effective date of your Workers Compensation policy.
8 Provide the expiration date of your Workers Compensation policy.

F. Subcontractor Information (Provide the following information for each Subcontractor that will be performing work at the project site. Use additional sheets, if necessary.)

1 Identify the name of the Subcontracting firm.
2 Provide the estimated value of the subcontracted activity.
3 Provide a contact name, preferably the project manager, for the Subcontractor.
4 Provide the mailing address for the Subcontractor.
5 Provide the phone number for the Subcontractor.
6 Provide the date the Subcontractor is scheduled to begin work.

G. Enrollment Questions

1 Determine if you will have any locations, off-site, that will be 100% dedicated to this project. Include material/supply storage as a possible location. Mark the appropriate box (yes/no). If you answer yes – provide the address of each location you identified as 100% dedicated.
2 Mark the box or boxes that apply. Contemplate only work performed under this contract.
3 Mark the box or boxes that apply. Employee Leasing Firm are those firms that supply the labor force for your company (You direct the activities of the Leasing Company's employees). Temporary Labor Firms supplement your labor force.

H. Warranty Statements:

1-6 Read each Warranty statement thoroughly. If you have questions regarding any of these statements, contact the Aon administrator identified on page 2.

I. Signature Block: This form must be signed by a representative of your company knowledgeable of its accuracy.

Forward the completed Enrollment Application to the Aon administrator identified at the bottom of page 2 of this form. The administrator prior to the start of your work on-site must receive this form.

Insert Company Letterhead

Skilled and Trained Workforce Certification Form

Month:_____ Year: _____

In accordance with Public Utilities Code section 132354.7 and Public Contract Code sections 2600-2602, _____ (the "Prime Contractor") certifies that all the workers performing work in an

(Prime Contractor Name)

apprenticeable occupation utilized on the project known as _____ (the "Project") during this monthly reporting period are either skilled journeypersons or apprentices registered in an apprenticeship

(Project Name)

program approved by the Chief of the Division of Apprenticeship Standards of the California Department of Industrial Relations (the "Chief").

"Skilled journeyperson" means a worker who either:

(1) Graduated from an apprenticeship program for the applicable occupation that was approved by the Chief or apprenticeship program located outside California and approved for federal purposes, pursuant to the apprenticeship regulations adopted by the Federal Secretary of Labor.

(2) Has at least as many hours of on-the-job experience in the applicable occupation as would be required to graduate from an apprenticeship program that is approved by the Chief.

In addition, the Prime Contractor certifies that it has met the requirements of Public Contract Code 2601(d), subject to certain exceptions set forth therein, that the required percentage of the skilled journeypersons or skilled journeyperson hours employed to perform work on the Project by the Prime Contractor and all subcontractors are graduates of an apprenticeship program for the applicable apprenticeable occupation[1].

A graduate of an apprenticeship program means either of the following:

(1) An individual that has been issued a certificate of completion under the authority of the California Apprenticeship Council for completing an apprenticeship program approved by the Chief pursuant to Section 3075 of the Labor Code, or

(2) An individual that has completed an apprenticeship program located outside California and approved for federal purposes pursuant to the apprenticeship regulations adopted by the federal Secretary of Labor.

I declare, under penalty of perjury under the laws of the State of California, that the foregoing is true and correct. I certify that the attached Skilled and Trained Workforce Monthly Compliance Reports are complete and accurate.

* Use Additional Pages if Necessary *

Under penalty of perjury under the laws of the State of California, I certify that I am responsible for the completeness and accuracy of the responses contained herein, and that all information provided is true, full and complete to the best of my knowledge and belief. I agree to provide written notice to the Mayor or Designee within five (5) business days if, at any time, I learn that any portion of this Mandatory Disclosure of Business Interests Form requires an updated response. Failure to timely provide the Mayor or Designee with written notice is grounds for Contract termination.

Print Name, Title _____ Signature _____ Date _____

Failure to sign and submit this form with the bid/proposal shall make the bid/proposal non-responsive. In the case of an informal solicitation, the contract will not be awarded unless a signed and completed Mandatory Disclosure of Business Interests Form is submitted.

DEBARMENT AND SUSPENSION CERTIFICATION

PRIME CONTRACTOR

FAILURE TO COMPLETE AND SUBMIT AT TIME OF BID SHALL RENDER BID NON-RESPONSIVE

EFFECT OF DEBARMENT OR SUSPENSION
To promote integrity in the City's contracting processes and to protect the public interest, the City shall only enter into contracts with responsible- bidders and contractors. In accordance with San Diego Municipal Code §22.0814 (a): *Bidders* and *contractors* who have been *debarred* or *suspended* are excluded from submitting bids, submitting responses to requests for proposal or qualifications, receiving *contract* awards, executing *contracts*, participating as a *subcontractor*, employee, agent or representative of another *person* contracting with the City.

As part of its bid or proposal (Non-Price Proposal in the case of Design-Build contracts), the Bidder shall provide to the City a list of Names of the Principal Individual owner(s).

The names of all persons interested in the foregoing proposal as Principals are as follows:

NAME	TITLE

IMPORTANT NOTICE: If Bidder or other interested person is a corporation, state secretary, treasurer, and manager thereof; if a co-partnership, state true name of firm, also names of all individual co-partners composing firm; if Bidder or other interested person is an individual, state first and last names in full.

The Bidder, under penalty of perjury, certifies that, except as noted below, he/she or any person associated therewith in the capacity of owner, partner, director, officer, manager:

- Is not currently under suspension, debarment, voluntary exclusion, or determination of ineligibility by any Federal, State or local agency;
- has not been suspended, debarred, voluntarily excluded or determined ineligible by any Federal, State or local agency within the past 3 years;
- does not have a proposed debarment pending; and
- has not been indicted, convicted, or had a civil judgment rendered against it by a court of competent jurisdiction in any matter involving fraud or official misconduct within the past 3 years.

If there are any exceptions to this certification, insert the exceptions in the following space.

Exceptions will be considered in determining bidder responsibility. For any exception noted above, indicate below to whom it applies, initiating agency, and dates of action.

USE ADDITIONAL FORMS AS NECESSARY*

INSTRUCTIONS FOR COMPLETION OF SF-LLL, DISCLOSURE OF LOBBYING ACTIVITIES

This disclosure form shall be completed by the reporting entity, whether subawardee or prime Federal recipient, at the initiation or receipt of a covered Federal action, or a material change to a previous filing, pursuant to title 31 U.S.C. section 1352. The filing of a form is required for each payment or agreement to make payment to any lobbying entity for influencing or attempting to influence an officer or employee of any agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with a covered Federal action. Use the SF-LLLA Continuation Sheet for additional information if the space on the form is inadequate. Complete all items that apply for both the initial filing and material change report. Refer to the implementing guidance published by the Office of Management and Budget for additional information.

1. Identify the type of covered Federal action for which lobbying activity is and/or has been secured to influence the outcome of a covered Federal action.
2. Identify the status of the covered Federal action.
3. Identify the appropriate classification of this report. If this is a follow up report caused by a material change to the information previously reported, enter the year and quarter in which the change occurred. Enter the date of the last previously submitted report by this reporting entity for this covered Federal action.
4. Enter the full name, address, city, State and zip code of the reporting entity. Include Congressional District, if known. Check the appropriate classification of the reporting entity that designates if it is, or expects to be, a prime or subaward recipient. Identify the tier of the subawardee, e.g., the first subawardee of the prime is the 1st tier. Subawards include but are not limited to subcontracts, subgrants and contract awards under grants.
5. If the organization filing there port in item 4 checks "Subawardee," then enter the full name, address, city, State and zip code of the prime Federal recipient. Include Congressional District, if known.
6. Enter the name of the Federal agency making the award or loan commitment. Include at least one organizational level below agency name, if known. For example, Department of Transportation, United States Coast Guard.
7. Enter the Federal program name or description for the covered Federal action (item1). If known, enter the full Catalog of Federal Domestic Assistance (CFDA) number for grants, cooperative agreements, loans, and loan commitments.
8. Enter the most appropriate Federal identifying number available for the Federal action identified in item 1 (e.g., Request for Proposal (RFP) number; Invitation for Bid (IFB) number; grant announcement number; the contract, grant, or loan award number; the application/proposal control number assigned by the Federal agency). Include prefixes, e.g., "RFP-DE-90-001."
9. For a covered Federal action where there has been an award or loan commitment by the Federal agency, enter the Federal amount of the award/loan commitment for the prime entity identified in item 4 or 5.
10. (a) Enter the full name, address, city, State and zip code of the lobbying entity engaged by the reporting entity identified in item 4 to influence the covered Federal action.

    (b) Enter the full names of the individual(s) performing services, and include full address if different from 10 (a). Enter Last Name, First Name, and Middle Initial (MI).
11. Enter the amount of compensation paid or reasonably expected to be paid by the reporting entity (item4) to the lobbying entity (item10). Indicate whether the payment has been made (actual) or will be made (planned). Check all boxes that apply. If this is a material change report, enter the cumulative amount of payment made or planned to be made.
12. Check the appropriate box(es). Check all boxes that apply. If payment is made through an in-kind contribution, specify the nature and value of the in-kind payment.
13. Check the appropriate box(es). Check all boxes that apply. If other, specify nature.
14. Provide a specific and detailed description of the services that the lobbyist has performed, or will be expected to perform, and the date(s) of any services rendered. Include all preparatory and related activity, not just time spent in actual contact with Federal officials. Identify the Federal official(s) or employee(s) contacted or the officer(s), employee(s), or Member(s) of Congress that were contacted.
15. Check whether or not a SF-LLLA Continuation Sheet(s) is attached.
16. The certifying official shall sign and date the form, print his/her name, title, and telephone number.

COMMITMENT TO COMPLY WITH SKILLED AND TRAINED WORKFORCE REQUIREMENTS

Bidder, on behalf of itself and its subcontractor(s) at every tier, hereby commits that a skilled and trained workforce will be used to perform all work on the Project that falls within an apprenticeship occupation in the building or construction trades in accordance with Chapter 2.9 (commencing with Section 2600) of Part 1 of Division 2 of the Public Contract Code. Pursuant to Public Contract Code section 2601, as of January 1, 2018:

"Skilled and trained workforce" means a workforce that meets all of the following conditions: All the workers performing work in an apprenticeable occupation in the building and construction trades are either skilled journeypersons or apprentices registered in an apprenticeship program approved by the chief.

For work performed on or after January 1, 2018, at least 40 percent of the skilled journeypersons employed to perform work on the contract or project by every contractor and each of its subcontractors at every tier are graduates of an apprenticeship program for the applicable occupation. This requirement shall not apply to work performed in the following occupations: acoustical installer, bricklayer, carpenter, cement mason, drywall installer or lather, marble mason, finisher, or setter, modular furniture or systems installer, operating engineer, pile driver, plasterer, roofer or waterproofer, stone mason, surveyor, teamster, terrazzo worker or finisher, and tile layer, setter, or finisher.

For work performed on or after January 1, 2019, at least 50 percent of the skilled journeypersons employed to perform work on the contract or project by every contractor and each of its subcontractors at every tier are graduates of an apprenticeship program for the applicable occupation. This requirement shall not apply to work performed in the following occupations: acoustical installer, bricklayer, carpenter, cement mason, drywall installer or lather, marble mason, finisher, or setter, modular furniture or systems installer, operating engineer, pile driver, plasterer, roofer or waterproofer, stone mason, surveyor, teamster, terrazzo worker or finisher, and tile layer, setter, or finisher.

For work performed on or after January 1, 2020, at least 60 percent of the skilled journeypersons employed to perform work on the contract or project by every contractor and each of its subcontractors at every tier are graduates of an apprenticeship program for the applicable occupation. This requirement shall not apply to work performed in the following occupations: acoustical installer, bricklayer, carpenter, cement mason, drywall installer or lather, marble mason, finisher, or setter, modular furniture or systems installer, operating engineer, pile driver, plasterer, roofer or waterproofer, stone mason, surveyor, teamster, terrazzo worker or finisher, and tile layer, setter, or finisher.

NOTE: The above commitment is required by California Public Utilities Code section 132354.7 and must be submitted by Bidder in order for the Bid to be responsive to the IFB.

A. CHANGES TO CONTRACT DOCUMENTS

The following changes to the Contract Documents are hereby made effective as though originally issued with the bid package. Bidders are reminded that all previous requirements to this solicitation remain in full force and effect.

B. BIDDER's QUESTIONS

Q1. Due to the size and complexity of the project an 8 week procurement schedule that includes the week of Thanksgiving is not enough time for Contractors to bid the project. We are requesting that the project bid date be extended until mid-January 2021.

A1. No extension on the project bid due date.

Q2. I am emailing you with regards to the Morena Pump Station Project in San Diego, Ideal Electric Company would like to propose that we be considered and equal or alternative to the three manufacturer's that are currently listed as approved manufacturer's under MV Motor Specification (Section 16 19 00) Part 2 ss. 2.1a. Ideal Electric is a US Based Manufacturer of industrial and commercial motors for application such as your project since 1903. I am attaching copies of our SOQ and our Company history and current Status for your review. Your consideration to be included as an acceptable manufacturer would be greatly appreciated. Please review the attached documentation and feel free to contact me at your earliest opportunity.

A2. Refer to section 4-1.6 " Trade Names or Equals" of the Supplementary Special Provisions for submittal of approved equal products. If the contractor intends to use an approved equal product, he or she will need to submit for review and approval to the City of San Diego. The use of the approved equal product needs prior approval from the City.

Q3. Manufacturing the pipe to specification:

SECTION 33 05 10 REINFORCED CONCRETE PIPE (RCP), RUBBER GASKET JOINT WITH PVC LINING
Part 2 2.2 E

Is not possible since T-Lock is no longer a product and there are no other approved PVC liners on the City of San Diego approved product lists.

E. **PVC-Liner:** PVC-liner shall conform to SSPWC Subsection 207.3 and shall be Amerplate T-Lock as manufactured by Northwest Pipe Company, Brea, California, or equal. The liner shall cover 330 degrees of the pipe interior surface, leaving an open arc of 30 degrees at the bottom of the pipe for observation of cracks that may occur during D- Load tests.

2.3 JOINTS

A. Joint assembly design shall be Carnegie bell and spigot steel joint or reinforced concrete raised or flush bell concrete joint incorporating a fully retained single rubber gasket in accordance with ASTM C 361 and as shown. For locations where pipelines will be installed below the water table, the CONTRACTOR shall provide double rubber gaskets.

One product that will perform better than PVC lined RCP is Meyer polymer concrete pipe. Meyer is approved on the City of San Diego wastewater approved products. It is non corrosive, it will handle curves, and is also a rigid product like RCP. Because the pipe is inherently corrosion resistant there is no welding required at the joints.

I've attached the city of San Diego approved products list and the meyer pipe guide.

We would like to propose Meyer as an equal to the City for consideration and approval before the project bid date.

A3. Refer to Section 4-1.6 "Trade Names or Equals" of the Supplementary Provisions for submittal of approved or equal product. If the contractor intends to use an approved equal product, he or she will need to submit for review and approval to the City of San Diego.

The use of the approved equal product needs prior approval from the City.

Q4. Specification Section 31 71 19 2.1.A states: "Sewer jacking pipe shall consist of plastic lined reinforced concrete pipe (PLRCP), as required to provide a safe, stable tunnel excavation and acceptable in-place pipe. Pipe materials shall be in accordance with the Contract Documents and specifications." Specification Section 33 05 10 1.1 A states: "RCP for use in trenchless construction shall be provided as identified in the section for Microtunneling." Please clarify if microtunneling pipe (sewer jacking pipe) must conform to Specification Section 33 05 10.

A4. Specification 33 05 10 is for Open Cut pipe and does not have to confirm to Jacking Pipe standards. Microtunneling Pipe specified in Section 31 71 19 does not have to conform to specification 33 05 10

Q5. Specification Section 33 05 10 2.2.E states: "PVC-liner shall confirm to SSPWC Subsection 207.3 and shall be Amerplate T-Lock as manufactured by Northwest Pipe Company, Brea, California, or equal."

T-Lock PVC liner is no longer manufactured by Northwest Pipe, and no equal is identified in the City's Approved Materials List. Please identify a commercially available PVC liner product meeting the intent of the specifications or identify an alternate microtunnel/jacking pipe material that will be acceptable for use on this project.

A5. PVC or HDPE pipe lining material not identified on the City's approved 2018 material list for wastewater will be considered in lieu of the no longer produced T-Lock PVC liner. HDPE lined pipe products such as Northwest's Perfect Pipe will e considered as "equal" if the manufacturer can show the proposed lining material is equivalent or better than T-lock lined pipe to te City's satisfaction. Please refer to Section 4-1.6 "Trade Names or Equals".

Q6. I have the following question about the Morena Pump Station Project.

9. Linings: Fittings shall be interior lined same as specified for the piping connected to the fitting. Refer to AWWA C205.
10. Manufacturer: Provide wall and floor pipe as manufactured by one of the following:
    a. Thompson Pipe Group.
    b. Northwest Pipe Company.
    c. Or equal.

B. Pipe Sleeves Through Walls or Floor Slabs (New Concrete Below Grade): Sleeves shall be cast into the wall as shown on the Contract Drawings.

1. Material: Steel with welded-on waterstop.
2. Dimensions: As recommended by manufacturer and link-seal manufacturer. Length as required.
3. Pipe Sizes: Greater than 22-inch diameters.
4. Product and Manufacturer: Provide one of the following:
    a. Steel Wall Sleeve, Model WS, Thunderline Corporation.
    b. Or equal.

C. Link Seals: Provide link type mechanical seals suitable for 20 psi working pressure, accessible from one side.

1. Sizes: As recommended by manufacturer and pipe sleeve manufacturer.
2. Seal Element: EPDM black.
3. Pressure Plates: Composites.
4. Bolts and Nuts:
    a. 316 stainless steel for all applications.
5. Product and Manufacturer: Provide one of the following:
    a. Link-Seal, Model C, Thunderline Corporation, for above grade applications.
    b. Link-Seal, Model S. Thunderline Corporation for below grade applications.
    c. Or equal.

D. Escutcheon Plates:

1. Bare pipes passing through walls and ceilings in finished rooms: Provide escutcheon plates of cast brass or cast iron nickel plated, clevis or split ring and hinged with set screws.
2. Insulated pipes passing through walls and ceilings in finished rooms: Provide plated escutcheon plates of 18 gage steel.

The Wall & Floor spools are called out to be manufactured by specific companies and or equal. Can Western Waterworks Supply be an approved equal?

A6. Any submittal of or "Equal" item – should be referred to Section 4-1.6 "Trade Names or Equals". If the Contractor intends to use or "Equal" item, he or she will need to submit and cannot use it without prior approval from the City.

Q7. Sht E-50 is not included in electronic file for this project. Please provide this drawing.

A7. See Sheet E-50, page 87, added in this Addendum.

Q8. In accordance with Notice Inviting Bids section 16, please respond to the following prebid questions:

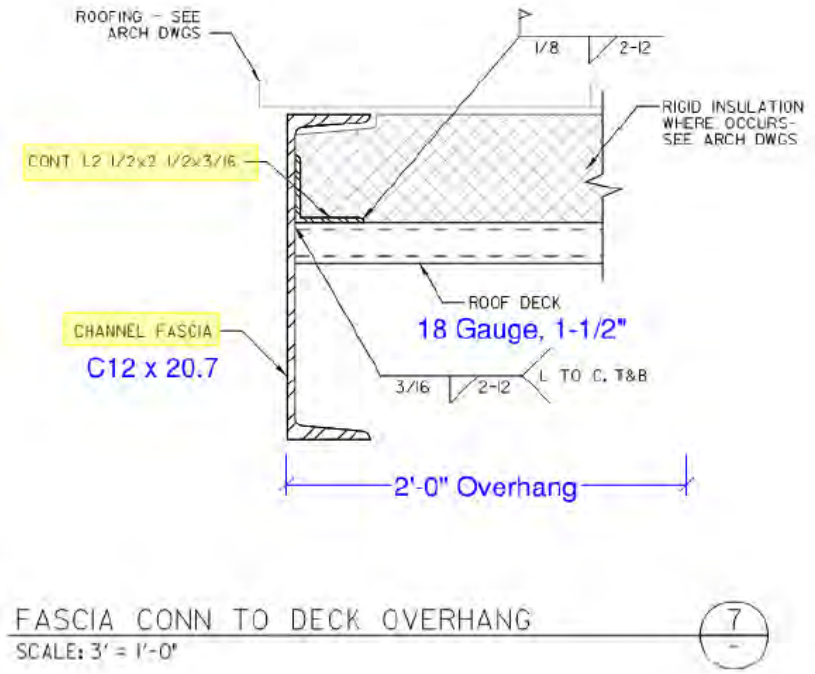
1. Reference Attachment E, section 6.2.2.1 calling for flagged vehicle access to the MTS Trolley overflow lot located on Friars Road during trolley operational hours. Is flagging required to stop public traffic in the event construction vehicles enter or leave this lot? Is flagging required to escort public traffic in and out of this lot when construction activities are nearby? Please clarify.

2. Reference drawing M-04 (40421-167-D) and note 3 calling for "10-0" X 10'-0" DOUBLE LEAF MOTORIZED ALUMINUM EQUIPMENT HATCH WITH HANDRAIL." Architectural drawings (A-07, A-38) do not mention these hatches being motorized. Specification section 08 31 13 ACCESS DOORS AND HATCHES would appear to apply here, yet there is no mention of motorized hatches. Electrical drawings fo not appear to indicate that power or controls are required at the locations of these hatches. Are these hatches actually manually operated? Please clarify.

A8. 1. Response: An excavation shaft within the parking lot is shown on drawing C-16, Section 6.2.2.1 is applicable.

2. Response: The hatches shall be motorized per specification Section 08 31 13.

Q9. After speaking with a metal deck supplier/installer, it is their opinion that this detail (Detail 7/S-59) does not work. The 1/8: weld, 2" long @ 12", will burn through the 18-gauge deck and not support the angle/fascia as detailed. Please advise.



A9. See revised detail on Drawing Sheet 40421-156-D provided in this Addendum.

Q10. On Sheet S-51, there is a monorail crane beam and support beam shown in the Maintenance Building. While the size and weight of the monorail beam is provided (S10 x 25.4) the support beam size is missing the weight information (W10 x ?). Please provide missing information.

A10. The Support Beam size is W10 X 19.

Q11. Sht. E-33, (Conduit & Cable Schedule) calls out "A" conduits numbering up to A-98.

Sht. E-27, (Duct Bank Sections) calls out "A" conduits in Duct Bank 1 and 3 which exceed the numbers called out in the Conduit Schedule… IE: A-104, 107, 119, 127, 128, 131 147, 148, 149.

Please Clarify!

We intend to exclude these conduits from our scope unless directed Otherwise.

A11. Additional conduits will be used for security wiring described as Bid Item 34 Security Systems (EOC Type I).

Q12. On Sheets S-09 note 8, S-10 note 5, S-11 note 19, S-27 note 15, it states "Waterproofing – Apply to all external wall surfaces below grade – see specification section 07 16 16." This section does not exist. Please confirm the note should reference specification section 07 13 26.

A12. Keynote 8 on S-09, keynote 5 on S-10, and keynote 19 on S-11 should reference Specification Section 07 13 26. Delete keynote 15 on S-27.

Q13. The stainless steel in the Process Piping spec 40 27 00 2.7 section calls out A-312 Pipe & A-815 Fittings. These are dissimilar materials. Is there a specific reason for this or can the Pipe and Fittings be the same material?

A13. Stainless Steel process pipe shall be A-312 as specified. Fittings maybe manufactured from same material or as recommended by the pipe manufacturer.

Q14. Drawing D-01, Note 6, indicates it is the contractor's responsibility for draining/ handling/ disposing of all water/ wastewater/ other media in piping and equipment found on site or connected to site and existing structures and buildings. Please provide quantities and types for all of this material to be disposed of.

A14. Disposal quantities are not determinable at this time. The quantity of disposal must be field evaluated and measured by the contractor and agreed to by the Construction Manager. Costs for disposal will be paid from a field order allowance.

Q15. Drawing S-31 indicates 10' square access hatches in Keynote 4. There does not appear to be a specification for these roof hatches. Please provide.

A15. Refer to Specification Section 07 72 33 for roof hatches shown on Drawing S-31.

Q16. Drawing M-01, Note 1, indicates the use of 316 SS hardware to be used inside the Screening Facility. Does this note extend to all hardware to be used in the Roof Structure? This is the same question for the Pump Station Building, too.

A16. Drawing M-01 Note 1 applies to the Mechanical drawings only. Roof Hardware shall be as shown on Structural and/or Architectural drawings.

Q17. Reference drawing C-16: At Sta. 2+00 of the 48" casing/36" Brine sewer, a Rip Rap Excavation Shaft is shown. Is the intent of the excavation to remove the toe of the rip rap in Friars Rd North Levee that is in conflict with the proposed 48" casing pipe and then rebuild the toe above the casing pipe? If so, at what distance above the top of the proposed 48" casing should the rip rap terminate? How far on either side of the proposed 48" casing pipe should the rip rap be removed?

A17. The Contractor should figure out the limits of the rip rap by probing as indicated in Note 2 of Dwg C-16. The Contractor will need to remove enough rip rap to be able to build the pipeline and then replace rip rap to meet the limits the rip rap exists now above and next to the pipe.

Q18. On Drawing C-21, Note No. 4 states that Stone Columns shall be installed at 9-ft on center with a 3-ft diameter, unless shown by the test section to allow different spacing and diameter and still achieve ground improvement objectives. Note No. 5 states that a 40-ft by 40-ft test section shall be performed and verified in the field by advancing Cone Penetrometer Test Soundings (CPTs). Additional Stone Columns may be required if the ground improvement goals are not met. Note No. 6 states that the means and methods, including final design, shall be developed by the selected Contractor.

Question: These statements contradict each other. Note 4 provides a design (depth, spacing, and diameter), while Note 5 and 6 states Design of the stone columns is the responsibility of the contractor. Please clarify if the stone columns installation scope is a prescriptive specification bid or design build performance specification bid.

A18. Note 4 was provided to provide a specification to bid to and have a baseline condition. If the Contractor can show during the test section or during production, that the spacing is different, this provides for either a cost savings for the Contractor or a change order for the ground conditions.

Q19. On Drawing C-22, Detail B, the details show the jet grouting limits along with a minimum wall thickness of 2-ft. This is also stated in Note No. 2. Note No. 8 states that the contractor may select to use jet grouting to assist with excavation shoring, groundwater control, and break in/out sections.

Question: Can the jet grouting extend beyond the limit of the ground improvement shown, in order to achieve the required primary objective and secondary functions?

A19. Yes, as long as the jet grouting does not damage existing improvements.

Q20. Are there Restoration limits for the Contract work in the Right of Way?

A20. Contractor is required to restore area to original condition, including replace in-kind any and all plantings/irrigation and hardscape damaged during construction.

Q21. Per contract specification section 31 71 19 - 1.04.F.3 Settlement monitoring points need to be monitored on a daily bases along the tunnel alignment. Can the City define the spacing between monitoring points along the tunnel alignments?

A21. The Contractor shall provide a monitoring plan and spacing to be approved or commented on by the City. Changes to the monitoring requirements per comments from the City may equate to changes in the compensation for monitoring.

Q22. Section 43 23 15, para. Item 1.6.A. states “Furnish for each of the five (5) sets of pumps” further described in subitems A.1 through A.8 with each line stating “…for 5 pumps”. Is each line item requiring a total of 25 sets of spares or a total of 5 sets of spares?

A22. A total of 5 sets of spares is required.

Q23. Section 43 42 56.04 has no pump material specification but in M26 & 27 fs 4 and 2, respectively, 316SS material for Submersible Pump is stated. Is the 316SS material a requirement for all the components such; motor casing, pump casing, impeller and base elbow?

A23. Yes, all pump components including motor casing, pump casing, impeller and base elbow shall be manufactured from 316 SS.

Q24. Does the City plan on pushing the bid of the project from the current date of December 17, 2020 – 2PM?

A24. No extension on the Bid Due Date.

Q25. Please confirm that concrete embedded and encased conduits are PVC Sch-40.

A25. Per Specification 26 05 33 – 3.03G concrete encased conduits shall be either rigid galvanized steel, intermediate metal, PVC Schedule 40 or PVC Schedule 80.

Q26. Please confirm that direct buried conduits are PVC Sch-80.

A26. Per Specification 26 05 33 – 3.03F direct buried conduits shall be either PVC Schedule 40, PVC Schedule 80, or PVC-coated rigid galvanized steel.

Q27. The Contract Drawings references Contract 40067-D in multiple drawings. Contract 40067-D has work on Custer & Sherman Street that will impede into the Morena Pump Station easement potentially affecting access to the project site. Please confirm when the scope of Contract 40067-D is complete or address how the coordination between the Contracts will ensue.

A27. 40067-D drawings are included in the following three contracts; Morena Conveyance North, South and Middle Projects. MPS Contractor will only interface/coordinate with the Morena Conveyance South Contractor as shown in Appendix F. The MPS contractor will be required to coordinate with the Morena Conveyance South per Supplementary Special Provision Section 2-14.3.

Q28. BG Waterproofing – section 07 13 26. There is a not on the drawings requesting an obscure batten stripe anchored on 6" centers but this accessory is not listed in section 07 13 26. Is this an error on the drawings?

A28. The referenced termination bars are applicable to the structure. Refer to Specification 07 13 26, Section 2.3 part F.

Q29. Room Finish Schedule. There is none other than what is listed in 09 90 00 Section 3.7 and 3.8. Are we to rely solely on these 2 sections? If so,

please review and confirm that this is an exhaustive list of the surfaces requiring field painting, coating or lining.

A29. The room finished schedule is provided in Specification 09 90 00, Section 3.8.

Q30. Reference Plan Sheet C-29. Please provide as-built drawings and flow rates for the existing sewer lines that show locations of adjacent manholes, cleanouts, etc., that can be utilized for bypass pump estimating. Specifically, for the as-builts, we are looking for more information on the following:

a. At MH1, the is an existing 8" VCP coming from the NW curb. Is this line coming from the property? (Google maps' street view shows this property is a Sears building). Please identify the nearest manholes upstream and downstream of the required sewer line improvements.

b. At MH2, there is an existing 10" VCP coming from the north along Grant Street. Please identify the nearest manholes upstream and downstream of the required sewer line improvements.

c. Upstream of MH3 there are two laterals that are part of the sewer improvements. Are these laterals to be 4"? Please identify the nearest upstream bypass access point locations for each of these (i.e. cleanout, or other). Are there any shut down restrictions for these laterals?

A30. The sewer entering MH1 indicated on C-29 is a lateral from the adjacent property. The existing 10-inch diameter VCP sewer coming from the north along Grant Street has an upstream MH located approximately 230-feet north of MH2 and a downstream MH south of MH3 approximately 320 feet. The two laterals located east of MH3 are to be 4-inch laterals. CONTRACTOR shall coordinate with the ENGINEER for the timing of cross over. CONTACTOR to assume no more than 24-hours of none sewer use for the properties. Connection points will need to occur in R/W. Record drawings are provided in the following link:

https://drive.google.com/drive/folders/1fvDMuQly1M5qlD4LZhHEcyDyxuSVQs3z?usp=sharing

Q31. Per specification 03 3 00.2.5A: The maximum temperature limit for mass concrete is specified to be 135 °F. Even if we use a concrete that contains 600 lbs/cuyd of cementitious where 50% is fly ash, the temperature rise will be 65 °F which means the concrete can't be warmer than 70 °F at the time of placement. This is not practical. The 135 °F limit is essentially not achievable without extreme (expensive) measures such as cooling pipes or liquid nitrogen precooling. The industry standard limit for mass concrete (reference ACI 301 and Caltrans) is 160 °F. Can the maximum temperature limit be increased from 135 °F to 160 °F?

A31. Maximum concrete temperature can be increased to 160°F. Cooling pipes are required by Specification Section 03 30 00 Part 1.04.C.

Q32. Per specification 03 3 00.3.1.G1: "Minimum curing period shall be 14 days. Unless otherwise permitted, preserve moisture by maintaining forms in place." Standard curing requirements for all concrete, including mass concrete is 7 days. Please confirm if our Thermal Control Plan allows us to remove the forms before 14 days we can finish the curing period using methods described in specification 03 39 00.3.1B Concrete Curing. We understand temperature control is different than curing (moisture retention).

A32. Forms may be removed after 7 days provided that curing is provided for a total of at least 14 days. Curing using methods described in Specification 03 39 00.3.01B, “Concrete Curing”.

Q33. Note 16 on Drawing S-11 identifies "T-Lock PVC Liner" on Junction & Diversion Cast in Place Concrete structures with no Technical Specifications provided. Please note that "T-Lock PVC Liner" is no longer in production or available to purchase per the manufacture. Please provide alternate product and Technical Specification for areas requiring "T-Lock PVC Liner".

A33. Refer to Section 4-6 "Trade Names” of the 2018 Supplementary Standard Specifications, “Whitebook” for submittal of an approved or equal product. As indicated in the “Whitebook”, the use of an equal product needs prior approval from the City.

Q34. Please confirm Permits that will be covered in Bid Item #19 Permits and Fees Allowance.

A34. Bldg Permit, PCD, SDG&E, Fire Department and other permits as required.

Q35. Please confirm Groundwater Dewatering Discharge to Sewer Fees will be paid in Bid Item #27 Dewatering permit and Discharge Fees Allowance.

A35. Confirmed.

Q36. Please confirm acceptance period of 90 calendar days for this project.

A36. Refer to Section 01 91 14 Testing, Integration, & Start Up and also Refer to Section 6-8.1 "Completion" and Section 6-8.2 "Acceptance" of the Supplementary Special Provisions and Technical Specifications Section 01 77 00 "Closeout Procedures" for requirements on project acceptance.

Q37. Please confirm performance and payment bonds shall be valid for one year after final acceptance.

A37. Refer to Greenbook Section 2-4 Contract Bonds.

Q38. Please confirm that builders risk policy covering contractor and subcontractors under OCIP includes off-site and in-transit coverage. Please confirm sub-limits of such coverage.

A38. Confirmed, $10M sub-limit.

Q39. Please confirm that builders risk policy covering contractor and subcontractors under OCIP provides for replacement cost coverage.

A39. Confirmed.

Q40. Please confirm that builders risk policy covering contractor and subcontractors under OCIP provides for terrorism coverage.

A40. Builders Risk Policy does not cover terrorism.

Q41. Attachment E, section 7-4.9 OCIP Builder's Risk Insurance – states that the builders risk policy under the OCIP does not provide for earthquake coverage. Please confirm that Owner is responsible for all losses as related to earthquake.

A41. Builders Risk Policy does not cover earthquakes. Owner is not responsible for all losses as they relate to earthquakes

Q42. Would Owner furnish contractor with a builders risk policy for review?

A42. Yes, Owner will furnish Contractor with a Builders Risk Policy for review.

Q43. Please confirm that OCIP builder's risk policy is DE5 or LEG3 level of coverage?

A43. LEG3 coverage.

Q44. With reference to The Whitebook section 6-5.5 relating to loss of project funding please confirm that Contractor will be entitled to receive payment for the value of the work completed to the date of termination not previously covered by monthly payments, including G&A and profit on such work incurred by Contractor to implement such termination.

A44. Contractor will be compensated per Whitebook Section 6-5.1 Termination Cost.

Q45. Please confirm that Contractor retains the right to suspend work in the event of Owner non-payment.

A45. Refer to Whitebook Section 3-5.1 Claims.

Q46. In an effort to adequately quantify risk would the Owner consider a total limit of liability for Contractor?

A46. No.

Q47. In an effort to provide the best possible price to the Owner and adequately quantify risk would the Owner consider a mutual waiver of consequential damages on this project.

A47. No.

Q48. With reference to Greenbook section 6-10 Use of Improvement During Construction – please confirm that Owner will pay any impact costs associated with such partial occupancy and will not impact contractor's work.

A48. No changes will be made to Greenbook Section 6-10.

Q49. Will the owner furnish the contractor with the Workers Compensation, General Liability, and Excess Liability Insurance for review?

A49. Yes.

Q50. Please confirm that the General Liability policy covering the ontractor and subcontractors under the OCIP will amend Damage to Your Work Exclusion will be deleted in its entirety or amended to clarify that the exclusion only applies to that particular part of your work which must be restored, repaired or replaced.

A50. The OCIP CGL Policy is endorsed with Resulting Damage To Your Work - Form 2 HS CG AM 1088 10 18.

Q51. Please confirm that the General Liability policy covering the contractor and subcontractors under the OCIP the Damage to your Product exclusion will be deleted in its entirety.

A51. The OCIP CGL Policy does not have a Damage to Your Product Exclusion.

Q52. Please confirm that the General Liability policy covering the contractor and subcontractors under the OCIP will be endorsed to modify the professional liability exclusion to the Contractors Professional Liability Limited Exclusion coverage provided by ISO endorsement CG 22 80.

A52. The OCIP CGL Policy is endorsed with Contractors Professional Liability Exclusion CG 22 79 04 13.

Q53. Please confirm that builders risk policy covering contractor and subcontractors under OCIP will not exclude resultant property damage caused by wind driven precipitation.

A53. Confirmed.

Q54. Please confirm that builders risk policy covering contractor and subcontractors under OCIP will not exclude resultant water damage to property that is not enclosed by a building envelope (i.e, Blue Tarp).

A54. The OCIP Builders Risk Policy does not define or exclude for coverage for property not enclosed by building envelope.

Q55. Please confirm that builders risk policy covering contractor and subcontractors under OCIP will provide for limits in an equal amount to

the full contract value plus any additional soft costs or delay in startup values as it relates to Water Damage.

A55. OCIP Builders Risk coverage for contract value for water damage - $250,000 sublimit for Blanket Undeclared Soft Costs.

Q56. Please confirm that builders risk policy covering contractor and subcontractors under OCIP will provide for limits in an equal amount to the full contract value plus any additional soft costs or delay in startup values for the perils of Flood and Named Windstorm.

A56. OCIP Builders Risk Flood coverage - $200M, except for property located in Flood Zone A, limit is $25M. $250,000 Blanketed Undeclared Soft Costs - Named Storm - Included.

Q57. Section 7-4.17 (3) – requires ISO form CG 00 01 10 01 or its equivalent, with no exclusion endorsements. Our policy uses ISO form CG 00 01 04 13 and have exclusion endorsements for coverages such as Pollution, Asbestos, Nuclear Energy Liability, Aircraft, Employment Related Practices, Professional Liability, etc. These exclusions are common exclusions on CGL policies for these coverages are covered separately via separate policies if required. Please advise if CG 00 01 04 13 and the general exclusions applicable to CGL policies will be acceptable.

A57. Bidders shall provide endorsements as identified in the OCIP contract specifications; no changes or modifications.

Q58. Section 7-4.17 (4) – Automobile Liability coverage at least as broad as ISO form CA 00 01 10 01. Please advise if ISO form CA 00 01 10 13 is acceptable.

A58. Bidders shall provide endorsements as identified in the OCIP contract specifications; no changes or modifications.

Q59. Section 7-4.17 (8a) – The additional insured endorsement shall provide coverage at least as broad as ISO form CG 20 10 11 01 and CG 20 37 10 01. Please advise if CG 20 10 04 13 and CG 20 27 04 13 are acceptable.

A59. Bidders shall provide endorsements as identified in the OCIP contract specifications; no changes or modifications

Q60. Reference is made to Attachment E, section 7-8.6.6.9 "Payment", item 3. Per the reference, the payment for dewatering includes any and all required equipment to treat hazardous groundwater. No groundwater contaminate study has been provided to enable us to quantify the treatment costs. Please provide the data needed to determine what treatment would be anticipated for each location. If a study cannot be provided, please add an allowance item for the treatment of contaminated groundwater.

A60. See Section 2.1.3 Ground Water Sampling & Appendix C, Geotechnical Report Morena Pump Station by AECOM dated January 5, 2018. Link provided in Supplementary Special Provisions 2.7.4.5.

Q61. Note 14 on Sheet S-28 calls out door 101E to be an FRP sound door and references the Door Schedule on A-24. Assuming we are to use the door schedule on A-37, door 101E is listed as HM not FRP. Please clarify which is correct

A61. The subject door should be Hollow Metal (HM).

Q62. Specification 26 05 33, section 2.11 C state that Raceway coatings will be per 09 90 00. Please provide coating system for exposed Rigid Galvanized Steel Conduit and PVC Coated conduit, if any

A62. There is no need to coat the subject galvanized steel or PVC conduits.

Q63. Please provide Payment Procedures for new bid items 9-14, 24-26 & 38 per Specification 01 29 00.1.14 Bid Items.

A63. Payment procedures are identified in the corresponding section of the Greenbook (GB), Whitebook (WB) or Supplementary Special Provision (SSP) next to the bid item.

Q64. Spec 01 50 25-3.13.L, first paragraph indicates complete redundant bypass pumping system. Please confirm this means 100% redundancy for flow capabilities produced by the bypass pumps. Additionally, please confirm this means 100% redundancy for discharge piping as well.

A64. Refer to redundancy of pumps and suction. Discharge piping can be sized for the PWWF's identified in Section 01 50 25.

Q65. Please refer to Specification Section 01 50 25 Sewer Bypass Pumping and the Potential Construction Sequencing Plan. Diversion Scenario 3 indicates to divert the 78" NMVI to the existing NMI Junction Structure. The drawing shows a green diversion line form the existing 78" NMVI pipe to the NMI structure. This is not realistic. Water isolation and bypass pumping needs to be diverted from an upstream manhole. The as-builts show a manhole near the YMCA. However, a few key pieces of information needs to be known:

a. Manhole depth from grade level to water level needs to be known in order to properly size pumps. Please provide the elevations or as-builts.

b. Assuming a 100% redundant system, the PWWF at 73.5 MGD means 147MGD bypass system will need to be in place. This amount of flow equates to approximately 15 pumps with suction sizes at 24"in diameter each. The amount of suction pipes will not fit in one manhole. Additional manholes and/or other means of diverting flow needs to be clarified in order to properly plan and price this scope of work. Please clarify how the bypass operation will be accomplished.

c. For the discharge piping to the NMI structure, please provide as-builts of the NMI structure.

d. To divert flow from the YMCA parking lot manhole to the NMI junction structure, discharge pipe will need to be routed through the Mission Valley Preserve and underneath the trolley bridge. Please clarify if any restrictions are associated in doing this.

A65. To divert flow from the YMCA parking lot manhole to the NMI junction structure, discharge pipe will need to be routed through the Mission Valley Preserve and underneath the trolley bridge. Please clarify if any restrictions are associated in doing this.

a. See Record Drawings 27256-D provided in this link. https://drive.google.com/drive/folders/1Z1flFEfdDYNajA5gYUxxkkh7CeX7TeBq?usp=sharing

b. See response above.

c. See Record Drawings 27152-D provided in this link. https://drive.google.com/drive/folders/1Z1flFEfdDYNajA5gYUxxkkh7CeX7TeBq?usp=sharing

d. Routing pipes through the preserve will not be allowed.

Q66. Reference drawing A-25, Control Room 303, Key Note 8 states in part "raised computer floor per details A-915, A-916 and A-917 on Sheet A-39." The floor elevation is missing in the drawings - the details have a 30" range. Please provide a specification for this flooring system.

A66. Raised floor to be flush with concrete landing pad at exterior; details A-915, A-916 & A-197 on Dwg A-39 call out for Concore All Steel Access Panel System. Recommend Concore 1000 series with high pressure laminate finish or equal.

Q67. Can you please provide the following information related to the bypass of the 78" NMVI pipeline:

a. What is the diameter of the manhole located in the YMCA parking lot (MH-1)?

b. Can the 78" NMVI pipeline be surcharged above the top of the 78" pipe?

c. Can you please provide as-builts of the existing NMI Junction structure, including the diameters of the manholes.

d. Are there any other sewer lines that dump into the 78" NMVI pipeline between MH-1 (in the YMCA parking lot) and the existing NMI Junction Structure?

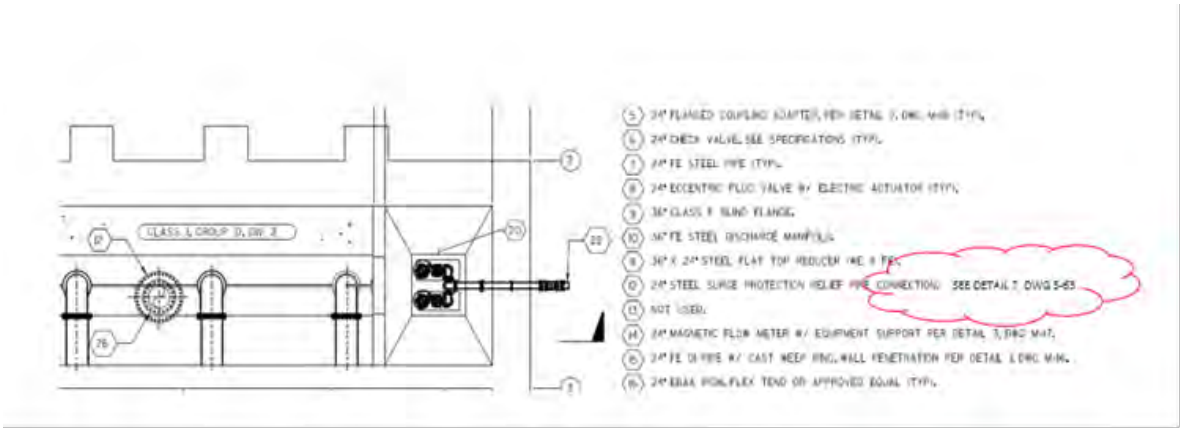
A67. It is understood that bypass pumping operation will not fit in a manhole. Due to the constraints of limited property at the upstream manhole and the adjacency to the Mission Valley Preserve it is anticipated that the NMVI will be exposed between NMI Junction Structure and the trolley tracks where bypass pumping can occur. The CONTRACTOR shall develop a plan for approval by the ENGINEER to open top of the NMVI and provide bypass pumping and repair upon completion. Routing pipes through the preserve will not be allowed. Record drawings 27256-D and 27152-D links have been provided via this Addendum.

Q68. Key note 5 on drawing M-07 calls out for a Flanged coupling adapter that is depicted on detail 2 on page M-18. Keynote 5 on page M-11 calls out for a Romac ECF400 which is an equipment connection fitting different of what is depicted on detail 2 page M-18. Please specify which fitting is the correct one.

A68. Provide Equipment Connection Fittings, Romac ECF-400 or approved equal, at all locations shown as such on Drawing M-11.

Q69. On page M-07 Key note 12 calls out for a Surge protection relief pipe connection on detail 5 of pg M-20. There is no detail 5 on page M-20. Can you please provide this detail?

A69. Connection detail is shown on Detail 7 of Drawing S-63. The reference on Drawing M-07 to Detail 5 on M-20 will be changed to Detail 7 on Drawing S-63. See revised Drawing M-07 provided in this Addendum.



C. NOTICE INVITING BIDS

1. To Item 12, SUBCONTRACTING PARTICIPATION PERCENTAGES, sub-item 12.7, page 10, **DELETE** in its entirety and **SUBSTITUTE** with the following:

12.7 Bid **shall** be declared non-responsive if the Bidder fails any of the following conditions:

12.7.1 Submission of GFE documentation, as specified in the Special Provisions.

12.7.1.1 Bidder's submission of Good Faith Effort documentation, saved in searchable portable

Document Format (PDF) and stored on Universal Serial Bus (USB) Type-A, Compact Disc (CD) or Digital Video Disc (DVD), demonstrating the Bidder made a good faith effort to outreach to and include DBE Subcontractors shall be submitted by 5 PM, 4 Working Days after the Bid opening.

12.7.1.2 Due to circumstances related to Covid-19, until further notice, all submittals in searchable PDF shall be submitted electronically within the prescribed time identified in the contract documents via a File Cloud link provided by the Contract Specialist to all bidders.

Upon circumstances returning to normal business as usual, the GFE shall once again be submitted to:

Engineering & Capital Projects Department,
Contracts Division
525 B Street, Suite 750 (7th Floor)
San Diego, California, 92101
Attention: Stephen Samara

12.7.2 Attending the Pre-Bid Meeting.

2. To Item 18, OWNER CONTROLLED INSURANCE PROGRAM (OCIP), page 12, **DELETE** in its entirety and **SUBSTITUTE** with the following:

18. OWNER CONTROLLED INSURANCE PROGRAM (OCIP): The City has implemented an Owner-Controlled Insurance Program (OCIP) for its Pure Water Projects. In this OCIP, the City furnishes Workers' Compensation, General, Excess, Pollution Liability and Builder's Risk insurance associated with construction of the Work, as detailed in Section 7- Responsibilities of the Contractor. Bidders, as well as all of their subcontractors, with a subcontract amount of greater than one half of one percent of the Contractors bid amount shall complete OCIP credit worksheets. Bidders shall submit, as well as OCIP credit worksheets obtained

from all their subcontractors, the OCIP credit worksheets two business days after bid opening. Compliance with the OCIP requirements will be a condition for award.

D. ATTACHMENTS

1. To Attachment D, FUNDING AGENCY PROVISIONS, (CASRF), (EPA), (CWSRF), (DWSRF), (WIFIA) PROP 68 and (BOR), item 10, DAVIS-BACON WAGE RATES AND PROVISIONS, Wage Rates, pages 54 through 81, **DELETE** in its entirety and **SUBSTITUTE** with pages 28 through 57 of this Addendum.

2. To Attachment D, FUNDING AGENCY PROVISIONS, (CASRF), (EPA), (CWSRF), (DWSRF), (WIFIA) PROP 68 and (BOR), item 12, DBE POTENTIAL RESOURCES CENTERS, sub-item 12.8, page 92, **DELETE** in their entirety and **SUBSTITUTE** with the following:

   12.8 Federal Agencies (must be contacted and solicitations posted on their websites):

E. SUPPLEMENTARY SPECIAL PROVISIONS

1. To **SECTION 2 – SCOPE AND CONTROL OF WORK**, page 113, **ADD** the following:

2-9.2 Surveying. To the "GREENBOOK" and "WHITEBOOK", **DELETE** in its entirety and **SUBSTITUTE** with the following:

2-9.2 Surveying (DESIGN-BID-BUILD).

2-9.2.1 General.

1. You shall provide all required site layout and general grade checking work not specified in 3-10.2, "Survey Services Provided by City".

2. Notify the City, in writing, at least 2 Working Days prior to requesting survey services provided by the City.

2-9.2.2 Survey Services Provided by City.

1. Monument Perpetuation, including mark-outs. You are responsible for requesting the coordination of these services.

   a) If at any time a monument will be destroyed or covered, such monument shall be perpetuated in accordance with state law. Inform the City Engineering Support & Technical Services Division's Land Survey Section (LSS), via project Resident Engineer, if any monument will be destroyed or covered during any construction activity.

2. The following surveying services (including construction staking), as defined in California Business & Professions Code §8726, shall be provided by the City:

   a) Locating or establishing alignment or elevations of all features or structures shown on project Plans.

b) Locating or establishing geodetic control points for all site feature or structure locations.

c) Produce topographic as-built data.

d) Locating, establishing, or re-establishing monuments, property lines, right-of-way lines, or easement lines.

e) Verifying structure finish grade elevations.

3. All construction survey stakes, control points, and other survey related marks provided by the City shall be preserved for the duration of the Project. If any construction survey stakes, control points, or other survey related marks are lost or disturbed and need to be replaced, such replacement shall be performed at your expense.

2-9.2.3 Payment.

1. The payment for site layout and general grade checking Work, coordination, and preservation of all survey related marks shall be included in the Contract Price.

2. To **SECTION 7, RESPONSIBILITIES OF THE CONTRACTOR**, Subsection 7-2, **LABOR**, Item 7-2.5, **Project Labor Agreement,** page 139, **DELETE** in its entirety and **SUBSTITUTE** with the following:

7-2.5 Project Labor Agreement. The Contractor and all subcontractors agree to be bound by the Project Labor Agreement (which is attached as Attachment I and incorporated by this reference) by submitting a Letter of Assent to the City's Labor Coordinator. The Contractor shall submit its Letter of Consent as a condition of award and all subcontractors shall submit their Letter of Assent before commencing any Work on the Project.

3. To Technicals, **SECTION 31 71 19**, **MICROTUNNELING**, pages 1281 through 1301, **DELETE** in its entirety and **SUBSTITUTE** with pages 58 through 79 of this Addendum.

F. PLANS

1. To Drawing Sheet Numbers 40421-01-D, 40421-22-D, 40421-92-D, 40421-103-D, 40421-155-D, 40421-156-D, and 40421-170-D, **DELETE** in their entirety and **REPLACE** with pages 80 through 86 of this Addendum.

2. To Drawing Plans, **ADD** Drawing Sheet Number 40421-261-D, E-50, page 87 of this Addendum.

James Nagelvoort, Director
Engineering & Capital Projects Department

Dated: *November 24, 2020*
San Diego, California

JN/AJ/lir

10. WAGE RATES This contract shall be subject to the following Davis-Bacon Wage Decisions:

"General Decision Number: CA20200001 10/30/2020

Superseded General Decision Number: CA20190001

State: California

Construction Types: Building, Heavy (Heavy and Dredging), Highway and Residential

County: San Diego County in California.

BUILDING CONSTRUCTION PROJECTS; DREDGING PROJECTS (does not include hopper dredge work); HEAVY CONSTRUCTION PROJECTS (does not include water well drilling); HIGHWAY CONSTRUCTION PROJECTS; RESIDENTIAL CONSTRUCTION PROJECTS (consisting of single family homes and apartments up to and including 4 stories)

Note: Under Executive Order (EO) 13658, an hourly minimum wage of $10.80 for calendar year 2020 applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2015. If this contract is covered by the EO, the contractor must pay all workers in any classification listed on this wage determination at least $10.80 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on the contract in calendar year 2020. If this contract is covered by the EO and a classification considered necessary for performance of work on the contract does not appear on this wage determination, the contractor must pay workers in that classification at least the wage rate determined through the conformance process set forth in 29 CFR 5.5(a)(1)(ii) (or the EO minimum wage rate,if it is higher than the conformed wage rate). The EO minimum wage rate will be adjusted annually. Please note that this EO applies to the above-mentioned types of contracts entered into by the federal government that are subject to the Davis-Bacon Act itself, but it does not apply to contracts subject only to the Davis-Bacon Related Acts, including those set forth at 29 CFR 5.1(a)(2)-(60). Additional information on contractor requirements and worker protections under the EO is available at www.dol.gov/whd/govcontracts.

Workers required to suit up and work in a hazardous material environment: $2.00 per hour additional. Combination mixer and compressor operator on gunite work shall be classified as a concrete mobile mixer operator.

SEE ZONE DEFINITIONS AFTER CLASSIFICATIONS

POWER EQUIPMENT OPERATORS CLASSIFICATIONS

GROUP 1: Bargeman; Brakeman; Compressor operator; Ditch Witch, with seat or similar type equipment; Elevator operator-inside; Engineer Oiler; Forklift operator (includes loed, lull or similar types under 5 tons; Generator operator; Generator, pump or compressor plant operator; Pump operator; Signalman; Switchman

GROUP 2: Asphalt-rubber plant operator (nurse tank operator); Concrete mixer operator-skip type; Conveyor operator; Fireman; Forklift operator (includes loed, lull or similar types over 5 tons; Hydrostatic pump operator; oiler crusher (asphalt or concrete plant); Petromat laydown machine; PJU

side dum jack; Screening and conveyor machine operator (or similar types); Skiploader (wheel type up to 3/4 yd. without attachment); Tar pot fireman; Temporary heating plant operator; Trenching machine oiler
GROUP 3: Asphalt-rubber blend operator; Bobcat or similar type (Skid steer); Equipment greaser (rack); Ford Ferguson (with dragtype attachments); Helicopter radioman (ground); Stationary pipe wrapping and cleaning machine operator

GROUP 4: Asphalt plant fireman; Backhoe operator (mini-max or similar type); Boring machine operator; Boxman or mixerman (asphalt or concrete); Chip spreading machine operator; Concrete cleaning decontamination machine operator; Concrete Pump Operator (small portable); Drilling machine operator, small auger types (Texoma super economatic or similar types - Hughes 100 or 200 or similar types - drilling depth of 30' maximum); Equipment greaser (grease truck); Guard rail post driver operator; Highline cableway signalman; Hydra-hammer-aero stomper; Micro Tunneling (above ground tunnel); Power concrete curing machine operator; Power concrete saw operator; Power-driven jumbo form setter operator; Power sweeper operator; Rock Wheel Saw/Trencher; Roller operator (compacting); Screed operator (asphalt or concrete); Trenching machine operator (up to 6 ft.); Vacuum or much truck

GROUP 5: Equipment Greaser (Grease Truck/Multi Shift).

GROUP 6: Articulating material hauler; Asphalt plant engineer; Batch plant operator; Bit sharpener; Concrete joint machine operator (canal and similar type); Concrete planer operator; Dandy digger; Deck engine operator; Derrickman (oilfield type); Drilling machine operator, bucket or auger types (Calweld 100 bucket or similar types - Watson 1000 auger or similar types - Texoma 330, 500 or 600 auger or similar types - drilling depth of 45' maximum); Drilling machine operator; Hydrographic seeder machine operator (straw, pulp or seed), Jackson track maintainer, or similar type; Kalamazoo Switch tamper, or similar type; Machine tool operator; Maginnis internal full slab vibrator, Mechanical berm, curb or gutter(concrete or asphalt); Mechanical finisher operator (concrete, Clary-Johnson-Bidwell or similar); Micro tunnel system (below ground); Pavement breaker operator (truck mounted); Road oil mixing machine operator; Roller operator (asphalt or finish), rubber-tired earth moving equipment (single engine, up to and including 25 yds. struck); Self-propelled tar pipelining machine operator; Skiploader operator (crawler and wheel type, over 3/4 yd. and up to and including 1-1/2 yds.); Slip form pump operator (power driven hydraulic lifting device for concrete forms); Tractor operator-bulldozer, tamper-scraper (single engine, up to 100 h.p. flywheel and similar types, up to and including D-5 and similar types); Tugger hoist operator (1 drum); Ultra high pressure waterjet cutting tool system operator; Vacuum blasting machine operator

GROUP 8: Asphalt or concrete spreading operator (tamping or finishing); Asphalt paving machine operator (Barber Greene or similar type); Asphalt-rubber distribution operator; Backhoe operator (up to and including 3/4 yd.), small ford, Case or similar; Cast-in-place pipe laying machine operator; Combination mixer and compressor operator (gunite work); Compactor operator (self-propelled); Concrete mixer operator (paving); Crushing plant operator; Drill Doctor; Drilling machine operator, Bucket or auger types (Calweld 150 bucket or similar types - Watson 1500, 2000 2500 auger or similar types - Texoma 700, 800 auger or similar types - drilling depth of 60' maximum); Elevating grader operator; Grade checker; Gradall operator; Grouting machine operator; Heavy-duty repairman; Heavy equipment robotics operator; Kalamazoo balliste regulator or similar type; Kolman belt loader and similar type; Le Tourneau blob compactor or similar type; Loader operator (Athey, Euclid, Sierra and similar types); Mobark Chipper or similar; Ozzie padder or similar types; P.C. slot saw; Pneumatic concrete placing machine operator (Hackley-Presswell or similar type); Pumpcrete gun operator; Rock Drill or similar types; Rotary drill operator (excluding caisson type); Rubber-tired earth-moving equipment operator (single engine, caterpillar, Euclid, Athey Wagon and similar types with any and all attachments over 25 yds. up to and including 50 cu. yds. struck); Rubber-tired earth-moving equipment operator (multiple engine up to and including 25 yds. struck); Rubber-tired scraper operator (self-loading paddle wheel type-John Deere, 1040 and similar single unit); Self-propelled curb and gutter machine operator; Shuttle buggy; Skiploader operator (crawler and wheel type over 1-1/2 yds. up to and including 6-1/2 yds.); Soil remediation plant operator; Surface heaters and planer operator; Tractor compressor drill combination operator; Tractor operator (any type larger than D-5 - 100 flywheel h.p. and over, or similar-bulldozer, tamper, scraper and push tractor single engine); Tractor operator (boom attachments), Traveling pipe wrapping, cleaning and bendng machine operator; Trenching machine operator (over 6 ft. depth capacity, manufacturer's rating); trenching Machine with Road Miner attachment (over 6 ft depth capacity): Ultra high pressure waterjet cutting tool system mechanic; Water pull (compaction) operator

GROUP 9: Heavy Duty Repairman

GROUP 10: Drilling machine operator, Bucket or auger types (Calweld 200 B bucket or similar types-Watson 3000 or 5000 auger or similar types-Texoma 900 auger or similar types-drilling depth of 105' maximum); Dual drum mixer, dynamic compactor LDC350 (or similar types); Monorail locomotive operator (diesel, gas or electric); Motor patrol-blade operator (single engine); Multiple engine tractor operator (Euclid and similar type-except Quad 9 cat.); Rubber-tired earth-moving equipment operator (single engine, over 50 yds. struck); Pneumatic pipe ramming tool and similar types; Prestressed wrapping machine operator;

Rubber-tired earth-moving equipment operator (single engine, over 50 yds. struck); Rubber tired earth moving equipment operator (multiple engine, Euclid, caterpillar and similar over 25 yds. and up to 50 yds. struck), Tower crane repairman; Tractor loader operator (crawler and wheel type over 6-1/2 yds.); Woods mixer operator (and similar Pugmill equipment)

GROUP 11: Heavy Duty Repairman - Welder Combination, Welder - Certified.

GROUP 12: Auto grader operator; Automatic slip form operator; Drilling machine operator, bucket or auger types (Calweld, auger 200 CA or similar types - Watson, auger 6000 or similar types - Hughes Super Duty, auger 200 or similar types - drilling depth of 175' maximum); Hoe ram or similar with compressor; Mass excavator operator less tha 750 cu. yards; Mechanical finishing machine operator; Mobile form traveler operator; Motor patrol operator (multi-engine); Pipe mobile machine operator; Rubber-tired earth- moving equipment operator (multiple engine, Euclid, Caterpillar and similar type, over 50 cu. yds. struck); Rubber-tired self- loading scraper operator (paddle-wheel-auger type self-loading - two (2) or more units)

GROUP 13: Rubber-tired earth-moving equipment operator operating equipment with push-pull system (single engine, up to and including 25 yds. struck)

GROUP 14: Canal liner operator; Canal trimmer operator; Remote- control earth-moving equipment operator (operating a second piece of equipment: $1.00 per hour additional); Wheel excavator operator (over 750 cu. yds.)

GROUP 15: Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (single engine, Caterpillar, Euclid, Athey Wagon and similar types with any and all attachments over 25 yds. and up to and including 50 yds. struck); Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (multiple engine-up to and including 25 yds. struck)

GROUP 16: Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (single engine, over 50 yds. struck); Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (multiple engine, Euclid, Caterpillar and similar, over 25 yds. and up to 50 yds. struck)

GROUP 17: Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (multiple engine, Euclid, Caterpillar and similar, over 50 cu. yds. struck); Tandem tractor operator (operating crawler type tractors in tandem - Quad 9 and similar type)

GROUP 18: Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - single engine, up to and including 25 yds. struck)

GROUP 19: Rotex concrete belt operator (or similar types); Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - single engine, Caterpillar, Euclid, Athey Wagon and similar types with any and all attachments over 25 yds.and up to and including 50 cu. yds. struck); Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - multiple engine, up to and including 25 yds. struck)

GROUP 20: Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - single engine, over 50 yds. struck); Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps, and similar types in any combination, excluding compaction units - multiple engine, Euclid, Caterpillar and similar, over 25 yds. and up to 50 yds. struck)

GROUP 21: Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - multiple engine, Euclid, Caterpillar and similar type, over 50 cu. yds. struck)

GROUP 22: Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (single engine, up to and including 25 yds. struck)

GROUP 23: Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (single engine, Caterpillar, Euclid, Athey Wagon and similar types with any and all attachments over 25 yds. and up to and including 50 yds. struck); Rubber-tired earth-moving equipment operator, operating with the tandem push-pull system (multiple engine, up to and including 25 yds. struck)

GROUP 24: Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (single engine, over 50 yds. struck); Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (multiple engine, Euclid, Caterpillar and similar, over 25 yds. and up to 50 yds. struck)

GROUP 25: Concrete pump operator-truck mounted; Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (multiple engine, Euclid, Caterpillar and similar type, over 50 cu. yds. struck)

CRANES, PILEDRIVING AND HOISTING EQUIPMENT CLASSIFICATIONS

GROUP 1: Engineer oiler; Fork lift operator (includes loed, lull or similar types)

GROUP 2: Truck crane oiler

GROUP 3: A-frame or winch truck operator; Ross carrier operator (jobsite)

GROUP 4: Bridge-type unloader and turntable operator; Helicopter hoist operator

GROUP 5: Hydraulic boom truck; Stinger crane (Austin-Western or similar type); Tugger hoist operator (1 drum)

GROUP 6: Bridge crane operator; Cretor crane operator; Hoist operator (Chicago boom and similar type); Lift mobile operator; Lift slab machine operator (Vagtborg and similar types); Material hoist and/or manlift operator; Polar gantry crane operator; Self Climbing scaffold (or similar type); Shovel, backhoe, dragline, clamshell operator (over 3/4 yd. and up to 5 cu. yds. mrc); Tugger hoist operator

GROUP 7: Pedestal crane operator; Shovel, backhoe, dragline, clamshell operator (over 5 cu. yds. mrc); Tower crane repair; Tugger hoist operator (3 drum)

GROUP 8: Crane operator (up to and including 25 ton capacity); Crawler transporter operator; Derrick barge operator (up to and including 25 ton capacity); Hoist operator, stiff legs, Guy derrick or similar type (up to and including 25 ton capacity); Shovel, backhoe, dragline, clamshell operator (over 7 cu. yds., M.R.C.)

GROUP 9: Crane operator (over 25 tons and up to and including 50 tons mrc); Derrick barge operator (over 25 tons up to and including 50 tons mrc); Highline cableway operator; Hoist operator, stiff legs, Guy derrick or similar type (over 25 tons up to and including 50 tons mrc); K-crane operator; Polar crane operator; Self erecting tower crane operator maximum lifting capacity ten tons

GROUP 10: Crane operator (over 50 tons and up to and including 100 tons mrc); Derrick barge operator (over 50 tons up to and including 100 tons mrc); Hoist operator, stiff legs, Guy derrick or similar type (over 50 tons up to and including 100 tons mrc), Mobile tower crane operator (over 50 tons, up to and including 100 tons M.R.C.); Tower crane operator and tower gantry

GROUP 11: Crane operator (over 100 tons and up to and including 200 tons mrc); Derrick barge operator (over 100 tons up to and including 200 tons mrc); Hoist operator, stiff legs, Guy derrick or similar type (over 100 tons up to and including 200 tons mrc); Mobile tower crane operator (over 100 tons up to and including 200 tons mrc)

GROUP 12: Crane operator (over 200 tons up to and including 300 tons mrc); Derrick barge operator (over 200 tons up to and including 300 tons mrc); Hoist operator, stiff legs, Guy derrick or similar type (over 200 tons, up to and including 300 tons mrc); Mobile tower crane operator (over 200 tons, up to and including 300 tons mrc)
GROUP 13: Crane operator (over 300 tons); Derrick barge operator (over 300 tons); Helicopter pilot; Hoist operator, stiff legs, Guy derrick or similar type (over 300 tons); Mobile tower crane operator (over 300 tons)

TUNNEL CLASSIFICATIONS

GROUP 1: Skiploader (wheel type up to 3/4 yd. without attachment)

GROUP 2: Power-driven jumbo form setter operator

GROUP 3: Dinkey locomotive or motorperson (up to and including 10 tons)

GROUP 4: Bit sharpener; Equipment greaser (grease truck); Slip form pump operator (power-driven hydraulic lifting device for concrete forms); Tugger hoist operator (1 drum); Tunnel locomotive operator (over 10 and up to and including 30 tons)

GROUP 5: Backhoe operator (up to and including 3/4 yd.); Small Ford, Case or similar; Drill doctor; Grouting machine operator; Heading shield operator; Heavy-duty repairperson; Loader operator (Athey, Euclid, Sierra and similar types); Mucking machine operator (1/4 yd., rubber-tired, rail or track type); Pneumatic concrete placing machine operator (Hackley-Presswell or similar type); Pneumatic heading shield (tunnel); Pumpcrete gun operator; Tractor compressor drill combination operator; Tugger hoist operator (2 drum); Tunnel locomotive operator (over 30 tons)

GROUP 6: Heavy Duty Repairman

GROUP 7: Tunnel mole boring machine operator

ENGINEERS ZONES

$1.00 additional per hour for all of IMPERIAL County and the portions of KERN, RIVERSIDE & SAN BERNARDINO Counties as defined below:

That area within the following Boundary: Begin in San Bernardino County, approximately 3 miles NE of the intersection of I-15 and the California State line at that point which is the NW corner of Section 1, T17N,m R14E, San Bernardino Meridian. Continue W in a straight line to that point which is the SW corner of the northwest quarter of Section 6, T27S, R42E, Mt. Diablo Meridian. Continue North to the intersection with the Inyo County Boundary at that point which is the NE

corner of the western half of the northern quarter of Section 6, T25S, R42E, MDM. Continue W along the Inyo and San Bernardino County boundary until the intersection with Kern County, as that point which is the SE corner of Section 34, T24S, R40E, MDM. Continue W along the Inyo and Kern County boundary until the intersection with Tulare County, at that point which is the SW corner of the SE quarter of Section 32, T24S, R37E, MDM. Continue W along the Kern and Tulare County boundary, until that point which is the NW corner of T25S, R32E, MDM. Continue S following R32E lines to the NW corner of T31S, R32E, MDM. Continue W to the NW corner of T31S, R31E, MDM. Continue S to the SW corner of T32S, R31E, MDM. Continue W to SW corner of SE quarter of Section 34, T32S, R30E, MDM. Continue S to SW corner of T11N, R17W, SBM. Continue E along south boundary of T11N, SBM to SW corner of T11N, R7W, SBM. Continue S to SW corner of T9N, R7W, SBM. Continue E along south boundary of T9N, SBM to SW corner of T9N, R1E, SBM. Continue S along west boundary of R1E, SMB to Riverside County line at the SW corner of T1S, R1E, SBM. Continue E along south boundary of T1s, SBM (Riverside County Line) to SW corner of T1S, R10E, SBM. Continue S along west boundary of R10E, SBM to Imperial County line at the SW corner of T8S, R10E, SBM. Continue W along Imperial and Riverside county line to NW corner of T9S, R9E, SBM. Continue S along the boundary between Imperial and San Diego Counties, along the west edge of R9E, SBM to the south boundary of Imperial County/California state line. Follow the California state line west to Arizona state line, then north to Nevada state line, then continuing NW back to start at the point which is the NW corner of Section 1, T17N, R14E, SBM

$1.00 additional per hour for portions of SAN LUIS OBISPO, KERN, SANTA BARBARA & VENTURA as defined below:

That area within the following Boundary: Begin approximately 5 miles north of the community of Cholame, on the Monterey County and San Luis Obispo County boundary at the NW corner of T25S, R16E, Mt. Diablo Meridian. Continue south along the west side of R16E to the SW corner of T30S, R16E, MDM. Continue E to SW corner of T30S, R17E, MDM. Continue S to SW corner of T31S, R17E, MDM. Continue E to SW corner of T31S, R18E, MDM. Continue S along West side of R18E, MDM as it crosses into San Bernardino Meridian numbering area and becomes R30W. Follow the west side of R30W, SBM to the SW corner of T9N, R30W, SBM. Continue E along the south edge of T9N, SBM to the Santa Barbara County and Ventura County boundary at that point whch is the SW corner of Section 34.T9N, R24W, SBM, continue S along the Ventura County line to that point which is the SW corner of the SE quarter of Section 32, T7N, R24W, SBM. Continue E along the south edge of T7N, SBM to the SE corner to T7N, R21W, SBM. Continue N along East side of R21W, SBM to Ventura County and Kern County boundary at the NE corner of T8N, R21W. Continue W along the Ventura County and Kern County boundary to the SE corner of T9N, R21W. Continue North along the East edge of R21W, SBM to the NE corner of T12N, R21W, SBM. Continue West along the north edge of T12N, SBM to the SE corner of T32S, R21E, MDM. [T12N SBM is a think strip between T11N SBM

and T32S MDM]. Continue North along the East side of R21E, MDM to the Kings County and Kern County border at the NE corner of T25S, R21E, MDM, continue West along the Kings County and Kern County Boundary until the intersection of San Luis Obispo County. Continue west along the Kings County and San Luis Obispo County boundary until the intersection with Monterey County. Continue West along the Monterey County and San Luis Obispo County boundary to the beginning point at the NW corner of T25S, R16E, MDM.

$2.00 additional per hour for INYO and MONO Counties and the Northern portion of SAN BERNARDINO County as defined below:

That area within the following Boundary: Begin at the intersection of the northern boundary of Mono County and the California state line at the point which is the center of Section 17, T10N, R22E, Mt. Diablo Meridian. Continue S then SE along the entire western boundary of Mono County, until it reaches Inyo County at the point which is the NE corner of the Western half of the NW quarter of Section 2, T8S, R29E, MDM. Continue SSE along the entire western boundary of Inyo County, until the intersection with Kern County at the point which is the SW corner of the SE 1/4 of Section 32, T24S, R37E, MDM. Continue E along the Inyo and Kern County boundary until the intersection with San Bernardino County at that point which is the SE corner of section 34, T24S, R40E, MDM. Continue E along the Inyo and San Bernardino County boundary until the point which is the NE corner of the Western half of the NW quarter of Section 6, T25S, R42E, MDM. Continue S to that point which is the SW corner of the NW quarter of Section 6, T27S, R42E, MDM. Continue E in a straight line to the California and Nevada state border at the point which is the NW corner of Section 1, T17N, R14E, San Bernardino Meridian. Then continue NW along the state line to the starting point, which is the center of Section 18, T10N, R22E, MDM.

LABORER (RESIDENTIAL CONSTRUCTION - See definition below)		
(1) Laborer.....	$ 30.82	18.80
(2) Cleanup, Landscape, Fencing (Chain Link & Wood).	$ 29.53	18.80

RESIDENTIAL DEFINITION: Wood or metal frame construction of single family residences, apartments and condominums - excluding (a) projects that exceed three stories over a garage level, (b) any utility work such as telephone, gas, water, sewer and other utilities and (c) any fine grading work, utility work or paving work in the future street and

public right-of-way; but including all rough grading work at the job site behind the existing right of way

LABORER CLASSIFICATIONS

GROUP 1: Cleaning and handling of panel forms; Concrete Screeding for Rought Strike-off; Concrete, water curing; Demolition laborer; Flagman; Gas, oil and/or water pipeline laborer; General Laborer; General clean-up laborer; Landscape laborer; Jetting laborer; Temporary water and and decks); air lines laborer; Material hoseman (walls, slabs, floors Plugging, filling of Shee-bolt holes; Dry packing of concrete ; Railroad maintenance, Repair Trackman and road beds, Streetcar and railroad construction trac laborers; Slip form raisers; Slurry seal crews (mixer operator, applicator operator, squeegee man, Shuttle man, top man), filling of cracks by any method on any surface; Tarman and mortar man; Tool crib or tool house laborer; Window cleaner; Wire Mesh puling-all concrete pouring operations

GROUP 2: Asphalt Shoveler; Cement Dumper (on 1 yard or larger mixer and handling bulk cement); Cesspool digger and installer; Chucktender; Chute man, pouring concrete, the handling of the cute from ready mix trucks, such as walls, slabs, decks, floors, foundations, footings, curbs, gutters and sidewalks; Concrete curer-impervious membrane and form oiler; Cutting torch operator (demoliton); Guinea chaser; Headboard man-asphlt; Laborer,
packing rod steel and pans; membrane vapor barrier installer; Power broom sweepers (small); Riiprap, stonepaver, placing stone or wet sacked concrete; Roto scraper and tiller; Tank sealer and cleaner; Tree climber, faller, chain saw operator, Pittsburgh Chipper and similar type brush shredders; Underground laborers, including caisson bellower

GROUP 3: Buggymobile; Concrete cutting torch; Concrete cutting torch; Concrete pile cutter; Driller, jackhammer, 2 1/2 feet drill steel or longer; Dri Pak-it machine; High sealer (including drilling of same); Hydro seeder and similar type; Impact wrench, mult-plate; Kettlemen, potmen and mean applying asphalt, lay-kold, creosote, line caustic and similar type materials (applying means applying, dipping, brushing or handling of such materials for pipe wrapping and waterproofing); Operators of pneumatic, gas, electric tools, vibratring machines, pavement breakers, air blasting, come-along, and similar mechanical tools not separately classified herein; Pipelayers back up man coating, grouting, making of joints, sealing, caulking, diapering and inclduing rubber gasket joints, pointing and any and all other services; Rotary Scarifier or multiple head concrete chipping scaarifier; Steel header board man and guideline setter; Tampers, Barko, Wacker and similar type; Trenching machine, handpropelled

GROUP 4: Asphalt raker, luterman, ironer, apshalt dumpman and asphalt spreader boxes (all types); Concrete core cutter

(walls, floors or ceilings), Grinder or sander; Concrete saw man; cutting walls or flat work, scoring old or new concrete; Cribber, shorer, lagging, sheeting and trench bracing, hand-guided lagging hammer; Laser beam in connection with laborer's work; Oversize concrete vibrator operator 70 pounds and over; Pipelayer performing all services in the laying, installation and all forms of connection of pipe from the point of receiving pipe in the ditch until completion of oepration, including any and all forms of tubular material, whether pipe, metallic or non-metallic, conduit, and any other stationary type of tubular device used for the conveying of any substance or element, whether water, sewage, solid, gas, air or other product whatsoever and without regard to the nature of material from which the tubular material is fabricated; No joint pipe and stripping of same; Prefabricated manhole installer; Sandblaster (nozzleman), Porta shot-blast, water blasting

GROUP 5: Blasters Powderman-All work of loading holes, placing and blasting of all pwder and explosives of whatever type, regardless of method used for such loading and placing; Driller-all power drills, excluding jackhammer, whether core, diamond, wagon, track, multiple unit, and any and all other types of mechanical drills without regard to the form of motive power.

LABORER CLASSIFICATIONS

GROUP 1: Laborer: General or Construction Laborer, Landscape Laborer. Asphalt Rubber Material Loader. Boring Machine Tender (outside), Carpenter Laborer (cleaning, handling, oiling & blowing of panel forms and lumber), Concrete

Laborer, Concrete Screeding for rough strike-off, Concrete water curing. Concrete Curb & Gutter laborer, Certified Confined Space Laborer, Demolition laborer & Cleaning of Brick and lumber,Expansion Joint Caulking; Environmental Remediation, Monitoring Well, Toxic waste and Geotechnical Drill tender, Fine Grader, Fire Watcher, Limbers, Brush Loader, Pilers and Debris Handlers. flagman. Gas Oil and Water Pipeline Laborer. Material Hoseman (slabs, walls, floors, decks); Plugging, filling of shee bolt holes; Dry packing of concrete and patching; Post Holer Digger (manual); Railroad maintenance, repair trackman, road beds; Rigging & signaling; Scaler, Slip-Form Raisers, Filling cracks on any surface, tool Crib or Tool House Laborer, Traffic control (signs, barriers, barricades, delineator, cones etc.), Window Cleaner

GROUP 2: Asphalt abatement; Buggymobile; Cement dumper (on 1 yd. or larger mixers and handling bulk cement); Concrete curer, impervious membrane and form oiler; Chute man, pouring concrete; Concrete cutting torch; Concrete pile cutter; driller/Jackhammer, with drill steel 2 1/'2 feet or longer; Dry pak-it machine; Fence erector; Pipeline wrapper, gas, oil, water, pot tender & form man; Grout man; Installation of all asphalt overlay fabric and materials used for reinforcing asphalt; Irrigation laborer; Kettleman-Potman hot mop, includes applying asphalt, lay-klold, creosote, lime caustic and similar tyhpes of materials (dipping, brushing, handling) and waterproofing; Membrane vapor barrier installer; Pipelayer backup man (coating, grouting, making of joints, sealing caulkiing, diapering including rubber basket joints, pointing); Rotary scarifier, multiple head concrete chipper; Rock slinger; Roto scraper & tiller; Sandblaster pot tender; Septic tank digger/installer; Tamper/wacker operator; Tank scaler & cleaner; Tar man & mortar man; Tree climber/faller, chainb saw operator, Pittsburgh chipper & similar type brush shredders.

GROUP 3: Asphalt, installation of all frabrics; Buggy Mobile Man, Bushing hammer; Compactor (all types), Concrete Curer - Impervious membrane, Form Oiler, Concrete Cutting Torch, Concrete Pile Cutter,Driller/Jackhammer with drill steel 2 1/2 ft or longer, Dry Pak-it machine, Fence erector including manual post hole digging, Gas oil or water Pipeline Wrapper - 6 ft pipe and over, Guradrail erector, Hydro seeder, Impact Wrench man (multi plate), kettleman-Potman Hot Mop includes applying Asphalt, Lay-Kold, Creosote, lime caustic and similar types of materials (dipping, brushing or handling) and waterproofing. Laser Beam in connection with Laborer work. High Scaler, Operators of Pneumatic Gas or Electric Tools, Vibrating Machines, Pavement Breakers, Air Blasting, Come-Alongs and similar mechanical tools, Remote-Controlled Robotic Tools in connection with Laborers work. Pipelayer Backup Man (Coating, grouting,m makeing of joints, sealing, caulking, diapering including rubber gasket joints, pointing and other services). Power Post Hole Digger,

Rotary Scarifier (multiple head concrete chipper scarifier), Rock Slinger, Shot Blast equipment (8 to 48 inches), Steel Headerboard Man and Guideline Setter, Tamper/Wacker operator and similar types, Trenching Machine hand propelled.

GROUP 4: Any worker exposed to raw sewage. Asphalt Raker, Luteman, Asphalt Dumpman, Asphalt Spreader Boxes, Concrete Core Cutter, Concrete Saw Man, Cribber, Shorer, Head Rock Slinger. Installation of subsurface instrumentation, monitoring wells or points, remediation system installer; Laborer, asphalt-rubber distributor bootman; Oversize concrete vibrator operators, 70 pounds or over. Pipelayer, Prfefabricated Manhole Installer, Sandblast Nozzleman (Water Balsting-Porta Shot Blast), Traffic Lane Closure.

GROUP 5: Blasters Powderman-All work of loading holes, placing and blasting of all powder and explosives of whatever type, regardless of method used for such loading and placing; Horizontal directional driller, Boring system, Electronic traking, Driller: all power drills excluding jackhammer, whether core, diamond, wagon, track, multiple unit, and all other types of mechanical drills without regard to form of motive power. Environmental remediation, Monitoring well, Toxic waste and Geotechnical driller, Toxic waste removal. Welding in connection with Laborer's work.

GROUP 1.....	$ 39.06	19.01
GROUP 2.....	$ 40.36	19.01
GROUP 3.....	$ 42.37	19.01
GROUP 4.....	$ 44.11	19.01

LABORERS - STRIPING CLASSIFICATIONS

GROUP 1: Protective coating, pavement sealing, including repair and filling of cracks by any method on any surface in parking lots, game courts and playgrounds; carstops; operation of all related machinery and equipment; equipment repair technician
GROUP 2: Traffic surface abrasive blaster; pot tender - removal of all traffic lines and markings by any method (sandblasting, waterblasting, grinding, etc.) and preparation of surface for coatings. Traffic control person: controlling and directing traffic through both

conventional and moving lane closures; operation of all related machinery and equipment

GROUP 3: Traffic delineating device applicator: Layout and application of pavement markers, delineating signs, rumble and traffic bars, adhesives, guide markers, other traffic delineating devices including traffic control. This category includes all traffic related surface preparation (sandblasting, waterblasting, grinding) as part of the application process. Traffic protective delineating system installer: removes, relocates, installs, permanently affixed roadside and parking delineation barricades, fencing, cable anchor, guard rail, reference signs, monument markers; operation of all related machinery and equipment; power broom sweeper

GROUP 4: Striper: layout and application of traffic stripes and markings; hot thermo plastic; tape traffic stripes and markings, including traffic control; operation of all related machinery and equipment

TRUCK DRIVER CLASSIFICATIONS

GROUP 1: Fuel Man, Swamper

GROUP 2: 2-axle Dump Truck, 2-axle Flat Bed, Concrete Pumping Truck, Industrial Lift Truck, Motorized Traffic Control, Pickup Truck on Jobsite

GROUP 3: 2-axle Water Truck, 3-axle Dump Truck, 3-axle Flat Bed, Erosion Control Nozzleman, Dump Crete Truck under 6.5 yd, Forklift 15,000 lbs and over, Prell Truck, Pipeline Work Truck Driver, Road Oil Spreader, Cement Distributor or Slurry Driver, Bootman, Ross Carrier

GROUP 4: Off-road Dump Truck under 35 tons 4-axles but less than 7-axles, Low-Bed Truck & Trailer, Transit Mix Trucks under 8 yd, 3-axle Water Truck, Erosion Control Driver, Grout Mixer Truck, Dump Crete 6.5yd and over, Dumpster Trucks, DW 10, DW 20 and over, Fuel Truck and Dynamite, Truck Greaser, Truck Mounted Mobile Sweeper 2-axle Winch Truck

GROUP 5: Off-road Dump Truck 35 tons and over, 7-axles or more, Transit Mix Trucks 8 yd and over, A-Frame Truck, Swedish Cranes

GROUP 6: Off-Road Special Equipment (including but not limited to Water Pull Tankers, Athey Wagons, DJB, B70 Wuclids or like Equipment)

GROUP 7: Repairman

WELDERS - Receive rate prescribed for craft performing operation to which welding is incidental.

==========

Note: Executive Order (EO) 13706, Establishing Paid Sick Leave for Federal Contractors applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2017. If this contract is covered by the EO, the contractor must provide employees with 1 hour of paid sick leave for every 30 hours they work, up to 56 hours of paid sick leave each year. Employees must be permitted to use paid sick leave for their own illness, injury or other health-related needs, including preventive care; to assist a family member (or person who is like family to the employee) who is ill, injured, or has other health-related needs, including preventive care; or for reasons resulting from, or to assist a family member (or person who is like family to the employee) who is a victim of, domestic violence, sexual assault, or stalking. Additional information on contractor requirements and worker protections under the EO is available at www.dol.gov/whd/govcontracts.

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (ii)).

The body of each wage determination lists the classification and wage rates that have been found to be prevailing for the cited type(s) of construction in the area covered by the wage determination. The classifications are listed in alphabetical order of ""identifiers"" that indicate whether the particular rate is a union rate (current union negotiated rate for local), a survey rate (weighted average rate) or a union average rate (weighted union average rate).
Union Rate Identifiers

A four letter classification abbreviation identifier enclosed in dotted lines beginning with characters other than ""SU"" or ""UAVG"" denotes that the union classification and rate were prevailing for that classification in the survey. Example: PLUM0198-005 07/01/2014. PLUM is an abbreviation identifier of the union which prevailed in the survey for this classification, which in this example would be Plumbers. 0198 indicates the local union number or district council number where applicable, i.e., Plumbers Local 0198. The next number, 005 in the example, is an internal number used in processing the wage determination. 07/01/2014 is the effective date of the most current negotiated rate, which in this example is July 1, 2014.

Union prevailing wage rates are updated to reflect all rate changes in the collective bargaining agreement (CBA) governing this classification and rate.

Survey Rate Identifiers

Classifications listed under the ""SU"" identifier indicate that no one rate prevailed for this classification in the survey and the published rate is derived by computing a weighted average rate based on all the rates reported in the survey for that classification. As this weighted average rate includes all rates reported in the survey, it may include both union and non-union rates. Example: SULA2012-007 5/13/2014. SU indicates the rates are survey rates based on a weighted average calculation of rates and are not majority rates. LA indicates the State of Louisiana. 2012 is the year of survey on which these classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. 5/13/2014 indicates the survey completion date for the classifications and rates under that identifier.

Survey wage rates are not updated and remain in effect until a new survey is conducted.

Union Average Rate Identifiers

Classification(s) listed under the UAVG identifier indicate that no single majority rate prevailed for those classifications; however, 100% of the data reported for the classifications was union data. EXAMPLE: UAVG-OH-0010 08/29/2014. UAVG indicates that the rate is a weighted union average rate. OH indicates the state. The next number, 0010 in the example, is an internal number used in producing the wage determination. 08/29/2014 indicates the survey completion date for the classifications and rates under that identifier.

A UAVG rate will be updated once a year, usually in January of each year, to reflect a weighted average of the current negotiated/CBA rate of the union locals from which the rate is based.

WAGE DETERMINATION APPEALS PROCESS

1.) Has there been an initial decision in the matter? This can be:

* an existing published wage determination
* a survey underlying a wage determination
* a Wage and Hour Division letter setting forth a position on a wage determination matter
* a conformance (additional classification and rate) ruling

On survey related matters, initial contact, including requests for summaries of surveys, should be with the Wage and Hour Regional Office for the area in which the survey was conducted because those Regional Offices have responsibility for the Davis-Bacon survey program. If the response from this initial contact is not satisfactory, then the process described in 2.) and 3.) should be followed.

With regard to any other matter not yet ripe for the formal process described here, initial contact should be with the Branch of Construction Wage Determinations. Write to:

Branch of Construction Wage Determinations
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

2.) If the answer to the question in 1.) is yes, then an interested party (those affected by the action) can request review and reconsideration from the Wage and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7). Write to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

The request should be accompanied by a full statement of the interested party's position and by any information (wage

payment data, project description, area practice material, etc.) that the requestor considers relevant to the issue.

3.) If the decision of the Administrator is not favorable, an interested party may appeal directly to the Administrative Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

4.) All decisions by the Administrative Review Board are final.

==========

END OF GENERAL DECISION"

SECTION 31 71 19
MICROTUNNELING

PART 1 - GENERAL

1.1 SCOPE OF WORK:

A. The Work specified in this Section consists of installing plastic lined reinforced concrete (PLRCP) pipe along the alignment shown in the Contract Drawings and documents by Microtunneling. The soil material and hydrological conditions are described in the Geotechnical Data Report (GDR) and Geotechnical Baseline Report (GBR). "Geotechnical Report, Pump Station Portion, Morena Pump Station, WW Force Main, and Brine/Centrate Conveyance Predesign (NC01), San Diego, California," prepared by AECOM, dated January 5, 2018. Curved and straight microtunneling are specified the CONTRACTOR may adjust the shown curved alignment within the project easement boundary subject to OWNER's approval. CONTRACTOR shall furnish all labor, tools, and equipment, and perform operations necessary or incidental for the excavation and support of microtunneling operations including construction of the launching and receiving shafts and supply of suitable jacking pipes.

B. The support of excavation for shafts shall be in accordance with the Contract Documents, except as modified herein for microtunneling operations. This specification describes the additional measures that shall be provided by CONTRACTOR for each of the launching and receiving shafts used with the microtunneling method.

C. The shafts used for launching and receiving shall be made fully adequate for the microtunneling work and for any permanent structures situated within the shafts. CONTRACTOR shall be responsible for providing each launching shaft and each receiving shaft with the provisions necessary to perform the microtunneling operations. Furnish labor, equipment, material, and additional design, as necessary, to meet the minimum requirements as contained herein.

D. CONTRACTOR shall hire a California licensed Professional Engineer meeting the requirements as contained herein. CONTRACTOR is responsible for the work produced by this engineer.

E. CONTRACTOR shall provide each launch shaft with thrust blocks, entrance seals, base slabs, pumping and drainage systems, ventilation systems, electrical systems, and lighting systems. CONTRACTOR's licensed engineer shall design the shaft support (SOE), thrust blocks, entrance seals, and base slabs including necessary modifications to the shoring. CONTRACTOR shall also be responsible for developing a Fluid Control Plan to be implemented by CONTRACTOR at each of the shaft sites in accordance with the requirements as contained herein.

F. CONTRACTOR shall provide each receiving shaft with exit seals, base slabs, and, as necessary, a pumping and drainage system to maintain dry working conditions. CONTRACTOR's licensed engineer shall design the exit seals including necessary modifications to the shoring.

G. CONTRACTOR shall prevent the inflow of ground and/or groundwater into the shafts during the microtunneling operations including but not limited to exit and entry of the shaft during the launching and receiving processes of the MTBM. The ground shall be improved, as necessary, to prevent any inflow of ground and/or groundwater in excess of specified tolerances as contained herein.

H. CONTRACTOR shall prevent the machine from veering off of the design alignment during the launching, jacking, and/or receiving process in excess of the specified tolerances as contained herein. CONTRACTOR shall redesign pipeline and associated structures at no additional cost to the OWNER, if and when necessary due to exceedance of the specified tolerances.

I. CONTRACTOR shall be responsible for ensuring that each of the shafts, including modifications, used with the microtunneling is fully adequate for installation of the permanent structures as shown on the Contract Documents. CONTRACTOR shall modify these shafts as necessary to accommodate the construction of these structures. Furthermore, CONTRACTOR's licensed engineer shall provide additional design necessary for completing this work.

J. The CONTRACTOR shall provide a microtunnel boring machine (MTBM) capable of excavating through the ground and any material as described in the GBR, furnishing and installing jacking pipe complete and operational as specified in the documents to the specified line and grade. Furnish and attempt to replace lubricant with grout behind the jacking pipes to completely fill any annular void between the pipe extrados and the excavated surface through grout holes in the pipes.

K. CONTRACTOR shall store, process, properly transport, and legally dispose of muck and/or excavated material in accordance with the Contract Documents.

L. Microtunneling operations will be carried out to minimize settlements to within limits established in the Contract Documents. CONTRACTOR shall be responsible for damage caused by construction activities to include damage by subcontractors, and conducting restoration of existing facilities for damages due to shaft construction and microtunneling related ground movement.

M. CONTRACTOR's engineer shall develop a Survey Plan in accordance with the requirements as contained herein. The Licensed surveyor shall perform survey readings associated with this plan.

N. The 60in PLRCP microtunnel drive between Junction Structure 1 jacking shaft and the pump station passes under a levee and buried levee RipRap as indicated in the GBR and on the drawings. Contractor is advised that pieces of RipRap may be found in the tunnel alignment. Contractor will carry out at least 3 pilot bores of at least 150ft long from the jacking shaft to probe for obstructions in the crown of the tunnel alignment. Contractor will submit means and methods to complete the pipeline as per the drawings.

O. The 48in steel casing microtunnel drive from Custer Street to the 66in Overflow Pipe on Friars road passes under the Trolley tracks and a levee and as indicated on the drawings and GBR will pass through the bottom levee rip rap. Contractor must submit means and methods to remove or pass through the rip rap and complete the casing installation without causing movement to the trolley tracks.

P. All tunneling construction work and services, including layout and excavation locations, shall be responsibility of the Contractor. All consultant service activities operating under the jurisdiction of a regulating professional state board or federal agency shall be duly certified and registered under the regulating body. The Contractor will be responsible for protecting and preserving all project survey reports. The City will provide QA/QC surveys on project settlement monitoring survey reports".

1.1 REFERENCES:

A. American Association of State Highway and Transportation Officials (AASHTO).

B. American Society of Civil Engineers (ASCE).

C. California Occupational Safety and Health Administration (CAL-OSHA) – Particular attention is called to Sub-part S, Underground Construction, and Sub-part K, Electrical, of the Standards and Guidelines 29 CFR Part 1926,

D. Guidelines 2007 and ASCE 36 Standard Construction Guidelines for Microtunneling

1.2 DEFINITIONS:

A. Microtunneling: A continuously supported trenchless installation of a pipe by jacking the pipe directly behind a closed face, remotely controlled, steerable, guided, microtunnel boring machine (MTBM) which provides a continuous pressure on the face of the excavation to balance groundwater and earth pressures.

B. Microtunneling Boring Machine (MTBM) :The total system of the mechanized excavating equipment, consisting of a boring and articulated steering head, trailing shield segment(s), auxiliary and support equipment, and other items necessary for the sustained excavation operations of the microtunnel.

C. Jacking Pipe: pipe specifically designed to withstand jacking loads as defined herein, that serves as initial construction lining and tunnel support, and as the final carrier or casing pipe.

D. Hydraulic pipe joint : Specialty pipe joint system for jacking pipe through a curved drive to spread the jacking force or reduce force concentration over the pipe perimeter. It consists of a hose mounted in the pipe joint with controllable deformation and fluid pressure, which can be translated into forces acting on the pipe.

E. Ground Conditioning Agents: Used during microtunneling operations to control settlement, reduce cutting head torque, and prevent excessive wear on cutting tools and other MTBM components. These may include 1) foam (both simple surfactant/air/ water foam and polymer/surfactant/air/water foam); 2) polymers; 3) bentonite slurry.

F. Lubrication: Bentonite and/or polymer lubricant injected in the annular space between the pipe and surrounding ground during microtunneling to support the annular space and reduce friction between the pipe and soil.

G. Muck: Material excavated from shafts or tunnel including any ground treatment, lubrication, or slurry. Also referred to as spoils.

H. Spoil Transport System: A system of piping, pumps, valves, screw conveyors, or other equipment which transports the muck from the tunnel face to the surface. This includes the slurry treatment plant if a slurry based system is utilized.

I. Jacking Shaft: Excavation from which the MTBM is launched, which incorporates a thrust block to spread reaction loads to the ground. Also referred to as launching shaft.

J. Receiving Shaft: Excavation to which the MTBM is launched towards. A shaft can be used as both a jacking shaft and receiving shaft for adjacent microtunnel drives but is not required.

K. Jacking System: A system of hydraulic jacks installed inside the jacking shaft that provides thrust for the string of pipe in the ground and the MTBM. Capacity of jacks and extension rate is synchronized with excavation rate of the MTBM.

L. Intermediate Jacking Station (IJS): A fabricated steel cylinder fitted with hydraulic jacks installed at intermediate locations in the pipe string to allow selective shoving of discrete segments of the total pipe string and MTBM.

M. Laser: An optical system projecting a beam to a target to provide guidance for and location of the MTBM.

N. Guidance system : A system that may be based on a laser for straight drives or a Gyro or an automated or manual system based on surveyors total stations and prisms to provide position information for curved drives

O. Controls: The system which provides operational control to the MTBM including steering and synchronizes excavation, removal of the excavated material, and jacking of pipe to maintain overall balance to provide complete and adequate ground support at all times. The controls are generally containerized and located on the surface adjacent to the Jacking shaft.

P. Face Access: Provision of an opening in the MTBM pressure wall to give man access to the muck chamber behind the cutter wheel to allow cutter tool changes in stable ground

Q. AirLock: A system that allows access to the muck chamber behind the cutter head under pressure to change cutter tools if required

R. Contact Grouting: Grout used to fill the annular space between the pipe and the soil due to MTBM overcut upon completion of a microtunnel drive.

S. Dewatering: System of wells or excavations and pumps used for lowering the groundwater and/or removing groundwater from the microtunnel shafts.

T. Entrance Seal: A mechanism incorporated into the launching shaft, including any necessary ground improvement, to prevent the inflow of ground and/or groundwater into the shaft while launching the MTBM and jacking subsequent pipes.

U. Exit Seal: A mechanism incorporated into the receiving shaft, including any necessary ground improvement, to prevent the inflow of ground and/or groundwater into the shaft while in the process of recovering the MTBM at the receiving shaft.

V. Grade: Vertical alignment.

W. Launching: The machine is in the process of being launched at the beginning of a drive when passing through the entrance seal along the alignment beyond the outside edge of the launching shaft

X. Line: Horizontal alignment.

Y. Receiving: The machine is in the process of being received at the end of a drive when passing through the exit seal along the alignment beyond the outside edge of the receiving shaft.

Z. Shoring: Scheme of the shaft for supporting the excavation and controlling the groundwater.

AA. Thrust Block: A thrust block, including necessary ground improvement, is used to evenly distribute the jacking loads to the ground as part of the pipe installation process without excess movement or misalignment of the equipment.

BB. Pilot Bore: A small diameter test bore to be used to probe the ground on the tunnel alignment for obstructions.

1.3 SUBMITTALS:

A. Submit the following in accordance with the Contract Documents.

1. Coordination and Implementation Plans to demonstrate that applicable requirements from the Contract Documents as well as the requirements as contained herein, have been reviewed and coordinated by CONTRACTOR. Each of the subcontractors, if any, shall sign these plans.

2. Fluid Control Plan to ensure that the equipment operator maintains full control over fluid volumes and fluid pressures during microtunneling operations including slurries and/or lubricants. CONTRACTOR shall determine the construction activities at each launch shaft site location and describe these in detail. CONTRACTOR's engineer shall evaluate these activities and develop a plan including recommendations to ensure that fluid control is not impeded to any degree by any construction activity occurring at the site including but not limited to backfilling operations, leakage in the shoring, dewatering activities, and induced flow of groundwater. Consideration shall be given to the ground and groundwater conditions as defined in the GBR. CONTRACTOR's engineer shall sign this plan.

3. Shaft Layout and Details: For each microtunneling shaft and drive from it, provide complete details, drawings, and schematics, as applicable. Show layout of shaft, including equipment, drawn to scale. Demonstrate that proposed layout of shafts is adequate for sequence of construction, equipment operations, and means and methods of pipe installation including required acceptance testing. Describe in detail provisions for the working slab, invert treatment, and pump and drainage systems. Include details of lighting, ventilation, hydraulic, and electrical systems.

4. Structures Shown on Contract Documents: Evaluate each microtunneling shaft and demonstrate that each shaft is adequate for installation of the permanent structures as shown on the Contract Documents including each stage of construction and backfilling. Provide detailed descriptions, procedures, shop drawings, schematics, and explanations. Furthermore for design modifications to accommodate these structures, provide fully

developed design details, material requirements, standards, calculations, shop drawings, procedures, construction stages, and explanations signed and sealed by CONTRACTOR's engineer. Evaluate ground improvement schemes and contingency measures to be implemented as part of the design.

5. Contractor will submit means and methods to carry out pilot tube probing under the levee on the drive between Junction structure 1 jacking shaft and the pump station, and if obstructions are found in the tunnel alignment a method for completing the drive as per the contract drawings.

6. Contractor will submit specific means and methods to complete the 48in casing drive through the levee riprap and under the trolley tracks between custer street and the 66in Overflow pipe.

7. Survey Techniques: Provide complete details that fully describe the survey techniques to be used for transfer of line and grade.

8. Provide details of site monitoring plan including provision of measuring ground movements at shafts and along the tunnel alighnment and the monitoring of any existing structures within 100ft of the centerline of the excavation and tunnel alignment. Submit a plan for actions to be taken in the case of ground movements or movements of structures exceeding the allowable movement limits (Unless otherwise submitted 1/2in movement requires action to be taken as per the plan)

9. Qualifications of key personnel to include CONTRACTOR's California licensed engineer, project superintendent, MTBM operators, shift supervisors, and licensed surveyor.

10. Field Inspections, not less than once per week, in accordance with requirements as contained herein.

B. Shop Drawings (Minimum of 60 days before microtunneling is scheduled to begin):

1. Calculations and working drawings signed and sealed by a Professional Engineer registered in the State of California, showing jacking and reception shafts support, including shaft exit cut outs and thrust blocks designed to resist maximum jacking loads.

2. Working drawings indicating limits of jacking and reception shafts showing layout of tunneling and ancillary equipment.

3. MTBM shop drawings including:

    a. Configuration of cutterhead and over cut.

b. Ventilation system details for personnel entry to the MTBM.
c. Provision for cutter tool replacement during a drive
d. If an Airlock is supplied the Airlock operational manual
e. Jacking pipe lubrication system details.
f. Grade and alignment control system details.
g. MTBM emergency groundwater control provisions.
h. Details of slurry pumping and separation control if applicable.

4. Jacking pipe calculations and details as required by the Contract Documents.

5. Calculations and working drawings signed and sealed by a Professional Engineer registered in the State of California for methods of controlling groundwater, in accordance with the Contract Documents, during microtunneling.

6. Show pertinent dimensions, spacing, and layout of Microtunneling components. Indicate sizes, shapes, material specifications, and elevations, as related to depth of excavation. Include plan, elevations, sections, and details showing the arrangement and method of installation during intermediate construction stages in addition to providing the final stages.

C. Design calculations:

1. Include design assumptions, and for computer software, provide the program input.

2. Demonstrate the integrity of the pipe design and conformance to applicable design standards. Account for loads, sequences, and conditions during the various construction stages.

3. Provide analyses to determine impacts with existing site improvements including but not limited to structures and utilities.

4. For backfilling of shafts after microtunneling operations, provide analyses for end bearing capacity, skin friction/down-drag, and settlement.

D. Show existing structures, utilities, trees, and other site improvements located within each of these shaft areas.

E. Product Data (Minimum of 60 days before microtunneling is scheduled to begin):

1. Submit details of muck or slurry conditioning additives used to reduce machine applied torque and maintain muck flow and pressure holding capability.

F. Examples of Shift reports & Data Recording printouts (Minimum of 60 days before microtunneling is scheduled to begin):

1. A sample of the Data log printout or manual log of the jacking operation to be used, which will include the following items and be provided every 24hrs:

    a. Position of the MTBM in relation to the design line and grade.
    b. Jacking forces exerted on the pipe and at each intermediate jacking station if applicable.
    c. Date, starting time, and finish time of each pipe joint.
    d. Instantaneous jacking rate and total distance jacked.
    e. Position of the steering jacks.
    f. Pitch and roll of the MTBM.
    g. Cutterhead RPM & torque.
    h. Details of problems, obstructions, or delays: including the conjectured cause.
    i. Rotational speed of screw conveyor if applicable.
    j. For slurry based system: The volume of slurry in both the supply and return side of the slurry loop, indication of slurry bypass valve position, and indication of pressure in face support chamber.
    k. Face water jet use .

    l. For slurry based system the viscosity and density of the slurry supply fluid to the MTBM
    m. Shift report identifying the operating crew, weather , any downtime and reasons, description of the ground being excavated,

2. A sample of the visual inspection form to be used.

3. Settlement monitoring report showing ground movements for each monitoring point and for each monitored structure. Monitoring survey will be carried out daily for all monitoring points within 100ft of the MTBM during excavation.

G. Special Equipment and Repair (Minimum of 60 days before microtunneling is scheduled to begin):

1. Certification by the original MTBM manufacturer of the thrust, torque, condition, and operational characteristics of equipment to be used for installing the specified pipe. The microtunneling equipment shall employ a spoil removal system with a pressure balance system that is capable of equalizing pressures between the tunnel face and the microtunneling machine head to positively and continuously support the face of the excavation to balance groundwater and earth pressures.

2. Manufacturer's literature describing in detail the microtunneling system to be used. If the contract documents specify curved microtunneling , provide a detailed description of at least one similarly sized microtunnel project on which this system or similar has been successfully used in a curved drive application. Provide the names, addresses and telephone numbers of owner's representatives for these projects as well as the length, diameter, curve properties, and pipe material used. Indicate whether the machine proposed for this contract currently exists, or will be newly manufactured.

3. Details of special precautions required and the inspection procedures to be taken when stopping the machine for repair, weekends, holidays etc. to ensure that the pipe string does not become "locked" by soil pressure and face stability is not compromised during the shutdown including contingency measures to be implemented if problems arise or in groundwater control if power is lost.

H. Installation and inspection data (Minimum of 45 days before microtunneling is scheduled to begin.):

1. A detailed technical description of the microtunneling procedure, and construction techniques to provide the access required to install the specified pipe in conformance with the Contract Documents to include:

    a. Intended machine parameters to achieve pressure balance at the tunnel face, including cutterhead rotation speed, torque, thrust, pump or screw conveyor speeds, and discharge rates, rate of advance, and volumetric control.
    b. Details of muck handling system, rock crushing and spoil separation methods if required, including proposed additive formulations and calculations of the system capacity to handle flows at all distances and changes of elevation to and from the MTBM.
    c. Details of conditioning agents to be used, including concentration, injection rate, injection point, and ratios of these conditioning agents.
    d. Details of main jacking system, intermediate jacking stations, hydraulic joints (if proposed) and their proposed spacing, method of operation and thrust capacity. Include calculations of anticipated jacking forces required to advance the pipe and calculations of maximum jacking force permissible on straight and curved sections for the selected jacking pipe material. Include details and supporting compression calculations for joints used with intermediate jacking stations and hydraulic joints. Describe controls to prevent the maximum jacking force from being exceeded during the curved drive including use of hydraulic joints and/or other measures to prevent pipe overstress.
    e. Description of guidance system and procedures for maintaining line and grade.

f. Method of spoil disposal conforming to the Contract Documents.
g. A startup plan for the MTBM and the method of launching through the launching shaft wall into the ground, and the plan for exiting the drive at the reception shaft.
h. A plan for contact grouting after the pipe has been installed. The details shall include injection pressure, method of controlling grout pressures, and method for verifying complete filling of the void space between the pipe and the surrounding ground.
i. Complete information on CONTRACTOR's safety plan for personnel conducting the tunneling or jacking operations and appurtenance installation in accordance with OSHA and local regulations. The plan shall include provisions for lighting, ventilation, and electrical safety.
j. Contingency Plan, detailing measures to be taken when surface settlement exceeds the maximum values as described herein and in the Contract Documents.
k. A procedure (method statement) for remedial grouting to reduce infiltration rates to specified levels, if applicable.

I. Performance reports and test data (daily when MTBM is operating):

1. Jacking operation data log containing the data detailed in this Specification taken at intervals no more than 1 minute apart and a minimum of 10 times per pipe section. If the data is collected digitally it shall be submitted in both hard copy and digital format on an appropriate storage media.

2. If the electronic data log is not submitted or available in a digital format then a CD video recording of the operator's console shall be required. Video shall show a real- time clock that matches the time scale used in the manual log, and information used by the operator in machine operation, guidance, and control. Indicators for the MTBM being viewed by the CD recorder shall indicate when the MTBM is excavating and the number of the pipe joint that is being pushed. (The video disk shall be submitted to the OWNER each week and a complete video recording at the end of each drive)

3. Separate log tracking pipe lubricant used in gallons, its measured viscosity, and pumping pressure,

4. Separate log tracking the volume of muck removed from the tunnel excavation for each pipe section and from the site each day.

J. Survey Plan:

1. This plan shall be developed by CONTRACTOR's engineer to transfer line and grade from the surface to the working floor of the shaft and to complete the as-built survey of the pipe installed by microtunneling.

2. In pipes over 48in inside diameter Include the survey techniques to be used for acquiring the as-built line and grade. The surveyed points along the installed pipe shall be spaced at a distance not to exceed 10 feet but not less than one survey reading shall be taken per pipe. Additionally, survey low or high points will be indicated.

3. Provide interpretation of this data; compare with specified tolerances for line and grade as contained herein as well as in the Contract Documents. Whichever are more restrictive.

4. Submit as-built survey data to OWNER at the end of each drive.

1.4 QUALITY ASSURANCE:

A. Experience Requirements:

1. Microtunnel construction is deemed specialty contractor work. The specialty subcontractor or CONTRACTOR, if the CONTRACTOR elects to self-perform this work, shall have experience using MTBMs of the types specified for this project.

2. CONTRACTOR's engineer shall be licensed by the State of California with experience designing microtunneling and shafts in similar ground conditions. This engineer shall meet applicable regulatory criteria for each system design. Experience and education shall be documented in a resume with a detailed description of the work actually performed on each of the reference projects. Include contact details for each of the reference projects to include the current phone number, e-mail address, and title of a senior project representative familiar with his/her work. Descriptions of reference project shall include the number of shafts designed, dimensions, shoring methods, modifications to shoring, base slab details, ground and groundwater conditions, and thrust block details. Also indicate method of analyses, standards, computer programs, and materials used for constructing the shafts to include the entrance and exit seal. Provide sample design documents.

3. The Licensed surveyor shall be registered in the State of California.

4. Provide a project superintendent with tunneling experience who has worked on microtunneling/pipe jacking projects in similar ground conditions and curved alignment using equipment similar to the equipment selected for this project.

5. Provide a MTBM operator and a shift supervisor for each shift with tunneling experience who has worked on microtunneling/pipe jacking projects using equipment similar to the equipment selected for this project,

in similar ground conditions, and if proposed, curved alignment experience.

B. CONTRACTOR Design Responsibilities:

1. Design and details of jacking unit thrust collar to be used for symmetric and uniform transfer of jacking forces to the pipe.

2. Design and arrangement of shafts, including dimensions, capacity and location of the jacking reaction thrust block, frame alignment and interface with the pipe, support system for shaft walls, and provisions for control of groundwater. The excavation and excavation support shall be coordinated with construction of the permanent structure, tunnel access and manhole facilities.

3. Design and arrangement of microtunneling system including:

    a. An MTBM specifically designed for excavating and installing pipe from the jacking shaft through the geological materials as described in the GDR and GBR, for the soil and rock types, density, strength, abrasivity and maximum hydrostatic, and earth pressures. The MTBM shall also be designed to cut through boulders or obstructions as described in the GBR. The excavated diameters shall be suitable for the installed pipe diameters along the alignment specified in the Contract Documents.
    b. A spoil transport system specifically designed for matching the excavation advance rate to the spoil removal rate while conveying the tunnel muck from the face for geologic materials as described herein and in the GBR. Including a surface separation plant if a recycled slurry based microtunneling system is selected, and additives, such as foams, or other muck conditioners.
    c. A jacking system specifically designed for maintaining microtunnel advance as prescribed in the Contract Documents through the geologic materials as described in the GBR.
    d. Design and arrangement of intermediate jacking stations, including jacking and reaction plates and their interface with the pipe, external shield, and jack capacity and location.
    e. A laser, theodolite or gyro guidance control system specifically designed for maintaining tunnel tolerances as it is advanced along the required alignment as prescribed in the Contract Documents through the subsurface environment as described in the GDR and GBR.

4. Methods of excavation at the face, and details of cutting head tooling.

5. For MTBM over 60in outside diameter, provision of entry to the cutter / muck chamber for changes of cutter tools or removal of obstructions.

6. Locations where pipe lubricant is to be used and lubrication procedure.

7. Requirements for ports in pipe wall, for introduction of lubricant and contact grouting.

8. Procedure for operation of the MTBM to maintain tunnel face stability and minimize surface settlements at all times and under all conditions indicated during both excavation operations and periods of MTBM shutdown.

9. For personnel entry provide provisions for adequate ventilation in tunnels and shafts.

10. Provision for gas monitoring in the MTBM and shafts

11. Provisions for adequate lighting to facilitate as required the work in tunnels and shafts. Power and lighting circuits shall be separate as per regulations.

C. Design Criteria:

1. The geotechnical conditions including groundwater elevations to be encountered during microtunneling as detailed in the GBR.

2. Minimum shaft design loadings as provided in the GBR, plus additional construction loads such as erection, handling, storage and jacking forces necessary for installation of the pipe and other structures. Truck loading shall be minimum HS-20 vehicle loading distributions in accordance with AASHTO.

3. At Friars Rd jacking shaft take into account the multiple drives to be undertaken from a single shaft and the shaft wall MTBM launch cut outs required to ensure shaft structural stability is not compromised.

4. Internal pipe diameter, alignment, and invert location and elevations shall conform to those shown in the Contract Documents.

5. All electrical equipment should be suitable for CAL OSHA Potentially Gassy Conditions in the MTBM with an automatic power shut down to the MTBM if elevated LEL is detected. Ventilation fans will require continuous power and, if located within the tunnel, be designed for M1 operation for Class 1 Zone 1. Ventilation systems will be operated as required by CAL OSHA at no additional cost to the Owner.

6. The MTBM shall meet the following minimum requirements:

    a. Providing continuous positive face support in excess of the in-situ pressure during all phases of tunnel excavation and shutdown.

b. Articulated to enable controlled steering in both the vertical and horizontal directions to the tolerances indicated in the Contract Documents.
c. All functions shall be controlled remotely from the surface under normal operation.
d. Capable of controlling shield rotation of the MTBM in the ground.
e. Capable of injecting lubricant from the back of the MTBM and around the exterior of the pipes being jacked. Lubricant shall be refined, processed natural high swelling montmorillonite clay or other product as approved by the OWNER as necessary to produce satisfactory lubrication and earth support.
f. Capable of controlling heave and settlement to the acceptable tolerances as specified in the Contract Documents.
g. Provide access to the rear of the cutter wheel via an access door on MTBM that are over 60in outside diameter and on MTBM with an outside diameter over 72in with the provision of compressed air and an air lock if required.
h. Capable of boring through the anticipated geotechnical conditions and any obstruction as described in the GBR.

7. The main and intermediate jacking system shall each consist of an even number of thrust cylinders arranged symmetrically. Each cylinder of the main jacking system shall have individual activation, synchronized activation and individual thrust control. Cylinders shall not exert force when idle but shall resist displacement. The installed thrust capacity shall be at least 20 percent greater than the maximum theoretical combined reactions from the hydrostatic pressure, pipe friction, earth pressure, and cutter forces of the proposed drive.

1.5 COORDINATION DOCUMENTATION:

A. CONTRACTOR's engineer shall inspect, to the extent necessary, and certify that construction operations were performed in accordance with the approved design submittals. Deficiencies shall be immediately corrected by CONTRACTOR and reported to OWNER.

1.6 CONDITIONS:

A. The entire length of tunnel is classified as "Potentially Gassy." Perform work as specified herein, in accordance with the Contract Documents, and with current applicable CAL OSHA regulations for potentially gassy conditions and codes of Federal, State, and local agencies. Comply with applicable provisions of 29 CFR Part 1926, Subpart S, "Underground Construction" Standard Number 1926.800 by OSHA and Subpart P, "Excavations", latest revision. Should there be conflict between these specifications and OSHA requirements, the more restrictive will apply.

B. CONTRACTOR shall comply with applicable codes, standards, and regulations.

C. CONTRACTOR shall assess existing conditions, including property rights of adjacent properties whether private or public. Be responsible for the proposed temporary works and construction methods.

D. CONTRACTOR shall provide access to OWNER at all times during construction operations to perform inspections.

1.7 TOLERANCES:

A. Inflow of Ground and Groundwater: Not more than a total of one (1) cubic foot of ground shall enter into the shaft. Not more than one (1) gallon per minute of groundwater shall enter into the shaft during the course of the drive. If the groundwater is mixed with slurry and/or lubricant, it shall be prevented from entering the shaft in accordance with Fluid Control Plan.

B. Line and Grade during the Launching and Receiving Operations: During launching and receiving operations, line shall be maintained within ± 3 inches and grade shall be maintained within ± 1.5in

C. Maximum variation from lines and grades shown on the Contract Documents: +/-3inches in lateral alignment and +/-1.5infor vertical grade, providing that the final grade of flowline shall be in the direction shown. In the case of variation outside the required tolerance correction of the line and grade will not exceed 1inch in 25ft.

D. Maximum ground settlements and/or differential settlements shall not exceed the limits provided in the ground movement monitoring plan.

PART 2 - PRODUCTS

2.1 MATERIALS:

A. Sewer jacking pipe shall consist of plastic lined reinforced concrete pipe (PLRCP), as required to provide a safe, stable tunnel excavation and acceptable in-place pipe. Pipe materials shall be in accordance with the Contract Documents and specifications.

B. CONTRACTOR shall be responsible for selecting and designing appropriate pipes and pipe joints to safely carry the loads imposed during construction, including jacking forces. Pipe joints shall be flush with the inside and outside of the pipe surface when pipes are assembled. Special consideration shall be given for a " jack control" system using hydraulic joints and/or other means on the curved segment of the alignment.

2.2 EQUIPMENT:

A. Microtunnel Boring Machine (MTBM)

1. The Microtunneling Boring Machine (MTBM) shall have a closed face capable of providing positive supporting pressure to the full excavated area (face) at all times and must have the capability of controlling and measuring the pressure at the face. The balancing of earth and groundwater pressures shall be achieved by the use of slurry pressure, auger earth pressure balance system, or a combination of the two. The system shall be capable of any adjustment required to maintain face stability for anticipated ground conditions. For equipment that uses a slurry spoil transportation system the earth and groundwater pressure at the face shall be controlled by the use of a variable flow slurry pumping system, pressure control valves and a minimum of two flow meters, one on the supply side and one on the return side. For equipment that uses an auger spoil transportation system the earth and groundwater pressures at the face shall be managed by controlling the volume of spoil removal relative to the advance rate (Earth Pressure Balance) and shall be augmented by the application of compressed air or soil conditioning agents if conditions require.

2. The MTBM shall be capable of controlling rotation or roll by means of bi-directional drive on the cutter head and/or by use of fins or grippers.

3. The MTBM cutter head shall be electro or hydro mechanically powered and shall provide sufficient torque to cut the face, crush material as required and feed the excavated material to the spoil transportation system.

4. The MTBM shall be articulated and fully steerable, both vertically and horizontally.

5. Automated Spoil Transportation

   a. The MTBM system shall include an automated spoil transportation system that has the capability of matching the excavation rate to the rate of spoil removal such that settlement tolerances can be maintained.
   b. A separation process shall be provided when using a slurry spoil transportation system. The separation process shall be designed to provide adequate and efficient separation of solids from the slurry so that clean slurry can be returned to the cutting face for reuse and the solids can be disposed of in an efficient manner.

B. Control Systems

1. A remote control system shall be provided that allows for the operation of the system without the need for personnel to enter the tunnel for routine operation of the system. The control equipment shall integrate the system of excavation, removal of spoil and its simultaneous replacement by a pipe. As each pipe section is jacked forward, the control system shall synchronize all of the operational functions of the system. The system shall provide complete and adequate ground support at all times.

2. Line and grade shall be controlled by a guidance system that relates the actual position of the MTBM to a design reference established by a surveying system. Typically in straight drives by a laser beam transmitted from the jacking shaft to a target mounted in the MTBM. The laser shall be mounted in the jacking shaft independent of the jacking frame and thrust block. For long or curved drives Laser guided tachimetry or theodolite or gyroscope is also acceptable and in any case shall be used for guidance through the curved portions of the alignment. The guidance system shall be checked and calibrated at least every 50ft of pipe jacking or once every day whichever is the sooner. The active steering information shall be monitored and transmitted to the operation console. The minimum information available to the operator at the control console shall include the position of the MTBM relative to the reference, roll, inclination, attitude, rate of advance, installed length, thrust force, and cutter head torque.

C. Jacking Equipment

1. Each pipe section shall be jacked forward as the excavation progresses in such a way as to provide complete and adequate ground support at all times. A jacking frame shall be provided for developing a uniform distribution of jacking forces around the perimeter of the pipe.

2. The thrust reaction block shall be properly designed and constructed and shall be perpendicular to the jacked pipe alignment. The thrust reaction block shall be designed to support the maximum estimated jacking force with a factor of safety of at least two.

3. Intermediate jacking stations shall be provided to maintain total jacking forces within the capacity of the main jacking system and the thrust reaction block. Intermediate jacking stations shall be provided of sufficient numbers and spacing to ensure completion of the drive and be of individual capacity compatible with the maximum safe jacking capacity of the pipe including through the curve.

PART 3 - EXECUTION

3.1 CONSTRUCTION:

A. General Requirements:

1. Do not begin work on the microtunneling and shafts until relevant submittals have been approved.

2. All permits have been issued by the relevant authorities

3. Construction techniques required to provide access for microtunneling shall be such as to ensure the safety of the work, at all times and during all stages of the work.

4. Support excavations and control movement of the ground, pavement, utilities or structures outside of the excavation. Ensure support of excavation conforms to applicable Local Safety Standards, OSHA Standards, trenching, and shoring standards.

5. If, at any time, the method being used by the CONTRACTOR for supporting any material or structure adjacent to excavation is not safe in the opinion of the OWNER or applicable Federal, State, or local inspection authorities, provide additional bracing and support necessary to furnish the added degree of safety required by the OWNER. Provide such added bracing and support by such method approved by the OWNER as the CONTRACTOR may elect to use but the taking of such added precautions shall in no way relieve the CONTRACTOR of their sole final responsibility for the safety of lives, work, and structures. The use of such additional bracing and support shall be at no additional cost to the OWNER. The absence of an order for additional bracing shall in no way relieve the CONTRACTOR of the sole and final responsibility.

6. Ventilation and air quality monitoring shall conform to the requirements of OSHA 3115-06R 2003 Underground Construction regulations for Gassy or Potentially Gassy Operations. The ventilation design shall be determined by the CONTRACTOR.

7. Furnish necessary labor, material, equipment, power, water, and utilities to complete the work. Additionally:

    a. Select the means and methods for performing the work.
    b. Select, design, and install the thrust blocks. The thrust blocks shall be sufficiently reinforced, isolated, and otherwise anchored, to include necessary ground improvement measures, to prevent movement from occurring within the launching shaft and/or misalignment of the jacking frame.
    c. Select, design, and install the entrance seals, including necessary modifications to the shoring, for the launching shafts.
    d. Select, design, and install the base slabs, including necessary modifications to the shoring, for the launching shafts.

e. Select, design, and install the exit / entry seals, including necessary modifications to the shoring, for the receiving shafts.

8. Construct the shafts to accommodate the installation of the pipe, MTBM, and jacking device. Execute microtunneling such that settlement is maintained below maximum levels detailed in this Section of the specification, such that the in-place pipe shall have full bearing against earth, and such that voids shall be fully filled with grout.

9. Damaged and/or deficient materials shall be repaired and/or replaced as directed by OWNER.

10. Provide surface drainage during the period of construction to protect the work.

11. Control of Line and Grade:

a. The OWNER will establish the baselines and benchmarks indicated on the plans. The CONTRACTOR shall check these baselines and benchmarks at the beginning of the contract period and report errors or discrepancies to the OWNER. Use these baselines and benchmarks to furnish and maintain reference lines and grades for microtunnel construction. Use these lines and grades to establish the starting location of the microtunnel.
b. Mount guidance system in a manner than isolates it from effects of movement by the jacking forces.
c. When the excavation is off line or grade, return to the plan line and/or grade at a rate of no more than 1 inch per 25 feet.

12. Grouting:

a. A uniform mixture of 1:6 maximum (cement:sand) cement grout shall be placed to fill voids, which exist between the pipe and the ground in accordance with the requirements of this Section and the Contract Documents. Grout shall have a minimum 28-day compressive strength of 500 psi.

13. Protect the existing improvements at the site from damage including but not limited to structures, utilities, and culverts.

3.2 INSTALLATION:

A. Perform work in accordance with the approved submittals.

B. The licensed surveyor shall be responsible for verifying control points identified in the Contract Documents. CONTRACTOR's surveyor shall check baseline

and/or benchmarks shown prior to starting and report errors or discrepancies to OWNER.

C. Notify OWNER immediately upon detecting larger than predicted deformation, distress, or damage to the excavation support system.

D. Notify OWNER immediately of any structural element that is not in accordance with the approved design submittals.

E. Do not resume construction activities until corrective measures have been fully implemented.

F. Microtunnel each pipe section as the excavation progresses in such a way to provide complete and adequate ground support at all times. Utilize a jacking frame that develops a uniform distribution of jacking forces around the periphery of the pipe. Design and construct the thrust block to sustain jacking reactions and construction forces. The thrust block shall be normal (square) with the proposed pipe alignment and designed to support the maximum obtainable jacking pressure with a factor of safety of at least 2.0. The jacking system, including intermediate jacks used, shall be capable of continuously monitoring the jacking pressure and rate of advancement.

G. On drives over 500ft utilize an automated (ABIS) lubrication system that injects a lubricant from the rear of the MTBM and at intervals along the pipeline to the external surface of the pipe, which lowers the friction developed on the outside of the pipe during jacking. Spacing of lubricant points along the pipe train shall be at the CONTRACTOR's option. Modify this system as required to prevent pipe binding or stoppage at no additional cost to the OWNER.

H. Utilize a spoil transportation method capable of handling and removing the expected excavated materials as indicated herein and in the GBR.

I. Limit the overcut on the tunnel shield to no more than ½ inch on radius for pipe 48in or less in diameter and ¾ inch on radius for pipes over 48in in diameter unless approved by the OWNER. The annular space created by the overcut shall be filled with a lubricant that has been proven suitable for the particular ground conditions to be tunneled.

J. After completion of microtunneling, attempt to replace lubricant between the pipe exterior and surrounding ground with a cement grout. Control the pressure and the amount of grout to prevent damage and displacement of the pipe.

K. Use additive as required in muck conditioning system to reduce machine applied torque and maintain muck flow and pressure holding capability.

L. If a slurry system is used then a slurry separation plant shall be used. The plant

shall clean the excavated spoil from the slurry for disposal and return the slurry back to the MTBM face for reuse. The type of separation plant used shall be designed by the CONTRACTOR.

M. Dispose of excavated material off-site in accordance with applicable permit and regulatory requirements and in accordance with the Contract Documents.

3.3 FIELD INSPECTION:

A. CONTRACTOR's engineer shall conduct visual inspections to verify:

1. Shafts and modifications to the shoring were constructed in accordance with the approved design submittals.

2. Entrance/exit seals were constructed in accordance with the approved design submittals.

3. Thrust Blocks were constructed in accordance with the approved design submittals.

4. Base slabs were constructed in accordance with the approved design submittals.

5. Layout of shaft is generally in accordance with approved submittals.

B. Details of these visual inspections shall be written into a field inspection report and submitted to OWNER.

C. Submit to the OWNER copies of field notes used to establish lines and grades; however, the CONTRACTOR remains fully responsible for the accuracy of the work and the correction of it, as required.

D. Record locations where the jacking pipe has deflected more than 3in off line or 1in off grade

END OF SECTION

NC MORENA BLVD PUMP STATION AND PIPELINES

PACKAGE A

CONTRACTOR'S RESPONSIBILITIES

1. PURSUANT TO SECTION 4216 OF THE GOVERNMENT CODE, AT LEAST 2 WORKING DAYS PRIOR TO EXCAVATION, YOU MUST CONTACT THE REGIONAL NOTIFICATION CENTER (E.G. UNDERGROUND SERVICE ALERT OF SOUTHERN CALIFORNIA) AND OBTAIN AN INQUIRY IDENTIFICATION NUMBER.
2. NOTIFY SDG&E AT LEAST 10 WORKING DAYS PRIOR TO EXCAVATING WITHIN 10' OF SDG&E UNDERGROUND HIGH VOLTAGE TRANSMISSION POWER LINES. (I.E., 69 KV & HIGHER)
3. LOCATE AND RECONNECT ALL SEWER LATERALS. LOCATIONS AS SHOWN ON THE PLANS ARE APPROXIMATE ONLY. LATERAL RECORDS ARE AVAILABLE TO THE CONTRACTOR AT THE WATER DEPARTMENT, 2797 CAMINITO CHOLLAS. LOCATE THE IMPROVEMENTS THAT WILL BE AFFECTED BY LATERAL REPLACEMENTS.
4. EXCAVATE AROUND WATER METER BOX (CITY PROPERTY SIDE) TO DETERMINE IN ADVANCE, THE SIZE OF EACH SERVICE BEFORE TAPPING MAIN.
5. CITY FORCES, WHEN SPECIFIED OR SHOWN ON THE PLANS, WILL MAKE PERMANENT CUTS & PLUGS AND CONNECTIONS.
6. KEEP EXISTING MAINS IN SERVICE IN LIEU OF HIGH-LINING, UNLESS OTHERWISE SPECIFIED SHOWN ON PLANS.
7. THE LOCATIONS OF EXISTING BUILDINGS AS SHOWN ON THE PLAN ARE APPROXIMATE.
8. STORM DRAIN INLETS SHALL REMAIN FUNCTIONAL AT ALL TIMES DURING CONSTRUCTION.
9. UNLESS OTHERWISE NOTED AS PREVIOUSLY POTHOLED (PH), ELEVATIONS SHOWN ON THE PROFILE FOR EXISTING UTILITIES ARE BASED ON A SEARCH OF THE AVAILABLE RECORD INFORMATION ONLY AND ARE SOLELY FOR THE CONTRACTOR'S CONVENIENCE. THE CITY DOES NOT GUARANTEE THAT IT HAS REVIEWED ALL AVAILABLE DATA. THE CONTRACTOR SHALL POTHOLE ALL EXISTING UTILITIES EITHER SHOWN ON THE PLANS OR MARKED IN THE FIELD IN ACCORDANCE WITH THE SPECIFICATIONS SECTION 33-UTILITIES.
10. EXISTING UTILITY CROSSING AS SHOWN ON THE PLANS ARE APPROXIMATE AND ARE NOT REPRESENTATIVE OF ACTUAL LENGTH AND LOCATION OF CONFLICT AREAS. SEE PLAN VIEW.
11. CONTRACTOR SHALL ATTEND PRECONSTRUCTION MEETING AS REQUIRED BY THE MITIGATION MONITORING AND REPORTING PROGRAM PER THE ENVIRONMENTAL IMPACT REPORT.

WORK TO BE DONE

THE PROJECT CONSISTS OF THE DEMOLITION OF EXISTING FACILITIES AT THE PROPOSED MORENA PUMP STATION SITE, THE CONSTRUCTION OF A NEW 37.7 MGD MORENA WASTEWATER PUMP STATION FACILITY, INCLUDING ODOR CONTROL SYSTEMS, ELECTRICAL BUILDING, SCREENING FACILITY, HIGH PURITY OXYGEN SYSTEM, MAINTENANCE BUILDING, ASSOCIATED CIVIL SITE WORK INCLUDING STORM DRAINAGE, YARD PIPING, PERIMETER WALLS, ACCESS GATES, PAVEMENT, AND LANDSCAPING.

THE PROJECT ALSO INCLUDES THE CONSTRUCTION OF 48-INCH, 60-INCH & 66-INCH DIVERSION AND OVERFLOW SEWERS, THREE DIVERSION STRUCTURES WITH SLIDE GATES AND JUNCTION STRUCTURE NO. 1.

SITE ADDRESS

887 SHERMAN STREET
SAN DIEGO, CA 92110

DECLARATION OF RESPONSIBLE CHARGE

* I HEREBY DECLARE THAT I AM THE ENGINEER OF WORK FOR THIS PROJECT THAT I HAVE EXERCISED RESPONSIBLE CHARGE OVER THE DESIGN OF THE PROJECT AS DEFINED IN SECTION 6703 OF THE BUSINESS AND PROFESSIONS CODE AND THAT THE DESIGN IS CONSISTENT WITH CURRENT STANDARDS. I UNDERSTAND THAT THE CHECK OF PROJECT DRAWINGS AND SPECIFICATIONS BY THE CITY OF SAN DIEGO IS CONFINED TO A REVIEW ONLY AND DOES NOT RELIEVE ME, AS ENGINEER OF WORK, OF MY RESPONSIBILITIES FOR PROJECT DESIGN.

ALAN SHAPIRO — 10/07/20 DATE

MONUMENTATION/SURVEY NOTES

THE CONTRACTOR SHALL BE RESPONSIBLE FOR SURVEY MONUMENTS AND/OR VERTICAL CONTROL BENCHMARKS WHICH ARE DISTURBED OR DESTROYED BY CONSTRUCTION. A LICENSED LAND SURVEYOR OR LICENSED CIVIL ENGINEER AUTHORIZED TO PRACTICE LAND SURVEYING IN THE STATE OF CALIFORNIA SHALL FIELD LOCATE, REFERENCE, AND/OR PRESERVE ALL HISTORICAL OR CONTROLLING MONUMENTS PRIOR TO ANY EARTHWORK, DEMOLITION OR SURFACE IMPROVEMENTS. IF DESTROYED, A LICENSED LAND SURVEYOR SHALL REPLACE SUCH MONUMENT(S) WITH APPROPRIATE MONUMENTS. WHEN SETTING SURVEY MONUMENTS USED FOR RE-ESTABLISHMENT OF THE DISTURBED CONTROLLING SURVEY MONUMENTS AS REQUIRED BY SECTIONS 6730.2 AND 8771 OF THE BUSINESS AND PROFESSIONS CODE OF THE STATE OF CALIFORNIA, A CORNER RECORD OR RECORD OF SURVEY, AS APPROPRIATE, SHALL BE FILED WITH THE COUNTY SURVEYOR. IF ANY VERTICAL CONTROL IS TO BE DISTURBED OR DESTROYED, THE CITY OF SAN DIEGO FIELD SURVEY SECTION SHALL BE NOTIFIED IN WRITING AT LEAST 7 DAYS PRIOR TO CONSTRUCTION. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE COST OF REPLACING AND VERTICAL CONTROL BENCHMARKS DESTROYED BY THE CONSTRUCTION.

1. MODULAR WETLAND SYSTEM, PER MW-01, DWG C-24
2. MODULAR WETLAND SYSTEM, PER MW-02, DWG C-24
3. 5' DIA, 10' DEEP CONTAINMENT MANHOLE WITH T-LOCK LINER, PER SDSD SDS-106
4. SDG&E EQUIPMENT, SEE DWG E-03
5. CURB RAMP, PER SDSD ~~SDG-138~~ SDG-133
6. STAIRS AND GUARDRAIL PER STRUCTURAL PLANS, SEE DWG S-05 & S-06
7. 4-FOOT WIDE CONCRETE WALKWAY PER SDSD SDG-155 (TYP)
8. 3/4-INCH CRUSHED ROCK PER SSPWC SEC. 200-1.2, 3-INCH DEEP, COMPACT AFTER PLACEMENT FOR FINAL DEPTH (TYP.)
9. 25-FOOT DOUBLE LEAF ENTRANCE ONLY ACCESS GATE, SEE DETAIL 1, DWG C-28
10. 25-FOOT WIDE 8-FOOT HIGH ROLLING GATE FOR EXIT ONLY, SEE DETAIL 2, DWG C-28
11. 35-FOOT WIDE, 8-FOOT HIGH ROLLING GATE, SEE DETAIL 2, DWG C-28
12. DOUBLE LEAF EQUIPMENT HATCH, PER DWG M-08 (TYP OF 2)
13. ELECTRICAL BLDG CONDENSING UNIT, SEE H DWGS
14. HYDROMODIFICATION TANK, PER DWG C-06
15. 10-FOOT WIDE ROLLING GATE, PER DETAIL 2, DWG C-28
16. 4-INCH BOLLARD PROTECTION POST, PER SDRSD, WM-04 "TYPE B" SPACED AT 3'-0" O.C. ON 3 SIDES OF CONCRETE PAD AS SHOWN
17. CONCRETE CATCH BASIN - TYPE I PER SDSD D-29
18. 8-FOOT MASONRY BLOCK WALL, SEE DWG S-26
19. MOTOR CONTROL ROOM CONDENSING UNIT, SEE H DWGS
20. 35-FOOT WIDE CONCRETE DRIVEWAY, PER SDSD, SDG-163
21. 25-FOOT WIDE CONCRETE DRIVEWAY PER SDSD, SDG-163
22. 5-FOOT WIDE CONCRETE SIDEWALK PER SDSD SDG-155 (TYP)
23. 6-INCH CURB AND GUTTER PER SDSD, SDG-151
24. DUAL CURB RAMPS PER SDSD, SDG-134
25. PROPOSED LANDSCAPING, SEE DWG L-01
26. 12-INCH REINFORCED CONCRETE SLAB ON GRADE PER DETAIL 2, DWG S-06
27. 10-FOOT WIDE CONC SIDEWALK, PER SDSD SDG-155
28. 9'-6" H FENCE PER STRUCTURAL DWGS
29. 6-INCH PCC SURFACE PER SDSD, G-18
30. BACKFLOW PREVENTER, PER DWG C-03
31. HIGH PURITY OXYGENATION FACILITY, SEE DWG M-13
32. 12'-0" X 12'-0" LIQUID OXYGEN FILL CONCRETE APRON
33. 6-INCH CONTAINMENT CURB, PER SDSD, SDG-150
34. 18" X 18" X 18" CONTAINMENT SUMP W/GRATING, DRAINS TO 5' CONTAINMENT MH VIA 4-INCH SCH 80 PVC PIPE
35. DRYWELL ACCESS STRUCTURES, SEE DWG S-39

NOTES:

1. FOR THE 25 FOOT AND 35 FOOT ACCESS GATES ON SHERMAN AND CUSTER STREETS. A MINIMUM OF 10 FEET OF WROUGHT IRON FENCING SHALL BE PROVIDED ON BOTH SIDES OF GATES. TO MEET THE VISIBILITY REQUIREMENTS OF CITY OF SAN DIEGO AT THOSE LOCATIONS, THE HEIGHT OF THE MASONRY BLOCK WALL SHALL BE LIMITED TO 3 FEET WHILE THE REMAINING 6'-6" HEIGHT WILL BE WROUGHT IRON FENCING.
2. NO OBSTRUCTION INCLUDING SOLID WALLS IN VISIBILITY AREAS ADJACENT TO ACCESS GATES SHALL EXCEED 3 FEET IN HEIGHT. PLANT MATERIAL, OTHER THAN TREES, WITHIN THE PUBLIC RIGHT-OF-WAY THAT IS LOCATED WITHIN VISIBILITY AREAS SHALL NOT EXCEED 24 INCHES IN HEIGHT, MEASURED FROM THE TOP OF THE ADJACENT CURB.
3. EXISTING UTILITIES AND PROPOSED UTILITIES ARE NOT SHOWN HERE FOR CLARITY. SEE DWG C-03 FOR EXISTING & PROPOSED UTILITIES.
4. FOR DRAINAGE PLAN SEE DWG C-02A.
5. DRIVEWAY IN SHERMAN STREET IN FRONT OF SCREENING BUILDING SHALL BE USED FOR EXIT ONLY AND FOR LOADING AND UNLOADING SCREENING BUILDING ROLL-OFF BINS.
6. SEE DWG S-26 FOR PERIMETER WALL PROFILES.
7. CONTRACTOR SHALL FURNISH AND INSTALL SIGNS FOR PARKING IN ACCORDANCE WITH THE CBC TO READ AS SUCH: "PARKING FOR AUTHORIZED VEHICLES ONLY".

NOTES (CONT.):
8. MORENA PUMP STATION IS EXEMPT FROM ACCESSIBILITY STANDARDS WITHIN PROPERTY LINES.

4/22/2019 rothr1

KEYNOTES

1. 8'-0" x 8'-0" DOUBLE LEAF FLOOR ACCESS HATCH (FLUSH MOUNTED).
2. STAGE 1 MOTOR AND FLYWHEEL (TYP).
3. STAGE 2 PUMP, MOTOR AND FLYWHEEL (TYP).
4. 14" X 24" FE STEEL REDUCER, RATED FOR 300-PSI PRESSURE (TYP).
5. 24" FLANGED COUPLING ADAPTER, PER DETAIL 2, DWG M-18 (TYP).
6. 24" CHECK VALVE, SEE SPECIFICATIONS (TYP).
7. 24" FE STEEL PIPE (TYP).
8. 24" ECCENTRIC PLUG VALVE W/ ELECTRIC ACTUATOR (TYP).
9. 36" CLASS F BLIND FLANGE.
10. 36" FE STEEL DISCHARGE MANIFOLD.
11. 36" X 24" STEEL FLAT TOP REDUCER (WE X FE).
12. 24" STEEL SURGE PROTECTION RELIEF PIPE CONNECTION, SEE DETAIL 7, DWG. S-63
13. NOT USED.
14. 24" MAGNETIC FLOW METER W/ EQUIPMENT SUPPORT PER DETAIL 3, DWG M-17.
15. 24" FE DI PIPE W/ CAST WEEP RING, WALL PENETRATION PER DETAIL 1, DWG M-16.
16. 24" EBAA IRON, FLEX TEND OR APPROVED EQUAL (TYP).
17. LOWER LEVEL CONCRETE SUPPORT COLUMN (TYP), SEE STRUCTURAL DWGS
18. 24" X 48" FE CML&TCMC FLAT BOTTOM REDUCER (96" LENGTH).
19. 48" CML&TCMC STEEL PIPE PRESSURE CLASS 300 PSI.
20. SCUM REMOVAL SUMP W/ DUPLEX SUBMERSIBLE PUMPS, PER DETAIL 1, DWG M-27
21. 36" SQ. VENTILATION DUCT FLOOR PENETRATION, SEE H DWGS.
22. 6" TYPE 316L SS SCUM DISCHARGE PIPE, SEE DWG C-03
23. PUMP CONCRETE SUPPORT PAD PER STRUCTURAL DWGS. PUMP CONCRETE EQUIPMENT ANCHOR & LEVELING, PER DETAIL 1, DWG M-24
24. PUMP CONCRETE SUPPORT PAD PER STRUCTURAL DWGS. SHAFT HANDING SYSTEM PER DETAIL 3, DWG M-24. PUMP CONCRETE EQUIPMENT ANCHOR & LEVELING, PER DETAIL 1, DWG M-24
25. 6" CONCRETE ENCASEMENT PER DETAIL 3, DWG S-55
26. 24" STEEL SURGE PROTECTION RELIEF PIPE, SEE DWG M-08.
27. PRESSURE INDICATOR GAUGE & TRANSMITTER PER DETAILS 3 & 4, DWG M-19 (TYP)
28. REINFORCED SUPPORT ANCHOR TEE, PER SPECIFICATIONS (TYP OF 5).
29. FABRICATED STEEL MOTOR AND FLYWHEEL SUPPORT FRAME BY PUMP MANUFACTURER.
30. 2-WIRE TEST STATION WITH 2 ANODES. SEE DETAIL 1, DWG CP-01
31. 3/4" WALL MOUNTED HOSE BIB & RACK PER DETAIL 3, DWG M-20
32. ROOF LEVEL ACCESS HATCH (ABOVE)
33. RESTRAINED FLEXIBLE COUPLING, PER DETAIL 2, DWG M-18 (TYP OF 3)
34. BRIDGE CRANE SERVICE AREA
35. 36" X 24" X 36" WELDED STEEL TEE
36. INSULATING FLANGE KIT, SEE DETAIL 3, DWG CP-03

NOTES:

1. VENTILATION SYSTEM AND ODOR CONTROL SYSTEM DETAILS ARESHOWN IN H DWGS.
2. ALL STEEL PIPING, FITTINGS, COUPLINGS, ETC. FOLLOWING STAGE 2 PUMPS, SHALL BE RATED FOR 300-PSI PRESSURE.
3. ALL PIPE SUPPORTS, BRACKETS, HANGERS, ANCHOR BOLTS, NUTS WASHERS, ETC. LOCATED IN THE PUMP STATION DRY WELL AND WET WELL SHALL BE TYPE 316 SS.
4. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE DESIGN, INSTALLATION, AND TESTING OF ALL ANCHORAGE, THRUST RESTRAIN, AND BRACING SYSTEMS IN ACCORDANCE WITH SPECIFICATIONS SECTION 01 88 15.

ENGINEER OF WORK

The engineering Specifications and Special Provisions contained herein have been prepared by or under the direction of the following Registered Engineer:

Shapiro, Alan — Digitally signed by Shapiro, Alan DN: cn=Shapiro, Alan, ou=USSDG1 Reason: I have reviewed this document Date: 2020.12.04 10:09:24 -08'00'

1) Registered Engineer (Morena Pump Station) — 12/4/2020 Date — Seal:

2) For City Engineer (Morena Pump Station) — 12/7/2020 Date — Seal:

A. CHANGES TO CONTRACT DOCUMENTS

The following changes to the Contract Documents are hereby made effective as though originally issued with the bid package. Bidders are reminded that all previous requirements to this solicitation remain in full force and effect.

THE SUBMITTAL DATE FOR THIS PROJECT HAS BEEN **EXTENDED AS STATED ON THE COVER PAGE.**

B. BIDDER's QUESTIONS

Q1. Detail 4 / S-06 shows a Stud config for Grating attachment. In our past projects, this config has been difficult to shop weld to ensure the studs will be centered between the Grating Bars. They often need to be cut off in the field for re-welding or shipped loose for field welding. Is it acceptable to use Self-drilling screws? If not, Struct-Fast (www.structfast.com) offers alternative types of grating clips that eliminate the need for field welding. If either of these alternative config is acceptable, it will save the cost for field welding of studs in between bars.

A1. Refer to revised Detail 4 on Drawing 40421-103-D, Sheet S-06, provided in Addendum A.

Q2. Section 43 23 15, para. Item 1.6.A. states "Furnish for **each** of the five (5) sets of pumps" further described in subitems A.1 through A.8 with each line stating "…for 5 pumps". Is each line item requiring a total of 25 sets of spares or a total of 5 sets of spares?

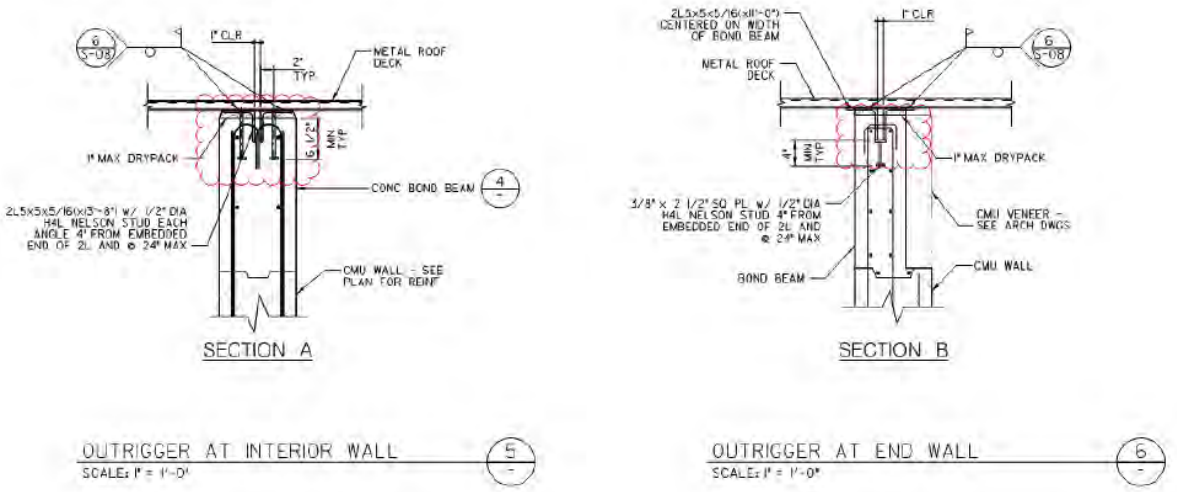
A2. A total of 5 sets of spares is required.

Q3. Section 43 42 56.04 has no pump material specification but in M26 & 27 Keynotes 4 and 2, respectively, 316SS material for Submersible Pump is stated. Is the 316SS material a requirement for all the components such; motor casing, pump casing, impeller and base elbow?

A3. Yes, all pump components including motor casing, impeller and base elbow shall be manufactured from 316SS.

Q4. There are outriggers detailed for both the Screenings Building and Electrical Building. They will cantilever either 4' or 3' depending on whether it is front or back of the structure. That will require 7' or 8' embedded into the beam for Detail 6 or 9'-8" or 10'- 8" embedded into the beam for Detail 5. Detail 6 is for both structures. Detail 5 is Electrical Building only. The outriggers are cast into the concrete beams on top of the block wall as shown. However,

the rebar shown cannot be installed through the continuous angles as shown. Either the rebar needs to be changed or the embed needs to be changed in order to install. Please advise.



A4. See revised Details 5 and 6 in Drawing 40421-155-D, Sheet S-58, provided in Addendum A.

Q5. Regarding the subject project request for bid and the following two bid items:

24- Testing, Sampling, Site Storage, and Handling of Transportation, and Disposal of Containerized RCRA Hazardous Waste – One 55-gallon drum

25- Testing, Sampling, Site Storage, and Handling of Transportation, and Disposal of Containerized RCRA Non-Hazardous Waste Non-RCRA Hazardous Waste – One 55-gallon drum

Do you have information regarding these hazardous waste or do we need to analyze the samples for everything that could characterize the waste as hazardous?

A5. These items are for hazardous waste left on-site by previous owner. See California Code of Regulations(CCR) Title 22, Division 4.5, Chapter 11, Articles 3 and 4 for classification and proper handling. These items have not been quantified but may consist of various hazardous chemicals, cleaners (Bleach and Ammonia), aerosols, among other things.

Q6. Reference is made to S-43/D and Note 33 at the Pump Station. Exterior concrete wall along Line '2' at the Pump Station requires #5 hairpins as shown in S-43/D. Rebar clearance between face of wall and main

reinforcement is 2" as shown. With the addition of #5 hairpins, rebar clearance to hairpin is reduced to approximately 1 ¼". Please confirm the Engineer's intention to keep the 2" rebar clearance is to hairpins.

A6. Refer to revised Drawing S-43 provided in this Addendum.

Q7. Reference is made to Screening Facility in S-32 Note 34, Grout Fill. Plans do not provide limits of Grout Fill from Inlet Pipe in Screening Facility to floor at EL: -16.00. Please provide plan view of Grout Fill limits.

A7. Refer to revised Drawing S-27 provided in this Addendum.

Q8. Are Liquidated Damages in Calendar Days or Working Days?

A8. Liquidated Damages are in Working Days.

Q9. Are liquidated Damages assessed adding on each milestone so that they may equal a total of $11,500 if delayed past the substantial completion or final completion? Or are you only assessed the $9,500 until completing that milestone and then the $1,000 LDS?

A9. Liquidated Damages will be applied to each working day after the milestone timeline until that milestone is complete. If Milestone 1 is not met Contractor will pay liquidated damages associated with Milestone 1 until that Milestone 1 is complete and accordingly with each Milestone

Q10. Reference is made to the GEOTECHNICAL REPORT PUMP STATION PORTION

MORENA PUMP STATION, WWFORCE MAIN, AND BRINE/CENTRATE CONVEYANCE PREDESIGN, dated January 5, 2018 prepared by AECOM.

Section 5.2.2 of the report provides an evaluation and estimate of groundwater discharge rates for construction dewatering to provide dry, firm working conditions as well as reduce hydrostatic uplift risk for the pump station excavation. The evaluation of groundwater pumping rate is based on stratigraphy and conductivity rates developed from boring PS-2 insitu silts and sands.

Even without taking into account the presence of the stone column grid the geotechnical evaluation provides dewatering flow rate a range variation of over 100% from 168,000 to 430,000 gpd.

Please provide a geotechnical evaluation of construction dewatering that takes into account the installation of the highly porous stone column grid

extending 30 feet below the pump station excavation subgrade into the pervious poorly graded sands.

Also, by installing the shallower 50 foot deep stone column grid throughout the site, will the upper permeable sand layer be hydraulically linked to the lower permeable sand layer? Should this also be incorporated into the modeling for dewatering flow nets for the pump station excavation?

A10. The dewatering rate will depend upon the stone columns, but also on the shoring system the contractor selects. The dewatering rate provided from the slug test is only information provide so that the contractor can make their own evaluation of the dewatering required based on the shoring, dewatering system, and construction method and schedule selected. No additional dewatering information will be provided.

Q11. Re Section 33 05 24 - Part 2.13.A.3 Tape Coat Rockshield System: Manufacturer Chase Tapecoat or Equal:

What AWWA standard the specified "Chase Tapecoat system" complies with?

A11. The "Chase Tape Coat System" complies with AWWA C209.

Q12. The Pump Station Section Drawings show walls pouring full height from top of SOG to bottom of upper deck with exception to Wet Well walls that have a CJ shown at EL -20.50. In an effort to reduce wall pour heights is it possible to install a horizontal Construction Joint in the Pump Station Walls.

A12. No.

Q13. Spec 01 50 25-3.1.L: Table 1 shows 60" EMBTS to have a PDWF of 12. Diversion Scenario plan shows the 60 EMBTS to have a PDWF of 19.6. Which one is correct?

A13. Interceptor and sewer diversion flows shown on Drawing G-8 depict anticipated post construction operation. Sewer bypass pumping flows for standby pumping capacity requirements during construction are detailed in Section 01 50 25 – 3.1.L Table 1. Flows have been updated to 2019 and are provided in the revised specification released as part of Addendum B. See revised Technicals, Section 01 50 25, Sewer Bypass Pumping, provided in this Addendum.

Q14. Spec 01 50 25-3.1.L: Table 1 shows MBTS & MBI to have a total PDWF of 34.2. Diversion Scenario plan shows MBTS & MBI to have a total PDWF of 44.9. Which one is correct?

A14. Interceptor and sewer diversion flows shown on Drawing G-8 depict anticipated post construction operation. Sewer bypass pumping flows for standby pumping capacity requirements during construction are detailed in Section 01 50 25 – 3.1.L Table 1. Flows have been updated to 2019 and are provided in the revised specification released as part of Addendum B. See revised Technicals, Section 01 50 25, Sewer Bypass Pumping, provided in this Addendum.

Q15. Reference Details 6 and 8 shown on Plan Sheet S-22. These details show wall rings where the 48", 60", and 66" PLRCP tie into structures and depict building the structure with wall rings complete before the pipe can be installed. Meanwhile, the pipe between structures will be driven via microtunneling. This will leave a small segment of PLRCP that will need to be tied in between the two fixed alignments. Realistically, these will not line up exactly in the field. We have the following questions:

a. Can we deviate from the wall detail and install a pipe stubbing out of the structure first, and then build the structure wall around the pipe stub? This would enable a more accurate pipe alignment from the structure to the microtunnel pipe.

b. Please provide a collar detail to tie the microtunnel pipe to the pipe coming out of the structure.

A15. A pipe stub cast into the wall with a retrofit waterstop per detail 7, sheet S-22 is acceptable in lieu of the cast-in-place wall ring provided a gasketed joint is installed within 4 feet of the exterior wall of the structure. A lined reinforced concrete closure structure using a cast-in-place wall ring on each end may be used to connect the adjoining fixed alignments. Contractor to submit, for approval, the closure structure location and detail to fit the selected pipeline lay schedule.

Gravity conveyance pipelines 48-inches in diameter and larger can be inspected visually with manned entry and do not require CCTV inspection.

Q16. With regard to the upcoming Morena PS bid, will there be any additional drawings being made available on Planetbids as there are currently insufficient drawings detailing the screens and gates with regard to channel dimensions and elevations?

A16. For screening channel dimensions and elevations, refer to existing drawings particularly Drawings S-27 and S-31. Additional design drawings are not necessary and will not be provided at this time.

Q17. Specifically, with regard to the FRP gates, the specs seem to indicate that they will need to hold back about 10ft of water differential however the spec isn't super clear on whether we are working with water differential and head pressure but generally stop plates hold back water. The spec seems to indicate they are actually "Stop Logs" and not "Stop Plates," please can this be clarified together with additional drawings if they are available of all the gate/stop log locations?

A17. FRP stop plates are required where shown in the screening building influent channels. There are no Stop logs for this project. For stop plate locations, refer to the Gate Schedule provided in Specification Section 35 20 16.25, which identifies stop plate locations, number required, materials of construction and differential head.

Q18. Additionally, would it be possible to name Huber as an acceptable screen manufacturer? Their RakeMax screen fully meets and exceeds the performance requirements of the specification including being able to exceed the required flow rate, have an improved capture rate and provide a more rugged and reliable design with simpler maintenance that can be completed without removing the screen from the channel as specified.

A18. As required by Specification Section 46 21 17 Mechanical Bar Screens shall be Parkson Aqua Guard Model ag-s-t 85 or approved equal. Evaluation of equal equipment and formal approval for equal equipment can be requested after bid award if the alternative screening equipment can fully meet the requirements of the specs and is very similar to the specified screening equipment.

Q19. Note-9 on Drawing E-03 references the "B.1 Contractor". Would you please clarify who the "B.1 Contractor" is?

A19. B1 Contractor is the Contractor selected to perform the Construction of the Morena B1 Southern Pipelines Project. Work identified for the B.1 Contractor is out of scope for this contract.

Q20. What are the elevations top of the invert slab and top of the roof of the angle structure on S-23?

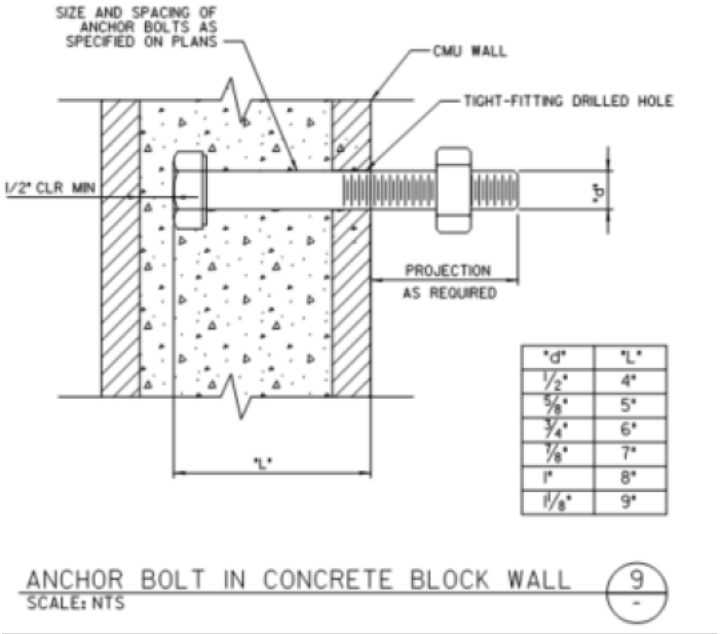
A20. Per S-24 grout fill above invert slab is 12 inches minimum below pipe invert at -10.73; hence Top of Invert slab elevation is -11.73. Per S-23 and S-24, provide 8′ minimum head space above top of bench (which is at the pipe OD elevation). Use -10.73 as pipe invert + 48″ pipe diameter + 6″ wall thickness + 8′ head space = elevation +1.77 at soffit of roof slab. Top of roof slab is 1.67 above at elevation +3.44.

Q21. Re Section 33 05 24 - Part 2.13.A.3 Tape Coat Rockshield System: Manufacturer Chase Tapecoat or Equal:

What AWWA standard the specified "Chase Tapecoat system" complies with?

A21. The Chase Corporation claims their tape coat system complies with AWWA C209.

Q22. Reference is made to Detail 9 on Sheet S-07, anchor bolt in concrete block wall. The detail shows a headed bolt being used within a block cell. While the drawing infers that the bolt can be installed with the parameters shown, this detail cannot be constructed as shown. A bolt having any projection out of the block would not be able to fit in the block cell and maintain the ½" clear shown. The detail also requires the drilled hole to be tight, which would not allow the bolt head to be installed from the outside of the block. Please revise detail to allow constructability.



A22. Detail 9 will be revised on Sheet S-07. Replacement Sheet S-07 is provided in this Addendum.

Q23. I'm with Flow N Control and we're working to bid the submersible and scum pumps on the Morena pump station project per spec section 43 42 56.04. We plan to bid ABS-Sulzer model XFP submersibles for which I've attached a brochure. We'd like to better understand a comment in the addendum recently published.

The published addendum states, "all pump components including motor casing, pump casing, impeller and base elbow shall be manufactured from 316 SS". However, in our experience with submersible pumps, the motor casing, pump casing and base elbow are typically not available in 316SS. This will significantly increase the cost and lead time of the pumps which will most likely need to be custom engineered to meet this requirement. Also, it seems to be in contradiction with spec 43 42 56.04 paragraph 2.6.B which calls for epoxy paint which is typically not applicable to stainless steel.

We'd like to understand where this requirement is coming from and if you've got a specific pump in mind.

A23. Submersible Sump and Scum Pumps supplied under Spec 43 42 56.04 shall be provided with stainless steel shafts, impellers, wear plate, and inlet extensions (grade 316 SS or better.) Pump casing, motor casing and base elbow shall be cast iron and epoxy coated per Specification Section 43 42 56.04 Paragraph 2.07.

Q24. After reviewing the Geotechnical Documents, it appears that the dewatering analysis done did not consider the presence of stone columns or a gravel layer. There is a large potential for the stone columns to interconnect a bunch of more permeable materials and greatly increase the vertical hydraulic conductivity of the soil mass. As a result of this the dewatering flow rates could be considerably higher than the 860,000 gpd that we are directed to assume in Specification Section 7-8.6.6.9.6. Please confirm that if the dewatering flow rates exceed 860,000 gpd that all the additional costs resulting from this will be paid as Extra Work.

A24. The estimate of 860,000 gpd potential dewatering flow identified in the GBR is a conservative estimate. Depending on the shoring system selected by the contractor during excavation, the amount of dewatering wells, the depth of groundwater drawdown below the excavation bottom, and other construction methods, the dewatering flow will vary. For example the use of secant piles will likely reduce the dewatering flow from the site. The

contractor can submit their selected shoring system for approval by the engineer and other construction methods. This will determine the assumed amount of dewatering in gpd. The 860,000 gpd was provided as a guideline only for the contractor assuming soldier beam and lagging excavation shoring. The Stone Columns installation may contribute more water volume to the dewatering due to the stone columns intersecting the deep gravel layer, but the additional water volume was accounted for in the 860,000 gpd estimate provided.

Q25. In the AECOM Geotechnical Report dated January 5, 2018 under Section 5.1 they discuss several methods of liquification mitigation and recommend utilizing vibro-replacement (stone columns). They note that cost considerations is one of the reasons for selection, however it does not appear they took into account that the stone columns terminate at a gravel layer and that there is a large potential for the stone columns to interconnect a bunch of more permeable materials, which in turn will greatly increase the dewatering costs. In addition to the direct costs there is the risk of settlement to adjacent structures resulting from the dewatering as it does not appear it can be limited to within the shoring. The Geotechnical Report discusses using a water-tight shoring/cut-off wall to limit the dewatering to the interior, however due to the gravel layer at the bottom of the stone columns and the deepest boring of 90 feet still within the gravel layer, it is not known where a less permeable zone is that the shoring will need to terminate in in order to cut-off the groundwater. Based on the above items it could be more cost effective and you would mitigate the risk of settlement to adjacent structures by utilizing the compaction grouting method also considered in the Geotechnical Report. Please consider revising the ground improvement within the zone of 80-foot stone columns to compaction grouting.

A25. Compaction grouting methods can be submitted for approval during the construction as a value engineering alternative. Please do not deviate from the current design documents for bidding purposes. An alternative can be discussed, but should not be included in the pricing for bidding purposes.

Q26. In Specification Section 7-8.6.6.9.3 it states the payment for dewatering hazardous contaminated water shall be included in the lump sum Bid item for "Shoring, Bracing and Dewatering of Non-Hazardous and Hazardous Contaminated Groundwater." Please confirm that we are to utilize the analytical test results provided in the Geotechnical Report under Section 5.2.2 as our basis of bid and that all additional costs resulting from

additional contaminants or contaminants above the limits stated will be paid as Extra Work.

A26. Section 2.1.3 Ground Water Sampling & Appendix C of the Geotechnical Report Morena Pump Station by AECOM dated January 5, 2018 provides anticipated pollutants to design treatment system for. If additional contaminants or increased concentration of contaminants that require additional treatment measures to be implemented, the Contractor can negotiate a changed condition per Greenbook Section 3-4 Changed Condition. If additional contaminants or increased concentration of contaminants are found and do not require additional treatment measures to be implemented, no additional compensation will be allowed.

Q27. In the AECOM Geotechnical Report dated January 5, 2018 under Section 3.4 it states groundwater (and soil) contamination may be present along West Morena Boulevard associated with former leaking underground storage tanks. As monitoring well PS-2 from which the analytical test results were provided is not in this area please provide a basis for bid for the potential groundwater (and soil) contamination on Friars Road or consider adding an allowance bid item for this work since it is an unknown.

A27. Contractor shall use the same information provided for the Pump Station for work in Friars Road. No allowance bid item will be provided.

Q28. In Specification Section 7-8.6.6.9.3 it states the payment for dewatering hazardous contaminated water shall be included in the lump sum Bid item for "Shoring, Bracing and Dewatering of Non-Hazardous and Hazardous Contaminated Groundwater," however in Specification Section 7-8.6.6.9.4 it states the payment for the handling and disposal of hazardous contamination shall be in accordance with F7-22.20, "Payment". Please clarify how payment is to be made for contaminated water and soil.

A28. Specification Section 7-8.6.6.9.4 defines the handling and disposal of pollutants collected in the process of treatment of dewatering.

Q29. As instructed by the City of San Diego "White book" page 97, I am submitting to the engineer a substitution proposal prior to Bid due date for Morena Pump Station. It is my understanding we have a three(3) working days period for the engineer of record to reply to our substitution prior to bid. Please let me know if the attached substitution proposal is satisfactory

for Section 43 23 15 Custom Engineered Vertical Non-Clog Variable Speed Pumps.

A29. Information provided with request is insufficient for review. Evaluation of equal pumps and formal approval for equal pumps can be requested after bid award if the alternative pumping equipment can fully meet the requirements of the specs and is very similar to the pumps specified. Comply with Supplementary Special Provisions Section 4-1.6, Trade Names or Equals for substitution requirements.

Q30. I am working on a quote for VFDs on this project and wanted to clarify the spares requirement.

The spec states to provide spares for each MVD. We typically see one set of spares for "each size" VFD as these are all identical (especially lift/hoisting mechanisms these are expensive and you probably do not want 5 of them).

One thing to note about Eaton as well we can include in our clarification: Eaton builds their VFDs with less components and more robust designs. Other competitors use lower rated modules (480V, etc) but use a lot of them to achieve medium voltage. Eaton uses medium voltage rated components. So you would be buying very large spares, and a lot of them, of an item that has an industry low failure rate.

I propose we quote one set of spares and make note of the details above in the letter proposal.

A30. Spare parts listed are total required, not per VFD. See revisions to Technicals, Section 26 19 23, Medium-Voltage Adjustable Frequency Drive System, sub-section 1.4, Extra Materials, provided in this Addendum.

Q31. Reference is made to S-16 Note 5, which states "Maintain level elevation around entire perimeter of structure during backfill operations. Do not backfill until top slab is in place." In Diversion Structure 3, there is a mezzanine deck at Elev: +7.00' and top slab is at Elev: +17.00'. Please confirm it is acceptable to backfill walls after mezzanine slab is in place.

A31. For Diversion Structure No. 3, it is acceptable to backfill up to elevation +5.00 once the mezzanine slab is in place.

Q32. In S-Drawings for Diversion Structures and Angle Structures, there is a note where top slab must be in place before backfilling of walls. See Note 5 in S-12, S-14, S-16 and Note 2 in S-23. However, there is no similar note for the Junction Structure 1 (see S-11). Please confirm walls may be backfilled in Junction Structure 1 without requirement of top slab in place as specified in 033000-3.6-A.

A32. For JS 1, Top Slab shall be in place before backfilling or loading of the walls. Refer to General Note 4 on Sheet S-01 of the drawings.

Q33. Bidding Documents, Certifications and Forms - List of Subcontractors and Named Equipment/Material Supplier List (pages 2193 & 2194): It is understood that the Contractor shall list all Subcontractors that will perform work in excess of one half of one percent in electronic format on PlanetBids. However, how are we to submit the Named Equipment/Material Supplier List? There is no way to electronically submit on PlanetBids. Please advise.

A33. Named Equipment/Material Supplier List is to be submitted by the awarded contractor at the preconstruction meeting.

Q34. Bidding Documents, Certifications and Forms – Debarment and Suspension Certification

- Prime Contractor and Debarment and Suspension Certification – Subcontractors, Suppliers, and Manufacturers (pages 2207 & 2208): These forms state that they must be completed and submitted at time of bid. This will be difficult to accomplish in view of all the other documentation that will need to be submitted at bid time (i.e., EPA forms 4500-3 and 4500-4). Would the City consider revising this requirement to completing and submitting these forms by 5 PM, 2 working days after bid opening? Also, is the Debarment and Suspension Certification for Subcontractors, Suppliers, and Manufacturers required of all Subcontractors and Suppliers or just those at ½ of 1 percent of the total amount bid?

A34. Please submit at bid time as specified in the solicitation. The Debarment and Suspension Certification for Subcontractors, Suppliers, and Manufacturers is required of all Subcontractors and Suppliers not just those at ½ of 1 percent.

Q35. Is the city providing water for testing?

A35. Contractor pays for the water for testing by connecting to a fire hydrant via a water meter for construction provided by the City, refer to Appendix B – Fire Hydrant Meter.

Q36. Is the city paying for the initial fill and testing of chemicals through extra work, or does the contractor need to cover this?

A36. The Contractor covers the cost. Refer to Appendix B – Fire Hydrant Meter.

Q37. Per Attachment E – Supplementary Special Provisions: Section 7-4.9(1), earthquake coverage is not included in the OCIP Builder's Risk. Are other types of earth movement (landslide, subsidence, et. Al) covered by this policy?

A37. No.

Q38. Will the General Liability and Excess Liability insurance coverage provided under the OCIP contain any exclusions for work within 50' of railroad property? Will MTS be allowed to be added as an Additional Insured on these policies if/when required by written contract/agreement?

A38. Yes. The OCIP CGL policy is endorsed with Contractual Liability - Railroads CG 24 17 10 01 on a blanket basis.

Q39. Please confirm the time period when the Builder's Risk insurance provided by the OCIP will cease. Would it be when any portion of the work is put to its intended use or after Intermediate, Substantial, or Final completion?

A39. Coverage shall cease the earlier of the time the Insured Property is taken over or taken into use by the owner or the expiration date stated in the Project Declaration Endorsement.

Q40. Will the micro tunneling work to be performed outside of the main footprint of the project be included as a covered location under the OCIP or will the contractor need to specifically request that this dedicated off-site location be insured, subject to the OCIP insurer's approval as required by Section 3, page 9 of the OCIP manual?

A40. Micro tunneling work included as part of the project work and covered under the OCIP.

Q41. Does the Builder's Risk insurance provided by the OCIP include tsunami/tidal wave in its definition of "Flood"? Please also provide the flood limit for this policy.

A41. No. Please also provide the flood limit for this policy. Flood - $200M per Occurrence and in the Annual Aggregate per project and for all projects combined except Flood for insured property in Flood Zone A - $25M.

Q42. Bidding Documents, Attachment E – Supplementary Special Provisions, 7-4.9.1 states the Owner provided Builder's Risk coverage has an applicable limit of $94 million per occurrence for this project; however, the OCIP Insurance Manual indicates the limit of liability for the Builder's Risk will be the Project Value which exceeds $94 million. Please confirm the applicable limit.

A42. The limit of liability for the Builder's Risk Insurance is the Contract Value.

Q43. The City charges from $0.005 - $0.015/gal (max) to discharge to the sewer system depending on water quality. Assuming twice the dewatering flow rate identified in the Geotechnical Report (168,000 to 430,000 GPD) x 2 = 860,000 GPD (max), the cost to discharge to the sewer could be up to $12,900/day. Please confirm that this cost is to be carried in Bid Item #15 Shoring, Bracing and Dewatering of Non- Hazardous and Hazardous Contaminated Groundwater" and not part of the allowance in Bid Item #27 "Dewatering Permit and Discharge Fees".

A43. The cost to discharge groundwater to the sewer system is a part of Bid Item #15 Shoring, Bracing and Dewatering of Non- Hazardous and Hazardous Contaminated Groundwater.

Q44. Supplementary Special Provisions, Section 4.16 "Trade Names or Equal" states that proposed substitutions for "equals" items shall be submitted no later than 5 working days after the determination of the Apparent Low Bidder. Section 4-6.3.a of the WHITEBOOK states, for review of substitutions prior to Bid, the engineer shall respond to substitutions at least 3 working days prior to the Bid date. Please clarify if the Engineer will be accepting and responding to "or Equal" substitution proposals before bid time, or if they must all be submitted 5 days after the determination of the Apparent Low Bidder.

A44. Please comply with the Supplementary Special Provisions, Section 4.16, Trade Names or Equal.

Q45. Paint spec section 09 90 00, Part 3.7B states that all buried and exposed above ground ductile iron piping, fittings, valves etc. shall be lined and coated with a fusion bonded epoxy system. However, section 33 05 19 Part 2.1F for Ductile Iron pipe states that pipe and fittings for clean water shall be cement mortar lined and asphaltic seal-coated. It then states that pipe and fittings are to be lined with 40 mil of ceramic epoxy. Please confirm whether the ductile iron pipe and fittings on the project are to be lined with fusion bonded epoxy system or with 40 mil of ceramic epoxy.

A45. All ductile iron pipe and fittings shall be fusion bonded epoxy lined and coated and conform to the requirements of 09900 Part 3.07 B.

C. ADDENDUM

1. To Addendum A, Section B, Bidders Questions, page 10, Q17 and A17, **DELETE** in its entirety and **SUBSTITUTE** with the following:

Q17. Reference drawing C-16: At Sta. 2+00 of the 48" casing/36" Brine sewer, a Rip Rap Excavation Shaft is shown. Is the intent of the excavation to remove the toe of the rip rap in Friars Rd North Levee that is in conflict with the proposed 48" casing pipe and then rebuild the toe above the casing pipe? If so, at what distance above the top of the proposed 48" casing should the rip rap terminate? How far on either side of the proposed 48" casing pipe should the rip rap be removed?

A17. Contractor to employ appropriate means and methods to remove existing rip rap as required to install the steel casing. Contractor to backfill rip rap excavation shaft with CLSM up to 18" above the steel casing, then refill with rip rap up to adjacent rip rap elevations (set first course of rip rap into wet CLSM), then backfill remainder of shaft with suitable soil material and re-pave asphalt.

2. To Addendum A, Section B, Bidders Questions, pages 20 and 21, Q65 and A65, **DELETE** in its entirety and **SUBSTITUTE** with the following:

Q65. Please refer to Specification Section 01 50 25 Sewer Bypass Pumping and the Potential Construction Sequencing Plan. Diversion Scenario 3 indicates to divert the 78" NMVI to the existing NMI Junction Structure. The drawing shows a green diversion line form the existing 78" NMVI pipe to the NMI structure. This is not realistic. Water isolation and bypass pumping needs to be diverted

from an upstream manhole. The as-builts show a manhole near the YMCA. However, a few key pieces of information needs to be known:

1. Manhole depth from grade level to water level needs to be known in order to properly size pumps. Please provide the elevations or as-builts.
2. Assuming a 100% redundant system, the PWWF at 73.5 MGD means 147MGD bypass system will need to be in place. This amount of flow equates to approximately 15 pumps with suction sizes at 24"in diameter each. The amount of suction pipes will not fit in one manhole. Additional manholes and/or other means of diverting flow needs to be clarified in order to properly plan and price this scope of work. Please clarify how the bypass operation will be accomplished.
3. For the discharge piping to the NMI structure, please provide as-builts of the NMI structure.
4. To divert flow from the YMCA parking lot manhole to the NMI junction structure, discharge pipe will need to be routed through the Mission Valley Preserve and underneath the trolley bridge. Please clarify if any restrictions are associated in doing this.

A65. It is understood that bypass pumping operation will not fit in a manhole. Due to the constraints of limited property at the upstream manhole and the adjacency to the Mission Valley Preserve it is anticipated that the NMVI will be exposed between NMI Junction Structure and the trolley tracks where bypass pumping can occur. The CONTRACTOR shall develop a plan for approval by the ENGINEER to open top of the NMVI and provide bypass pumping and repair upon completion.

1. See Record Drawings 27256-D provided in this link. https://drive.google.com/drive/folders/1Z1flFEfdDYNajA5gYUxxkkh7CeX7TeBq?usp=sharing
2. See response above.
3. See Record Drawings 27152-D provided in this link. https://drive.google.com/drive/folders/1Z1flFEfdDYNajA5gYUxxkkh7CeX7TeBq?usp=sharing
4. Routing pipes through the preserve will not be allowed

3. To Addendum A, Section E - Supplementary Special Provisions, Item 1, page 25**,** **DELETE** in its entirety and **SUBSTITUTE** with the following:

2-9.2 Surveying. To the "GREENBOOK" and "WHITEBOOK", **DELETE** in its entirety and **SUBSTITUTE** with the following:

2-9.2 Surveying (DESIGN-BID-BUILD).

2-9.2.1 General.

1. You shall provide all required site layout and general grade checking work not specified in 3-10.2, "Survey Services Provided by City".

2. Notify the City, in writing, at least 2 Working Days prior to requesting survey services provided by the City.

3. You shall provide all required traffic control in support of the City's survey work.

2-9.2.2 Survey Services Provided by City.

1. Monument Perpetuation, including mark-outs. You are responsible for requesting the coordination of these services.

    a) If at any time a monument will be destroyed or covered, such monument shall be perpetuated in accordance with state law. Inform the City Engineering Support & Technical Services Division's Land Survey Section (LSS), via project Resident Engineer, if any monument will be destroyed or covered during any construction activity.

2. The following surveying services (including construction staking), as defined in California Business & Professions Code §8726, shall be provided by the City:

    a) Locating or establishing alignment or elevations of all features or structures shown on project Plans.

    b) Locating or establishing geodetic control points for all site feature or structure locations.

    c) Produce topographic as-built data.

d) Locating, establishing, or re-establishing monuments, property lines, right-of-way lines, or easement lines.

e) Verifying structure finish grade elevations.

3. All construction survey stakes, control points, and other survey related marks provided by the City shall be preserved for the duration of the Project. If any construction survey stakes, control points, or other survey related marks are lost or disturbed and need to be replaced, such replacement shall be performed at your expense.

2-9.2.3 Payment.

1. The payment for site layout and general grade checking Work, coordination, and preservation of all survey related marks shall be included in the Contract Price.

D. SUPPLEMENTARY SPECIAL PROVISIONS

1. To Section 7, Responsibilities of the Contractor, sub-section 7-4, Owner-Controlled Insurance Program, Item 7-4.9, OCIP Builder's Risk Insurance, sub-item 1, page 145, **DELETE** in its entirety and **SUBSTITUTE** with the following:

    1. OCIP Coverage for builder's risk will provide coverage on an all-risk basis, including coverage against fire, flood, lightning, wind damage, hail, explosion, collapse, offsite storage and in-transit, and installation risks of equipment to be installed as part of the work. Earthquake coverage is not included. The policies for such insurance will be secured and maintained by the City in a form and amount consistent with such coverage commonly purchased for large construction projects. The Contractor's coverage for Builder's Risk shall be the Contract value per occurrence with no aggregate.

2. To Technicals, SECTION 26 19 23, MEDIUM -VOLTAGE ADJUSTABLE FREQUENCY DRIVE SYSTEM**,** sub-section 1.4, Part 1 General, Extra Materials**,** page 1106, **DELETE** in its entirety and **SUBSTITUTE** with the following:

    1.4 EXTRA MATERIALS

        A. Spare Parts: Furnish the following spare parts.

            1. Two power modules (Cells) with accompanying printed circuit boards.

2. Five spare LEDs of each type used.

3. Three spare fuses of each type used.

4. Two spare control relays of each type used.

5. Two spare sets of all replacement air filters.

6. One hoisting mechanism for removal and replacement of cells, if required.

3. To Technicals, Section 44 47 00, High Purity Oxygen System, pages 1951 through 1967, **DELETE** in their entirety and **SUBSTITUTE** with pages 22 through 37 of this Addendum.

4. To Technicals, Section 01 50 25, Sewer Bypass Pumping, pages 288 through 300, **DELETE** in their entirety and **SUBSTITUTE** with pages 38 through 51 of this Addendum.

E. PLANS

1. To Drawing Sheet Numbers 40421-01-D, 40421-104-D, 40421-124-D and 40421-140-D, **DELETE** in their entirety and **REPLACE** with Drawing Sheets provided in pages 52 through 55 of this Addendum.

James Nagelvoort, Director
Engineering & Capital Projects Department

Dated: *December 7, 2020*
San Diego, California

SECTION 44 47 00
HIGH PURITY OXYGEN SYSTEM

PART 1 GENERAL

1.01 RELATED SECTIONS

A. Division 26 – Electrical

B. Division 40 – Process Integration

C. Division 43 – Process Gas and Liquid handling, Purification, and Storage Equipment

1.02 REFERENCE STANDARDS

A. The following is a list of standards which may be referenced in this section:

1. Occupational Safety and Health Administration (OSHA)
2. National Fire Protection Association (NFPA) 53
3. Compressed Gas Association (CGA) G-4.1
4. American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code (BPVC) Section VIII, Div. 1
5. ASME B16.1/B16.5 Pipe Flanges and Flanged Fittings.

1.03 SYSTEM DESCRIPTION

A. The Super Oxygenation System (System) shall be designed to elevate dissolved oxygen (D.O.) levels at the Morena force main to reduce dissolved sulfides and subsequent vapor phase hydrogen sulfide (H_2S) levels in the sewer collection system. The System will be designed to achieve a minimum oxygen transfer efficiency of greater than 90 percent. To achieve this goal, the System shall provide a large oxygen/water interface generated by an intense bubble swarm to achieve dissolution such that the gaseous oxygen is completely dissolved into the wastewater before being blended back into the force main flow.

B. The System shall contain no internal nozzles, mixers, or inner baffles that are prone to clogging and all openings shall be a minimum of 4 inches in diameter to pass raw wastewater. The SuperOxygenation System shall not be pressurized

above the operating discharge pressure of the force main being treated. No pure oxygen headspace shall be developed inside of the dissolution vessel. No devices may be placed within the force main to aid dissolution as said devices may become fouled and/or otherwise adversely affect force main flow characteristics.

C. The Supplier shall provide all labor, materials, equipment and incidentals as specified and indicated herein and as required to meet the specified performance requirements to furnish:

1. One complete SuperOxygenation System and appurtenances complete and operational. Components are to include:
   a. SuperOxygenation Cone (Speece Cone).
   b. PLC based Process Control Panel.
   c. Oxygen Control Panel.
   d. Two 40 HP Side stream pump.
2. All mechanical components shall be designed and constructed in accordance with the latest edition and revision of all applicable codes and regulations, including the following:
   a. ASTM
   b. ANSI
   c. ASME
3. Equipment Materials:
   a. All components of the System shall be compatible with the conditions and chemicals to which they will be subjected to during normal operation.
   b. Compounds with which the materials of construction must be compatible include, but are not limited to:
      1) Hydrogen sulfide.
      2) Sulfuric acid.

D. Unit Responsibility and Scope of Supply:

1. The products shall be the end product of one responsible System manufacturer or responsible System supplier.
2. The System manufacturer shall provide components suitable for the service conditions listed herein.
3. The Contractor shall be responsible for coordinating with System manufacturer for Contractor's Scope of Supply.

4. The Contractor shall be responsible to provide and install, but not limited to, the following:
    a. Interconnecting raw sewage piping including valves and accessories.
    b. Oxygen feed piping to the System, and accessories.
    c. Installation and assembly of all equipment and instrumentation components for a complete system including labor.
    d. Site preparation.
    e. Utility requirements, including main electrical service and field wiring.

1.04 SYSTEM SUPPLIER

A. The Super Oxygenation system shall be furnished by a single System Supplier. The System Supplier shall have experience in similar installations with permanently installed and operating systems adding a similar amount of oxygen to what are required per these specifications.

B. The System Supplier shall be ECO Oxygen Technologies, LLC of Indianapolis, IN.

1.05 SUBMITTALS

A. Action Submittals:

1. Detailed mechanical and electrical drawings showing equipment dimensions, system fabrication, arrangement, assembly, including locations and type of connections and weights of major equipment and components.
2. Power and control wiring diagrams, including terminals and numbers.
3. Factory finish system.
4. External utility requirements such as air, water, power, drains, etc., for each component.
5. Control panel elevation drawings showing panel face layout, construction, and placement of operator interface devices and other elements.
6. Complete set of engineered drawings for system I/O and Process control.
7. Make, model, weight, and horsepower of each pump assembly.
8. Complete pump and motor catalog information, descriptive literature, specifications, and identification of materials of construction.
9. Performance data curves at nominal pump speed showing head, capacity, horsepower demand, NPSH required, and pump efficiency over entire operating range of pump, from shutoff to maximum capacity.

10. Complete motor nameplate data, as defined by NEMA, motor manufacturer, and including any motor modifications.
11. Installation Manual.
12. Manufacturer shall have experience in the installation of HPO facilities in similar applications under similar circumstances and of similar size.

B. Informational Submittals:

1. Manufacturer's Certificate of Compliance.
2. Warranty Certificate,
3. Operation and Maintenance Manuals (3 hard copies, 1 electronic copy).
4. Manufacturer's Certificate of Proper Installation.
5. Equipment Testing and Field Startup Report.

1.06 QUALITY ASSURANCE

A. Qualifications:

1. The manufacturer must be able to provide the Owner with training as specified herein.

1.07 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. All materials and equipment shall be shipped, stored, handled and installed in such a manner as to not degrade quality, serviceability or appearance.

B. All exposed equipment openings shall be properly protected.

C. Appropriate measures shall be taken to prevent the entrance of moisture or water to equipment during shipment and storage onsite.

1. Control panels should be stored in an enclosed place, safe from the weather until installed.

1.08 PATENTS

A. The manufacturer shall warrant that the use of their system and its equipment, in the process for which the system has been expressly designed, will not infringe on

any U.S. or foreign patents or patents pending. In the event of any claim of infringement, the manufacturer shall defend and indemnify the Owner free from any liabilities associated with the use of the patented equipment or process.

B. The manufacturer hereby grants to the City, in perpetuity, a paid-up license to use any inventions covered by patent or patents pending owned, or controlled by the manufacturer in the operation of the facility being constructed in conjunction with the equipment supplied under this Contract, but without the right to grant sublicenses.

1.09 WARRANTY

A. The manufacturer shall guarantee that the SuperOxygenation system will perform in accordance with the specifications when operated within the specified design conditions.

B. The manufacturer shall guarantee all materials and equipment to be free from all defects due to faulty materials or workmanship for a period of one (1) year from the date of startup and shall be limited to the repair or replacement of the SuperOxygenation system.

1.10 PERFORMANCE GUARANTEE

A. SuperOxygenation System Supplier shall guarantee that the System shall provide a minimum oxygen transfer efficiency of 90% or greater.

1. One-time performance testing as described in the FIELD TESTING section shall be means of proving performance criteria is met.

1.11 PAYMENT

A. Payment for equipment shall be in accordance with System Supplier's payment terms.

PART 2 PRODUCTS

2.01 SERVICE CONDITIONS

A. The SuperOxygenation System shall be designed to operate under the following operating conditions:

Process Parameter	Value
Diameter of Force Main (inches)	48
Length of Force Main to be Treated (ft)	56,760
Total Dynamic Head at Maximum Flow Conditions (ft)	494
Static Head	389
Force Main Pump Operation	Continuous
Daily Average Flow (gpm)	21,910
Maximum Flow Rate (gpm)	26,180
Minimum Flow Rate (gpm)	5,000
Max Hydraulic Retention Time (hrs)	15
Existing Dissolved Sulfides (mg/L)	3
Site Elevation Above Sea Level (ft)	16
Max Temperature of Sewage (°C)	25
Oxygen Uptake Rate (OUR) (mg/L/hr)	15
Daily Oxygen Addition Required Based on Above Parameters (lbs O_2/day)	20,205

2.02 PERFORMANCE CRITERIA

A. The SuperOxygenation System shall be designed to achieve an oxygen transfer efficiency of greater than 90%.

1. The System Supplier shall submit performance data from a minimum of 10 permanently installed and operational systems that prove a minimum oxygen transfer efficiency of greater than 90% under actual operating conditions. Data from factory tests with clean water or data from temporary pilot tests is not acceptable.
2. To achieve the high oxygen transfer efficiency, the system shall provide a large oxygen/water interface generated by an intense bubble swarm to achieve oxygen dissolution such that the gaseous oxygen is completely dissolved into the wastewater before being blended back into the main flow.
3. Systems with a pressurized pure oxygen headspace shall not be considered.
4. Systems which insert venturis, nozzles, diffusers, mixers, or other such devices into the force main will not be considered.
5. Discharge D.O. levels shall be measured upon system start-up to confirm transfer efficiency.

B. The SuperOxygenation System should run continuously with a minimum amount of maintenance to guarantee reliable D.O. control. Therefore, the system shall contain no internal nozzles, mixers or inner baffles that are prone to clogging, and all openings shall be a minimum of 4 inches to avoid scaling and clogging. Additionally, no device such as a venturi, nozzle, mixer or diffuser shall be installed within the force main.

C. The SuperOxygenation System shall be operated at or near the existing pressure in the force main line to prevent the potential for oversaturation of dissolved oxygen and pure oxygen gas off-gassing. The SuperOxygenation System shall not be pressurized above the operating pressure of the force main. The side stream pump shall not be used to maintain a pressure differential across nozzles or venturis.

2.03 INJECTION CONE

A. The SuperOxygenation Injection cone shall be constructed of Type 304 stainless steel and fabricated to ASME standards for 300 psig pressure rated vessels.

B. Features:

1. Self-cleaning bottom discharge design.
2. Sight glasses.
3. Manway.
4. 10 inch flanged inlet and discharge ports.
5. 1 inch female NPT threaded oxygen port.
6. System discharge instrumentation ports.
7. Bead blast finish.
8. Free standing vessel with lower mounting flange/feet for anchoring.

C. SuperOxygenation System Dimensions and Parameters:

1. Model Number: ECO2-7-12-PC
2. Cone Diameter: 7 feet.
3. Cone Nominal Height: 18 feet.
4. Total head loss shall not exceed 15 feet through the SuperOxygenation System at design conditions.
5. Side Stream Flow Rate: 4,200 gpm.
6. Side Stream Pump Duty Head: 28 feet.

2.04 SIDE STREAM PUMP

A. General:

1. Provide a complete, coordinated, and fully functional operating system.
2. Coordinate pump requirements with motor manufacturer and be responsible for pump and motor requirements.
3. Pumps supplied under this section to be a standard product of manufacturer and to have proven reliability.

B. Pump:

1. Furnish and install two vertical non-clog wastewater pump(s). Each pump shall be equipped with a 40 HP electric motor, connected for operation on 480 volts, 3 phase, and 60 hertz.

2. Each pump is vertical close-coupled dry-pit solids-handling angle-flow design with a 14" diameter suction and 12" diameter discharge. Each unit shall be furnished with a pump, driver, and motor high ring base with guard. Pumps are to be connected to drivers by suitably sized flexible coupling.

C. Performance Requirements:

1. Capacity: 4,200 gpm.
2. Total Dynamic Head: 28 feet of head.
3. Suction Pressure: 215 psi
4. Minimum Rated Pump Hydraulic Efficiency at Rated Capacity: 80 percent
5. Constant speed.
6. Motor Size: 40 Horsepower.
7. Motor Speed: 710 rpm (10 pole)

D. Manufacturers:

1. Pump(s) shall be the product of Fairbanks Nijhuis or approved equal.
2. Manufacturer shall have installations of like or similar application with a minimum of 5 years' service for this pump size.

E. Design:

1. Rotation:
   The pump will be clockwise rotation when viewed from the driver end looking at the pump.

2. Impeller:

   a. The impeller shall be cast corrosion resistant alloy conforming to ASTM A743 CA6NM and be of the 3-vane, enclosed mixed-flow design, single suction, solids-handling type designed to pass a minimum sphere size of a 4 inch diameter.
   b. The impeller is to be dynamically balanced and secured to the shaft by means of a key, and impeller capscrew, and matched to the volute/casing. The arrangement shall be such that the impeller cannot be loosened from torque in either forward or reverse rotation.
   c. Wiper vanes on the back impeller shroud are not allowed.

3. Volute/Casing:
    a. The volute shall be matched to the impeller and made of cast ductile iron conforming to ASTM A395 Gr 65-45-12. The volute is to be of one-piece design with smooth fluid passages large enough to pass any size solid that can pass through the impeller.
    b. The volute shall be side flanged tangential discharge and capable of rotation in 45 degree increments to accommodate piping orientation. The volute shall be designed to permit front or back impeller removal. Diffusion vanes are not permitted.
    c. The volute shall be furnished with a large contoured inspection and cleanout opening located at the cutwater, to allow access to the impeller. Discharge flange 250 lb. ANSI drilling.
    d. The volute shall be designed to permit front or back impeller removal and to permit the removal of the rotating assembly without disturbing the suction or discharge piping. The casing shall be hydrostatically tested to 1.3 times the maximum pressure (max suction pressure plus pump shutoff TDH).
4. Wear Rings:
    a. Axial-type removable wear ring is to be provided on the impeller and the volute for reduction of recirculation.
    b. Wear rings shall be stainless steel. The impeller wear ring shall be approximately 50 Brinell softer than the fronthead wear ring.
5. Fronthead:
    a. The fronthead shall be made of cast ductile iron conforming to ASTM A395, Gr. 65-45-12 and have the base integrally cast. It shall be cast separately of the volute. Fronthead suction flange shall be 250 lb. ANSI drilling.
    b. Fronthead shall incorporate a hand hole for inspection.
6. Backhead:
    a. A separately cast ductile iron backhead with large access openings and integral sealing box conforming to ASTM A395 Gr. 65-45-12 shall be provided. The sealing box shall be cast integrally with the backhead and be designed to accommodate either packing or mechanical seal without re-machining. The sealing box shall be drilled and tapped for external flushing with seal cage.

b. A ¾" minimum backhead drain tap shall be provided. Sealing box leakage will be collected by the backhead drain trough and piped directly to drain, eliminating any drippage to the floor.

c. Pumps shall be equipped with mechanical seals. There shall be no reduction in shaft size through the seal area. Provide silicon carbide seal, Type CURC manufactured by AES, or approved equal.

7. Bearing Frame Assembly:

a. The bearing housing shall be close-grained cast iron conforming to ASTM A48 CL30 and of heavy, rugged design for carrying the bearings and machined for accurate and permanent bearing alignment completely enclosing the shaft between the bearings. Bearing supports are to be of heavy-duty construction providing for self-centering fit with the casing for proper alignment. The bearing housing shall be of dust-proof design, incorporating lip-type grease seals in contact with the shaft to prevent the entrance of contaminants. Jacking bolts for external impeller adjustments are required. Zerk-type grease fittings for bearing lubrication shall be supplied at the bearing housing.

b. The pump shaft shall be made from type 4140 alloy steel, of sufficient diameter to carry the maximum loads imposed and to prevent vibration and fatigue. The shaft shall be accurately machined along its entire length. Keyways shall be provided at both ends.

c. A renewable shaft sleeve, positive adhesive sealed to prevent leakage between the shaft and the sleeve, shall protect the shaft through the sealing box area. The shaft sleeve shall be 316 stainless steel and shall extend beyond the stuffing box to accommodate seal outboard length.

d. Radial (inboard) bearings shall be grease-lubricated single-row deep-grooved ball type, self-aligning, designed to carry the hydraulic radial loads encountered in the service conditions. Thrust (outboard) bearings shall be angular contact, duplex mounted, designed to carry the pump hydraulic axial and dead load thrust.

e. Bearings shall be designed for an L10 life of 100,000 hours per AFBMA at best efficiency point. Grease relief ports with plugs shall be provided.

8. Fits and Hardware:
   The volute/casing, fronthead, backhead, and frame shall be manufactured with concentric shoulder fits to assure accurate alignment. All machined bolts, nuts, and capscrews shall be 316 stainless steel and of the hex-head type and will not require the use of any special tools.
9. High Ring Base:
   The motor high ring base shall be fabricated steel designed to support the weight of the motor and to assure accurate alignment of the pump and motor shaft and be of adequate height to permit access to the coupling and furnished with a shaft guard.
10. Vibration Limitations (Field):
    The limits of vibration as set forth in the standards of the Hydraulic Institute shall govern.
11. Testing:
    A certified factory hydrostatic and performance test shall be performed on each pumping unit in accordance with Hydraulic Institute Standards, latest edition. Tests shall be sufficient to determine the curves of head, input horsepower, and efficiency relative to capacity from shutoff to 130% of design flow. A minimum of six points, including shutoff, shall be taken for each test. At least one point of the six shall be taken as near as possible to each specified condition. Results of the performance tests shall be certified by a Registered Professional Engineer and submitted for approval before final shipment.

2.05 PIPING, VALVES, AND ACCESSORIES

A. By others as necessary and as shown on the drawings.

2.06 INSTRUMENTATION AND CONTROL

A. General:

1. Provide control panels, electrical components and wiring for a complete, functional system.
2. Provide all items not specifically specified which are required to implement the specified functions and the functions required for proper system operation.
3. Coordinate controls with existing SCADA system.

B. Process Control Panel: PLC driven automatic system control with sensing features. The system shall be designed for automatic flow control with full manual backup control of oxygen flow and side stream pump control. The oxygen feed rate shall be continuously adjusted to the actual process water flow rate. The control panel shall be rated for use on a 120 volt power supply and shall be housed in a NEMA Type 4X 304 stainless steel enclosure. The control panel shall contain an Allen-Bradley Programmable Logic Control (PLC), operator interface screen and have the capability to monitor system parameters for alarm indication and data logging and trending.

1. Instrumentation included with the system and controlled/monitored by the Process Control Panel:
   a. Oxygen mass flow controller.
   b. One (1) solenoid valve.
   c. One (1) actuated ball valve.
   d. Side stream flow meter.
   e. Side stream pressure sensor.
   f. Side stream temperature sensor.
2. PLC and I/O:
   a. Allen-Bradley MicroLogix Processor.
   b. Ethernet switch.
   c. MicroLogix fixed racks, power supplies, expansion analog and digital I/O.
   d. Trend recording: The PLC shall record the following data as a minimum:
      1) Oxygen addition, current day's total.
      2) Oxygen addition, previous day's total.
      3) Force main flow.
      4) Side stream flow.
      5) Side stream pressure.
      6) Side stream temperature.
3. Operator Interface:
   a. Panel Door-mounted HMI:
      1) Trending and logging.
      2) Ethernet communication capable (for remote connection).
4. Main Control Enclosure:
   a. Preassemble and wired, NEMA 4X 304 stainless steel construction.
   b. System Hand-Off-Auto switch.
   c. Interposing I/O relays as necessary.
   d. Disconnects and fusing for AC power distribution.
   e. DC power supply and fusing for DC power distribution.

f. All necessary wireways, wiring, labels, and miscellaneous hardware for a complete control panel.

C. Oxygen Control Panel: NEMA 4X 304 stainless steel panel complete with oxygen mass flow controller, rotameter, solenoid valve, check valves, isolation valves and stainless steel tubing and fittings as required. Panel will be powered, monitored and controlled by the Process Control Panel.

D. Additional Components: The following additional components will be provided for mounting on the Injection Cone for redundant control and system isolation of the oxygen delivery piping:

1. Isolation valve
2. Check valve.
3. Actuated ball valve.

E. Inputs to Process Control Panel:

1. Force main flow rate.
2. Side stream pump signal(s).
3. System enable/permission to run.

F. Description of Operation:

1. The Super Oxygenation System shall operate by redirecting a side stream of raw wastewater from the force main and pumping it through the Injection Cone. Gaseous oxygen is fed into the Injection Cone by the Oxygen Control Panel as controlled by the Process Control Panel. The Injection Cone shall provide a large oxygen/water interface as generated by an intense bubble swarm to achieve rapid oxygen dissolution such that the gaseous oxygen is completely dissolved before being blended back into the force main. The Super Oxygenation System shall not have a pure oxygen headspace inside of the vessel.
2. The Process Control Panel PLC shall monitor the force main flow rate, side stream water flow rate, and water temperature and system pressure. Based on this data, the PLC shall calculate the amount of oxygen required to meet the oxygen demand of the wastewater. The PLC shall be capable of adjusting the

oxygen feed rate into the Injection Cone by means of the mass flow controller to match the calculated oxygen demand.

3. The Super Oxygenation System shall be capable of automatically adding variable amounts of oxygen as required by varying force main flow rates.
4. The PLC shall also monitor the side stream pump operation, side stream water flow rate, oxygen flow rate, and water temperature and system pressure. These parameters shall be checked against design inputs to ensure optimal system performance and provide for system shutdown and/or alarm notification if the operation is out of tolerance.

G. Alarms shall be capable of being transmitted to the owner in accordance with their requirements, specified herein under specifications Division 40.

PART 3 EXECUTION

3.01 GENERAL INSTALLATION

A. Manufacturer shall provide written instructions for installation of equipment by Contractor.

B. Anchor Bolts: Contractor shall provide all necessary anchor bolts and field install after receipt of equipment. All anchor bolts, nuts, washers, etc. shall be type 316 stainless steel.

3.02 PUMP INSTALLATION

A. Provide pump manufacturer's written instructions for pump installation by Contractor.

3.03 MANUFACTURER'S SERVICES

A. Manufacturer's Representative: Present at Site or classroom as designated by Owner, for minimum person-days listed below, travel time excluded:

1. Function Testing, Performance Testing, Training of Owner's Staff, and Completion of Manufacturer's Certificate of Proper Installation: 3 days and two trip.

B. Schedule with Owner's manufacturer's services/Contractor to avoid conflict with other onsite testing or other onsite activities.

C. Furnish trained, articulate personnel to perform manufacturer's services.

D. Establish training schedule to ensure adequate training of appropriate personnel as deemed necessary by Owner.

E. Training Lesson Plan: Provide the following:

1. Title and objectives.
2. Course description and outline of course content.
3. Recommended attendees and time required.
4. Format (e.g. lecture, hands-on).

3.04 FIELD TESTING

A. Prior to acceptance by Owner, an operational test of the SuperOxygenation system shall be conducted to determine if the installed equipment meets the purpose and intent of the Specifications. Tests shall demonstrate that all equipment is electrically, mechanically, and otherwise acceptable; it is safe and in optimum working condition; and conforms to the specified operating characteristics.

B. All equipment shall be tested to check for proper operation, proper alignment, faulty equipment, and for excessive vibration.

C. Any and all alterations, modifications, additions and/or work necessary to rectify defects or nonconformance with the Section of the Specifications shall be in such a manner as to provide for the satisfactory operation of the system, all at no additional cost to the Owner.

D. Upon completion of Field Testing, the Manufacturer shall provide a summary report documenting the results of the required field testing.

E. All labor, instruments, equipment, apparatus, fuel, temporary piping, water and electrical power required for testing shall be provided by the Contractor at no additional cost to the Owner.

END OF SECTION

SECTION 01 50 25
SEWER BYPASS PUMPING

PART 1 – GENERAL

1.1 SCOPE OF WORK

A. Furnish all labor, materials, equipment, and incidentals to provide temporary sewage bypass pumping throughout the construction phase of the project and until all project improvements are constructed and accepted by the City.

1. Contractor shall construct and maintain all temporary bypass sewers and be responsible for all bypass pumping of sewage that may be required to prevent backing up of sewage and allow appropriate conditions for proper inspection, rehabilitation, testing or drainage during force main rehabilitation, replacement of pumps, or reconnections to existing sewers. The Contractor shall immediately remove and dispose of all offensive matter spilled during the bypass pumping at his own expense. The Contractor shall also be responsible for paying any fines imposed as a result of spills or overflows that occur as a result of the bypass pumping operations.

2. Contractor shall provide a 100% redundant bypass pumping system, including intake and discharge conduit, and other equipment necessary to provide continuous wastewater flow and prevent the backing up of sewage in the case of emergencies at all times.

3. Noise levels shall not exceed 70 dBA measured at 30-feet from the engine.

4. Contractor shall provide all necessary equipment to provide odor control facilities during bypass pumping and to ensure that no odor complaints are received by the City from surrounding businesses and residents. The Contractor shall be responsible for obtaining and securing any required permits needed for odor control systems and standby generators with the San Diego APCD at no additional cost to the City.

1.2 SUBMITTALS

A. The design, installation, and operation of the temporary pumping system shall be the sole responsibility of the Contractor. The Contractor shall employ the services of a subcontractor who can demonstrate, to the Engineer extensive experience in design, installation, and operation of temporary bypass pumping systems.

B. The Contractor shall prepare a specific, detailed description of the proposed pumping system (Bypass Pumping Plan). The Bypass Pumping Plan shall be submitted for review and approval by the Engineer prior to the mobilization of any of the equipment included in the Bypass Pumping Plan. The Bypass Pumping Plan shall outline all provisions and precautions to be taken by the Contractor regarding handling of existing wastewater flows. The Bypass Pumping Plan must be specific and complete, including such items as schedules, locations, elevations, capacities of equipment, materials, and all other incidental items necessary and/or required to ensure proper protection of the facilities, including protection of the access and bypass pumping locations for damage due to the discharge flows, and compliance with the requirements and permit conditions specified herein. No Construction shall begin until all provisions and requirements have been reviewed and accepted by the Engineer. The plan shall include but not limited to the following details:

1. Staging areas for pumps.

2. Sewer plugging method and types of plugs.

3. Size and location of manholes or access points for suction and discharge hose or piping.

4. Size of pipeline or conveyance system to be bypassed.

5. Number, size, material, location and method of installation of suction piping.

6. Number, size, material, location and method of installation of discharge piping.

7. Bypass pump sizes, capacities, and number of each size to be provided on- site including all primary, secondary, and spare pumping units.

8. Calculations of static lift, friction losses, and flow velocity (pump curves showing pump, operating range shall be submitted).

9. Downstream discharge plan.

10. Method of protecting discharge manholes or structures from erosion and damage.

11. Thrust and restraint block sizes and locations. Provide the details necessary to demonstrate the integrity of all suction and discharge piping including piping and fittings associated with all primary and secondary pumping units.

12. Sections showing suction and discharge pipe depth, embedment, select fill and special backfill.

13. Method of noise control for each pump and any additional equipment that is included in the Bypass Pumping Plan to maintain specified noise levels.

14. Any temporary pipe supports and anchoring requirements.

15. Access plans to all bypass pumping locations indicated on the drawings.

16. Calculations for selection of bypass pumping pipe size.

17. Schedule for installation of and maintenance of bypass pumping lines.

18. Plan indicating location of bypass pumping pipe locations.

19. A detailed Emergency Response Plan (ERP)for adverse weather and flooding for various phases of the Work. The ERP shall be prepared in collaboration with the City's O&M staff to ensure that the plan is acceptable to the City. The Contractor is responsible for conducting any workshops with City staff to complete the emergency response plan.

20. The Contractor shall provide continuous 24-hour monitoring of all equipment required for the bypass pumping operation, including motors, hoses, pipes, valves, generators, etc. The contractor shall provide continuous 24-hours a day qualified personnel in operation and maintenance of bypass pumping systems on site throughout the duration of any bypass work. The Contractor shall submit list of monitoring personnel and their qualifications for review and approval by the City. The Contractor shall maintain in good working condition all valves, gauges, meters associated with bypass system and shall replace any defective monitoring devices within 24 hours.

PART 2 – PRODUCTS (NOT USED)

PART 3 – EXECUTION

3.1 BYPASS PUMPING

A. The Contractor shall supply pumps, conduits, power, and other equipment to divert the flow of sewage from existing gravity influent sewer to the existing force mains. The bypass system shall be of sufficient capacity to handle the wastewater flows in the table located at the end of this section. It is the intent of these Specifications to require the Contractor to establish adequate bypass pumping as required regardless of the flow condition.

B. All bypass pumping piping for force main materials, shall be HDPE and conform to the following requirements:

1. All polyethylene (HDPE) pipes shall meet the requirements of ASTM F714. DR rating of the pipe shall be sufficient to withstand the pressure and leakage test outlined below.

2. HDPE Pipe shall be furnished in standard laying lengths not exceeding 50 feet.

3. Joining system: The HDPE pipe shall be joined with butt, heat fusion joints. All joints shall be made in strict compliance with the manufacturer's recommendations and ASTM 2657. Where required, flange connections, mechanical joint connections and butt connections using bolted mechanical couplers shall be provided from a pipe stub with a polyethylene and steel stiffener. Flanged connections shall be provided from a pipe stub and a steel back-up flange. Back flanges shall be primed and painted in corrosion protected paint. Quick connect couplings will not be permitted on HDPE bypass piping.

4. HDPE fittings shall be fully pressure rated to match the pipe DR pressure rating. All fittings shall be molded or fabricated by the same manufacturer as the pipe. HDPE fittings shall be joined using butt, heat fusion and/or electro- fusion. Adhesives and solvent cements shall not be permitted.

C. The Contractor shall perform leakage and pressure tests of the bypass pumping discharge piping using clean water prior to the actual operation. The pressure and leakage test shall be conducted at one-and-a-half times the maximum pressure the system will experience based on the approved Bypass Pumping Plan for a period of two hours. No leakage is permitted during this test. The Engineer will be given 72 hours' notice prior to testing. In addition, the Contractor shall demonstrate that the pumping system is in good working order and is sufficiently sized to successfully handle flows by performing a test run for a period of 72 hours prior to beginning the Work.

D. Each bypass pumping operation shall include the components and systems to accomplish the bypass in accordance with these Specifications.

E. The Contractor shall provide on-site manual oversight of all bypass pumping operations 24 hours per day, 7 days per week when the bypass pumping system is in operation.

F. The Contractor shall be required to repair, at his own expense, any damage to public or private property caused by his operations.

G. Should damage of any kind occur to the existing sewers, the Contractor shall, at his own expense make repairs to the satisfaction of the Engineer.

H. The Contractor shall immediately notify the governing authority should a sanitary sewer overflow (SSO) occur and take the necessary action to clean up and disinfect the spillage to the satisfaction of the Authority and/or other governmental agency. If sewage is spilled onto public or private property, the Contractor shall wash down, clean up, and disinfect the spillage to the satisfaction of the property owner, Authority, and/or other governmental agency.

I. The Contractor shall not be permitted to overflow, bypass, pump or by any other means convey drainage to any land, street, storm drain or water course.

J. The Contractor shall cease bypass pumping operations and return flows to the new and/or existing sewer when directed by the Owner. During bypassing, no wastewater shall be leaked, dumped, or spilled in or onto any area outside the existing wastewater system. When bypass operations are complete, all bypass piping shall be flushed with fresh water and drained into the wastewater system prior to disassembly.

K. Contractor must take care to prevent damage to existing structures. Discharge piping to gravity sewer systems shall be designed in such a manner as to prevent discharge from contacting manhole walls or benching and full discharge shall go into downstream pipe with as minimal turbulence as possible. Contractor is responsible for any damage to manholes. It may be necessary to remove the manhole cone to provide sufficient space for the bypass piping. If this is required, the Contractor shall be responsible for any damage to existing manhole components.

L. The Contractor shall establish adequate bypass pumping adherent to the conditions above and anticipate severe weather conditions and increases in peak flows during rain events. Available flow and capacity data for Contractor's use in sizing equipment is as follows. Bypass pumps shall be sized with an additional 1.5 safety factor applied to the peak dry weather flows (PDWF) listed below, or a complete redundant bypass pumping system shall be provided.

Table 1 presents the wastewater flows for the existing trunk sewers that were provided by the City based on recordings of existing flows during 2019. Contractor shall request from the City updated flow data prior to start of construction of the project and prior to conducting any bypass pumping.

Table 1 – Existing Influent

Table 1 – Existing Influent Sewer Wastewater Flows					
	(NMVI) 78-inch	(MBI) 72-inch	(MBTS) 33-inch (1)	(EMBTS) 60-inch	TOTAL
	Q, (mgd)	Q, (mgd)	Q, (mgd)	Q, (mgd)	Q, (mgd)
Per 2019 Flow Meter Data					
ADWF	29.8	28.8	1.8	9.2	69.6
PDWF	40.0	42	2.9	13.6	98.5
PWWF	73.5	78.2	6.2	26.5	184.4

(1) The existing 33-inch MBTS connects to the 72-inch MBI upstream of proposed Diversion Structures 1 and 2.

LEGEND:

NMVI – North Mission Valley Interceptor
MBI – Morena Blvd Interceptor
MBTS – Morena Blvd Trunk Sewer
EMBTS – East Mission Bay Trunk Sewer

Drawing C-05 provides an overview of the arrangement of the existing influent sewers along with their associated record drawings. It also shows the existing 66-inch Abandoned Sewer that extends from the rail road tracks on the west side of the proposed Morena Pump Station to the east where it connects to the City's 108-inch North Metro Interceptor (NMI).

The abandoned 66-inch sewer has diversion structures that enables diversion of sewer flows from the MBI and MBTS (See Record Drawings 30507 -D). The estimated maximum flow that can be diverted through the 66-inch is 50 mgd. If the Contractor intends to utilize the existing 66-inch sewer for any sewer diversion, then this needs to be coordinated with the City. If the Contractor plans on utilize the 66-inch for sewer diversion, then the Contractor needs to investigate the condition of the existing diversion and the 66-inch sewer. This will require visual inspection of structures, slide gates, and CCTV of the existing 66-inch sewer. The Contractor would be required to provide a report to the City documenting the inspection work. The report should indicate any repairs intended to be made by the Contractor to any of the existing facilities and the costs associated with these repairs. The cost for sewer bypass pumping should be included in the Contractor base bid and there should not be any additional costs to the City outside of the required repairs identified by the Contractor.

The Contractor should note that sections of the existing 66-inch sewer will need to be removed and abandoned in order to construct the new facilities including the pump station and the 30-inch brine line. The Contractor should take all of these

factors into consideration as part of his/hers construction sequencing plan for the project.

M. The 24-hour monitoring staff shall be properly trained, experienced, and mechanically qualified such that they can quickly and effectively address any potential emergency and non-emergency situations associated with the pumps and bypass pumping system that must remain in operation for an extended period.

3.2 SUPPLEMENTS

A. The supplements listed below, following “End of Section” are a part of this specification:

Abbreviations

DS – Diversion Structure

JS – Junction Structure

MT – Microtunnel

MPS – Morena Pump Station

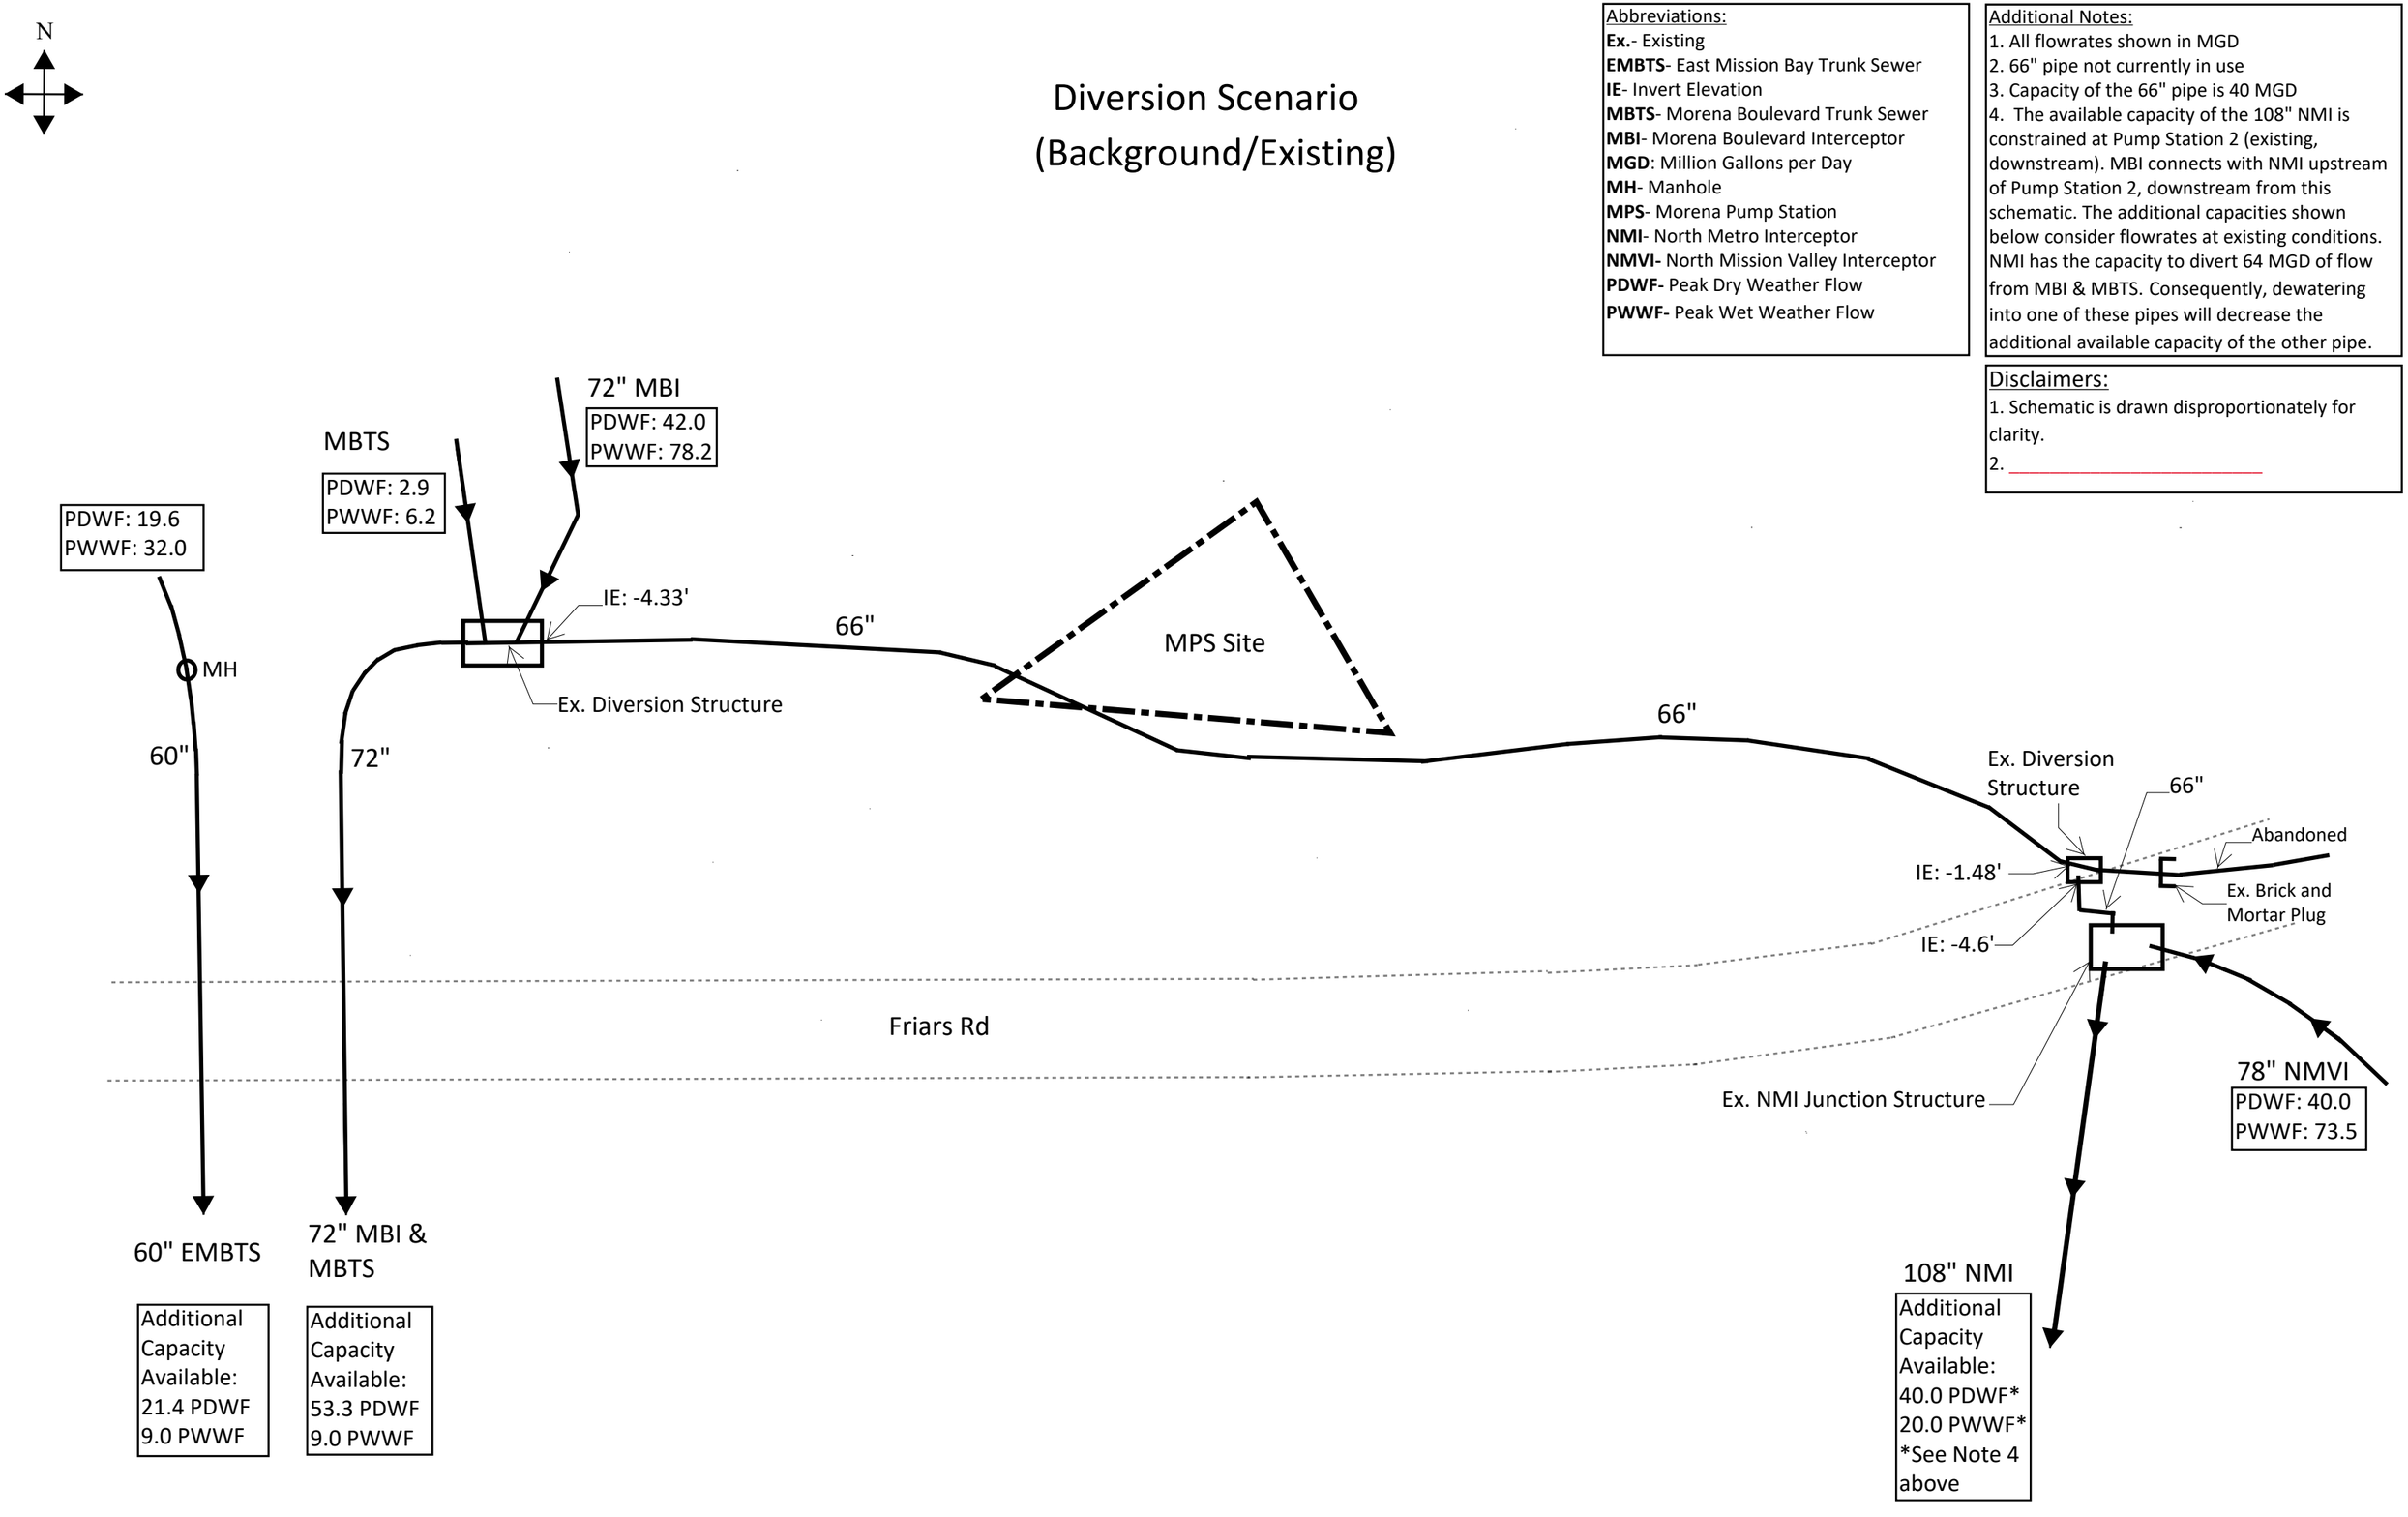
NMVI – North Mission Valley Interceptor

Diversion Scenario (Background/Existing)

Abbreviations:
Ex.- Existing
EMBTS- East Mission Bay Trunk Sewer
IE- Invert Elevation
MBTS- Morena Boulevard Trunk Sewer
MBI- Morena Boulevard Interceptor
MGD: Million Gallons per Day
MH- Manhole
MPS- Morena Pump Station
NMI- North Metro Interceptor
NMVI- North Mission Valley Interceptor
PDWF- Peak Dry Weather Flow
PWWF- Peak Wet Weather Flow

Additional Notes:
1. All flowrates shown in MGD
2. 66" pipe not currently in use
3. Capacity of the 66" pipe is 40 MGD
4. The available capacity of the 108" NMI is constrained at Pump Station 2 (existing, downstream). MBI connects with NMI upstream of Pump Station 2, downstream from this schematic. The additional capacities shown below consider flowrates at existing conditions. NMI has the capacity to divert 64 MGD of flow from MBI & MBTS. Consequently, dewatering into one of these pipes will decrease the additional available capacity of the other pipe.

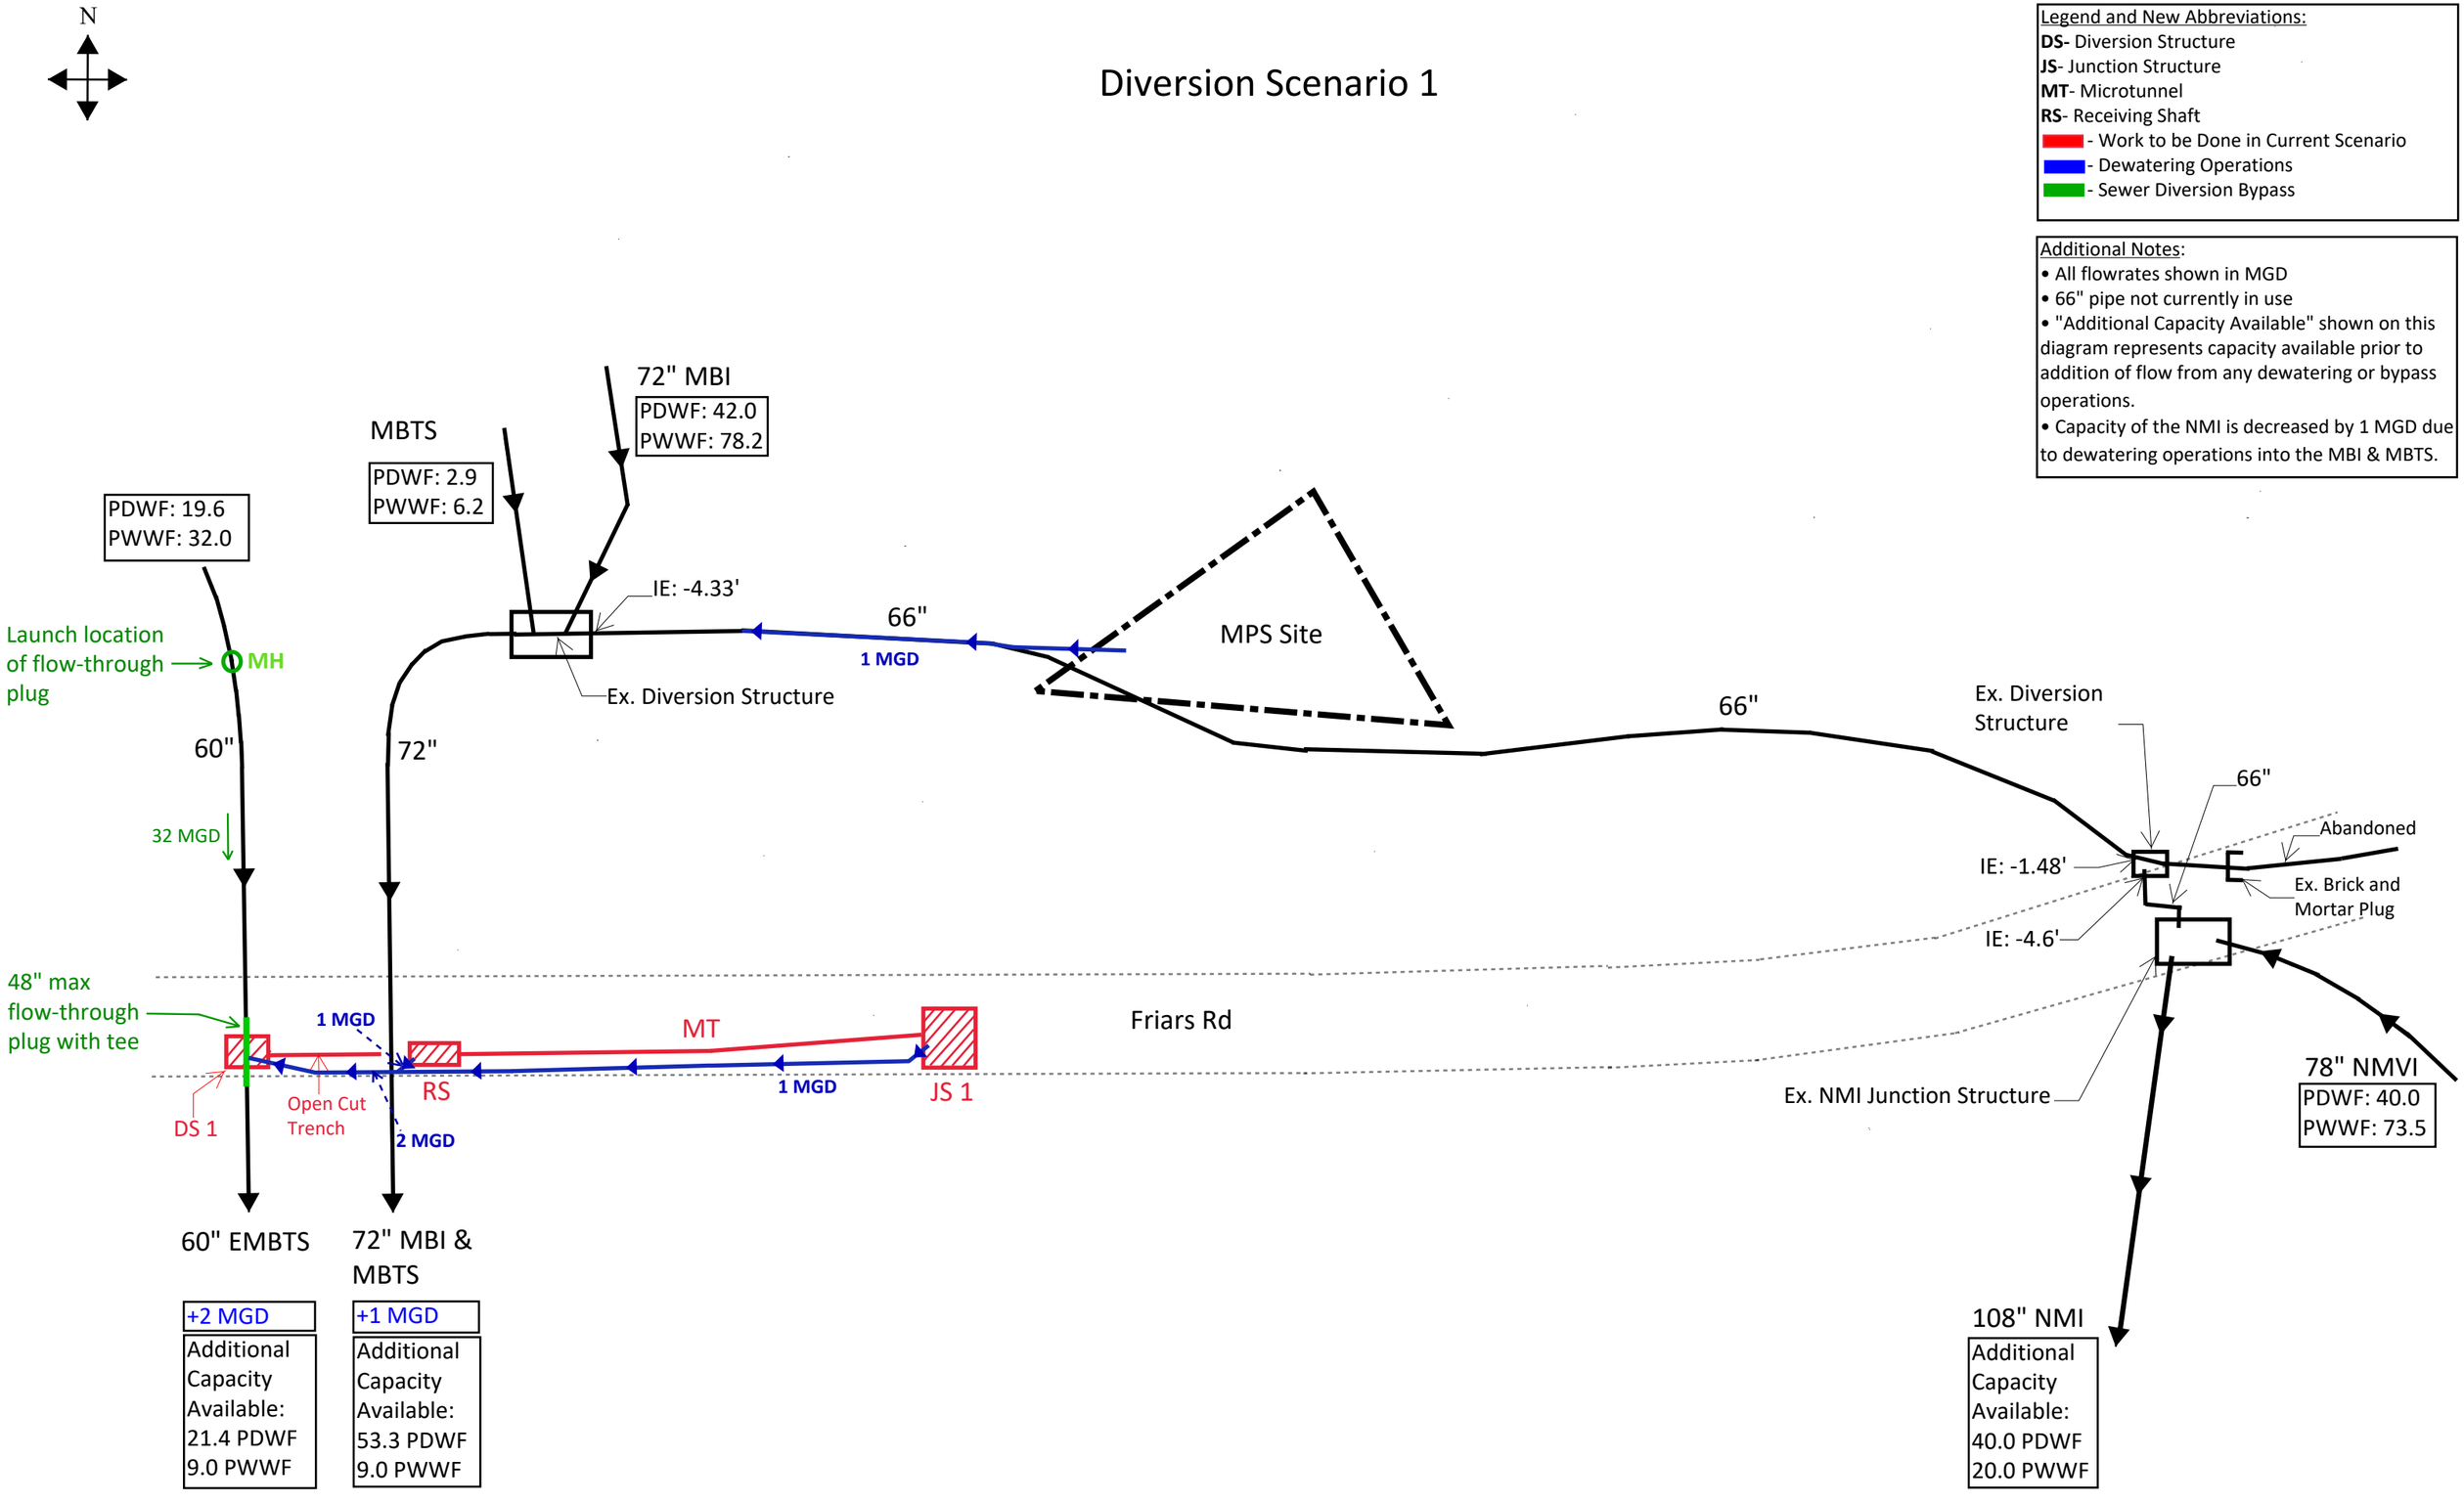
Disclaimers:
1. Schematic is drawn disproportionately for clarity.
2. _____



Diversion Scenario 1

Legend and New Abbreviations:
DS- Diversion Structure
JS- Junction Structure
MT- Microtunnel
RS- Receiving Shaft
- Work to be Done in Current Scenario
- Dewatering Operations
- Sewer Diversion Bypass

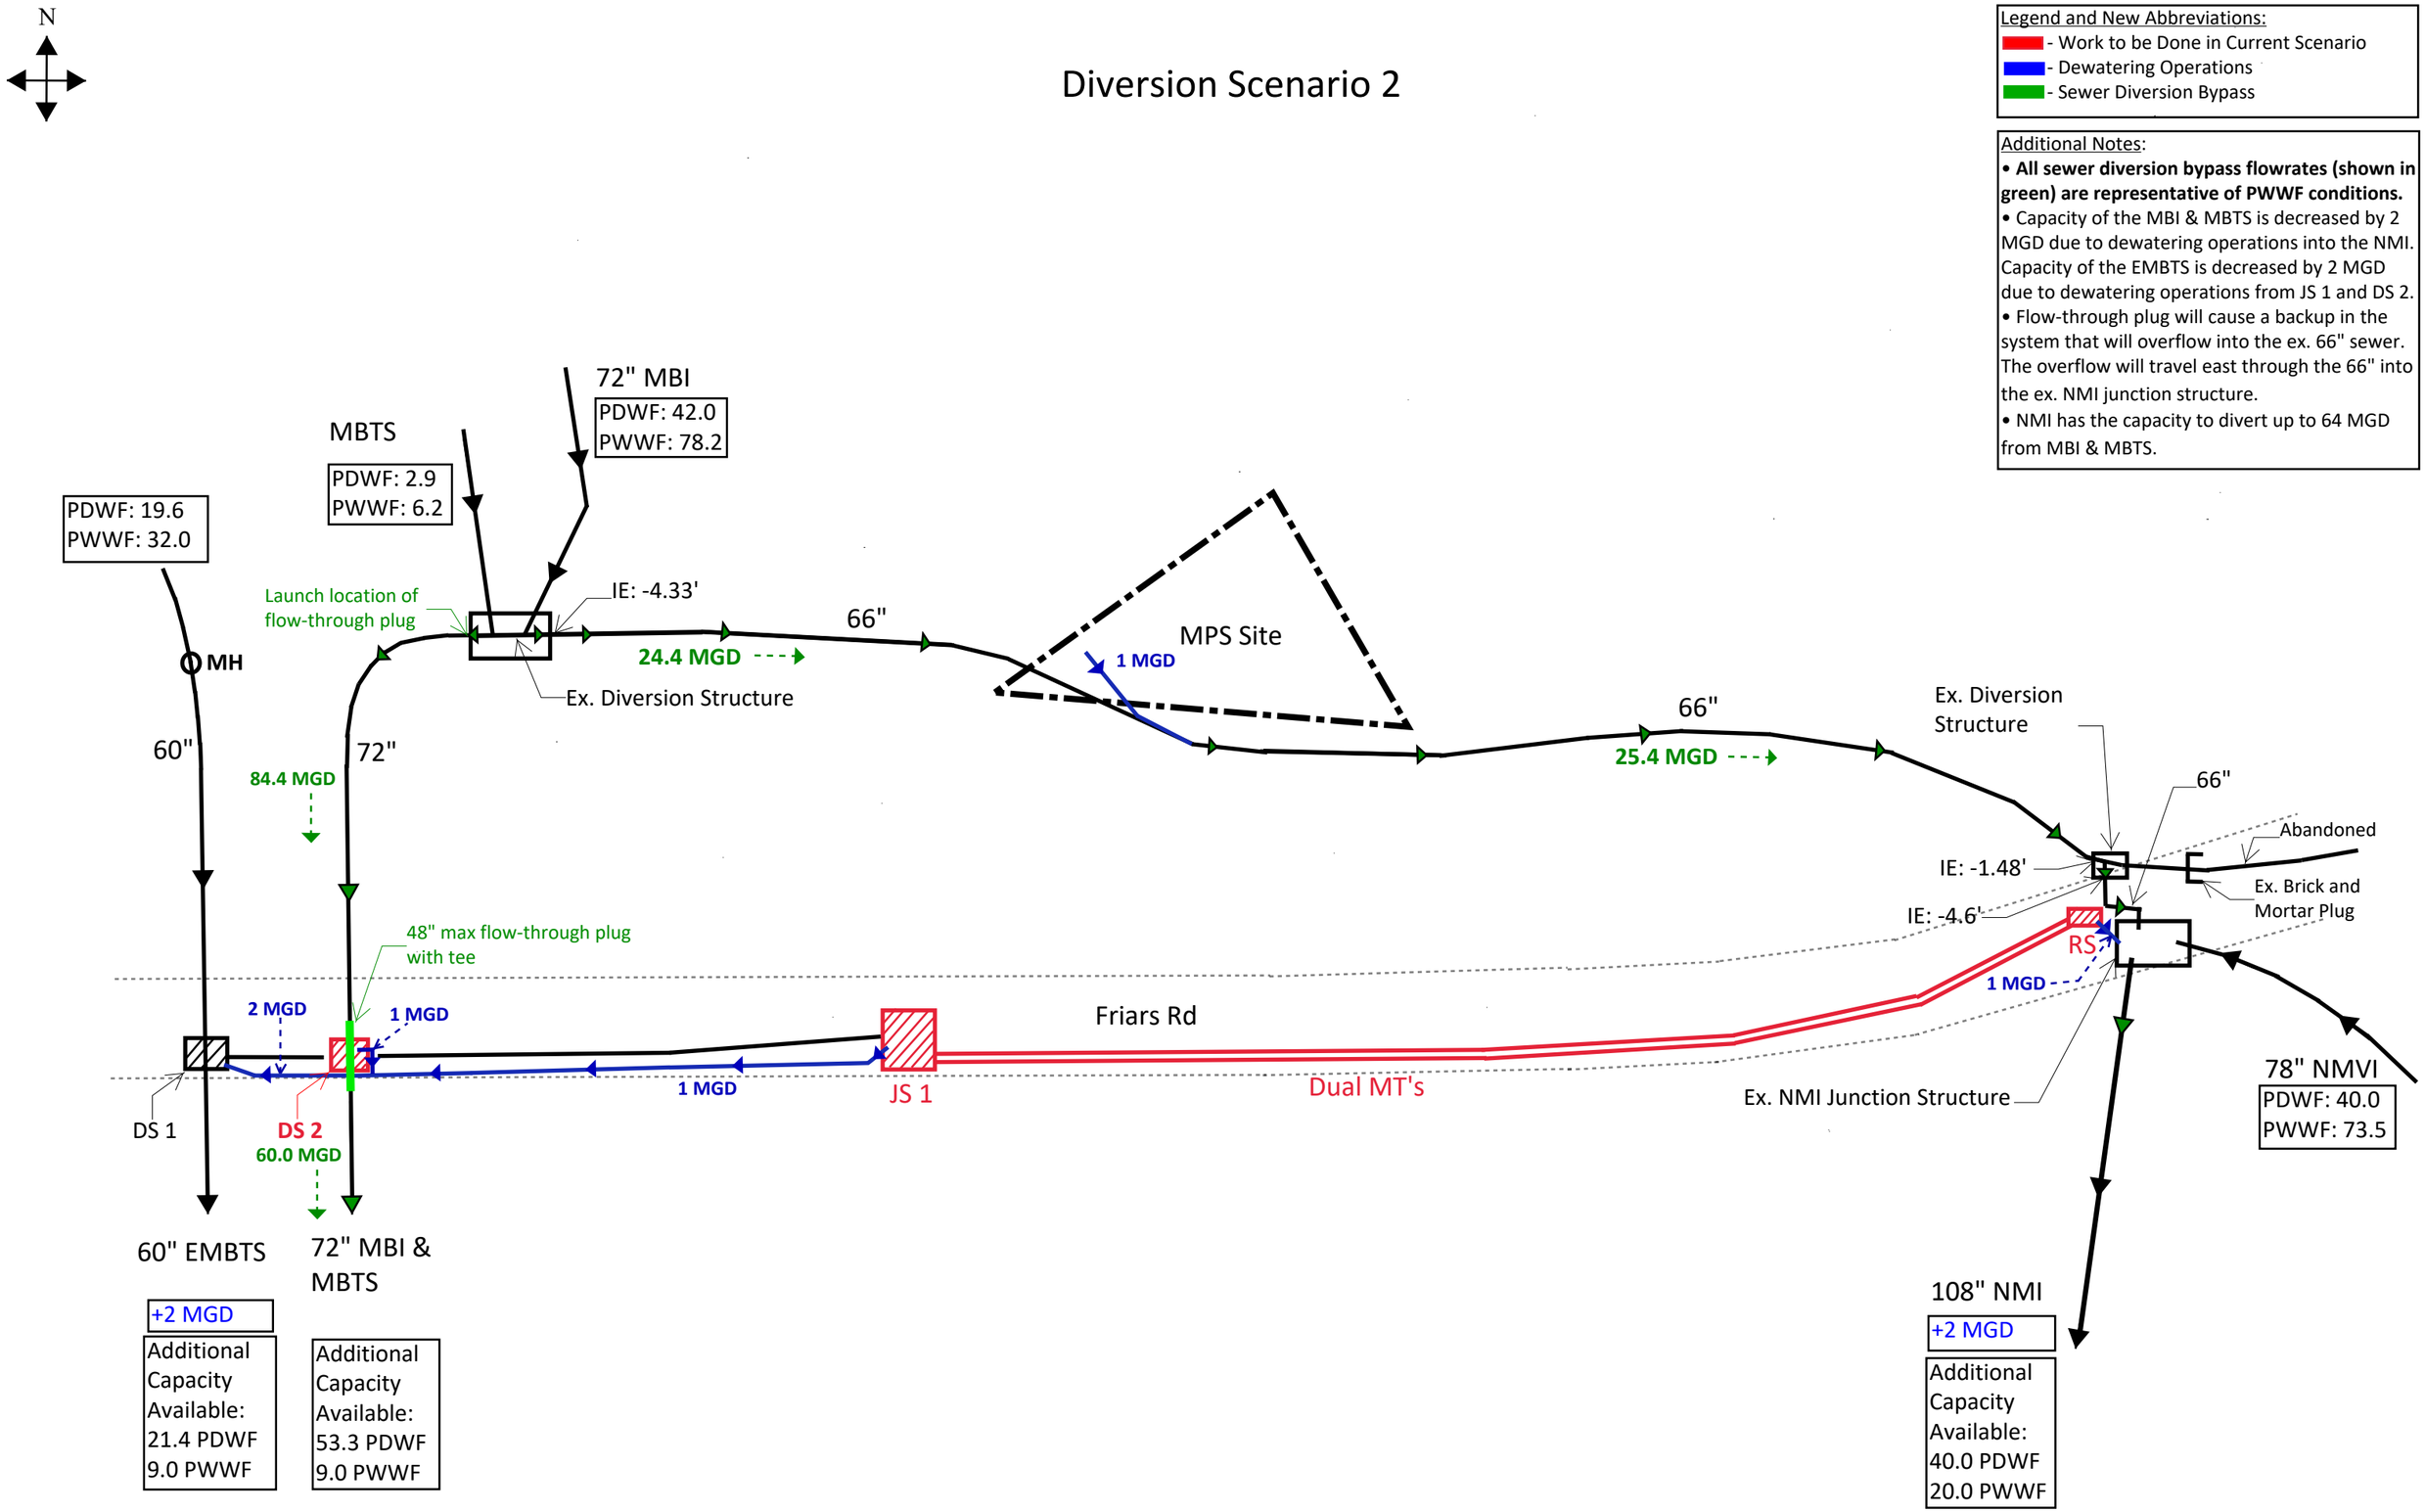
Additional Notes:
- All flowrates shown in MGD
- 66" pipe not currently in use
- "Additional Capacity Available" shown on this diagram represents capacity available prior to addition of flow from any dewatering or bypass operations.
- Capacity of the NMI is decreased by 1 MGD due to dewatering operations into the MBI & MBTS.



Diversion Scenario 2

Legend and New Abbreviations:
- Work to be Done in Current Scenario
- Dewatering Operations
- Sewer Diversion Bypass

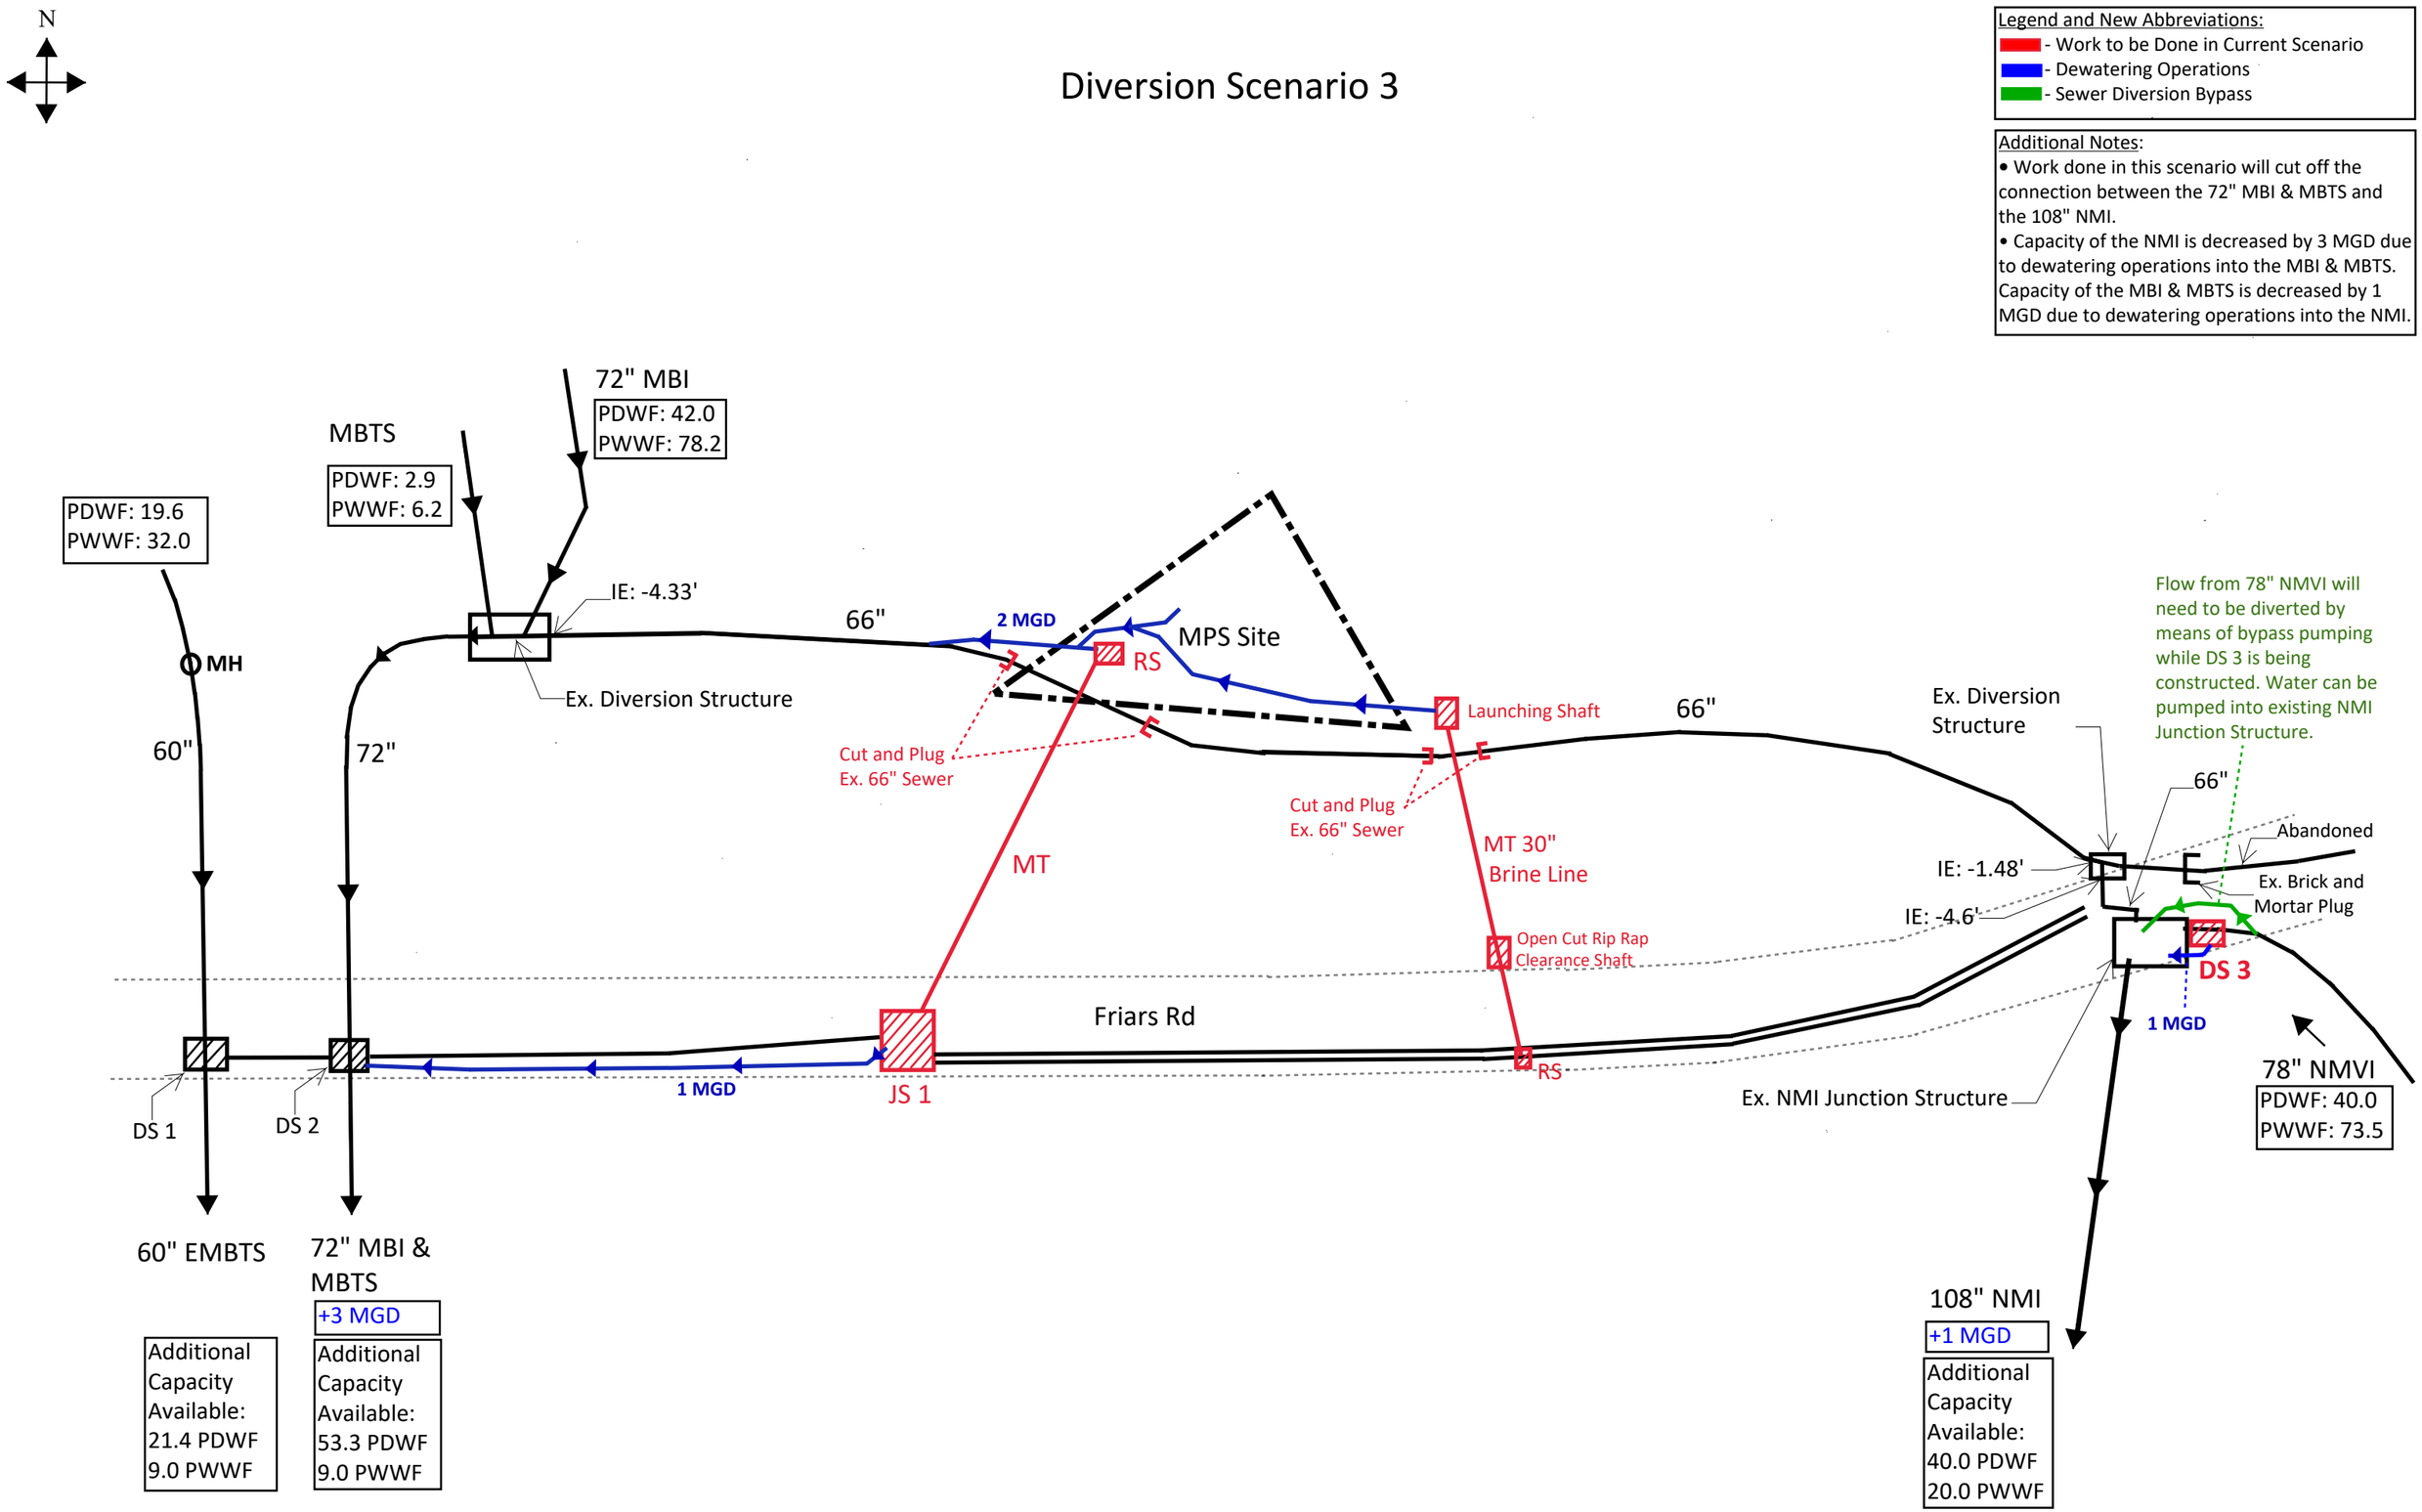
Additional Notes:
- **All sewer diversion bypass flowrates (shown in green) are representative of PWWF conditions.**
- Capacity of the MBI & MBTS is decreased by 2 MGD due to dewatering operations into the NMI. Capacity of the EMBTS is decreased by 2 MGD due to dewatering operations from JS 1 and DS 2.
- Flow-through plug will cause a backup in the system that will overflow into the ex. 66" sewer. The overflow will travel east through the 66" into the ex. NMI junction structure.
- NMI has the capacity to divert up to 64 MGD from MBI & MBTS.



Diversion Scenario 3

Legend and New Abbreviations:
- Work to be Done in Current Scenario
- Dewatering Operations
- Sewer Diversion Bypass

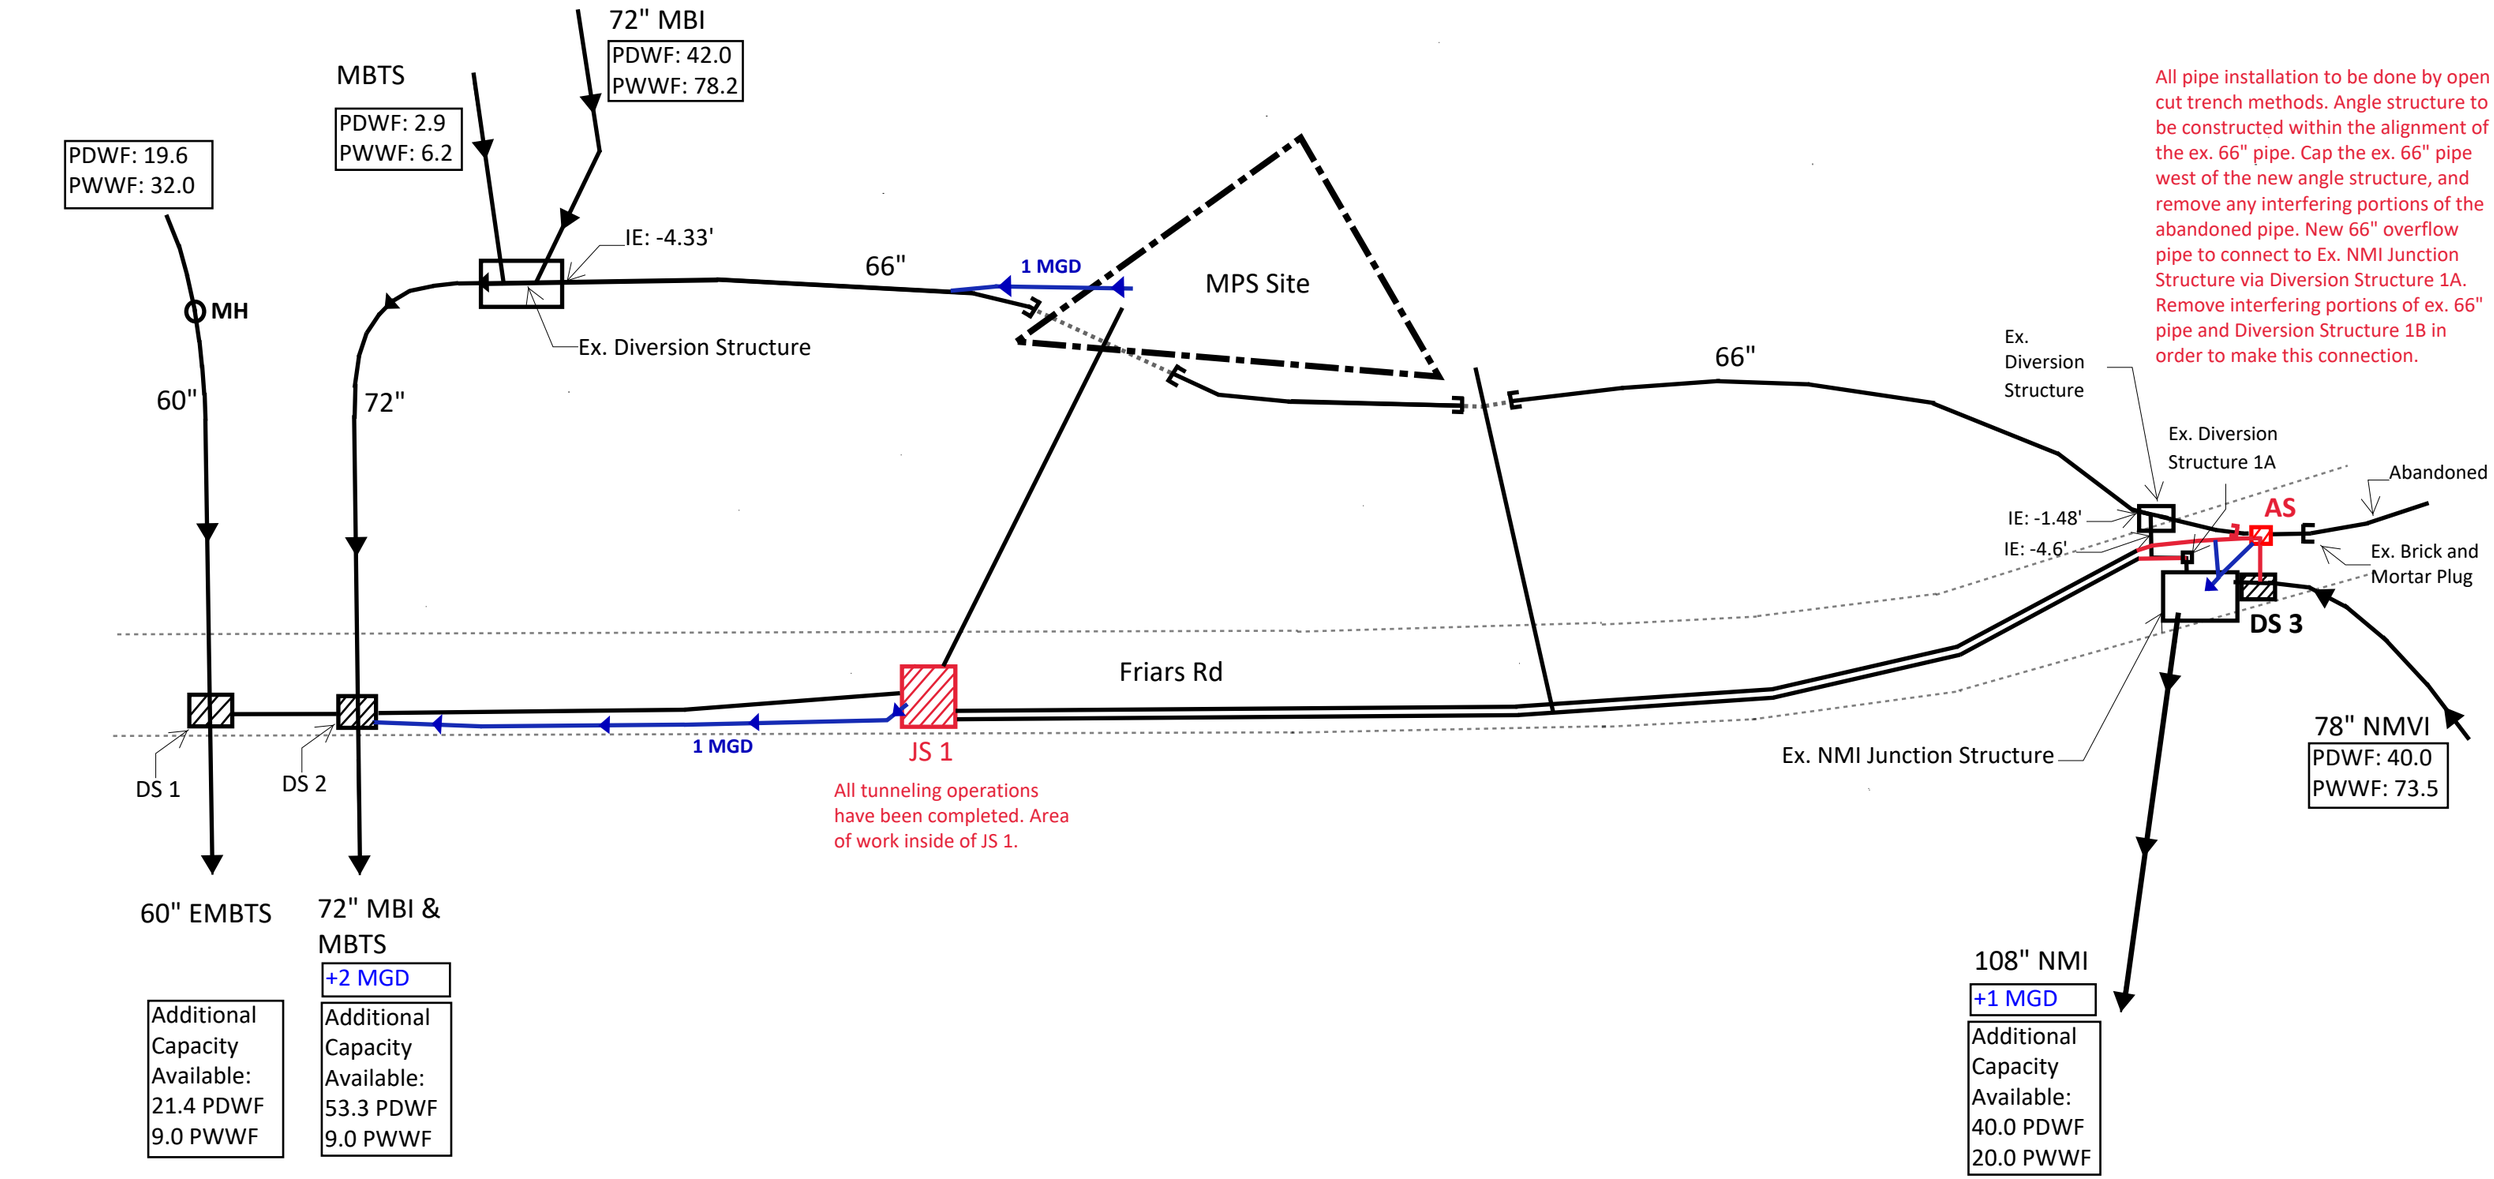
Additional Notes:
- Work done in this scenario will cut off the connection between the 72" MBI & MBTS and the 108" NMI.
- Capacity of the NMI is decreased by 3 MGD due to dewatering operations into the MBI & MBTS. Capacity of the MBI & MBTS is decreased by 1 MGD due to dewatering operations into the NMI.



Diversion Scenario 4

Legend and New Abbreviations:
- **AS** - Angle Structure
- Work to be Done in Current Scenario
- Dewatering Operations
- Sewer Diversion Bypass

Additional Notes:
- Capacity of the NMI is decreased by 2 MGD due to dewatering operations into the MBI & MBTS. Capacity of the MBI & MBTS is decreased by 1 MGD due to dewatering operations into the NMI.

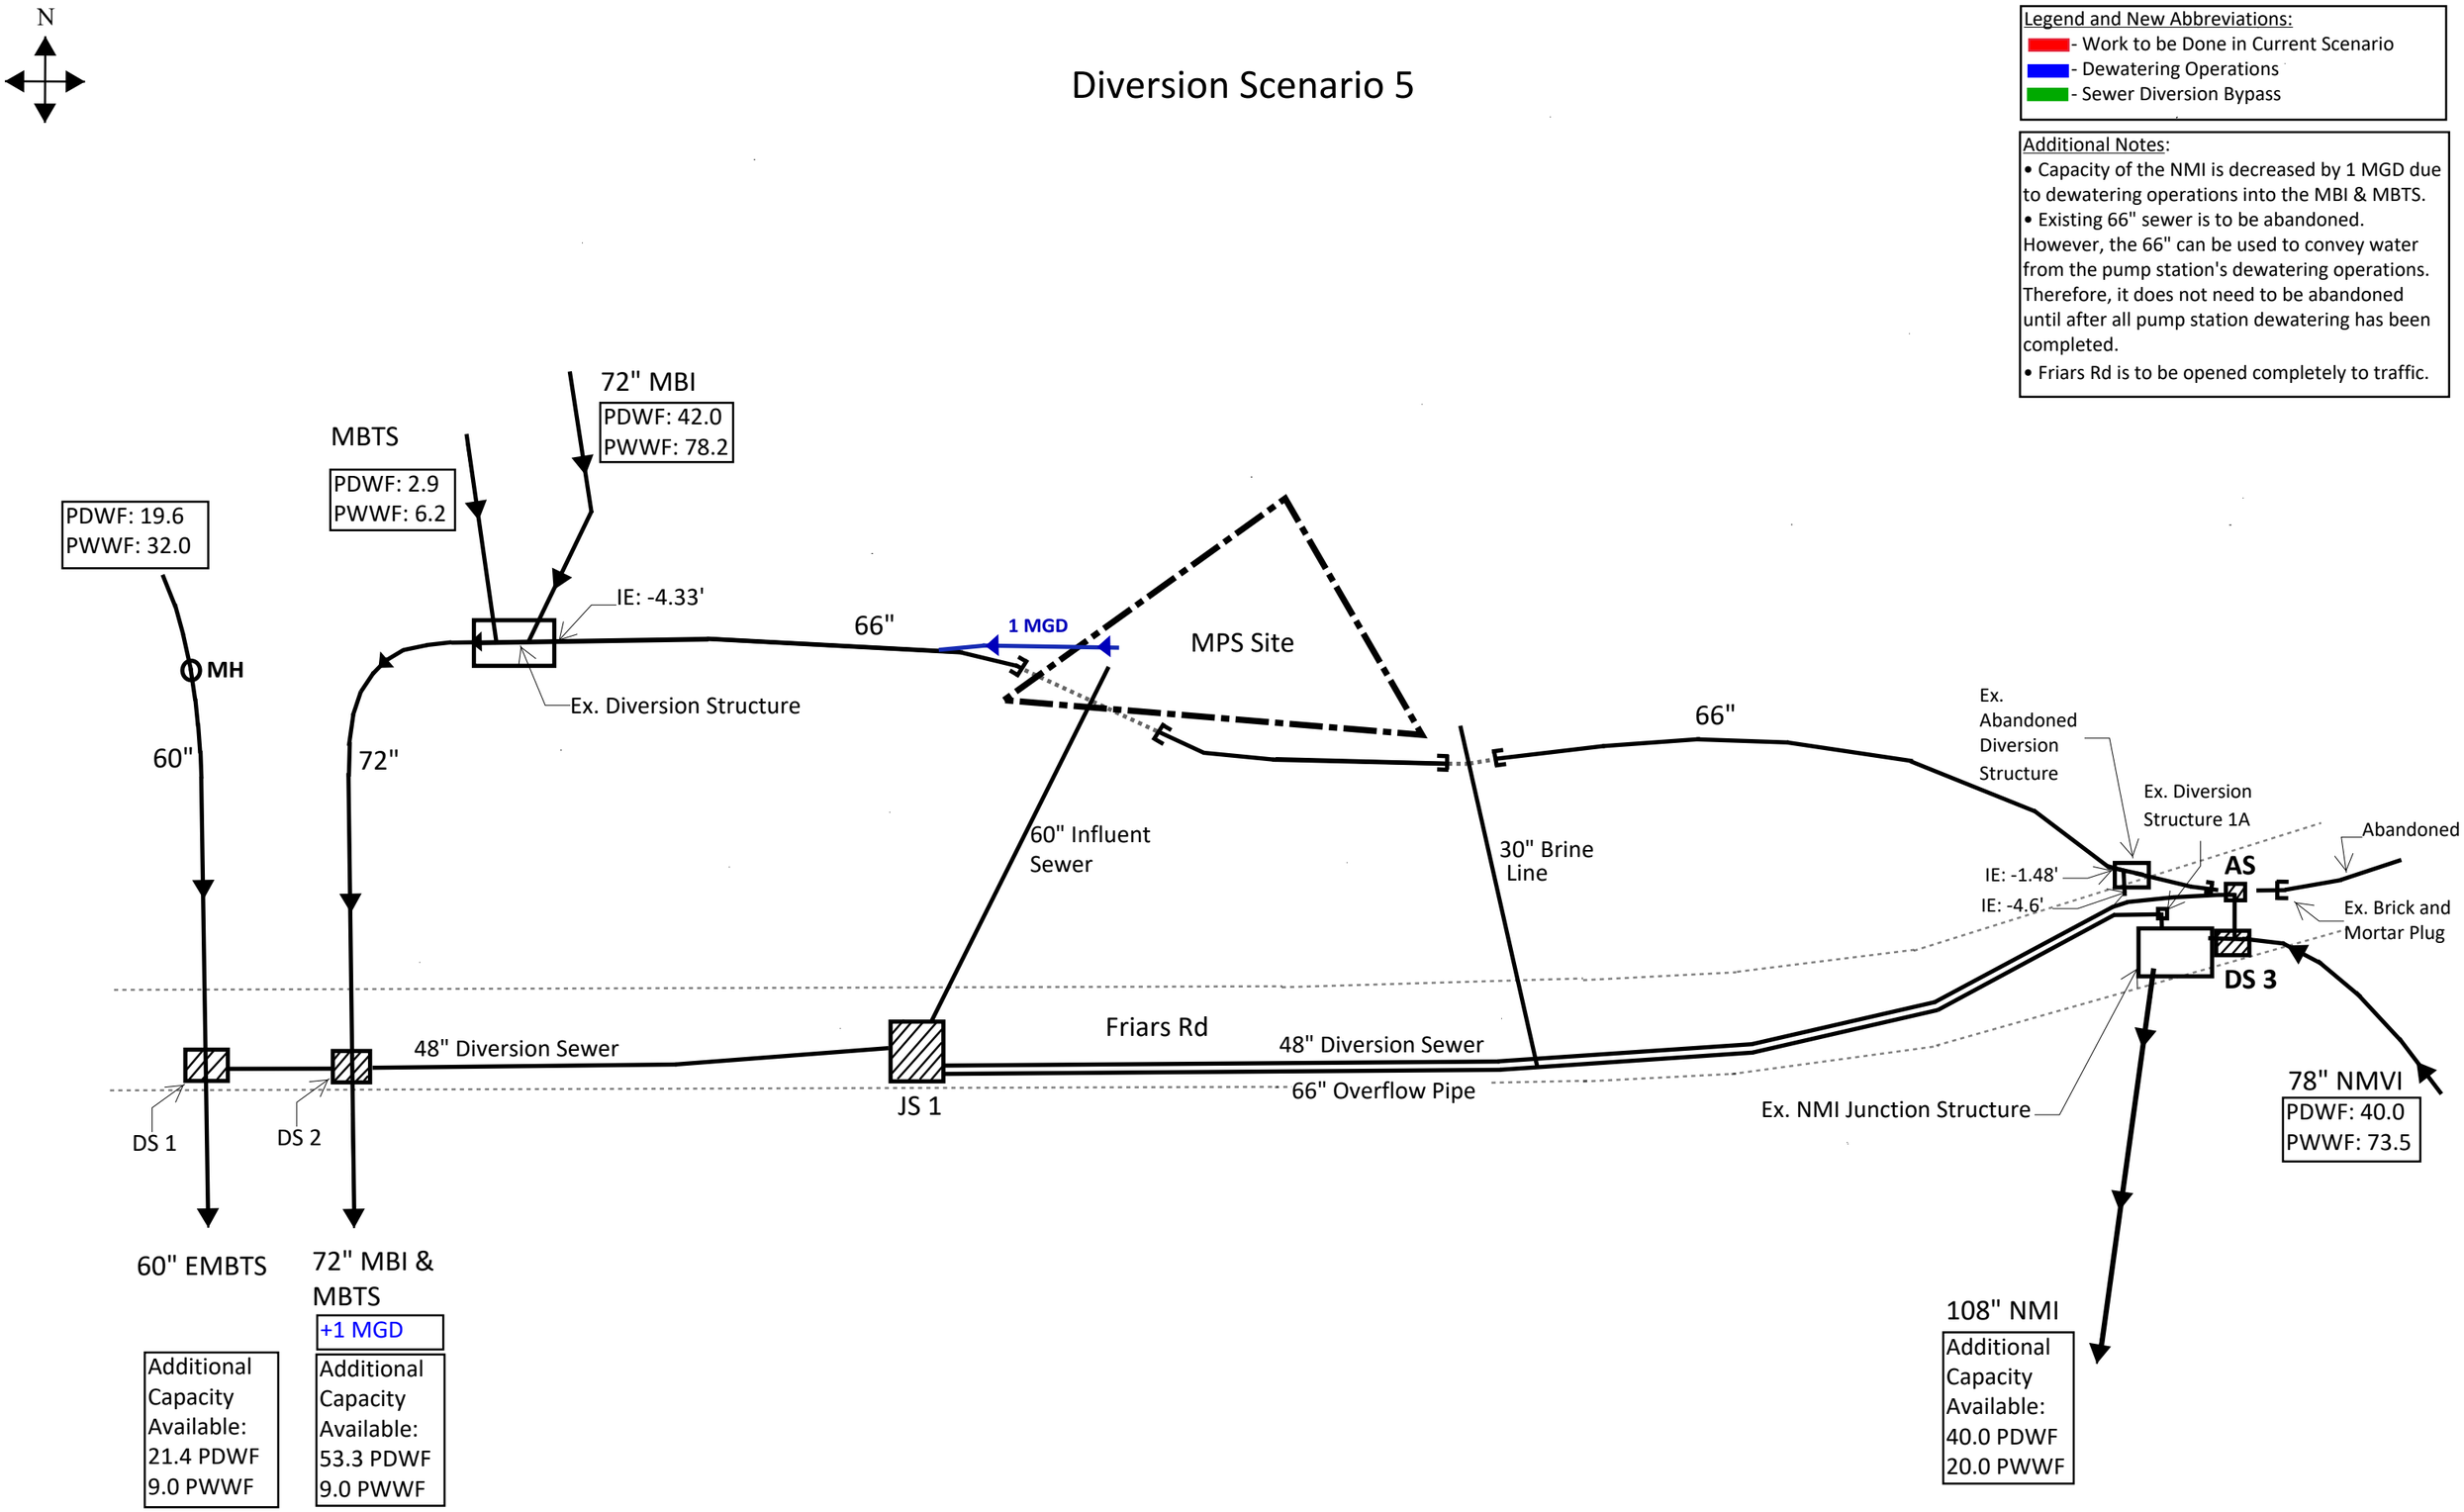


All pipe installation to be done by open cut trench methods. Angle structure to be constructed within the alignment of the ex. 66" pipe. Cap the ex. 66" pipe west of the new angle structure, and remove any interfering portions of the abandoned pipe. New 66" overflow pipe to connect to Ex. NMI Junction Structure via Diversion Structure 1A. Remove interfering portions of ex. 66" pipe and Diversion Structure 1B in order to make this connection.

Diversion Scenario 5

Legend and New Abbreviations:
- Work to be Done in Current Scenario
- Dewatering Operations
- Sewer Diversion Bypass

Additional Notes:
- Capacity of the NMI is decreased by 1 MGD due to dewatering operations into the MBI & MBTS.
- Existing 66" sewer is to be abandoned. However, the 66" can be used to convey water from the pump station's dewatering operations. Therefore, it does not need to be abandoned until after all pump station dewatering has been completed.
- Friars Rd is to be opened completely to traffic.



NC MORENA BLVD PUMP STATION AND PIPELINES

PACKAGE A

CONTRACTOR'S RESPONSIBILITIES

1. PURSUANT TO SECTION 4216 OF THE GOVERNMENT CODE, AT LEAST 2 WORKING DAYS PRIOR TO EXCAVATION, YOU MUST CONTACT THE REGIONAL NOTIFICATION CENTER (E.G. UNDERGROUND SERVICE ALERT OF SOUTHERN CALIFORNIA) AND OBTAIN AN INQUIRY IDENTIFICATION NUMBER.
2. NOTIFY SDG&E AT LEAST 10 WORKING DAYS PRIOR TO EXCAVATING WITHIN 10' OF SDG&E UNDERGROUND HIGH VOLTAGE TRANSMISSION POWER LINES. (I.E., 69 KV & HIGHER)
3. LOCATE AND RECONNECT ALL SEWER LATERALS. LOCATIONS AS SHOWN ON THE PLANS ARE APPROXIMATE ONLY. LATERAL RECORDS ARE AVAILABLE TO THE CONTRACTOR AT THE WATER DEPARTMENT, 2797 CAMINITO CHOLLAS. LOCATE THE IMPROVEMENTS THAT WILL BE AFFECTED BY LATERAL REPLACEMENTS.
4. EXCAVATE AROUND WATER METER BOX (CITY PROPERTY SIDE) TO DETERMINE IN ADVANCE, THE SIZE OF EACH SERVICE BEFORE TAPPING MAIN.
5. CITY FORCES, WHEN SPECIFIED OR SHOWN ON THE PLANS, WILL MAKE PERMANENT CUTS & PLUGS AND CONNECTIONS.
6. KEEP EXISTING MAINS IN SERVICE IN LIEU OF HIGH-LINING, UNLESS OTHERWISE SPECIFIED SHOWN ON PLANS.
7. THE LOCATIONS OF EXISTING BUILDINGS AS SHOWN ON THE PLAN ARE APPROXIMATE.
8. STORM DRAIN INLETS SHALL REMAIN FUNCTIONAL AT ALL TIMES DURING CONSTRUCTION.
9. UNLESS OTHERWISE NOTED AS PREVIOUSLY POTHOLED (PH), ELEVATIONS SHOWN ON THE PROFILE FOR EXISTING UTILITIES ARE BASED ON A SEARCH OF THE AVAILABLE RECORD INFORMATION ONLY AND ARE SOLELY FOR THE CONTRACTOR'S CONVENIENCE. THE CITY DOES NOT GUARANTEE THAT IT HAS REVIEWED ALL AVAILABLE DATA. THE CONTRACTOR SHALL POTHOLE ALL EXISTING UTILITIES EITHER SHOWN ON THE PLANS OR MARKED IN THE FIELD IN ACCORDANCE WITH THE SPECIFICATIONS SECTION 33-UTILITIES.
10. EXISTING UTILITY CROSSING AS SHOWN ON THE PLANS ARE APPROXIMATE AND ARE NOT REPRESENTATIVE OF ACTUAL LENGTH AND LOCATION OF CONFLICT AREAS. SEE PLAN VIEW.
11. CONTRACTOR SHALL ATTEND PRECONSTRUCTION MEETING AS REQUIRED BY THE MITIGATION MONITORING AND REPORTING PROGRAM PER THE ENVIRONMENTAL IMPACT REPORT.

WORK TO BE DONE

THE PROJECT CONSISTS OF THE DEMOLITION OF EXISTING FACILITIES AT THE PROPOSED MORENA PUMP STATION SITE, THE CONSTRUCTION OF A NEW 37.7 MGD MORENA WASTEWATER PUMP STATION FACILITY, INCLUDING ODOR CONTROL SYSTEMS, ELECTRICAL BUILDING, SCREENING FACILITY, HIGH PURITY OXYGEN SYSTEM, MAINTENANCE BUILDING, ASSOCIATED CIVIL SITE WORK INCLUDING STORM DRAINAGE, YARD PIPING, PERIMETER WALLS, ACCESS GATES, PAVEMENT, AND LANDSCAPING.

THE PROJECT ALSO INCLUDES THE CONSTRUCTION OF 48-INCH, 60-INCH & 66-INCH DIVERSION AND OVERFLOW SEWERS, THREE DIVERSION STRUCTURES WITH SLIDE GATES AND JUNCTION STRUCTURE NO. 1.

DECLARATION OF RESPONSIBLE CHARGE

* I HEREBY DECLARE THAT I AM THE ENGINEER OF WORK FOR THIS PROJECT THAT I HAVE EXERCISED RESPONSIBLE CHARGE OVER THE DESIGN OF THE PROJECT AS DEFINED IN SECTION 6703 OF THE BUSINESS AND PROFESSIONS CODE AND THAT THE DESIGN IS CONSISTENT WITH CURRENT STANDARDS. I UNDERSTAND THAT THE CHECK OF PROJECT DRAWINGS AND SPECIFICATIONS BY THE CITY OF SAN DIEGO IS CONFINED TO A REVIEW ONLY AND DOES NOT RELIEVE ME, AS ENGINEER OF WORK, OF MY RESPONSIBILITIES FOR PROJECT DESIGN.

MONUMENTATION/SURVEY NOTES

THE CONTRACTOR SHALL BE RESPONSIBLE FOR SURVEY MONUMENTS AND/OR VERTICAL CONTROL BENCHMARKS WHICH ARE DISTURBED OR DESTROYED BY CONSTRUCTION. A LICENSED LAND SURVEYOR OR LICENSED CIVIL ENGINEER AUTHORIZED TO PRACTICE LAND SURVEYING IN THE STATE OF CALIFORNIA SHALL FIELD LOCATE, REFERENCE, AND/OR PRESERVE ALL HISTORICAL OR CONTROLLING MONUMENTS PRIOR TO ANY EARTHWORK, DEMOLITION OR SURFACE IMPROVEMENTS. IF DESTROYED, A LICENSED LAND SURVEYOR SHALL REPLACE SUCH MONUMENT(S) WITH APPROPRIATE MONUMENTS. WHEN SETTING SURVEY MONUMENTS USED FOR RE-ESTABLISHMENT OF THE DISTURBED CONTROLLING SURVEY MONUMENTS AS REQUIRED BY SECTIONS 6730.2 AND 8771 OF THE BUSINESS AND PROFESSIONS CODE OF THE STATE OF CALIFORNIA, A CORNER RECORD OR RECORD OF SURVEY, AS APPROPRIATE, SHALL BE FILED WITH THE COUNTY SURVEYOR. IF ANY VERTICAL CONTROL IS TO BE DISTURBED OR DESTROYED, THE CITY OF SAN DIEGO FIELD SURVEY SECTION SHALL BE NOTIFIED IN WRITING AT LEAST 7 DAYS PRIOR TO CONSTRUCTION. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE COST OF REPLACING AND VERTICAL CONTROL BENCHMARKS DESTROYED BY THE CONSTRUCTION.

ENGINEER OF WORK

The engineering Specifications and Special Provisions contained herein have been prepared by or under the direction of the following Registered Engineer:

Shapiro, Alan

Digitally signed by Shapiro, Alan
DN: cn=Shapiro, Alan, ou=USSDG1
Reason: I have reviewed this document
Date: 2020.12.11 13:22:12 -08'00'

1) Registered Engineer (Morena Pump Station) — 12/11/2020 Date — Seal:

2) For City Engineer (Morena Pump Station) — 12/11/20 Date — Seal:

A. CHANGES TO CONTRACT DOCUMENTS

The following changes to the Contract Documents are hereby made effective as though originally issued with the bid package. Bidders are reminded that all previous requirements to this solicitation remain in full force and effect.

B. BIDDER's QUESTIONS

Q1. Geneva Pipe and Precast is a division of Northwest Pipe Company (NWP). NWP has discontinued the manufacturing and supply of PVC Liner, Ameritech T-Lock as specified in section 33 05 10 Materials sections 2.2.E. NWP through Geneva Pipe and Precast now offers HDPE Perfect Liner as manufactured by AGRU. Execution of the HDPE liner installation as specified in section 33 05 10 Execution Section 3.2 conforms to SSPWC Subsection 311-1.

We are asking to replace the "Ameritech T-Lock" product with "HDPE Perfect Liner".

A1. Installed HDPE liner shall conform to Specification 33 05 00, HDPE Liner, provided in this Addendum.

Q2. It is requested that EPDM tilting edge gaskets installed on an internal pipe coupler be permitted with the following changes, indicated with quotations, incorporated into the Specification: Rubber Gaskets: Rubber gaskets "used on the concrete spigot" shall be neoprene and shall comply with the requirements of ASTM C 361. "Any additional gaskets used internally, such as EPDM tilting edge gaskets on an internal pipe coupler, are permitted."

Please respond if EPDM tilting edge gaskets installed on an internal pipe coupler will be permitted.

A2. Installed HDPE liner shall conform to Specification 33 05 00, HDPE Liner, provided in this Addendum.

Q3. Perfect Pipe, as produced by Geneva Pipe and Precast, utilizes an internal joint coupler which compresses two EPDM tilting edge gaskets to an HDPE liner cast 360 degrees around the interior of the pipe to eliminate the need for field welding plastic in diameters 60" and smaller. The current specification calls for the liner to cover 330 degrees of the pipe interior surface, leaving an open arc of 30 degrees at the bottom of the pipe.

Please respond if a liner cast 360 degrees around pipe interior surface will be permitted.

A3. Liner cast 360 degrees within the pipe will not be permitted. HDPE lined RCP shall conform to Specification 33 05 01.10, HDPE Lined Reinforced Concrete Pipe for Jacking and Tunneling, provided in this addendum.

Q4. There are manholes on the upstream ends of the 60" interceptor up beside I-5 and the 78" interceptor in the YMCA parking lot. Can these structures be used for bypass pumping?

A4. Limited access to the YMCA parking lot will be allowed. Access to the sewer besides I-5 will require a Caltrans encroachment Permit.

Q5. Can Owner confirm whether or not all funding is in place for this project?

A5. Funding is secured.

Q6. Please confirm that a San Diego Business Tax certificate is not required until project award.

A6. Confirmed.

Q7. Regarding Section 09 90 00 Painting And Coating. Please confirm the attached is the current and correct version for the 12/17/20 bid opening.

A7. The "Final" issue is the correct version.

Q8. Regarding Part 3.7 Protective Coatings and 3.8 Architectural Paint Application Schedules. Absent a room finish schedule, please confirm that 3.7 and 3.8 of the attached Section 09 90 00 is an exhaustive list of the surface requiring field painting.

A8. Confirmed, Sections 3.7 and 3.8 are the schedules.

Q9. Key note 5 on drawing M-07 calls out for a Flanged coupling adapter that is depicted on detail 2 on page M-18. Keynote 5 on page M-11 calls out for a Romac ECF400 which is an equipment connection fitting different of what is depicted on detail 2 page M-18. Please specify which fitting is the correct one.

A9. Provide Equipment Connection Fittings, Romac ECF-400 or approved equal, at all locations shown as such on Drawing M-11.

Q10. On page M-07 Key note 12 calls out for a Surge protection relief pipe connection on detail 5 of pg M-20. There is no detail 5 on page M-20. Can you please provide this detail?

A10. Connection detail is shown on Detail 7 of Drawing S-63. The reference on drawing M-07 to Detail 5 on M-20 will be changed to Detail 7 on Drawing S-63. Plans revised as part of Addendum A.

Q11. Do any of the conveyance pipelines require CCTV?

A11. Gravity conveyance pipelines 48-inches in diameter and larger can be inspected visually with manned entry and do not require CCTV inspection.

Q12. Reference the window schedule on Sheet A-37. Mark A and Mark B are located in the same wall in the Screenings Building, however, they have different heights (A is 6’-0" H and B is 9’-4" H). Both Sheet A-13 and the schedule places the bottom sill at 17’-4" AFF (EL 33.33). Sheet S-36 shows that there is only 7’-4" of wall for the window to be placed (EL 40.67 – EL 33.33 = 7.34’). Please confirm that window B should be 6’-0" not 9’-4".

A12. Both Mark A and Mark B should be 6’-0”.

Q13. Section 07 72 00 Roof Accessories and 07 72 33 Roof Hatches (Bilco Type D) both cover the roof hatch. Why are there two different specifications for the same item? Can one be deleted so as not to confuse or contradict the other?

A13. Section 07 72 33 is deleted via this Addendum.

Q14. Reference Sheet S-31, which shows the overhang outside of B and C Line to be 2’-0". Sheet A-06 shows the same overhang to be 2’-10". Which dimension is correct?

A14. Use the 2' -0" overhang dimension as shown on S-31 for the Screening Facility.

Q15. On the Arema Table 1-5-6 on SHT 40-D of the plans, cathodic protection is marked as not required. On SHT 44-D, Detail 4, note 4, it states "The steel casing installation shall include a cathodic protection test station per SDW-121 and SDW-129 on each end of casing." Please provide clarification if cathodic protection will be required on the 36" Brine line.

A15. No cathodic protection is required for the casing. A 4-wire casing test station will be required at least on one end of the casing. Two wires attach to the pipe and two wires attach to the casing.

Q16. In specification Section 33 05 10, subpart 2.2.E states: "The liner shall cover 330 degrees of the pipe interior surface, leaving an open arc of 30 degrees at the bottom of the pipe for observation of cracks that may occur during D- Load tests." Although unlikely with the geotechnical conditions for this project, the trenchless method of installation has the potential to roll- turning the pipe in either direction, which would render the plastic lined interior out of the above-mentioned specification. Was this considered in the design? Is there an allowable deviation from this on the tunneled portions?

A16. Liner cast 360 degrees within the pipe will not be permitted. Installed HDPE lined RCP shall conform to Specification 33 05 01.10, HDPE Lined Reinforced Concrete Pipe for Jacking and Tunneling, provided in this Addendum.

Q17. In Section 31 71 19, subpart 1.5 the experience requirements for microtunneling are vaguely stated. They don't specify any particulars, such as amount of work performed previously, drive lengths, number of drives, etc. This allows for non-qualified contractors to bid this highly specialized work. This is different from other City-bid microtunneling projects in the past. We request that the City include specific microtunneling qualifications for the Contractor, Superintendent and MTBM Operator.

A17. Qualifications stated in solicitation shall remain.

Q18. White Book, SD, 54. Normal Working Hours - Unless specified otherwise, Normal Working Hours shall be 7:00 AM to 5:00 PM, Monday through Friday, inclusive. Saturdays, Sundays, and City Holidays are excluded.

SUPPLEMENTARY SPECIAL PROVISIONS; To the "WHITEBOOK", item 54, "Normal Working Hours", ADD the following: The Normal Working Hours are 8:00 AM to 4:00 PM. Construction activities outside of the normal working hours may occur with prior approval by the Resident Engineer, at no additional cost to the City.

A. This project specifies normal working hours 8 am to 4 pm, 8-hours a day and excludes work on weekends and holiday. To keep jacking load low tunnel work is typically performed during extended working hours or 24/7. We respectfully request the Owner identify what working hours will be allowed during the tunneling activities prebid at no additional cost to the City so this can be considered by the by the bidding Tunneling Contractors; I.E. See, below.

- Extended working hours, 12 hours a day
- Double shifts working hours, up 12-hours per shift
- Working hours, 24 x 7

A18. As stated in 1-2 Item 54 "Construction Activities outside of the normal working hours may occur with prior approval by the Resident Engineer, at no cost to the City." The Resident Engineer is likely to approve; extended working hours to 12-hours a day, double shifts, altering start times and end times, and continuous work for tunneling. The Contractor's request for altered working hours will need to address any changes in Traffic Control and anticipated work so the Resident Engineer can provide the appropriate staffing.

Q19. Will As-Built reports for the ground improvement projects for the North Metro Interceptor and the Mid-Coast Trolley be made available to bidding Contractors?

A19. The City is not in posession of the requested information.

Q20. Will foundation plans for the Pacific Highway bridge and the SANDAG MCTC bridge, including any post 1940s foundation improvements be made available to bidding Contractors?

A20. The City is not in posession of the requested information.

Q21. What is the allowable settlement of railroad racks for the MTS Trolley?

A21. No settlement of MTS tracks will be allowed.

Q22. Will a rip rap removal shaft be allowed at the 60" Influent Sewer alignment (should pilot tube proved encounter rip rap) as at the 36" Brine pipeline alignment (see Drawing C-16)

A22. Yes, a rip rap removal shaft would be appropriate at both locations, if the rip rap interferes with the proposed pipeline alignment.

Q23. SECTION 33 05 10, REINFORCED CONCRETE PIPE (RCP), RUBBER GASKET JOINT WITH PVC LINING, PART 2 PRODUCTS, 2.2 MATERIALS, E. PVC-Liner: PVC-liner shall conform to SSPWC Subsection 207.3 and shall be Amerplate T-Lock as manufactured by Northwest Pipe Company, Brea, California, or equal. The liner shall cover 330 degrees of the pipe interior surface, leaving an open arc of 30 degrees at the bottom of the pipe for observation of cracks that may occur during D- Load tests.

A. We understand the Amerplate T-Lock as manufactured by Northwest Pipe Company, Brea, California is no longer available, please identify whom provides an approved equal.

B. The liner only covering 330 degrees is potentially problematic, the rotation of the pipe within in a tunnel alignment cannot be controlled when using intermediate jacking stations that will be required on this work due to the tunnel lengths and pipe thrust capacities. We respectfully request the Owner change this requirement to 360 degrees or specify an alternative product to PLRCP with experience providing pipe for microtunneling installations.

A23. Liner cast 360 degrees within the pipe will not be permitted. HDPE lined RCP shall conform to Specification 33 05 01.10, HDPE Lined Reinforced Concrete Pipe for Jacking and Tunneling, provided in this Addendum.

Q24. Can the 48-inch Casing be increased to a 60-casing casing between Stations 3+33 to 1+00 at no cost to the Owner.

A24. Casing size may be increased at no cost to the Owner.

Q25. Can the 60-inch PLRCP be increased to a 66-PLRCP between Stations 19+53 to 22+30 at no cost to the Owner.

A25. Casing size may be increased at no cost to the Owner.

Q26. SECTION 31 71 19, MICROTUNNELING; C. Design Criteria: Sheet; 6. The MTBM shall meet the following minimum requirements: g. Provide access to the rear of the cutter wheel via an access door on MTBM that are over 60in outside diameter and on MTBM with an outside diameter over 72in with the provision of compressed air and an air lock if required.

A. The most challenging tunnel on the project will be the 48-inch PLRCP (59.50 OD) curved tunnel over 1,600 lf long that will not be over 60-inch outside diameter and installed without face access or the possibility of air interventions. Due to the limited footage on this project for the 60-inch and 66-inch PLRCP we would ask the Owner to consider removing the requirement in section (g) from the specification to significantly reduced the overall project costs.

A26. The pipe OD is nominal 59.5in the MTBM Body and overcut will be 60in or larger therefore face access is required.

Q27. SECTION 31 71 19, MICROTUNNELING; 2.2 EQUIPMENT: Control Systems 2. For long or curved drives Laser guided tachimetry or theodolite or gyroscope is also acceptable and in any case shall be used for guidance through the curved portions of the alignment. The guidance system shall be checked and calibrated at least every 50ft of pipe jacking or once every day whichever is the sooner.

A. The recommendation by the guidance system manufactures is to check and calibrate at least every 50-meters. We would ask the Owner to consider adopting the Guidance System MFG's recommendation.

A27. No change to the specification.

Q28. In the process of doing our outreach to meet the good faith effort requirements, several disadvantaged subcontractors have expressed concerns of not being able to bid this project because it is due a week

before the Christmas week and many of them take time off during that time. We respectfully request that the bid be postponed 2 to 3 weeks so that we get these subcontractors can submit their bid.

A28. See revised Bid Date in Addendum B.

Q29. We have concerns that we may not receive quotes for demolition of the existing facility from the demolition subcontractor because they did not attend the scheduled site visit. We would like to request a second site visit be set up so that these demolition subcontractors can attend.

A29. A second site visit is not available.

Q30. Specification section 01 50 25 describes the requirements for sewer bypass pumping on this project, but does not mention any restrictions related to the 78" NMVI bypass. The nearest upstream manhole on the 78" NMVI pipeline appears to be in the YMCA parking lot adjacent to the Mission Valley Preserve. Are there any restrictions with using a portion of the YMCA parking lot for this bypass? Are there any restrictions with installing bypass piping through the Mission Valley Preserve.

A30. At the Contractor's option, Diversion Structure 3 may be constructed without the use of a pumped bypass of the existing 78-inch NMVI. Construction methods such as the use of flow through tubes and construction sequencing shall be performed to maintain live sewage flow at all times through the work area. Addendum A, response to Q67 will be revised to state a detailed work plan for structure construction and sequencing will need to be submitted for City approval prior to construction. The work plan shall describe the construction sequence and means and methods employed to convey a maximum of approximately 80 MGD (City to confirm) through the work area without the possibility of a sewage spill or surcharging the upstream portion of the NMVI sewer. The City reserves the right to reject the Contractor's work plan if such means and methods do not provide sufficient protection from sewage spill or provide adequate flow through capacity.

Q31. The Owner Representative Field Office Per SSP 8-2.5F1 on page 179 states the office shall be available within 30 days of the notice to proceed through notice of completion. Please confirm the Owner Representative Field Office is to be removed after Intermediate Substantial Completion 750 working days from NTP.

A31. The Owner Representative field office is to be removed after Final Completion, 925 working days from NTP.

Q32. The project drawings call DIP piping to have Fusion Bonded Epoxy Lining and Coating (Key Notes 7/C03, 1/C08, 15/M-14, Details 1,2/M-16). Specification Section 09 90 00, Paragraph 3.7.B Coating and Lining for Steel and Ductile Iron Pipe, Fittings, Couplings, Adapters, and Valves provides specific requirements to such lining and coating. Although, per Spec Section 33 05 19, Paragraph 2.01.F.2, pipe and fittings shall be lined with 40-mil ceramic epoxy, as manufactured by Induron, or equal, and this section is silent on the matter of coating of ductile iron piping. Please clarify which provision applies to DIP lining and coating (buried, submerged, and exposed).

A32. All ductile iron pipe and fittings shall be fusion bonded epoxy lined and coated and conform to the requirements of Section 09 90 00 Part 3.07 B.

Q33. Specification Section 09 90 00, Paragraph 3.7.B is titled "Coating and Lining for Steel and Ductile Iron Pipe, Fittings, Couplings, Adapters, and Valves", although the first sentence of this paragraph only mentions Ductile Iron piping, fittings, etc., and requires it to be lined and coated with a fusion bonded epoxy system. There is no mentioning of the Steel piping within this paragraph and it is not clear whether Steel piping is also a subject for fusion epoxy lining and coating. Further, the Spec Section 33 05 24 Steel Pipe, Paragraph 3.7.A says: "Apply cement mortar lining to welded steel pipe, pipe fittings and specials except where the limits of epoxy or polyurethane lined pipe is shown on the Plans. Apply pipeline coatings to welded steel pipe, pipe fittings and specials according to the limits for the type of coating system as shown on the Plans, or as specified herein".

a. The drawings show 48" Pump Station Forcemain, CML & TCML welded steel pipe (Key Note 5/C-03). The profile for this pipe (Section A/C-07) calls for "1-inch min thick cement mortar liner & a coating of Rock Shield" (Note 1/C-07). Please provide a clarity on which lining and which coating applies to this section of steel pipe.

b. Key Note 7/M-08 calls for 24" CML&C steel pipe with … 1" cement liner. Please clarify cement mortar lining applies this pipe; also advise whether mortar coating will be practical for this exposed portion of pipe.

A33. a) Pump Station 48" Diameter Force Main shall be CML & TCMC welded steel pipe per Specification Section 33 05 24, with 1-inch min thick cement mortar liner per drawings.

b) Exposed 24" CML welded steel pipe shall receive 1-inch min thick cement mortar liner and coating per System 4 Specification Section 09 90 00.

Q34. The drawing C-29 shows what seems to be two existing lateral connections to newly installed 8" sewer line (between STA 11+50 and STA 11+90).

a. The size of these laterals is unknown. According to City of San Diego Sewer Design Guide, Table 2-6, the lateral connection shall be made either to Main itself or a Manhole, depending on the size/type combination of Lateral and Main. Since there is no new manholes shown where the Laterals connect to Main, it is fair to conclude that the intent is for these two connections to be made directly to Main line. If the results of potholing show that a Manhole is required to perform a connection, will the Contractor be entitled to payment for such additional work?

b. Please clarify what shall be assumed for bidding purposes: a) these existing laterals will be have to be re-built as they are shown on the drawing (going beyond the curb and sidewalk into the parking lot of the adjacent property); b) these existing laterals will be just disconnected from old Main, cut shorter and reconnected to new 8" Main, within limits of Sherman St.?

A34. Responses to a & b: Connect the lateral to the 8" main shown on Drawing C-29 in accordance with the sewer lateral connection standard COSD drawing SDS 105.

Q35. The Contractors Note on sheet C-29 says "The Contractor shall pothole all sewer laterals at property line between STA.10+00 and STA.11+90 prior to construction of new sewer main. This information will be

reviewed by the Resident Engineer for final sewer main slope and depth approval".

a. If the revised design requires additional work beyond what is shown in the bid documents, will the Contractor be entitled for additional compensation?

b. If more sewer laterals (over two shown on the drawing) are discovered on the course of the project, will the Contractor be entitled for additional compensation for work to construct such additional connections?

A35. Responses to a & b: Yes, additional compensation would be in accordance with the contract documents.

Q36. Bid Item #11 Sherman St. Sewer Relocation – Sewer Bypass eludes to bypassing required to perform the work on drawing C-29.

a. Please confirm flow rates of existing lines to be bypassed.

b. Please confirm where to intercept flow and discharge flow being bypassed.

c. Can the private owner laterals be stopped to tie in or can this be completed at night?

A36. Existing flow within the 10-inch VCP Sewer is unkown. Flow can be intercepted at the upstream manhole located. The sewer entering MH1 indicated on C-29 is a lateral from the adjacent property. The existing 10-inch diameter VCP sewer coming from the north along Grant Street has an upstream MH located approximately 230-feet north of MH2 and a downstream MH south of MH3 approximately 320 feet. The two laterals located east of MH3 are to be 4-inch laterals. CONTRACTOR shall coordinate with the ENGINEER for the timing of cross over. CONTACTOR to assume no more than 24hours of none sewer use for the properties. Connection points will need to occur in R/W.

Q37. Note 3 of the MTS Standard Construction Notes on Drawing G-07 states that a Railroad Protective Liability policy will most likely be required. Please clarify the limits that are likely required on this policy.

A37. Required insurance is stated in Item 6. of the MTS Rail License

Agreement. And summarized as follows: $2,000,000 for injury to or death to one or more persons as a result of any accident or incident and for damages to or destruction of any property of others; and $2,000,000 per occurrence and $6,000,000 general aggregate for a railroad protective liability insurance policy, with San Diego MTS listed as the named insured.

Q38. Please confirm this project is subject to the California Acts of God statute which relieves the contractor from the cost associated with damage caused by an earthquake exceeding 3.5 on the Richter Scale in excess of 5% of the contractor's bid.

A38. No, this project is not subject to Public Contract Code Chapter, Contract Clauses -7105. (a). However, the City isn't requiring the contractor to be responsible for acts of God.

Q39. Bidding Documents, Performance Bond, Labor and Materialmen's Bond Form. It would appear that a new sentence has been added to the existing bond form that automatically eliminates the ability of the Surety to consider using the Principal as its completion contractor. While we understand that the preceding sentence provides the City with the ability to reject any contractor proposed by the Surety, specifically eliminating the ability of the Surety to utilize the Principal may be prejudicial to the Surety and to the completion of the project itself. When a Surety makes the decision to utilize its Principal to complete the project, it does so after an independent investigation of, among other things, the most cost effective and expeditious means of completing the work. Effectively, the Surety becomes the intermediary between the Principal and the City and the City's future communication regarding project completion is directly with the Surety, as opposed to having to maintain a direct relationship with the Principal. As a result, it may be in the best interests of the City and the Surety to discuss the use of a particular completion contractor during the course of the Surety's investigation, as opposed to foreclosing the option at the outset. Accordingly, please consider the below revision:

~~"The Surety shall not utilize the Principal in completing the improvements and work specified in the Agreement in the event the City terminates the Principal for default.."~~

A39. The requested revision will not be incorporated.

Q40. The profile view on sheet C-16 shows the need for the contractor to remove a portion of the 66" Sewer Line that runs underneath the MTS Trolley Tracks because it blocks the path of the microtunneled brine line. The portion of pipe that is to be removed is within the "prohibited zone" as outlined in note 5.1. Excavating underneath the trolley tracks to install shoring is not feasible to remove this section of pipe. Will the contractor be allowed to lower the elevation of the microtunneled brine line in order to pass underneath the 66" Sewer line? Is there another way to avoid removing the section of the 66" Sewer line that runs underneath the trolley tracks and in the way of the microtunneled brine line?

A40. The profile of the brine centrate line cannot be lowered due to system hydraulics. It is anticipated that entry into the 66-inch NMVIS pipe will be required to remove the interfering portion of the pipe. Reference note 2 on C-16.

Q41. Please confirm gallon capacity requirement of the Hydromodification Tank to be designed by the Pre-Cast Concrete Supplier on drawing C-06.

A41. Precast tank has nominal volume of 83,776 Gallons.

Q42. Please provide Traffic Control Plans for work to be performed in Custer and Sherman Street adjacent to Pump Station. Specifically scope of work on Drawings D-02, C-03 & C-16.

A42. Contractor to submit TC plan for site work.

Q43. The Keynote 1/C-08 says "Provide 16" CL 300 Flanged DIP … for both HPO Sewer Intake and Oxygenated Lines…". Use of Flanged fittings will require using a pair of MJ or similar Adapters at each fitting to switch from Restrained Joint pipe to Flanged fitting, this way increasing the overall cost and creating additional potential leak points. Please advise whether fittings with Restrained or Mechanical joints (used as allowed by the specification) will be acceptable, or the intent is indeed to use specifically Flanged fittings for these pipe lines.

A43. Restrained joints in accordance with Specification 33 05 19 are acceptable.

Q44. Per SSP 6-2.2 Work Restrictions: The item below is in reference to the Morena Pump Station Drawings 40421-D: 1. Contractor shall provide flagged vehicular access to the MTS Trolley overflow lot located on Friar's Road during trolley operational hours. -- Please confirm the only flaggers required are identified on the Traffic Control Plan T-01 to T-08.

A44. Confirmed.

Q45. Per multiple Q&A in Addendum A concerning T-Lock PVC Liner that is no longer in production. Please consider providing approved product to be used in lieu of T-Lock PVC Liner before the bid date so the contractors are bidding the same product.

A45. HDPE lined RCP will be acceptable in leu of PVC lined pipe and shall conform to Specification 33 05 01.10, HDPE Lined Reinforced Concrete Pipe for Jacking and Tunneling, provided in this Addendum.

Q46. 7.4.17 Contractor Provided Insurance That Is Not Covered By The OCIP Insurance- This section outlines the insurance the Contractor shall procure and maintain for the excluded parties. Confirm the excluded parties can purchase or maintain such insurance to meet the requirement. I would recommend amending to "Contractor shall procure and maintain or cause to be procured and maintained. "

A46. Contractor shall procure and maintain or cause to be procured and maintained.

Q47. Per the OCIP Definitions, excluded parties include 6) Subcontractors work with a value of less than $10,000, unless their work extends to be greater than three days of work or more. Confirm these subcontractors are exempt from meeting the requirements specified in 7.4.17 as subcontractors of this size may not be able to meet the required limits and requiring them to purchase additional limits would add unneeded costs to the project

A47. Contractor shall specify insurance requirements for subcontractors less than $10,000.

Q48. A42 stated that Owner would provide the builders risk policy for review. Please provide access to it accordingly.

A48. Policy information related to OCIP has been added. See new link:

https://drive.google.com/drive/folders/1Pv7h5YLs3K-57mTVSrLGWOThlj1Inz21?usp=sharing

Q49. A49 stated that Owner will provide workers compensation, general liability, and excess liability insurance for review. Please provide access accordingly.

A49. Policy information related to OCIP has been added. See new link:

https://drive.google.com/drive/folders/1Pv7h5YLs3K-57mTVSrLGWOThlj1Inz21?usp=sharing

Q50. SECTION 31 71 19, MICROTUNNELING; 1.4 SUBMITTALS: A. Submit the following in accordance with the Contract Documents. 8. Provide details of site monitoring plan including provision of measuring ground movements at shafts and along the tunnel alignment and the monitoring of any existing structures within 100ft of the centerline of the excavation and tunnel alignment. Submit a plan for actions to be taken in the case of ground movements or movements of structures exceeding the allowable movement limits (Unless otherwise submitted 1/2in movement requires action to be taken as per the plan).

A50. Yes, 1/2 in movement requires action to be taken as per the plan.

Q51. Reference is made to Addendum A, response to Q67, which requires the Contractor to develop a plan and design to open the top of the 78" NMVI pipeline to provide the necessary bypass pumping (in the area between the NMI Junction Structure and the trolley tracks). The response to Q67 creates two significant problems with this approach.

a) The referenced site is not large enough to support all the bypass equipment and pumps, which is necessary to successfully bypass flows and maintain a sufficient work area to allow construction of the new Diversion Structure 3.

b) The response to Q67 also requires the Contractor to design the repair of the existing 78" NMVI pipe. The requirement for the Contractor to design the repair of existing 78" NMVI pipeline is unusual and typically the Engineer of Record would furnish this design requirement. Please provide the following:

1. Bypass plan for a mandated work area with design considerations for the construction of the new Diversion Structure 3.

2. Provide a design for removing the top portion and the repairing of the existing 78" NMVI Pipeline for this bypass operation.

A51. At the Contractor's option, Diversion Structure 3 may be constructed without the use of a pumped bypass of the existing 78-inch NMVI. Construction methods such as the use of flow through tubes and construction sequencing shall be performed to maintain live sewage flow at all times through the work area. Addendum A, response to Q67 will be revised to state a detailed work plan for structure construction and sequencing will need to be submitted for City approval prior to construction. The work plan shall describe the construction sequence and means and methods employed to convey a maximum of approximately 80 MGD (City to confirm) through the work area without the possibility of a sewage spill or surcharging the upstream portion of the NMVI sewer. The City reserves the right to reject the Contractor's work plan if such means and methods do not provide sufficient protection from sewage spill or provide adequate flow through capacity.

Q52. Regarding Spec Section 44 47 28.26, my odor control manufacturer Daniel Company respectfully requests for the City to revise the requirement of **having a service center 25 miles from the jobsite** (Section 44 47 28.26, paragraph 1.7.A.3) to **having a service center 200 miles from the jobsite**. PLEASE NOTE that when this project was previously issued for bids in Summer 2019 we had requested – and the City had granted – this same change. The City had changed it previously via addendum but forgot to include the change in the new set of specs. See attached Addendum C from the last go around. The City increased the distance to 200 miles on page 26 of 48.

A52. Service center will be increased to 200 miles of the jobsite D.

Q53. Attachment E Section 31 45 20 1.3G JET GROUTING calls for a monitoring plan. Please provide details on the monitoring requirement.

G. The contractor shall provide a monitoring plan for nearby existing improvements

1. MTS light rail.

2. Unitied States Army Corps of Engineers (USACE) levee north of and bording Friars Road.

A53. The contractor needs to submit a monitoring plan of the surrounding improvements to be approved by the Engineer and in some cases, by the USACE and the rail authority.

Q54. Will the Builder's Risk insurance policy provided by the OCIP exclude or limit coverage in regards to equipment testing, interior water damage, piling, dewatering, and/or defects?

A54. See OCIP Builders Risk Policy in the link provided below.

https://drive.google.com/drive/folders/1Pv7h5YLs3K-57mTVSrLGWOThlj1Inz21?usp=sharing

Q55. Per General Structural Note 4 in S-1, "no backfill or loading of concrete wall shall occur until roof slabs are constructed and concrete has reached its 28-day compressive strength." Is this requirement applicable to the Morena Pump Station since there are concrete buttresses on all sides of the structure (see S-36 Note 4)? Please confirm if it's acceptable to backfill walls around Pump Station after concrete walls reach full compressive strength (no roof slab will be in place before backfill).

A55. Pump Station roof slab is required to be in place before backfilling walls.

Q56. It appears there is Fire Alarm System required as shown on electrical building plan, but missing fire alarm spec. Please verify if fire alarm system will be included and issue fire alarm spec.

A56. A fire alarm system is to be provided as shown on the electrical building plans. Technical Section 28 31 00 is provided in pages 27 through 49 of this Addendum.

Q57. I'm contacting you today to add our IPS couplings to the steel piping section of the NC Morena Pump Station Testimonials/Specifications. Victaulic is already listed in the Ductile Iron and Stainless Steel sections. I have attached our steel pipe specification literature and corresponding submittals for your review and to add.

A57. Materials/Equipment addition request by the selected contractor will be reviewed upon submittal.

Q58. In Spec Attachment E (p.159), it states sewer discharge fees shall be paid by Contractor. However, in Spec Sect 01 29 00-1.14R it defines Dewatering and Discharge Fees –Allowance and says it's for fees paid by the Contractor to the City for disposal of dewatering discharges to the sanitary sewer system. In Addendum A Q&A 35 the City confirms the fees will be paid under Bid Item #27. However, in Addendum B Q&A 43 it states cost to discharge groundwater to the sewer system is part of Bid Item #15 which is not an allowance. The discharge fee is a function of the volume of discharge, which the City has directed the Contractor to assume at twice the high end of the Geotechnical report. However, it may vary considerably and the contaminants which are there are only the results from one monitoring well. So, these could vary considerably as well. It makes a lot more sense for this to be paid under an allowance item so that the City isn't paying for items that may or may not occur. Please confirm that the dewatering discharge fees will be paid under Bid Item #27.

A58. The discharge fee paid to Public Utilities shall be paid as part of Bid Item 27.

Q59. Reference is made to S-43/D and Note 33 at the Pump Station. Exterior concrete wall along Line '2' at the Pump Station requires #5 hairpins as shown in S-43/D. Rebar clearance between face of wall and main reinforcement is 2" as shown. With the addition of #5 hairpins, rebar clearance to hairpin is reduced to approximately 1 ¼". Please confirm the Engineer's intention to keep the 2" rebar clearance is to hairpins.

A59. See revised drawing S-43 on Addendum B.

Q60. Reference is made to Screening Facility in S-32 Note 34, Grout Fill. Plans do not provide limits of Grout Fill from Inlet Pipe in Screening Facility to floor at EL: -16.00. Please provide plan view of Grout Fill limits.

A60. See revised drawing S-43 on Addendum B.

Q61. Paint spec section 09 90 00, Part 3.7B states that all buried and exposed above ground ductile iron piping, fittings, valves etc. shall be lined and coated with a fusion bonded epoxy system. However, section 33 05 19 Part 2.1F for Ductile Iron pipe states that pipe and fittings for clean water shall be cement mortar lined and asphaltic seal-coated. It then states that pipe and fittings are to be lined with 40 mil of ceramic epoxy.

Please confirm whether the ductile iron pipe and fittings on the project are to be lined with fusion bonded epoxy system or with 40 mil of ceramic epoxy.

A61. All ductile iron pipe and fittings shall be fusion bonded epoxy lined and coated and conform to the requirements of Section 09 90 00 Part 3.07 B.

Q62. During the site visit we noticed there were some steel casings in the parking lot. Will those be removed prior to NTP by others or is the awarded Contractor to remove?

A62. Contractor shall be responsible for removing steel casings.

Q63. Drawing D-02 shows several overhead utilities to be relocated by others. Please provide information regarding timing and duration for this work.

A63. Timing for relocation will occur per Section 5-6.2. Section 5-6.2 shall be modified from the first 30 days of the Contract time to the first 83 days. Also Section 2-14.3 add h) AT&T Relocation for B15141 NC Morena Blvd. Pump Station and Pipeline (Sherman & Custer), Judith Villacruz-Brandt 858-886-1910.

Q64. Drawings C-10 and C-11 (Keynote 11) calls for replacement of pavement sections on Friars Road with AC over "AC Base". Please clarify the AC Base?

A64. Sheet C-10, Keynote 11 states 7-inches AC Pvmt over 7-inches AC base. Assume full depth AC of 14 inches per City Std drawing SDG 113.

Q65. In the soils report (Geotechnical Report Morena Pump Station by AECOM Jan 5, 2018) it calls for "ground improvements on the entire pump station site". Please confirm that the entire site should receive ground improvements and not only the pump station footprint.

A65. Yes, the entire site. Not just the pump station footprint.

Q66. Supplementary Special Provisions Section 1-2 shows "Normal Working Hours" to be from 8am to 4pm. Please consider revising this to 7am start as this would minimize additional cost to the bid.

A66. As stated in 1-2 Item 54 "Construction Activities outside of the normal working hours may occur with prior approval by the Resident Engineer, at no cost to the City." The Resident Engineer is likely to approve; extended working hours to 12-hours a day, double shifts, altering start times and end times, and continuous work for tunneling. The Contractor's request will for altered working hours will need to address any changes in Traffic Control and anticipated work so the Resident Engineer can provide the appropriate staffing.

Q67. Attachment B Phase Funding Provisions mentions "…fund availability for each phase" and issuing of NTP for each Phase. Please provide some clarity to each of the phases referenced in the section.

A67. The Contractor with Resident Engineer and City Project Manager will meet to discuss needed funds per fiscal year and will collectively determine the appropriate level phased funds for the project based on the Contractor's anticipated spend curve plus contingency.

Q68. Attachment E Section 7-8.1 calls for a street sweeper every working day. Please confirm that this is correct as it appears excessive given that most of the work will be confined to one location (i.e. pump station).

A68. Street Sweeping is intended for the pump station, Sherman Street and Friars Road and is appropriate for the project.

Q69. Attachment E Section 7-16 Community Outreach outlines a detailed description of the requirements for this work. Based on the amount of work that will be needed to meet this requirement, it appears that a dedicated consultant specializing in community outreach may be needed. Please confirm that a Contractor's staff member will suffice.

A69. A Contractor's staff member will suffice for the responsibilities indicated under Community Outreach. The City's Construction Manager has procured an outreach consultant (an assigned Community Liaison) will lead outreach activities, and the Contractor's designated team member will support.

Q70. Attachment E Section 6-7.1.2 calls for a shutdown moratorium from May until October for shutdown of 16" and larger pipes. Please specify the day in May and October (i.e. May 15…October 1??). We have prepared a preliminary construction schedule (including the 120 working days for

testing/commissioning PLUS 30 working days for Acceptance testing) and it shows that the moratorium will push the completion beyond the 750 day Milestone 1, if the moratorium end is towards the end of October.

A70. Actual dates for shutdown moratorium of 16-inch and larger water mains is determined annually based on fire risk danger.

Q71. Plan page C-08 calls out ductile to be epoxy lined and coated per the 099000 spec section. Spec section 099000 3.7 calls out for ductile iron to be epoxy lined and coated with 16 mils of 206N and to be holiday free. I have been informed by my supplier that they can only epoxy line and coat holiday free pipe up to 5'0" long. In spec Section 33 05 19 it calls out for ductile iron to be lined with 40 mils of P-401 lining. Please confirm what lining and coating needs to be used on ductile iron pipe and fittings.

A71. Lining: Ductile Iron Pipe and Fittings shall be lined with 40 mils ceramic epoxy as manufactured by Induron or equal as required in Specification Section 33 05 19. Coating: Buried Pipe shall be Asphaltic Coated as required in Specification Section 33 05 19. Exposed pipe shall receive Coating System 4 as specified in Specification Section 09 90 00 - Painting and Coating.

Q72. Addendum A, A41 states that owner is not responsible for any losses as a result of earthquake. Our insurance broker is stating that earthquake coverage cannot be purchased by contractor without an underlying policy for same maintained by owner. If Owner policy does not provide at least a minimum of coverage for earthquake contractor cannot purchase a wrap policy for any additional coverage for earthquake. If contractor is responsible for all losses as a result of earthquake please confirm that Owner will add at least a minimum of such cover to their policy

A72. The OCIP builders Risk policy does not include earthquake coverage.

Q73. Spec section 40 27 00 part 2.2B calls for the diameter of Cement-lined steel pipe to be determined by the lining inside diameter. Keynote callout 7 on Drawing M-8 calls for the overflow piping on top of the pump station roof to the wet well to be 24" CML&C. If this piping was actually required to be CML&C, it would need to have an OD of 27" to

meet the ID required by the spec. It would have to be specially fabricated (rolled) since standard mill-manufactured steel piping does not come in this size. Please confirm whether this was the intent. Note that keynote callout 3 on drawing M-11 shows the same overflow piping as 24" welded steel FE pipe. Is this piping run to be CML&C or just welded steel FE piping without cement lining and coating?

A73. Closest standard size pipe is acceptable. Pipe will CML and Paint coated with system 4 09 90 00.

Q74. Keynote callout 14 on drawing H-08 for FRP duct supports on top of the pump station calls for duct support details shown on drawing H-12. However, there are no duct support details for this support configuration on drawing H-12. Please provide a support detail for the FRP duct supports at this location.

A74. Use Detail 4 on M-12 as called out. Invert support and place on 6-inch concrete pad as shown on H-08.

Q75. Drawing M-13 does not provide a joint type for the 1" 316 stainless steel HPO piping. Please confirm the joint type.

A75. Provide Welded joints.

Q76. The specification does not provide clear directions on the cleaning requirements of the 1" HPO piping. Spec section 43 42 00 part 1.04B states that items precleaned prior to shipment does not require further cleaning after installation. However, this seems to only apply to the vaporizer specification. Please confirm whether the 1" HPO piping needs to be cleaned and dried in the field.

A76. 1” HPO piping shall be cleaned and dried in the field.

Q77. Spec sections 05 05 23, 1.2B, 2.1A, 3.2A and 3.3A all make mention of CWI inspections, but none of them are clear on whether a CWI is required to be present for pipe shop welds. The Pipe spec section doesn’t not clarify this either. Please confirm whether CWI Inspector and inspections are required for shop Pipe Fabrication.

A77. CWI requirement is for field welding, not shop welding.

Q78. Per Spec 055000 para 1.1 A (9), it mentioned a reference to NSF-61. However, we don't find further items in Spec Div 05 specifically calling for NSF-61 requirements. Does this requirement apply to any specific item / under water item?

A78. NSF-61 Compliance is required for items where called for in individual specifications or as required by the drawings.

Q79. Does the SS Manual Bar Rack per S-28, M-01, M-23 need NSF-61 Certification?

A79. NSF-61 Certification is not needed for the Manual Bar Rack.

C. ADDENDUM

1. To Addendum B, Section B, Bidder's Questions, page 15, Q38 and A38, **DELETE** in its entirety and **SUBSTITUTE** with the following:

   Q38. Will the General Liability and Excess Liability insurance coverage provided under the OCIP contain any exclusions for work within 50' of railroad property?

   No.

   Will MTS be allowed to be added as an Additional Insured on these policies if/when required by written contract/agreement?

   A38. Yes. The OCIP CGL policy is endorsed with Contractual Liability – Railroads CG 24 17 10 01 on a blanket basis.

D. SUPPLEMENTARY SPECIAL PROVISIONS

1. To Technicals, SECTION 07 72 33, Roof Hatches (BILCO Type D), pages 617 through 619, DELETE in its entirety.

2. To Technicals, **ADD** Division 28, Electronic Safety and Security Manufacturers, SECTION 28 31 00, FIRE DETECTION AND ALARM, in pages 27 through 49 of this Addendum

3. To Technicals, Division 33, Utilities, **ADD** SECTION 33 05 00, HDPE LINER, in pages 50 through 53 of this Addendum.

4. To Technicals, Division 33, Utilities, **ADD** SECTION 33 05 01.10 HDPE LINED REINFORCED CONCRETE PIPE FOR JACKING AND TUNNELING, in pages 54 through 57 of this Addendum.

James Nagelvoort, Director
Engineering & Capital Projects Department

i. 1480, Speakers for Fire-Protective Signaling Systems.
j. 1604, Electrical Equipment for Use in Class I and Class II, Division 2, and Class III Hazardous (Classified) Locations.
k. 1638, Visual Signaling Appliances – Private Mode Emergency and General Utility Signaling.
l. 1971, Signaling Devices for the Hearing Impaired.

9. Uniform Fire Code (UFC): 3-600-01, Design: Fire Protection Engineering for Facilities.
10. Unified Facilities Criteria (UFC): 4-021-01, Design and O&M: Mass Notification Systems.

1.02 DEFINITIONS

A. Addressable: A fire alarm system component with a unique identification that can have its status individually identified or that is used to individually control other functions.

B. AHJ: Authority Having Jurisdiction.

C. CAD: Computer Aided Design.

D. Coded: Audible or visible signal that conveys information about alarm event. Examples are, number of rings of a bell or flashes of a strobe. This could be used to convey location or type of alarm.

E. dB: Decibels.

F. DXF: Drawing Interchange Format.

G. ECP: Environmental Control Panel.

H. FACP: Fire Alarm Control Panel.

I. HVAC: Heating, Ventilating, and Air Conditioning.

J. I/O: Input/Output.

K. LCD: Liquid Crystal Display.

L. LED: Light-Emitting Diode.

M. MOV: Metal Oxide Varistor.

N. RAM: Random Access Memory.

O. SOM: Sequence of Operations Matrix.

P. Zone: A defined area within the protected premises. A zone can define an area from which an alarm signal can be received or an area to which a signal can be sent. The term zone is typically used when describing conventional, nonaddressable systems.

1.03 SYSTEM DESCRIPTION

A. Design Requirements:

1. Contract Drawings show location of fire alarm panel emergency alarm components required by IFC 2704. Other component locations and quantities shall be determined by fire alarm system installer and shall be included as part of their design. This includes, but is not limited to, smoke detectors, heat detectors, manual pull stations, and notification appliances. Design and installation shall meet requirements of the local AHJ.
2. Contract Drawings show location of fire alarm system components.
3. Design, coordinate, and provide system in accordance with building codes indicated in Section 01 61 00, Common Product Requirements.
4. Design conduit layout and wiring interconnection of devices specified herein.
5. Coordinate, and include in design, requirements for interfacing with HVAC system.
6. Equipment suitable for addressable fire alarm system.

B. Performance Requirements:

1. Actuation of alarm (smoke or heat detector, flow switch, or other normally open initiating device contact) or trouble (trouble or supervisory switch) shall cause the following operations:
   a. Audible and visual indications of alarmed devices on fire alarm control panel display.
2. Actuation of duct smoke detectors shall, send signal (contact closure) to air handling unit to shut off HVAC equipment and send a Supervisory Alarm to the fire control panel.
3. Sequence of Operations Matrix at the End of Section describes functions of fire alarm system.

1.04 SUBMITTALS

A. Action Submittals:

1. Descriptive product information for each individual system component.

2. Dimensional drawings of panels and associated equipment.
3. Itemized bill of material.
4. Operating and programming instructions.
5. Control panel configuration and module data.
6. Complete point to point wiring diagrams of system and device interconnection. Identify spare connection points.
7. Alarm initiating, indicating, and supervisory device electrical data.
8. Annunciator configuration and module data.
9. Plans showing device and panel locations as well as conduit and cable sizes. Prepare drawings and diagrams on drawing sheets of uniform size without extraneous information. Marked up electrical, HVAC, lighting or similar drawings or copies of catalog data sheets are not acceptable in lieu of required drawings or diagrams.
10. Sequence of Operation Matrix.
11. Battery sizing calculations.
12. Supervisory power requirements for equipment.
13. Alarm power requirements for equipment.
14. Power supply rating justification showing power requirements for system power supplies.
15. Voltage drop calculations for wiring runs, demonstrating worst case condition.
16. Conduit fill calculations.
17. Sample warranty.
18. Recommended types and quantities for spare parts.
19. For each system's control panel, provide written schedule of active and spare addresses provided on each addressable circuit.
20. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:

1. Experience and qualifications of firm(s) proposed to design and install system.
2. Certifications documenting service technician's training. Certification shall indicate name of individual, training, dates, systems qualified, and current status.
3. Seismic anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.
4. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection and Testing.
5. Copy of design documents, Shop Drawings, and calculations submitted to code-enforcement authorities.
6. Code-enforcement authority approval letter.
7. Factory test reports.

8. Detailed program and schedule for testing, inspection, and maintenance of fire alarm system that satisfies requirements of NFPA 72, manufacturer's recommendations, and local authority having jurisdiction.
9. Written documentation for logic modules as programmed, for system operation, with matrix showing interaction of input signals with output commands.
10. System program hard copy and CD-ROM showing system functions, controls, and labeling of equipment and devices.
11. Documentation of system voltage, current, and resistance readings taken during installation, testing, and ATP phases of system installation.
12. System record drawings and wiring details including one set of reproducible masters and drawings on CD-ROM in a DXF format suitable for use in a CAD drafting program.
13. NFPA 72, Record of Completion: Submit to Owner and code-enforcement authorities.
14. NFPA 72, Inspection and Testing Form: Submit to Owner and code enforcement authorities.
15. Operation and Maintenance Data as specified in Section 01 78 23, Operation and Maintenance Data.

1.05 QUALITY ASSURANCE

A. Qualifications:

1. Provide names of projects, locations, and telephone numbers of persons to contact for at least two installations where Contractor or Subcontractor has installed detection and alarm systems that are similar in size and scope as this.
2. System design, installation and testing shall be performed by licensed firm(s) with established reputation in fire alarm system industry having experience in design, installation, and testing of fire alarm systems.
3. Technician with minimum of NICET Level II Certification for fire alarm systems or professional engineer registered in State of California shall be available onsite.
4. Service technician shall be formally trained by manufacturer.

B. Regulatory Requirements: Submit Shop Drawings and system design calculations for approval to the following code enforcement authorities.

1. Fire Marshal

1.06 SPECIAL GUARANTEE

A. Provide manufacturer's extended guarantee or warranty, with Owner named as beneficiary, in writing, as special guarantee. Special guarantee shall provide for correction, or at the option of the Owner, removal and replacement of Work specified in this Specification section found defective during a period of 5 years after the date of Substantial Completion. Duties and obligations for correction or removal and replacement of defective Work shall be as specified in the General Conditions.

1.07 MAINTENANCE

A. Maintenance Service: For 2 years after Correction Period, provide maximum of 2 service calls, at Owner's request, to make adjustments or repairs required to keep system in satisfactory, full operation.

1.08 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage the following spare parts:

Item	Quantity
Detectors and actuating devices	One complete set

B. Delivery: In accordance with Section 01 61 00, Common Product Requirements.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:

1. Siemens Building Technologies.
2. Simplex/Grinnell.
3. FCI.
4. Notifier Fire Systems.
5. Edwards Systems Technology.

2.02 GENERAL

A. Material and equipment shall be standard products of their respective manufacturers, and shall be of a model that has been in production for not less than 3 years. Equipment shall be supported by a service organization that is, in the opinion of Owner, reasonably convenient to Site.

B. Contractor shall become familiar with details of Project, verify dimensions in field, and revise conduit and equipment locations to avoid obstructions and allow installation of new equipment.

C. Contractor shall not begin system installation prior to receiving written approval of Shop Drawings from Engineer.

2.03 UL COMPLIANCE

A. Products manufactured within scope of Underwriters Laboratories, Inc. shall conform to UL Standards and have an applied UL listing mark.

B. Equipment shall be UL listed in accordance with requirements of NFPA.

2.04 SERVICE CONDITIONS

A. Altitude: Not greater than 3,300 feet above sea level.

B. Ambient Temperature:

1. Maximum 40 degrees C.
2. Minimum 0 degrees C.

C. Equipment shall be fully rated without derating for these conditions.

2.05 RADIO ALARM TRANSMITTER

A. Provide 8 zone (minimum) Monaco BT2-7 radio fire alarm transceiver, narrow band type. Notwithstanding any other provisions of this Contract, no other product will be accepted. Transceiver shall be factory assembled and tested, complete with manufacturer's locking cabinet, 60-hour rechargeable battery set, automatic battery charger, antenna surge arrestor, and coaxial cable.

B. Provide with manufacturer's standard wall mounted omnidirectional antenna and UHF antenna kit.

C. Provide manufacturer recommended lightning arrestor with NEMA 4 rated enclosure.

2.06 POSTED OPERATING INSTRUCTIONS (POI)

A. POIs shall be prepared on full size drawing sheets.

B. POIs shall be framed in extruded metal frames, mounted under glass and shall be water/weather resistant. Instructions shall be permanently mounted on reserved wall area in space shown on Drawings.

C. POIs shall include:

1. Facility floor plans showing location of fire equipment and devices with coordinated identification. Show items such as firewalls, fire dampers, and fire alarm devices.
2. Fire alarm wiring diagrams and schematics, with zone identification and device address list.

2.07 FIRE ALARM CONTROL PANELS

A. General:

1. Control panel circuit for 24V dc, power limited, initiating circuits per NFPA 70, Article 760.
2. Assembled panel UL 864 listed Product Category UOJ2, as an integrated control system.
3. Enclosure:
   a. NEMA 250 Type 1.
   b. Color: Red.
4. Internally Mounted Module with:
   a. Transformer with 120 V ac input and 21.5V ac output.
   b. Solid state rectifier for 21.5V ac input and fuse protected, filtered, and regulated 26V dc no-load output.
   c. Solid state transfer switch, minimum 8 amp-hours.
   d. Standby Ni-Cd batteries sized for system operating period of 24 hours of standby mode operation.
   e. Solid state battery charger.
   f. Over/under voltage monitor supervisory circuit.
   g. LEDs for status of normal power, battery trouble, and power supply module trouble.
   h. Alarm mode of 5 minutes after standby operation.
5. Local differentiating audible sound device for alarm, trouble, and supervisory conditions.
6. Full digital transmission protocol.
7. Addressable signal transmission protocol to be either digital pole/response protocol or proprietary communication protocol, with all antilog sensing device signals digitally transmitted to control panel.
8. MOV/gas discharge transient protection for power supply module.
9. For addressable systems provide additional 20 percent capacity for future indicating and initiating devices.
10. EMI/RF Protection:

a. Protect control equipment, devices, and wiring against unwanted radiated electro-magnetic interference (EMI) and from effects of audio and radio frequencies (RF) that can cause transmission of spurious alarms.
b. System shall be designed and installed so as to be unaffected (with control cabinet faceplates installed) by operation of handheld, portable radios of up to 5 watts, or portable cellular telephones up to 1 watt, within 12 inches of system components.

B. Three-Mode Control Panel:

1. Alarm, supervisory, and trouble modes of operation.
2. Modular construction with solid state microprocessor-based components and central processing unit, continuously scanning each module for status change.
3. Coded, fire alarm system with Class B, Style B initiating device circuits and Class B, Style Y notification appliance circuits.
4. Operator Interface Panel:
   a. Indicators, control switches, and tone device.
   b. LCD or digital display to indicate event type and zone location or LEDs with differentiating color lenses for:
      1) AC power on.
      2) Power trouble.
      3) System trouble.
      4) Supervisory alarm.
      5) Earth-ground trouble.
      6) Alarm for each zone.
      7) Trouble for each zone.
      8) Alarm signaling circuit trouble.
      9) Annunciator circuit trouble.
   c. Control Switches for:
      1) Alarm silence.
      2) System reset.
      3) Trouble signal silence and ring-back feature.
      4) Municipal connection circuit disconnect.
      5) Manual evacuation drill.
      6) Auxiliary one bypass.
      7) Auxiliary two bypass.
   d. Piezo-electric tone device with pulsed march time rate for alarm and continuous for trouble conditions.
5. Separate annunciator outputs rated 2-milliamperes supervisory and 120-milliamperes alarm.
6. Smoke Detector Output:
   a. Two- or four-wire as required, rated 2 amperes, 24V dc.

b. Interrupted when system is reset.

7. Supervised remote inputs for alarm silence and system reset.
8. Switch Selectable:
   a. System diagnostic tests.
   b. Alarm verification.
   c. Alarm silence inhibit.
   d. March time alarm code at cadence of 120 beats per minute.
   e. Temporal alarm code repeated at 1/2-second on and off intervals.
   f. Signal alarm circuit cutout.
   g. Manual evacuation.
   h. Selective signaling.
9. Two alarm and one trouble, Form C auxiliary/output relays rated 2 amperes, 30V dc, 0.5 ampere, 120V ac each.
10. Minimum of 12 input zones.

C. Addressable Control Panel:

1. Modular construction with solid state, microprocessor-based components, programmable central processor unit, back lighted display of primary control status and essential alarm operating conditions, and concealed, maintenance, purpose operator's keypad.
2. With Signaling Line Circuit Class B and Class B, Style Y Notification Appliance Circuits.
3. Main control module consisting of operator's keyboard/keypad, local and remote communications and supervision capabilities, system control memory, and programming interface.
   a. Two-line, back lighted, 80 alphanumerical LCD characters with:
      1) Visible cursor for entering data information.
      2) Displayable when cabinet door is open.
   b. Primary operators keypad with:
      1) Acknowledge keys and LEDs for system alarm, supervisory service, and system trouble conditions.
      2) Power on LED.
      3) Alarm silence reset keys.
      4) Displayable when cabinet door is closed.
   c. Pass code protected action display keypad for:
      1) Circuit/device enable or disable.
      2) Control on/off.
      3) Test/status.
      4) Auto or manual.
      5) Activate/reset.
      6) Display historical logs/real time.
      7) Function/menu.
      8) Program.

9) Delete.
10) Displayable when cabinet door is open.

d. Numerical entry and selection keypad, used in conjunction with action display keypad, to perform control function on system zones, initiating circuits, or auxiliary relays, and to gain access to system information. Displayable when cabinet door is closed.

e. Programmable control keypad with five pass code keys, associated LEDs, and identification labels for:
1) HVAC shutdown disable.
2) Displayable when door is open.

f. Four function keys for control of variable functions related to primary operations keypad, displayable when door is open.

4. TIA 485, NFPA 72, Style 4, Style 6, or Style 7 data circuit capability for remote annunciators.
5. Form C relay contacts rated 2 amperes, 24V dc.
6. Down loader port for connection to microprocessor-based transponder.
7. Power supply interface module generating digital voltage and current data to LCD with:
   a. dc power conversion and output terminals.
   b. Supervision and control of power supply.
8. Modules with coded input on first alarm, local trouble LED, and in/out capabilities for:
   a. 120 addressable initiating alarm sensors consisting of analog/addressable or traditional detector methods.
   b. Four hardwired I/O points, field selectable in any combination to be either NFPA 72, Style B or Style D, initiating device circuits or NFPA 72, Style Y or Style Z, indicating appliance circuits or auxiliary control circuits.
   c. Auxiliary control circuit contacts shall be single-pole, double-throw, rated 2 amperes at 24V dc and 0.5 amperes at 120V ac.
9. Auxiliary control circuit contacts shall be single-pole, double-throw rated, 2 amperes at 24V dc and 0.5 ampere at 120V ac.
10. Two isolated TIA 232 communication port modules.

2.08 ADDRESSABLE DETECTOR BASE

A. Solid state circuitry with integral LED visual alarm, dip switch or program selectable addressing, and common base receptacle for ionization, photoelectric, and heat detectors. Device address shall be located in base.

B. Constantly monitors detector status and status changes.

C. Suitable for mounting on standard outlet box.

D. Normally open, double-pole contacts rated 3 amperes, 125V ac for resistive loads.

2.09 INDIVIDUAL ADDRESSABLE MODULE

A. Solid state circuitry with selectable latch/nonlatch operating conditions and mounting plate.

B. Monitors single and multiple devices with dry contacts.

C. Suitable for installing inside 4-inch by 4-inch by 2-1/2-inch electrical box.

2.10 ZONE ADDRESSABLE MODULE

A. Monitor module with solid state circuitry for Class A four-wire detection circuits serving dry contact initiating devices.

B. Signal module with solid state circuitry for supervising and operating Class A circuits serving 24V dc signals, speakers, and telephone devices.

C. Control module with solid state circuitry for supervised control functions.

D. Module complete with mounting plate, suitable for installation in 4-inch by 4-inch by 2-1/2-inch electrical box having 1-1/2-inch deep extension ring.

2.11 INITIATING DEVICE

A. Pull Station, Fire:

1. Single-action station for general alarm.
2. Constructed of die-cast metal with baked red enamel finish, and raised white letters stating “FIRE.”
3. Surface-mounted with hinged front cover having keyed or allen-wrench reset lock.
4. Recessed pull handle for single action lift door and pull handle for double action operating station with plastic break rod.
5. Activated station pull handle, latched in protruding position until reset by key.
6. Stations keyed alike with fire alarm control panel.
7. Screw terminal for field connections.
8. Double-pole contacts rated 3 amperes, 125V ac for resistive loads.
9. Manual Pull Station: Microprocessor-based communication circuit address, and compatible with fire alarm control panel.

B. Smoke Detector:

1. Photoelectric type with plug-in, twist-lock addressable base per UL 217 and UL 268.
2. Solid state circuitry, unipolar, single source, dual sensing chamber, suitable for device releasing service.
3. Concealed, field adjustable, sensitivity test switch.
4. LED; pulsed indication for power availability and steady indication for activated detectors.
5. Self-Compensating Circuitry:
    a. Voltage Range: 15V dc to 30V dc, 24V dc nominal.
    b. Temperature Range: 0 degrees C to 38 degrees C.
    c. Operating Temperature Range: Minus 10 degrees C to 50 degrees C.
    d. Humidity Range: 0 to 95 percent relative humidity.
6. Double-pole contacts, rated 3 amperes, 125V ac for resistive loads.
7. Detectors equipped with insect screen.
8. Photoelectric sensors adjusted to within 3 percent of UL 217 window obturation sensitivity value.

C. Air Duct Smoke Detector:

1. Duct mounted housing with prealigned sampling and exhaust tubes, analog sensing, solid state circuitry, and plug-in, twist-lock addressable base for photoelectric detector in accordance with UL 286A, NFPA 72, NFPA 90A, and NFPA 101.
2. Sampling tubes to extend full width of branch air return duct.
3. Self-Compensating Circuitry:
    a. Voltage Range: 15V dc to 30V dc, 24V dc nominal.
    b. Temperature Range: 0 degrees C to 38 degrees C.
    c. Humidity Range: 10 percent to 90 percent relative humidity.
    d. Velocity Range: 400 feet to 4,000 feet per minute.
4. Front mounted LED with pulsed indication for alarm condition.
5. Normally open, single-pole, double-throw auxiliary relay with 2 amperes, 125V ac rated contacts for resistive loads.

2.12 ALARMS

A. Audible Alarm:

1. General:
    a. Polarized, 24V dc device with sound power measured dB in accordance with UL 464.
    b. Separate in/out wire leads for field connections.
    c. Baked red enamel finish.
    d. Audibility: In accordance with NFPA 72 and local requirements.

2. Modular Horn:
    a. Surface basic unit, complete with single projector, designed for mounting on 4-inch square standard electrical box.
    b. Manufacturer supplied box with flush grille plate and basic surface unit for recessed horns.

B. Visual Alarm, Fire:

1. Polarized, 24V dc, multi-candela indicating output per UL 1638.
2. Solid state circuitry for high-intensity control of xenon flashtube.
3. Tamper-proof, translucent molded, polycarbonate, pyramidal shaped lens with "FIRE" in red lettering visible from 180-degree viewing field; red enclosure.
4. Polarized in/out wiring.
5. Designed for mounting on wall, single-gauge electrical box, or as part of audible/visible base housing.

2.13 WIRING

A. AC power wiring shall meet requirements of Section 26 05 05, Conductors.

B. Low voltage wiring shall be solid copper or bunch tinned (bonded) stranded copper, minimum 14 AWG, and shall meet NEC Article 760 for nonpower limited service.

C. Network or addressable loop cables shall be as recommended by manufacturer for installation of their system and UL Listed for Fire Alarm Systems.

2.14 RACEWAYS

A. Conduit used for installation of Fire Alarm system shall follow requirements as identified in Section 26 05 33, Raceway and Boxes.

2.15 END-OF-LINE RESISTORS

A. Ohmic value and power rating as determined by manufacturer based upon number of circuit devices supplied and circuit configuration as installed.

B. Loose resistors at last device in circuit.

2.16 SURGE SUPPRESSORS

A. Transient Voltage Surge Suppressors (TVSS): In accordance with Section 26 43 00, Transient Voltage Suppression.

B. Transient Voltage Surge Suppressors (TVSS):

1. Provide to suppress voltage transients that might damage fire alarm panel/transmitter components. Unit shall wire in series to power supply of protected equipment with screw terminations.
2. Unit shall be UL 1449 listed with a 330-volt suppression level and have a maximum response time of 5 nanoseconds.
3. Unit shall meet IEEE C62.41 Category B tests for surge capacity.
4. Features:
    a. Multi-stage construction that includes inductors and silicon avalanche zener diodes.
    b. Long life indicator lamp (LED or neon lamp) which extinguishes upon failure of protection components. Fusing shall be externally accessible when this feature is available.
5. Manufacturer and Product: Edco of Florida, Ocala, FL; Model HSP-121BT2.

PART 3 EXECUTION

3.01 GENERAL

A. Coordinate with other trades for mounting and interfacing with fire alarm system related devices.

B. Install control panels, initiating and alarm devices, conduit, and wiring for interconnection of devices specified herein for complete and operable system.

3.02 INSTALLATION

A. Install and connect fire detection and alarm equipment in accordance with manufacturer's instructions and recommendations, and in accordance with applicable codes and standards.

B. Mount devices in accordance with manufacturer's instructions.

C. Provide outlet and junction boxes that are compatible with raceway system.

D. Mount detector LEDs so they are readily visible from floor.

E. Arrange duct detectors to monitor duct area and point of duct penetration sealed and reinsulated.

F. Install conductors in accordance with Section 26 05 05, Conductors, and NFPA 70, Article 760.

G. Install initiating alarm, signal, and communication conductors in separate and independent raceway system.

H. Circuit wiring color-code, as established by installer, to be maintained throughout installation.

I. Size conductors in accordance with device manufacturer's recommendations. Increase AWG size of alarm conductors, if necessary, to maintain terminal voltage drop within acceptable level required by NEC and NFPA.

J. Detectors shall not be installed until after construction clean up of trades is complete, per requirements of NFPA. Exception, where required by AHJ for protection during construction, detectors installed prior to final clean-up by trades shall be cleaned or replaced.

K. Duct Smoke Detector: Furnish, wire, and connect to fire alarm system in accordance with this Specification. Installed in accordance with Section 23 09 00, HVAC Controls, Field Components, and Instruments.

L. HVAC Equipment: Wire and connect fire alarm system to air handling system.

3.03 RADIO ALARM TRANSMITTER (RAT)

A. Installation shall be in strict accordance with manufacturer's recommended practices, product listings or approvals, NFPA 70, NFPA 72, and NFPA 1221. Ground transceiver and antenna to a driven ground rod and facility electrical ground system. Do not provide a separate ground rod. Mount transceiver adjacent to fire alarm panel. Supply power to transceiver through a line voltage surge suppressor as shown.

B. The Monaco BT2-7 transceiver frequency shall be determined by City. City personnel will be responsible for programming head end equipment.

3.04 CONDUIT

A. Requirements apply to fire alarm system conduits, electrical enclosures, terminal cabinets, junction boxes, pullboxes, and device backboxes.

B. Conduit systems shall be dedicated to fire alarm system and shall contain no unrelated conductors.

C. Fire alarm system conduits shall be of sizes and types specified under Section 26 05 33, Raceway and Boxes.

1. Conduit shall be as identified under Section 26 05 33, Raceway and Boxes. Flexible metallic conduit may be used for whips to devices only, maximum length 6 feet, 3/4-inch diameter minimum. Set screw type couplings or connectors are specifically prohibited.

2. Size conduits according to conductors contained therein. Cross sectional area percentage fill for fire alarm system conduits shall not exceed 40 percent.

D. Route and install conduit to minimize potential for physical damage, either mechanical or by fire, and so as not to interfere with existing building systems, facilities or equipment, and to facilitate service and minimize maintenance. Coordinate installation between different trades to avoid conflicts.

1. Conduit, except flexible conduit whips to devices, shall be solidly attached to building structural members or permanent walls. Conduit shall not be attached to existing conduit, ductwork, cable trays, other ceiling equipment, drop ceiling hangers/grids or partition walls, except where necessary to connect to initiating, evacuation signaling or auxiliary function devices.
2. Conduit shall be routed either parallel or perpendicular to building structural members.
3. Conduit shall be installed at a height so as not to obstruct any portion of a window, doorway cable tray, stairway or a passageway, and shall not interfere with operation of existing mechanical or electrical equipment.
4. Conduit, junction boxes, pull boxes, terminal cabinets, electrical enclosures and device backboxes shall be readily accessible for inspection, testing, service and maintenance.
5. Conduits shall be arranged to minimize the possibility of water in those conduits draining through control panels.
    a. Conduit, except nipples between control panels shall be arranged to enter control cabinets from below.
    b. Conduit shall be provided with three, 1/4-inch drain holes at horizontal low point beneath each control cabinet.
6. Bushings shall be provided at termination of conduit, prior to installation of wire.
7. Install junction boxes as necessary. Conductors shall be pulled through junction boxes, without splices.
8. Pullboxes shall be installed in each conduit at intervals not to exceed 100 feet. Pullboxes shall be 4-inch square, minimum.
9. Device backboxes and junction boxes shall be sized to accommodate number of conductors contained. Extension rings or extension boxes are prohibited.
10. Junction boxes, pull boxes, terminal cabinets, device backboxes, and raceways shall be gasketed and weather-tight per requirements of Section 26 05 33, Raceway and Boxes.

E. Conduit, junction boxes, panels, electrical enclosures, relays and device backboxes shall be exposed in unfinished areas. Conduit and device backboxes shall be concealed in walls, ceiling spaces, electrical shafts or closets, in finished areas, except as noted on Drawings. Exposed conduit penetrations of walls shall be provided with escutcheon plates on either side of the wall.

F. Conduit penetrations of walls, floors and ceilings shall be sealed around conduit(s) in accordance with Section 07 92 00, Joint Sealants, restoring walls, floors and ceilings to their original condition, fire resistance and integrity.

G. Pull boxes, junction boxes, conduit bodies, and terminal cabinets shall be painted “fire engine red” prior to installation. Provide touch-up painting, of normally visible pull boxes, junction boxes, and terminal cabinets prior to final acceptance testing.

H. Conduit shall be grounded by approved ground clamps, and per NEC requirements.

I. Mount end-of-line resistors on terminal blocks.

J. Detection and alarm wire shall be installed in separate conduits. Outgoing and return conductors for each supervised circuit shall be routed in separately as required by NFPA 72. The minimum separation of outgoing and return conduits shall be 1 foot vertically and 4 feet horizontally.

3.05 IDENTIFICATION

A. Junction, terminal, and pulling box covers shall be painted red and identified with engraved labels by zone and circuit that it contains.

B. Detection and terminal devices shall have engraved alphanumeric identification that shall be keyed to posted operations and maintenance instructions.

3.06 CONDUCTORS

A. Requirements apply to fire alarm system conductors, including all signaling line, initiating device, indicating appliance, releasing function, remote signaling, ac and dc power and grounding/shield drain circuits.

B. Conductors shall be:

1. New; wire that has scrapes, nicks, gouges or crushed insulation shall not be used.

2. Installed in conduit.
3. Continuous between devices and between devices and intermediary terminal cabinets.
4. Low voltage conductors shall be minimum size No. 14 AWG. Smaller conductors shall only be permitted where part of a manufacturer's specific communications cable, i.e. addressable system.
5. In accordance with requirements of NEC, Article 760 for nonpower limited service.

C. Splices in conductors are specifically prohibited.

D. Types:

1. Conductors, except ac power conductors and grounding conductors, shall be solid copper or bunch tinned (bonded) stranded copper.
2. Stranded copper conductors are acceptable for ac power conductors and grounding conductors only.

E. Terminations, including field connections to supervisory resistors, diodes, relays or other devices shall be to numbered terminals or terminal strips and readily accessible for inspection, service, testing and maintenance.

1. Terminations shall be within junction boxes, device backboxes, terminal cabinets, control panels or other suitable metal enclosures.
2. Terminals and terminal strips shall be suitable for the size and number of conductors connected to them.
3. Each conductor termination shall be uniquely numbered with durable plastic tags or uniquely identifiable by a combination of numbers and color codes. These conductor numbers shall be shown on Contractor's Record Drawings (floor plans and detailed wiring diagrams) in a manner allowing ready identification of conductor terminations.
4. Wire nuts are prohibited.
5. Where pigtail devices are factory provided with wires too short to be connected to terminal strips (i.e., solenoids), such connections shall be soldered and taped.

F. Control Panel Wiring:

1. Fully dressed and bundled with nylon tie wraps at 3-inch intervals.
2. Bundled wiring shall be routed parallel to terminal strips within control panels, with individual conductors turned out at 90 degree angles to their associated terminal connections.
3. AC power conductors shall be bundled and routed separately from low voltage conductors. A minimum 2-inch separation shall be maintained

between ac power conductors and low voltage conductors wherever possible.

4. Control cabinets shall be sized to accommodate the requirements of this Section.
5. Control panels shall not be used as raceways. Conductors that do not terminate within a control panel shall not be routed through that control panel.

G. Conductors shall be separated into the following categories:

1. Low voltage circuits that serve devices.
2. ac power circuits.

H. Each category of conductors shall be installed in physically separated, dedicated conduits, and shall not interface with one another, except at common associated control equipment. Conductors shall be further segregated as necessary to conform to fire alarm system manufacturer's recommendations and as necessary to prevent electrical crosstalk between conductors installed in common conduits.

I. Wiring shall be THHN or TFFN stranded. Use of multi-conductor twisted pair or similar wiring is not permitted.

J. Install as nonpower limited circuits in accordance with NFPA 72, and NEC, Article 760.

K. Conductors looped around terminals are prohibited.

L. Wire nut splices are prohibited.

M. T-tapping of circuits is prohibited.

N. Circuits shall be megger tested to voltage rating of their insulation before final terminations are made.

3.07 OVERVOLTAGE AND SURGE PROTECTION

A. Install TVSS for fire alarm control panel and radio alarm transmitter per manufacturer's requirements.

3.08 REPAIR/RESTORATION

A. Touch up scratches, mars, and dents, incurred during shipment or installation of equipment.

B. If required because of extensive damage, as determined by Engineer, refinish entire assembly.

C. Keep covers on smoke detectors until areas have been thoroughly cleaned.

3.09 TESTS AND INSPECTION

A. In accordance with Section 01 91 14, Equipment Testing and Facility Startup, and NFPA 72.

B. Demonstrate entire system meets performance requirements specified in Article System Description.

C. Perform tests in presence of code-enforcement authorities, Owner and Engineer.

D. Each smoke detector shall be individually field tested prior to installing device at its designated location to ensure reliability after shipment and storage conditions. A dated log indicating system address, type of device, sensitivity and initials of technician performing test, using test equipment specifically designed for that purpose, shall be prepared and kept for final acceptance documentation. After testing detection devices, base shall be labeled with system address, date, and initials of installing technician. Labeling shall not be visible after installation is complete.

E. Test wiring runs for continuity, short circuits, and grounds before system is energized. Resistance, current, and voltage readings shall be made as work progresses.

1. Systematic record shall be maintained of all readings using schedules or charts of tests and measurements. Areas shall be provided on logging form for readings, dates, and witnesses.
2. Notify Fire Marshal and Owner before start of any required tests. Correct items found at variance with Drawings or Specification during testing or inspection.
3. Deliver test reports to Fire Marshal and Owner as completed.

F. Prepare final as-built Sequence of Operations Matrix referencing each alarm input to every output function affected as a result of an alarm, trouble, or supervisory condition on that. In case of outputs programmed using more complex logic functions involving “any”, “or”, “not”, “count”, “time”, and “timer” statements; complete output equation shall be referenced in matrix.

G. Prepare complete listing of device labels for alphanumeric annunciator displays prior to acceptance test.

1. Test system wiring to demonstrate correct system response and correct subsequent system operation in event of:
    a. Open, shorted, and grounded intelligent analog signaling line circuit.
    b. Open, shorted, and grounded network signaling line circuit.
    c. Open, shorted, and grounded conventional initiating device circuits.
    d. Primary power or battery disconnected.
    e. Intelligent device removal.
    f. Incorrect device address.
2. Demonstrate system evacuation alarm indicating appliances as follows:
    a. Alarm notification appliances actuate as programmed.
    b. Audibility and visibility at required levels.
3. System indications shall be demonstrated as follows:
    a. Correct message display for each alarm input at control panel.
    b. Correct annunciator light for each alarm input.
4. Demonstrate system onsite and offsite reporting functions as follows:
    a. Correct alarm custom message display, address, device type, date and time transmitted, for each alarm input.
    b. Correct trouble custom message display, address, device type, date and time transmitted, for each alarm input.
    c. Trouble signals received for disconnect.
5. Secondary power capabilities shall be demonstrated as follows:
    a. Disconnect system primary power for a period of time as specified herein; at end of period, alarm condition shall be created and system shall perform as specified for period as specified.
    b. Restore system primary power for 48 hours and system-charging current shall be normal trickle charge for fully charged battery bank.
    c. Check system battery voltages and charging currents at fire alarm control panel using test codes and LCD displays

H. In the event system fails to perform as specified and programmed during acceptance test, test shall be terminated at discretion of acceptance inspector.

1. Retest system, correcting deficiencies and providing test documentation to acceptance inspector.
2. In event that software changes are required during acceptance test, system manufacturer to compare edited program with original and shall furnish utility program. Utility shall yield printed list of changes and system functions, inputs and outputs affected by changes. Items listed by program shall be minimum acceptable to be retested before calling for resumption of acceptance test. Submit printed list and printer log of retesting before scheduling of acceptance test.

3. Acceptance inspector may elect to require complete acceptance test to be performed again if, in their opinion, modifications to system hardware or software warrant complete retesting.

I. Upon completion of tests, complete and provide the following:

1. NFPA 72, Record of Completion, and Inspection and Testing Form.
2. Certification that final system meets UL.

3.10 MANUFACTURER'S SERVICES

A. Furnish manufacturer's representative in accordance with Section 01 43 33, Manufacturers' Field Services, for the following services at site or classroom as designated by Owner, for minimum person-days listed below, travel time excluded:

1. One person-day for installation assistance and inspection.
2. One person-day for functional and performance testing.
3. One person-days for prestartup classroom or site training.

END OF SECTION

HDPE LINER

Section 33 05 00

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: This specification incudes the requirements for production, installation, and testing of HDPE liner.

1.02 REFERENCES

A. American Society for Testing and Materials (ASTM):
   1. D7240 - Standard Practice for Electrical Leak Location Using Geomembranes with an Insulating Layer in Intimate Contact with a Conductive Layer via Electrical Capacitance Technique (Conductive-Backed Geomembrane Spark Test)
   2. D7853 - Standard Test Method for Hydraulic Pullout Resistance of a Geomembrane with Locking Extensions Embedded in Concrete

B. International Organization for Standardization (ISO):
   1. 527 – Plastics – Determination of tensile properties.
   2. 1133 – Plastics – Determination of the melt mass-flow rate (MFR) and melt volume-flow rate (MVR) f thermoplastics.
   3. 1183 – Plastics – Methods for determining the density of non-cellular plastics.

1.03 PERFORMANCE REQUIREMENTS

A. Plastic liner:
   1. Impermeable to sewage gases and liquids.
   2. Nonconductive to bacterial and fungus growth.
   3. Flexible.
   4. Attached to concrete by liner manufacturer selected extruded locking mechanism.
   5. Withstand 30 pounds per square inch back hydrostatic pressure applied to liners under surface without losing anchorage and without rupture and leakage.

1.04 SUBMITTALS

A. General: Submit as specified in bid document requirements

1.05 QUALITY ASSURANCE

A. Qualifications of welders:
   1. Welder and Weld Inspector shall be certified by the liner manufacturer.

PART 2 PRODUCTS

2.01 MATERIALS

A. Field sheets:
   1. Material: High Density Poly Ethylene (HDPE).
   2. Thickness: Minimum of 1.65 mm.
   3. Manufactured from inert products combined with synthetic resins, pigments, and plasticizers.
   4. Color: PE yellow RAL 1018.

B. Performance characteristics:
   1. Chemical resistance: Resistant to oxidizing agents; sulfuric, phosphoric, nitric, chromic, oleic, and stearic acids; sodium and calcium hydroxides; ammonia, sodium, calcium, magnesium, and ferric chlorides; ferric sulfate, petroleum oils and greases; vegetable and animal oils, fats, greases, and soaps.
   2. Permeability to sewer gases and liquids: None.
   3. Conductivity to bacterial and fungus growth: None.
   4. Material Properties:

	Property	Standard	Unit	Product
	Specific density at 23 degrees C	ISO 1183	g/cm^3	0.94-0.96
	Melt Flow rate MFR 190/5	ISO 1133	g/10min	1.6-2.0
Mechanical Properties	Tensile stress at yield	ISO 527	MPa	≥ 12
	Elongation at yield	ISO 527	%	≥ 8
	Elongation at break	ISO 527	%	> 400
	Modulus of elasticity	ISO 527	%	≥ 620
System Properties	Pull out resistance at 23 degrees Celsius Tensile Test 5mm/min (short term)	DIN ISO 4624	N/Stud kN/m^2	≥ 500* 854
	Anchor stud arrangement	-	$Studs/m^2$	~1709 central section ~2324 edge section
	Backpressure Resistance at 23 degree Celsius	DIBt-Pruefmethode	1.5 bar/1000h	Fulfilled
	Max. Working Temperature	-	Degrees Celsius	60
	Linear coefficient of thermal expansion	DIN 53752	$K^{-1} \times 10^{-4}$	1.8**

	Flammability	UL 94 DIN 4102 EN 13501	-	94-HB B2 Class E
Other Properties	UV Stabilized	-	-	3 year Central Europe 15 month South-western Asia
	Color	-	-	yellow

* Pull-out test was carried out with self-compacting concrete.
** guide value.

5. Back pressure resistance per ASTM D7853: Minimum 30 pounds per square inch for 200 hours without losing anchorage of liner anchors or rupturing of liner without need of bonding adhesive or adhesive bond of self-consolidated concrete.

C. Joint welding strips: Polyester backed HDPE sheet, minimum thickness 3.0 mm.

D. Liner patches: Polyester backed HDPE sheet, minimum thickness 3.0 mm.

E. Liner adhesive: Construction grade, two part adhesive epoxy.

2.02 FABRICATION

A. Integrally mold with heat and pressure or extrude liner studs/anchors on back of liner, capable of providing stability under anticipated loads including loads imposed by steel bands and wires used to secure liner to forms.

2.03 SOURCE QUALITY CONTROL

A. Reject liners, including liner anchors, joint strips, corner strips, and welding strips, that have cracks, cleavages, and other defects that adversely affect the protective characteristics of liners.

B. Check liners electrically per ASTM D7240 to determine presence of porosity or pin holes.
1. Reject liners with porosity or pinholes.

PART 3 EXECUTION

3.01 INSTALLATION

A. Install per manufacturer's recommendations.

3.02 PLASTIC LINER REPAIRS

A. Patch liner defects in accordance with liner manufacturer's instructions.

B. Patch small defects, such as nails, form tie holes, and small repairs and abraded areas, by fusing welding strips over defects to liner.

C. Patch larger defects by adhering smooth liner patches over defects, plus minimum 1-inch around defects, to liner with adhesive, centering welding strips over edges of patches, and fusing welding strips to liner and patches.

3.03 FIELD QUALITY CONTROL AND TESTING

A. Provide equipment required to test liner in accordance with manufacturer's instructions and ASTM D7240

END OF SECTION

HDPE LINED REINFORCED CONCRETE PIPE FOR JACKING AND TUNNELING

Section 33 05 01.10

PART 1 GENERAL

1.01 SUMMARY

A. This specification incudes the requirements for production, installation, and testing HDPE Lined Concrete Pipe.

1.02 REFERENCES

ASTM International

- ASTM C76/C76M – Standard Specification for Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe (Metric)
- ASTM C361 – Standard Specification for Reinforced Concrete Low-Head Pressure Pipe
- ASTM C443 – Standard Specification for Joints for Concrete Pipe and Manholes, Using Rubber Gaskets
- ASTM C497 – Standard Test Methods for Concrete Pipe, Concrete Box Sections, Manhole Sections, or Tile
- ASTM C1619 – Standard Specification for Elastomeric Seals for Joining Concrete Structures.
- ASTM D7240 – Standard Practice for Electrical Leak Location Using Geomembranes with an Insulating Layer in Intimate Contact with a Conductive Layer via Electrical Capacitance Technique (Conductive-Backed Geomembrane Spark Test)

OTHER STANDARDS

- HDPE Liner Specification, Section 33 05 00
- NPCA (National Precast Concrete Association) Quality Control Manual

1.03 SUBMITTALS

A. All shop drawings will be submitted for approval prior to any production. Drawings will include details showing all pipe dimensions, reinforcing requirements, gasket details, and any lifting requirements needed.

B. Submittals shall include complete calculations needed for jacking and tunneling.

C. All material data sheets, and sourcing will be submitted for approval before production.

1.04 QUALITY ASSURANCE/QUALITY CONTROL (QAQC)

A. Producers must be certified by the NPCA (National Precast Concrete Association) Quality Control Program. Producer must be certified prior to, and during production of all pipe.

B. All quality control testing will be kept on file and easily accessible upon request. Test reports and inspections will be stored and maintained for a minimum 3 years.

PART 2 PRODUCT

2.01 MATERIALS

A. All materials used will be pre-approved and documented.

B. HDPE liner
   1. HDPE liner material shall have a manufactures certificate of compliance meeting applicable ASTM standards. All certifications will be kept on file per section 1.04.
   2. Liner material shall be HDPE (High-Density Polyethylene) concrete liner material with a minimum thickness of 1.65 mm.
   3. Liner material shall meet requirements of the HDPE Liner Specification

C. Concrete pipe materials
   1. All materials shall have manufactures certificate of compliance meeting applicable ASTM standards. All certifications will be kept on file per section 1.04.

D. All materials used to produce the HDPE Lined Concrete Pipe shall meet the requirements of ASTM C76/C76M
   1. Cementitious Materials – Section 6.2
   2. Aggregates – Section 6.3
   3. Admixtures – Section 6.4
   4. Steel Reinforcement – Section 6.5
   5. Water – Section 6.7

E. Concrete pipe joints
   1. All joint materials, including HDPE weld strips, rubber gaskets, and steel bell bands shall have product certifications. All certifications will be kept on file per section 1.04.
   2. HDPE weld strips shall meet the requirements of the HDPE Liner Specification.
   3. Rubber gaskets will be O-Ring Gaskets meeting ASTM C1619.
   4. Steel bell bands will meet the requirements of ASTM C361 section 6.6.

2.02 MANUFACTURE

A. All products will be manufactured with dedicated forming. Documentation of production dates and details will be kept on file.

B. The pipe shall be manufactured using the vertically cast method (wet-cast) between stationary inner and outer metal forms. The concrete shall be transported and placed by methods that shall prevent the separation of the concrete materials and the displacement of reinforcement steel in the forms.

C. Curing shall be performed as specified in ASTM C76/76M Section 10.2

D. Liner shall be cast at the top 330 degrees throughout the pipe interior, leaving the bottom 30 degrees of concrete pipe exposed at the invert.

E. Approved manufacturer – Geneva Pipe and Precast

2.03 DIMENSIONS

A. Permissible Variations - All pipe tolerances will meet the requirements of ASTM C76/76M.
   1. Internal Diameter – Section 12.1
   2. Wall Thickness – Section 12.2
   3. Length of Two Opposite Sides – Section 12.3
   4. Length of Pipe – Section 12.4
   5. Position or Area of Reinforcement – Section 12.5

B. Pipe Deficiencies - HDPE Lined Pipe that does not meet all specifications will be labeled as “Approval Needed”. Producer may repair imperfections with an approved submittal outlining the process and procedures to repair the product. If product does not meet requirements and cannot be repaired, it will be labeled as “Non-Compliant” and separated from the other approved products.

2.04 TESTING

A. All sampling, testing, and inspection will be documented and saved according to section 1.04.

B. All concrete sampling and testing will meet ASTM C76 sections 11.4-11.8

C. All product will have a pre-pour and post-pour inspection. These inspections will meet the requirements of ASTM C76 and NPCA Quality Control Manual. Documentation will be in accordance with section 1.04. At a minimum, the following items will be checked and documented:
   1. Pre-Pour
      a. Forming
         1) Cleanliness
         2) Smoothness
         3) Geometry
      b. Reinforcing Cage

1) Geometry
2) Area of Steel

c. Liner
1) Defects
2) Geometry

2. Post-Pour
a. Concrete Quality
b. Geometry
c. Liner

D. All HDPE Liner welded joints will be testing in accordance with ASTM D7240

E. Concrete Pipe
1. Joint testing will be completed using ASTM C497 to meet the requirements of ASTM C443. Joint testing will be completed using the same cushioning type material as used during the Jacking/Tunneling process. One joint per size and per class of pipe will be tested.
2. Concrete Three-Edge Bearing D-Load Testing will be completed using ASTM C497. Concrete Pipe to be tested will not have liner installed in the tested sections for more accurate crack evaluation. The frequency of the testing will be in accordance with the NPCA Quality Control Manual. Daily concrete sampling and testing will also be required per section 4.02.

PART 3 EXECUTION

3.01 GENERAL

A. All lined HDPE Concrete Pipe will be handled, stored, and installed per manufactures recommendations. Extra care will be taken to insure product is not damaged.

3.02 JACKING/TUNNELING PROCESS

A. Concrete Pipe jacking/tunneling processes will be approved by the manufacturer. Items of concern are total jacking forces, alignment of jacking/tunneling, and any other special conditions that would put loading on the pipe.

3.03 FIELD TESTS

A. All lined HDPE Concrete Jacked/Tunneled Pipe will be required to have field welded joints. Welds will be completed by an approved certified welder from the liner manufacturer. All welds will be spark tested per ASTM D7240.

B. Infiltration/Exfiltration Test: Maximum allowable leakage shall be per local specification requirements.

C. Individual Joint Testing: For pipes large enough to enter, individual joints may be pressure tested with a portable tester to 5 psi maximum with air or water in lieu of line infiltration/exfiltration or air testing.

ENGINEER OF WORK

The engineering Specifications and Special Provisions contained herein have been prepared by or under the direction of the following Registered Engineer:

Shapiro, Alan

Digitally signed by Shapiro, Alan
DN: cn=Shapiro, Alan, ou=USSDG1
Reason: I have reviewed this document
Date: 2020.12.23 13:46:11 -08'00'

12/23/2020 Seal:

1) Registered Engineer (Morena Pump Station) Date

Nabil Batta

12/23/2020 Seal:

2) For City Engineer (Morena Pump Station) Date

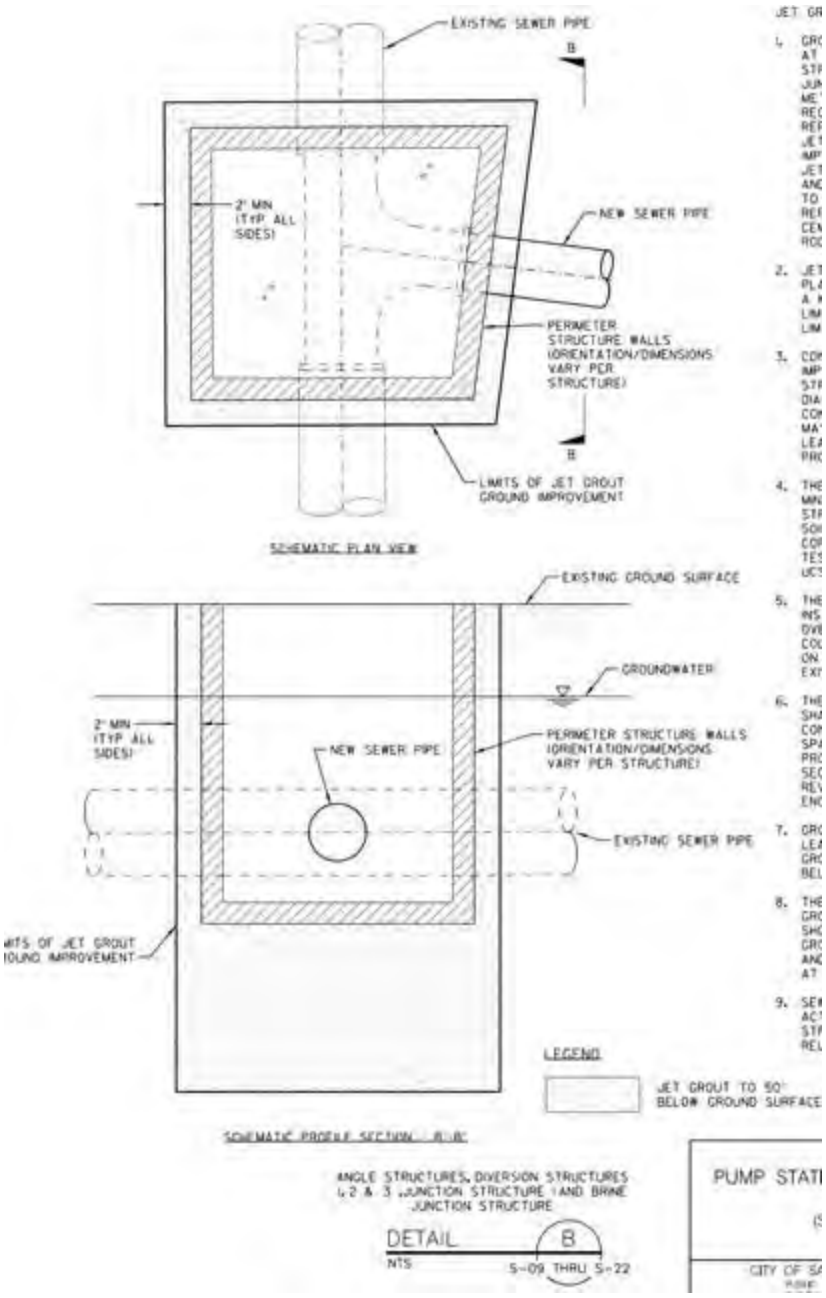
A. CHANGES TO CONTRACT DOCUMENTS

The following changes to the Contract Documents are hereby made effective as though originally issued with the bid package. Bidders are reminded that all previous requirements to this solicitation remain in full force and effect.

B. THE SUBMITTAL DATE FOR THIS PROJECT HAS BEEN EXTENDED AS STATED ON THE COVER PAGE.

C. BIDDER's QUESTIONS

Q1. Reference Detail B on Drawing Sheet C-22: There is a 2' section of jet grout at the perimeter of the structure. Is the intent to use the 2' section as a form to which the structure will be poured? If so, this 2' section is not feasible as shown. Since the purpose of the jet grout is to stabilize the ground beneath the new structure, we suggest that the jet grout only be required from the structure subgrade to 50' below ground surface. Additionally, if the concern is to stabilize the subgrade beneath the structure and at the perimeter, a realistic option would be to backfill with concrete slurry. Please review and advise.



A1. The 2’ perimeter grout was intended to extend the ground improvement 2’ around the structure from the bottom of the structure footing to 50’ below the ground surface. The portion of the grout above the bottom of the structure footing was intended for potential shoring for the excavation to build the structure. The grout above the bottom of the structure footing is not required, but the contractor would be required to provide shoring for the excavation support.

Q2. Specification 01 91 14 – 3.13.G states an estimated quantity of 5760 hours has been allocated for maintenance personnel during Integration Period. Please confirm whether contractors should include this qty and cost in the bid, or if it is going to be paid out from an allowance?

A2. Contractor's operators shall be included in the Contract Price with an estimated 5760 hours. Note the Contractor will operate during startup and testing, until Substantial Completion.

Q3. Specification 01 91 14 – 3.13.A states "The project milestone for the commencement of the 120 Day Integration Period is 120 days after Intermediate Substantial Completion" and "A 120-Day time period commencing 120 days after the Intermediate Substantial Completion…" This would make the total duration after the Intermediate Substantial Completion to the end of the Integration Period, be 240 Days. Please clarify if the second "120 days" in each of those sentences is meant to be deleted as the duration as it is currently won't fit in the project schedule.

A3. Modify Statement in 01 91 14 - 3.313.A "The project milestone for the commencement of the 120 Day Integration Period is 60 days after Intermediete Substantial Completion." Please note that the days described in Section 01 91 14 are Calendar Days.

Q4. Specification 01 32 00 – 3.1.A provides time allowance for inclement weather. Should its successor be Intermediate Substantial Completion with 39 working days or Substantial Completion with 52 working days?

A4. The successor should be substantial completion with 52 working days.

Q5. 2.03.B.4 lists 10 inch flanges and 2.03.C.1 part number indicates 12 inch flanges. Drawing M-14 shows 12 inch flanges. 12 inch flanges are the correct design parameter.

A5. Flange size shall be 12-inch as shown on Drawing M-14.

Q6. Drawing M-13 shows a 16 inch magmeter on 16 inch pipe which seems to be adequate. Drawing I-16 indicates a 24 inch magmeter. Please verify the requirement for the 16 inch magmeter.

A6. Magnetic flow meter shall be 16-inch as shown on Drawing M-13.

Q7. Is the PLC control system provided by ECO2 under 44 47 00 subject to the requirements of section 40 99 90 Packaged Control Systems?

a. 44 47 00 Part 2.06.B.2.a specifies an Allen Bradley Micrologix PLC where 40 99 00 Part 2.06.A.1.a requires an Allen Bradley ControlLogix. ECO2 standard is Micrologix.

b. 44 47 00 Part 2.06.B.4.a calls out 304 stainless steel panels where 40 99 00 Part 2.05.D calls out 316 stainless steel panels.

A7. The High Purity Oxygen PLC Control System is subject to 40 99 90 Packaged Control Systems.

a. Allen Bradley Micrologix PLC is acceptable for the High Purity Oxygen System PLC.

b. The PLC control system is subject to the requirements of Section 40 99 90.

Q8. Can you confirm where the technical details are located in the specs for the 1/2 HP pump shown in plan C-06? It references drawing M-20 which refers to the specifications but we can't find any details in the specs.

A8. Pump shall be covered under Specification Section 43 42 56.04 Submersible Pumps except as follows:

- Pump design operating point is 85 gpm @ 23 feet of head, minimum efficiency of 40%.
- 3600 RPM 1-1/2 hp Motor.
- Pump shall be EBARA Submersible stainless steel pump model 50DWF(A)U61.1 or approved equal.

Q9. I'm trying to see if there's a way I can have our technology be considered for this project. I've attached our brochure for you to look over. Our small footprint units only need water and electrical hook ups to work. We use Hydroxyl Radicals as our oxidant to break the bonds of H2S and other odor compounds. We are also a great source for breaking up FOG and stopping Corrosion.

A9. Product will be reviewed as part of the Submittal process.

Q10. Bidding Documents, Certifications and Forms – List of Subcontractors and Named Equipment/ Material Supplier List (pages 2207 & 2208): Each of these lists state that if the Subcontractor or Supplier is a DBE, that the Bidder shall include a valid proof of certification. When is this proof certification to be submitted?

A10. Proof of certification is to be submitted with the Good Faith Effort (GFE) Documentation. Please refer to section 12.7.3 of the Notice of Inviting Bids for GFE submittal instructions.

Q11. For the 48" x 48" gates in Diversion Structures 1 & 2 (Dwngs C-11 and C-11A), the gate operators are shown below the chamber ceiling. The thickness of the chamber ceiling and height of electric operator are not called out. Will you please let us know the thickness of the chamber ceiling and desired height of electric operator?

A11. Electric operator maximum height is 22-inches above the frame, or 120 inches above the pipe invert. Diversion Structures 1&2 top slab arrangement including thickness and access panel thickness are shown on Drawings S-13, S-15 and S-17.

Q12. Keynote #3 on Drawing C-11A refers to 2 slide gates… one 48" x 48" slide gate in Diversion Structure #1 and one 48" x 48" slide gate in Diversion Structure #2. Are those two 48" x 48" gates are also intended to be non-rising stem gates, just as the 60" x 60" gate in Diversion Structure #1 and the 72" x 72" gate in Diversion Structure #2 are called out to be in Keynotes 6 and 7 on Sheet C-11A?

A12. Yes, Diversion Structure 1 and 2 - 48" x 48" slide gates are both non-rising stem.

Q13. Addendum B, question 12 response stated that horizontal construction joints beyond those shown are NOT allowable in pump station walls. This response incidentally eliminates any internally braced shoring systems from being used for the pump station excavation, which significantly increases shoring costs. The pump station excavation will have to be a tieback system without the allowance of an additional horizontal construction joint. Please note, there will be vertical construction joints in the pump station walls, so the addition of a

horizontal construction joint will not have an impact on the structure's performance. Please confirm additional horizontal construction joints will be allowable to accommodate an internally braced shoring systems as selected by the Contractor.

A13. The Answer to Question 12 of Addendum B shall be revised as follows: The addition of horizontal construction joints will be allowed. Contractor shall consider in the construction cost for these joints (including all waterstops and rebar couplers, etc.) that will be needed and the engineering cost by the design consultant to modify the drawings to include these joints and obtain City approval. Contractor shall provide the engineering for any portion of the new structure required to retain backfill loads prior to the construction of the permanent supports for said portions.

D. ADDENDUM

1. To Addendum A, Section D, Attachments, Item 1, FUNDING AGENCY PROVISIONS, (CASRF), (EPA), (CWSRF), (DWSRF), (WIFIA) PROP 68 and (BOR), item 10, DAVIS-BACON WAGE RATES AND PROVISIONS, Wage Rates, pages 28 through 57, **DELETE** in its entirety and **SUBSTITUTE** with pages 13 through 41 of this Addendum.

2. To Addendum B, Section B, Bidder's Questions, page 6, Q12 and A12, **DELETE** in their entirety and **SUBSTITUTE** with the following:

   Q12. The Pump Station Section Drawings show walls pouring full height from top of SOG to bottom of upper deck with exception to Wet Well walls that have a CJ shown at EL -20.50. In an effort to reduce wall pour heights is it possible to install a horizontal Construction Joint in the Pump Station Walls.

   A12. The addition of horizontal construction joints will be allowed. Contractor shall consider the construction cost for these joints (including all waterstops and rebar couplers, etc.) that will be needed and the engineering cost by the design consultant to modify the drawings to include these joints and obtain City approval. Contractor shall provide the engineering for any portion of the new structure required to retain backfill loads prior to the construction of the permanent supports for said portions.

3. To Addendum C, Section B, Bidder's Questions, page 11, Q32 and A32, **DELETE** in their entirety and **SUBSTITUTE** with the following:

   Q32. The project drawings call DIP piping to have Fusion Bonded Epoxy Lining and Coating (Key Notes 7/C03, 1/C08, 15/M-14, Details 1,2/M-16). Specification Section 09 90 00, Paragraph 3.7.B Coating and Lining for Steel and Ductile Iron Pipe, Fittings, Couplings, Adapters, and Valves provides specific requirements to such lining and coating. Although, per Spec Section 33 05 19, Paragraph 2.01.F.2, pipe and fittings shall be lined with 40-mil ceramic epoxy, as manufactured by Induron, or equal, and this section is silent on the matter of coating of ductile iron piping. Please clarify which provision applies to DIP lining and coating (buried, submerged, and exposed).

   A32. All ductile iron pipe and fittings shall be fusion bonded epoxy lined and coated and conform to the requirements of Section 09 90 00 Part 3.7 B

4. To Addendum C, Section B, Bidder's Questions, pages 20 and 21, Q61 and A61, **DELETE** in their entirety and **SUBSTITUTE** with the following:

   Q61. Paint spec section 09 90 00, Part 3.7B states that all buried and exposed above ground ductile iron piping, fittings, valves etc. shall be lined and coated with a fusion bonded epoxy system. However, section 33 05 19 Part 2.1F for Ductile Iron pipe states that pipe and fittings for clean water shall be cement mortar lined and asphaltic seal-coated. It then states that pipe and fittings are to be lined with 40 mil of ceramic epoxy. Please confirm whether the ductile iron pipe and fittings on the project are to be lined with fusion bonded epoxy system or with 40 mil of ceramic epoxy.

   A61. All ductile iron pipe and fittings shall be fusion bonded epoxy lined and coated and conform to the requirements of Section 09 90 00 Part 3.7 B.

5. To Addendum C, Section B, Bidder's Questions, page 21, Q63 and A63, **DELETE** in their entirety and **SUBSTITUTE** with the following:

   Q63 Drawing D-02 shows several overhead utilities to be relocated by others. Please provide information regarding timing and duration for this work.

   A63 Timing for relocation will occur per Section 5-6, Item 2 of the Supplementary Special Provisions. Item 2 is modified from the first 30 days of the Contract time to the first 83 days. To Section 2-14.3 **ADD**:

   h) AT&T Relocation for B15141 NC Morena Blvd. Pump Station and Pipeline (Sherman & Custer), Judith Villacruz-Brandt 858-886-1910.

6. To Addendum C, Section B, Bidder's Questions, pages 23 and 24, Q73 and A73, **DELETE** in their entirety and **SUBSTITUTE** with the following:

   Q73. Spec section 40 27 00 part 2.2B calls for the diameter of Cement-lined steel pipe to be determined by the lining inside diameter. Keynote callout 7 on Drawing M-8 calls for the overflow piping on top of the pump station roof to the wet well to be 24" CML&C. If this piping was actually required to be CML&C, it would need to have an OD of 27" to meet the ID required by the spec. It would have to be specially fabricated (rolled) since standard mill-manufactured steel piping does not come in this size. Please confirm whether this was the intent. Note that keynote callout 3 on drawing M-11 shows the same overflow piping as 24" welded steel FE pipe. Is this piping run to be CML&C or just welded steel FE piping without cement lining and coating?

   A73. Closest standard size pipe is acceptable. Pipe shall be CML and Paint coated with System 4 per Technical Section 09 90 00.

E. SUPPLEMENTARY SPECIAL PROVISIONS

1. To Section 2-14.3, COORDINATION, page 115, **ADD** the following:

   h) AT&T Relocation for B15141 NC Morena Blvd. Pump Station and Pipeline (Sherman & Custer), Judith Villacruz-Brandt (858) 886-1910.

2. To Section 5.6, COOPERATION, Item 2, page 128, **DELETE** in its entirety and **SUBSTITUTE** with the following:

   2. SDG&E will be relocating power poles on Sherman and Custer Streets during the first 83 days of the Contract time.

3. To Techicals, Section 01 91 14, Testing, Integration and Setup, Part 3, Execution, sub-section 3.13, Integration Testing Period, Item A, page 354, **DELETE** in its entirety and **SUBSTITUTE** with the following:

   A. 120-Day time period commencing 60 days after Intermediate Substantial Completion during which the overall Pure Water Program system will be tested and operated, including the Morena Conveyance, the NCWRP Expansion, NCPWF Influent Pump Station and Conveyance, NCPWF the Metropolitan Biosolids Center Improvements, the NCPW Pump Station and the NCPWPL, and Dechlorination Facilities. The project milestone for the commencement of the120 Day Integration Period is 60 days after Intermediate Substantial Completion. The overall logic of the 120-Day Integration Period is shown on Attachment 1 – Phase 1 Commissioning Model.

4. To Technicals, Section 44 47 28.26, ACTIVATED CARBON ODOR CONTROL SYSTEMS, Sub-section 1.7, QUALITY ASSURANCE, ITEM A, Qualifications, Sub-item 3, page 1974, **DELETE** in its entirey and **SUBSTITUTE** with the following:

   3. The odor control system supplier shall have complete, ongoing service capability with factory trained personnel. The supplier shall have a service center/manufacturing facility located in southern California within 200 miles of the jobsite for quick response. The service center/manufacturing facility shall be staffed with at least five (5) full- time employees of the odor

control system supplier. A manufacturer's sales representative office and sales representative personnel staffing shall not be acceptable. No exception to this requirement will be allowed.

James Nagelvoort, Director
Engineering & Capital Projects Department

Dated: *December 23, 2020*
San Diego, California

WAGE RATES This contract shall be subject to the following Davis-Bacon Wage Decisions:

"General Decision Number: CA20200001 12/11/2020
Superseded General Decision Number: CA20190001
State: California

Construction Types: Building, Heavy (Heavy and Dredging), Highway and Residential

County: San Diego County in California.

BUILDING CONSTRUCTION PROJECTS; DREDGING PROJECTS (does not include hopper dredge work); HEAVY CONSTRUCTION PROJECTS (does not include water well drilling); HIGHWAY CONSTRUCTION PROJECTS; RESIDENTIAL CONSTRUCTION PROJECTS (consisting of single family homes and apartments up to and including 4 stories)

Note: Under Executive Order (EO) 13658, an hourly minimum wage of $10.80 for calendar year 2020 applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2015. If this contract is covered by the EO, the contractor must pay all workers in any classification listed on this wage determination at least $10.80 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on the contract in calendar year 2020. If this contract is covered by the EO and a classification considered necessary for performance of work on the contract does not appear on this wage determination, the contractor must pay workers in that classification at least the wage rate determined through the conformance process set forth in 29 CFR 5.5(a)(1)(ii) (or the EO minimum wage rate,if it is higher than the conformed wage rate). The EO minimum wage rate will be adjusted annually. Please note that this EO applies to the above-mentioned types of contracts entered into by the federal government that are subject to the Davis-Bacon Act itself, but it does not apply to contracts subject only to the Davis-Bacon Related Acts, including those set forth at 29 CFR 5.1(a)(2)-(60). Additional information on contractor requirements and worker protections under the EO is available at www.dol.gov/whd/govcontracts.

POWER EQUIPMENT OPERATORS CLASSIFICATIONS

GROUP 1: Bargeman; Brakeman; Compressor operator; Ditch Witch, with seat or similar type equipment; Elevator operator-inside; Engineer Oiler; Forklift operator (includes loed, lull or similar types under 5 tons; Generator operator; Generator, pump or compressor plant operator; Pump operator; Signalman; Switchman

GROUP 2: Asphalt-rubber plant operator (nurse tank operator); Concrete mixer operator-skip type; Conveyor operator; Fireman; Forklift operator (includes loed, lull or similar types over 5 tons; Hydrostatic pump operator; oiler crusher (asphalt or concrete plant); Petromat laydown machine; PJU side dum jack; Screening and conveyor machine operator (or similar types); Skiploader (wheel type up to 3/4 yd. without attachment); Tar pot fireman; Temporary heating plant operator; Trenching machine oiler

GROUP 3: Asphalt-rubber blend operator; Bobcat or similar type (Skid steer); Equipment greaser (rack); Ford Ferguson (with dragtype attachments); Helicopter radioman (ground); Stationary pipe wrapping and cleaning machine operator

GROUP 4: Asphalt plant fireman; Backhoe operator (mini-max or similar type); Boring machine operator; Boxman or mixerman (asphalt or concrete); Chip spreading machine operator; Concrete cleaning decontamination machine operator; Concrete Pump Operator (small portable); Drilling machine operator, small auger types (Texoma super economatic or similar types - Hughes 100 or 200 or similar types -

drilling depth of 30' maximum); Equipment greaser (grease truck); Guard rail post driver operator; Highline cableway signalman; Hydra-hammer-aero stomper; Micro Tunneling (above ground tunnel); Power concrete curing machine operator; Power concrete saw operator; Power-driven jumbo form setter operator; Power sweeper operator; Rock Wheel Saw/Trencher; Roller operator (compacting); Screed operator (asphalt or concrete); Trenching machine operator (up to 6 ft.); Vacuum or much truck

GROUP 5: Equipment Greaser (Grease Truck/Multi Shift).

GROUP 6: Articulating material hauler; Asphalt plant engineer; Batch plant operator; Bit sharpener; Concrete joint machine operator (canal and similar type); Concrete planer operator; Dandy digger; Deck engine operator; Derrickman (oilfield type); Drilling machine operator, bucket or auger types (Calweld 100 bucket or similar types - Watson 1000 auger or similar types - Texoma 330, 500 or 600 auger or similar types - drilling depth of 45' maximum); Drilling machine operator; Hydrographic seeder machine operator (straw, pulp or seed), Jackson track maintainer, or similar type; Kalamazoo Switch tamper, or similar type; Machine tool operator; Maginnis internal full slab vibrator, Mechanical berm, curb or gutter(concrete or asphalt); Mechanical finisher operator (concrete, Clary-Johnson-Bidwell or similar); Micro tunnel system (below ground); Pavement breaker operator (truck mounted); Road oil mixing machine operator; Roller operator (asphalt or finish), rubber-tired earth moving equipment (single engine, up to and including 25 yds. struck); Self-propelled tar pipelining machine operator; Skiploader operator (crawler and wheel type, over 3/4 yd. and up to and including 1-1/2 yds.); Slip form pump operator (power driven hydraulic lifting device for concrete forms); Tractor operator-bulldozer, tamper-scraper (single engine, up to 100 h.p. flywheel and similar types, up to and including D-5 and similar types); Tugger hoist operator (1 drum); Ultra high pressure waterjet cutting tool system operator; Vacuum blasting machine operator

GROUP 8: Asphalt or concrete spreading operator (tamping or finishing); Asphalt paving machine operator (Barber Greene or similar type); Asphalt-rubber distribution operator; Backhoe operator (up to and including 3/4 yd.), small ford, Case or similar; Cast-in-place pipe laying machine operator; Combination mixer and compressor operator (gunite work); Compactor operator (self-propelled); Concrete mixer operator (paving); Crushing plant operator; Drill Doctor; Drilling machine operator, Bucket or auger types (Calweld 150 bucket or similar types - Watson 1500, 2000 2500 auger or similar types - Texoma 700, 800 auger or similar types - drilling depth of 60' maximum); Elevating grader operator; Grade checker; Gradall operator; Grouting machine operator; Heavy-duty repairman; Heavy equipment robotics operator; Kalamazoo balliste regulator or similar type; Kolman belt loader and similar type; Le Tourneau blob compactor or

similar type; Loader operator (Athey, Euclid, Sierra and similar types); Mobark Chipper or similar; Ozzie padder or similar types; P.C. slot saw; Pneumatic concrete placing machine operator (Hackley-Presswell or similar type); Pumpcrete gun operator; Rock Drill or similar types; Rotary drill operator (excluding caisson type); Rubber-tired earth-moving equipment operator (single engine, caterpillar, Euclid, Athey Wagon and similar types with any and all attachments over 25 yds. up to and including 50 cu. yds. struck); Rubber-tired earth-moving equipment operator (multiple engine up to and including 25 yds. struck); Rubber-tired scraper operator (self-loading paddle wheel type-John Deere, 1040 and similar single unit); Self-propelled curb and gutter machine operator; Shuttle buggy; Skiploader operator (crawler and wheel type over 1-1/2 yds. up to and including 6-1/2 yds.); Soil remediation plant operator; Surface heaters and planer operator; Tractor compressor drill combination operator; Tractor operator (any type larger than D-5 - 100 flywheel h.p. and over, or similar-bulldozer, tamper, scraper and push tractor single engine); Tractor operator (boom attachments), Traveling pipe wrapping, cleaning and bendng machine operator; Trenching machine operator (over 6 ft. depth capacity, manufacturer's rating); trenching Machine with Road Miner attachment (over 6 ft depth capacity): Ultra high pressure waterjet cutting tool system mechanic; Water pull (compaction) operator

GROUP 9: Heavy Duty Repairman

GROUP 10: Drilling machine operator, Bucket or auger types (Calweld 200 B bucket or similar types-Watson 3000 or 5000 auger or similar types-Texoma 900 auger or similar types-drilling depth of 105' maximum); Dual drum mixer, dynamic compactor LDC350 (or similar types); Monorail locomotive operator (diesel, gas or electric); Motor patrol-blade operator (single engine); Multiple engine tractor operator (Euclid and similar type-except Quad 9 cat.); Rubber-tired earth-moving equipment operator (single engine, over 50 yds. struck); Pneumatic pipe ramming tool and similar types; Prestressed wrapping machine operator; Rubber-tired earth-moving equipment operator (single engine, over 50 yds. struck); Rubber tired earth moving equipment operator (multiple engine, Euclid, caterpillar and similar over 25 yds. and up to 50 yds. struck), Tower crane repairman; Tractor loader operator (crawler and wheel type over 6-1/2 yds.); Woods mixer operator (and similar Pugmill equipment)

GROUP 11: Heavy Duty Repairman - Welder Combination, Welder - Certified.

GROUP 12: Auto grader operator; Automatic slip form operator; Drilling machine operator, bucket or auger types (Calweld, auger 200 CA or similar types - Watson, auger 6000 or similar types - Hughes Super Duty, auger 200 or similar types - drilling depth of 175' maximum); Hoe ram or similar

with compressor; Mass excavator operator less tha 750 cu. yards; Mechanical finishing machine operator; Mobile form traveler operator; Motor patrol operator (multi-engine); Pipe mobile machine operator; Rubber-tired earth- moving equipment operator (multiple engine, Euclid, Caterpillar and similar type, over 50 cu. yds. struck); Rubber-tired self- loading scraper operator (paddle-wheel-auger type self-loading - two (2) or more units)

GROUP 13: Rubber-tired earth-moving equipment operator operating equipment with push-pull system (single engine, up to and including 25 yds. struck)

GROUP 14: Canal liner operator; Canal trimmer operator; Remote- control earth-moving equipment operator (operating a second piece of equipment: $1.00 per hour additional); Wheel excavator operator (over 750 cu. yds.)

GROUP 15: Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (single engine, Caterpillar, Euclid, Athey Wagon and similar types with any and all attachments over 25 yds. and up to and including 50 yds. struck); Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (multiple engine-up to and including 25 yds. struck)

GROUP 16: Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (single engine, over 50 yds. struck); Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (multiple engine, Euclid, Caterpillar and similar, over 25 yds. and up to 50 yds. struck)

GROUP 17: Rubber-tired earth-moving equipment operator, operating equipment with push-pull system (multiple engine, Euclid, Caterpillar and similar, over 50 cu. yds. struck); Tandem tractor operator (operating crawler type tractors in tandem - Quad 9 and similar type)

GROUP 18: Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - single engine, up to and including 25 yds. struck)

GROUP 19: Rotex concrete belt operator (or similar types); Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - single engine, Caterpillar, Euclid, Athey Wagon and similar types with any and all attachments over 25 yds.and up to and including 50 cu. yds. struck); Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - multiple engine, up to and including 25 yds. struck)

GROUP 20: Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar

types in any combination, excluding compaction units - single engine, over 50 yds. struck); Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps, and similar types in any combination, excluding compaction units - multiple engine, Euclid, Caterpillar and similar, over 25 yds. and up to 50 yds. struck)

GROUP 21: Rubber-tired earth-moving equipment operator, operating in tandem (scrapers, belly dumps and similar types in any combination, excluding compaction units - multiple engine, Euclid, Caterpillar and similar type, over 50 cu. yds. struck)

GROUP 22: Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (single engine, up to and including 25 yds. struck)

GROUP 23: Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (single engine, Caterpillar, Euclid, Athey Wagon and similar types with any and all attachments over 25 yds. and up to and including 50 yds. struck); Rubber-tired earth-moving equipment operator, operating with the tandem push-pull system (multiple engine, up to and including 25 yds. struck)

GROUP 24: Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (single engine, over 50 yds. struck); Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (multiple engine, Euclid, Caterpillar and similar, over 25 yds. and up to 50 yds. struck)

GROUP 25: Concrete pump operator-truck mounted; Rubber-tired earth-moving equipment operator, operating equipment with the tandem push-pull system (multiple engine, Euclid, Caterpillar and similar type, over 50 cu. yds. struck)

CRANES, PILEDRIVING AND HOISTING EQUIPMENT CLASSIFICATIONS

GROUP 1: Engineer oiler; Fork lift operator (includes loed, lull or similar types)

GROUP 2: Truck crane oiler

GROUP 3: A-frame or winch truck operator; Ross carrier operator (jobsite)

GROUP 4: Bridge-type unloader and turntable operator; Helicopter hoist operator

GROUP 5: Hydraulic boom truck; Stinger crane (Austin-Western or similar type); Tugger hoist operator (1 drum)

GROUP 6: Bridge crane operator; Cretor crane operator; Hoist operator (Chicago boom and similar type); Lift mobile operator; Lift slab machine operator (Vagtborg and similar types); Material hoist and/or manlift operator; Polar gantry crane operator; Self Climbing scaffold (or similar type); Shovel, backhoe, dragline, clamshell operator (over 3/4 yd. and up to 5 cu. yds. mrc); Tugger hoist operator

GROUP 7: Pedestal crane operator; Shovel, backhoe, dragline, clamshell operator (over 5 cu. yds. mrc); Tower crane repair; Tugger hoist operator (3 drum)

GROUP 8: Crane operator (up to and including 25 ton capacity); Crawler transporter operator; Derrick barge operator (up to and including 25 ton capacity); Hoist operator, stiff legs, Guy derrick or similar type (up to and including 25 ton capacity); Shovel, backhoe, dragline, clamshell operator (over 7 cu. yds., M.R.C.)

GROUP 9: Crane operator (over 25 tons and up to and including 50 tons mrc); Derrick barge operator (over 25 tons up to and including 50 tons mrc); Highline cableway operator; Hoist operator, stiff legs, Guy derrick or similar type (over 25 tons up to and including 50 tons mrc); K-crane operator; Polar crane operator; Self erecting tower crane operator maximum lifting capacity ten tons

GROUP 10: Crane operator (over 50 tons and up to and including 100 tons mrc); Derrick barge operator (over 50 tons up to and including 100 tons mrc); Hoist operator, stiff legs, Guy derrick or similar type (over 50 tons up to and including 100 tons mrc), Mobile tower crane operator (over 50 tons, up to and including 100 tons M.R.C.); Tower crane operator and tower gantry

GROUP 11: Crane operator (over 100 tons and up to and including 200 tons mrc); Derrick barge operator (over 100 tons up to and including 200 tons mrc); Hoist operator, stiff legs, Guy derrick or similar type (over 100 tons up to and including 200 tons mrc); Mobile tower crane operator (over 100 tons up to and including 200 tons mrc)

GROUP 12: Crane operator (over 200 tons up to and including 300 tons mrc); Derrick barge operator (over 200 tons up to and including 300 tons mrc); Hoist operator, stiff legs, Guy derrick or similar type (over 200 tons, up to and including 300 tons mrc); Mobile tower crane operator (over 200 tons, up to and including 300 tons mrc)

GROUP 13: Crane operator (over 300 tons); Derrick barge operator (over 300 tons); Helicopter pilot; Hoist operator, stiff legs, Guy derrick or similar type (over 300 tons); Mobile tower crane operator (over 300 tons)

TUNNEL CLASSIFICATIONS

GROUP 1: Skiploader (wheel type up to 3/4 yd. without attachment)

GROUP 2: Power-driven jumbo form setter operator

GROUP 3: Dinkey locomotive or motorperson (up to and including 10 tons)

GROUP 4: Bit sharpener; Equipment greaser (grease truck); Slip form pump operator (power-driven hydraulic lifting device for concrete forms); Tugger hoist operator (1 drum); Tunnel locomotive operator (over 10 and up to and including 30 tons)

GROUP 5: Backhoe operator (up to and including 3/4 yd.); Small Ford, Case or similar; Drill doctor; Grouting machine operator; Heading shield operator; Heavy-duty repairperson; Loader operator (Athey, Euclid, Sierra and similar types); Mucking machine operator (1/4 yd., rubber-tired, rail or track type); Pneumatic concrete placing machine operator (Hackley-Presswell or similar type); Pneumatic heading shield (tunnel); Pumpcrete gun operator; Tractor compressor drill combination operator; Tugger hoist operator (2 drum); Tunnel locomotive operator (over 30 tons)

GROUP 6: Heavy Duty Repairman

GROUP 7: Tunnel mole boring machine operator

ENGINEERS ZONES

$1.00 additional per hour for all of IMPERIAL County and the portions of KERN, RIVERSIDE & SAN BERNARDINO Counties as defined below:

That area within the following Boundary: Begin in San Bernardino County, approximately 3 miles NE of the intersection of I-15 and the California State line at that point which is the NW corner of Section 1, T17N,m R14E, San Bernardino Meridian. Continue W in a straight line to that point which is the SW corner of the northwest quarter of Section 6, T27S, R42E, Mt. Diablo Meridian. Continue North to the intersection with the Inyo County Boundary at that point which is the NE corner of the western half of the northern quarter of Section 6, T25S, R42E, MDM. Continue W along the Inyo and San Bernardino County boundary until the intersection with Kern County, as that point which is the SE corner of Section 34, T24S, R40E, MDM. Continue W along the Inyo and Kern County boundary until the intersection with Tulare County, at that point which is the SW corner of the SE quarter of Section 32, T24S, R37E, MDM. Continue W along the Kern and Tulare County boundary, until that point which is the NW corner of T25S, R32E, MDM. Continue S following R32E lines to the NW corner of T31S, R32E, MDM. Continue W to the NW corner of T31S, R31E, MDM. Continue S to the SW corner of T32S, R31E, MDM. Continue W to SW corner of SE quarter of Section 34, T32S, R30E, MDM. Continue S to SW corner of T11N, R17W, SBM. Continue E along south boundary of T11N, SBM to SW corner of T11N, R7W, SBM. Continue S to SW corner of T9N, R7W, SBM. Continue E along

south boundary of T9N, SBM to SW corner of T9N, R1E, SBM. Continue S along west boundary of R1E, SMB to Riverside County line at the SW corner of T1S, R1E, SBM. Continue E along south boundary of T1s, SBM (Riverside County Line) to SW corner of T1S, R10E, SBM. Continue S along west boundary of R10E, SBM to Imperial County line at the SW corner of T8S, R10E, SBM. Continue W along Imperial and Riverside county line to NW corner of T9S, R9E, SBM. Continue S along the boundary between Imperial and San Diego Counties, along the west edge of R9E, SBM to the south boundary of Imperial County/California state line. Follow the California state line west to Arizona state line, then north to Nevada state line, then continuing NW back to start at the point which is the NW corner of Section 1, T17N, R14E, SBM

$1.00 additional per hour for portions of SAN LUIS OBISPO, KERN, SANTA BARBARA & VENTURA as defined below:

That area within the following Boundary: Begin approximately 5 miles north of the community of Cholame, on the Monterey County and San Luis Obispo County boundary at the NW corner of T25S, R16E, Mt. Diablo Meridian. Continue south along the west side of R16E to the SW corner of T30S, R16E, MDM. Continue E to SW corner of T30S, R17E, MDM. Continue S to SW corner of T31S, R17E, MDM. Continue E to SW corner of T31S, R18E, MDM. Continue S along West side of R18E, MDM as it crosses into San Bernardino Meridian numbering area and becomes R30W. Follow the west side of R30W, SBM to the SW corner of T9N, R30W, SBM. Continue E along the south edge of T9N, SBM to the Santa Barbara County and Ventura County boundary at that point whch is the SW corner of Section 34.T9N, R24W, SBM, continue S along the Ventura County line to that point which is the SW corner of the SE quarter of Section 32, T7N, R24W, SBM. Continue E along the south edge of T7N, SBM to the SE corner to T7N, R21W, SBM. Continue N along East side of R21W, SBM to Ventura County and Kern County boundary at the NE corner of T8N, R21W. Continue W along the Ventura County and Kern County boundary to the SE corner of T9N, R21W. Continue North along the East edge of R21W, SBM to the NE corner of T12N, R21W, SBM. Continue West along the north edge of T12N, SBM to the SE corner of T32S, R21E, MDM. [T12N SBM is a think strip between T11N SBM and T32S MDM]. Continue North along the East side of R21E, MDM to the Kings County and Kern County border at the NE corner of T25S, R21E, MDM, continue West along the Kings County and Kern County Boundary until the intersection of San Luis Obispo County. Continue west along the Kings County and San Luis Obispo County boundary until the intersection with Monterey County. Continue West along the Monterey County and San Luis Obispo County boundary to the beginning point at the NW corner of T25S, R16E, MDM.

$2.00 additional per hour for INYO and MONO Counties and the Northern portion of SAN BERNARDINO County as defined below:

That area within the following Boundary: Begin at the intersection of the northern boundary of Mono County and the California state line at the point which is the center of

Section 17, T10N, R22E, Mt. Diablo Meridian. Continue S then SE along the entire western boundary of Mono County, until it reaches Inyo County at the point which is the NE corner of the Western half of the NW quarter of Section 2, T8S, R29E, MDM. Continue SSE along the entire western boundary of Inyo County, until the intersection with Kern County at the point which is the SW corner of the SE 1/4 of Section 32, T24S, R37E, MDM. Continue E along the Inyo and Kern County boundary until the intersection with San Bernardino County at that point which is the SE corner of section 34, T24S, R40E, MDM. Continue E along the Inyo and San Bernardino County boundary until the point which is the NE corner of the Western half of the NW quarter of Section 6, T25S, R42E, MDM. Continue S to that point which is the SW corner of the NW quarter of Section 6, T27S, R42E, MDM. Continue E in a straight line to the California and Nevada state border at the point which is the NW corner of Section 1, T17N, R14E, San Bernardino Meridian. Then continue NW along the state line to the starting point, which is the center of Section 18, T10N, R22E, MDM.

	Rates	Fringes
LABORER (BUILDING and all other Residential Construction)		
Group 1	$ 34.18	20.48
Group 2	$ 34.86	20.48
Group 3	$ 35.57	20.48
Group 4	$ 36.37	20.48
Group 5	$ 38.30	20.48
LABORER (RESIDENTIAL CONSTRUCTION - See definition below)		
(1) Laborer	$ 30.82	18.80
(2) Cleanup, Landscape, Fencing (Chain Link & Wood)	$ 29.53	18.80

RESIDENTIAL DEFINITION: Wood or metal frame construction of single family residences, apartments and condominums - excluding (a) projects that exceed three stories over a garage level, (b) any utility work such as telephone, gas, water, sewer and other utilities and (c) any fine grading work, utility work or paving work in the future street and public right-of-way; but including all rough grading work at the job site behind the existing right of way

LABORER CLASSIFICATIONS

GROUP 1: Cleaning and handling of panel forms; Concrete Screeding for Rought Strike-off; Concrete, water curing; Demolition laborer; Flagman; Gas, oil and/or water pipeline laborer; General Laborer; General clean-up laborer; Landscape laborer; Jetting laborer; Temporary water and air lines laborer; Material hoseman (walls, slabs, floors and decks); Plugging, filling of Shee-bolt holes; Dry packing of concrete; Railroad maintenance, Repair Trackman and road beds, Streetcar and railroad construction trac laborers; Slip form raisers; Slurry seal crews (mixer operator, applicator operator, squeegee man, Shuttle man, top man), filling of cracks by any method on any surface; Tarman and mortar man; Tool crib or tool house laborer; Window cleaner; Wire Mesh puling-all concrete pouring operations

GROUP 2: Asphalt Shoveler; Cement Dumper (on 1 yard or larger mixer and handling bulk cement); Cesspool digger and installer; Chucktender; Chute man, pouring concrete, the handling of the cute from ready mix trucks, such as walls, slabs, decks, floors, foundations, footings, curbs, gutters and sidewalks; Concrete curer-impervious membrane and form oiler; Cutting torch operator (demoliton); Guinea chaser; Headboard man-asphlt; Laborer,
packing rod steel and pans; membrane vapor barrier installer; Power broom sweepers (small); Riiprap, stonepaver, placing stone or wet sacked concrete; Roto scraper and tiller; Tank sealer and cleaner; Tree climber, faller, chain saw operator, Pittsburgh Chipper and similar type brush shredders; Underground laborers, including caisson bellower

GROUP 3: Buggymobile; Concrete cutting torch; Concrete cutting torch; Concrete pile cutter; Driller, jackhammer, 2 1/2 feet drill steel or longer; Dri Pak-it machine; High sealer (including drilling of same); Hydro seeder and similar type; Impact wrench, mult-plate; Kettlemen, potmen and mean applying asphalt, lay-kold, creosote, line caustic and similar type materials (applying means applying, dipping, brushing or handling of such materials for pipe wrapping and waterproofing); Operators of pneumatic, gas, electric tools, vibratring machines, pavement breakers, air blasting, come-along, and similar mechanical tools not separately classified herein; Pipelayers back up man coating, grouting, making of joints, sealing, caulking, diapering and inclduing rubber gasket joints, pointing and any and all other services; Rotary Scarifier or multiple head concrete chipping scaarifier; Steel header board man and guideline setter; Tampers, Barko, Wacker and similar type; Trenching machine, handpropelled

GROUP 4: Asphalt raker, luterman, ironer, apshalt dumpman and asphalt spreader boxes (all types); Concrete core cutter (walls, floors or ceilings), Grinder or sander; Concrete saw man; cutting walls or flat work, scoring old or new concrete; Cribber, shorer, lagging, sheeting and trench bracing, hand-guided lagging hammer; Laser beam in connection with laborer's work; Oversize concrete vibrator operator 70 pounds and over; Pipelayer performing all services in the laying, installation and all forms of connection of pipe from the point of receiving pipe in the ditch until completion of oepration, including any and all forms of tubular material, whether pipe, metallic or non-metallic, conduit, and any other stationary type of tubular device used for the conveying of any substance or element, whether water, sewage, solid, gas, air or other product whatsoever and without regard to the nature of material from which the tubular material is fabricated; No joint pipe and stripping of same; Prefabricated manhole installer; Sandblaster (nozzleman), Porta shot-blast, water blasting

GROUP 5: Blasters Powderman-All work of loading holes, placing and blasting of all pwder and explosives of

whatever type, regardless of method used for such loading and placing; Driller-all power drills, excluding jackhammer, whether core, diamond, wagon, track, multiple unit, and any and all other types of mechanical drills without regard to the form of motive power.

LABORER CLASSIFICATIONS

GROUP 1: Laborer: General or Construction Laborer, Landscape Laborer. Asphalt Rubber Material Loader. Boring Machine Tender (outside), Carpenter Laborer (cleaning, handling, oiling & blowing of panel forms and lumber), Concrete Laborer, Concrete Screeding for rough strike-off, Concrete water curing. Concrete Curb & Gutter laborer, Certified Confined Space Laborer, Demolition laborer & Cleaning of Brick and lumber,Expansion Joint Caulking; Environmental Remediation, Monitoring Well, Toxic waste and Geotechnical Drill tender, Fine Grader, Fire Watcher, Limbers, Brush Loader, Pilers and Debris Handlers. flagman. Gas Oil and Water Pipeline Laborer. Material Hoseman (slabs, walls, floors, decks); Plugging, filling of shee bolt holes; Dry packing of concrete and patching; Post Holer Digger (manual); Railroad maintenance, repair trackman, road beds; Rigging & signaling; Scaler, Slip-Form Raisers, Filling cracks on any surface, tool Crib or Tool House Laborer, Traffic control (signs, barriers, barricades, delineator, cones etc.), Window Cleaner

GROUP 2: Asphalt abatement; Buggymobile; Cement dumper (on 1 yd. or larger mixers and handling bulk cement); Concrete curer, impervious membrane and form oiler; Chute man, pouring concrete; Concrete cutting torch; Concrete pile cutter; driller/Jackhammer, with drill steel 2 1/'2 feet or longer; Dry pak-it machine; Fence erector; Pipeline wrapper, gas, oil, water, pot tender & form man; Grout man; Installation of all asphalt overlay fabric and materials used for reinforcing asphalt; Irrigation laborer; Kettleman-Potman hot mop, includes applying asphalt, lay-klold, creosote, lime caustic and similar tyhpes of

materials (dipping, brushing, handling) and waterproofing; Membrane vapor barrier installer; Pipelayer backup man (coating, grouting, making of joints, sealing caulkiing, diapering including rubber basket joints, pointing); Rotary scarifier, multiple head concrete chipper; Rock slinger; Roto scraper & tiller; Sandblaster pot tender; Septic tank digger/installer; Tamper/wacker operator; Tank scaler & cleaner; Tar man & mortar man; Tree climber/faller, chainb saw operator, Pittsburgh chipper & similar type brush shredders.

GROUP 3: Asphalt, installation of all frabrics; Buggy Mobile Man, Bushing hammer; Compactor (all types), Concrete Curer - Impervious membrane, Form Oiler, Concrete Cutting Torch, Concrete Pile Cutter,Driller/Jackhammer with drill steel 2 1/2 ft or longer, Dry Pak-it machine, Fence erector including manual post hole digging, Gas oil or water Pipeline Wrapper - 6 ft pipe and over, Guradrail erector, Hydro seeder, Impact Wrench man (multi plate), kettleman-Potman Hot Mop includes applying Asphalt, Lay-Kold, Creosote, lime caustic and similar types of materials (dipping, brushing or handling) and waterproofing. Laser Beam in connection with Laborer work. High Scaler, Operators of Pneumatic Gas or Electric Tools, Vibrating Machines, Pavement Breakers, Air Blasting, Come-Alongs and similar mechanical tools, Remote-Controlled Robotic Tools in connection with Laborers work. Pipelayer Backup Man (Coating, grouting,m makeing of joints, sealing, caulking, diapering including rubber gasket joints, pointing and other services). Power Post Hole Digger, Rotary Scarifier (multiple head concrete chipper scarifier), Rock Slinger, Shot Blast equipment (8 to 48 inches), Steel Headerboard Man and Guideline Setter, Tamper/Wacker operator and similar types, Trenching Machine hand propelled.

GROUP 4: Any worker exposed to raw sewage. Asphalt Raker, Luteman, Asphalt Dumpman, Asphalt Spreader Boxes, Concrete Core Cutter, Concrete Saw Man, Cribber, Shorer, Head Rock Slinger. Installation of subsurface instrumentation, monitoring wells or points, remediation system installer; Laborer, asphalt-rubber distributor bootman; Oversize concrete vibrator operators, 70 pounds or over. Pipelayer, Prfefabricated Manhole Installer, Sandblast Nozzleman (Water Balsting-Porta Shot Blast), Traffic Lane Closure.

GROUP 5: Blasters Powderman-All work of loading holes, placing and blasting of all powder and explosives of whatever type, regardless of method used for such loading and placing; Horizontal directional driller, Boring system, Electronic traking, Driller: all power drills excluding jackhammer, whether core, diamond, wagon, track, multiple unit, and all other types of mechanical drills without regard to form of motive power. Environmental remediation, Monitoring well, Toxic waste and Geotechnical driller, Toxic waste removal. Welding in connection with Laborer's work.

LABO0300-005 03/01/2020

	Rates	Fringes
Asbestos Removal Laborer.....	$ 36.13	20.33

SCOPE OF WORK: Includes site mobilization, initial site cleanup, site preparation, removal of asbestos-containing material and toxic waste, encapsulation, enclosure and disposal of asbestos- containing materials and toxic waste by hand or with equipment or machinery; scaffolding, fabrication of temporary wooden barriers and assembly of decontamination stations.

LABO0345-001 07/01/2020

	Rates	Fringes
LABORER (GUNITE)		
GROUP 1.....	$ 45.05	19.62
GROUP 2.....	$ 44.10	19.62
GROUP 3.....	$ 40.56	19.62

FOOTNOTE: GUNITE PREMIUM PAY: Workers working from a Bosn'n's Chair or suspended from a rope or cable shall receive 40 cents per hour above the foregoing applicable classification rates. Workers doing gunite and/or shotcrete work in a tunnel shall receive 35 cents per hour above the foregoing applicable classification rates, paid on a portal-to-portal basis. Any work performed on, in or above any smoke stack, silo, storage elevator or similar type of structure, when such structure is in excess of 75'-0"" above base level and which work must be performed in whole or in part more than 75'-0"" above base level, that work performed above the 75'-0"" level shall be compensated for at 35 cents per hour above the applicable classification wage rate.

GUNITE LABORER CLASSIFICATIONS

GROUP 1: Rodmen, Nozzlemen

GROUP 2: Gunmen

GROUP 3: Reboundmen

LABO1184-001 07/01/2020

GROUP 3	$ 42.37	19.01
GROUP 4	$ 44.11	19.01

LABORERS - STRIPING CLASSIFICATIONS

GROUP 1: Protective coating, pavement sealing, including repair and filling of cracks by any method on any surface in parking lots, game courts and playgrounds; carstops; operation of all related machinery and equipment; equipment repair technician

GROUP 2: Traffic surface abrasive blaster; pot tender - removal of all traffic lines and markings by any method (sandblasting, waterblasting, grinding, etc.) and preparation of surface for coatings. Traffic control person: controlling and directing traffic through both conventional and moving lane closures; operation of all related machinery and equipment

GROUP 3: Traffic delineating device applicator: Layout and application of pavement markers, delineating signs, rumble and traffic bars, adhesives, guide markers, other traffic delineating devices including traffic control. This category includes all traffic related surface preparation (sandblasting, waterblasting, grinding) as part of the application process. Traffic protective delineating system installer: removes, relocates, installs, permanently affixed roadside and parking delineation barricades, fencing, cable anchor, guard rail, reference signs, monument markers; operation of all related machinery and equipment; power broom sweeper

GROUP 4: Striper: layout and application of traffic stripes and markings; hot thermo plastic; tape traffic stripes and markings, including traffic control; operation of all related machinery and equipment

TRUCK DRIVER CLASSIFICATIONS

GROUP 1: Fuel Man, Swamper

GROUP 2: 2-axle Dump Truck, 2-axle Flat Bed,Concrete Pumping Truck, Industrial Lift Truck, Motorized Traffic Control, Pickup Truck on Jobsite

GROUP 3: 2-axle Water Truck, 3-axle Dump Truck, 3-axle Flat Bed, Erosion Control Nozzleman, Dump Crete Truck under 6.5 yd, Forklift 15,000 lbs and over, Prell Truck, Pipeline Work Truck Driver, Road Oil Spreader, Cement Distributor or Slurry Driver, Bootman, Ross Carrier

GROUP 4: Off-road Dump Truck under 35 tons 4-axles but less than 7-axles, Low-Bed Truck & Trailer, Transit Mix Trucks under 8 yd, 3-axle Water Truck, Erosion Control Driver, Grout Mixer Truck, Dump Crete 6.5yd and over, Dumpster Trucks, DW 10, DW 20 and over, Fuel Truck and Dynamite, Truck Greaser, Truck Mounted Mobile Sweeper 2-axle Winch Truck

GROUP 5: Off-road Dump Truck 35 tons and over, 7-axles or more, Transit Mix Trucks 8 yd and over, A-Frame Truck, Swedish Cranes

GROUP 6: Off-Road Special Equipment (including but not limited to Water Pull Tankers, Athey Wagons, DJB, B70 Wuclids or like Equipment)

GROUP 7: Repairman

WELDERS - Receive rate prescribed for craft performing operation to which welding is incidental.

==========

Note: Executive Order (EO) 13706, Establishing Paid Sick Leave for Federal Contractors applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2017. If this contract is covered by the EO, the contractor must provide employees with 1 hour of paid sick leave for every 30 hours they work, up to 56 hours of paid sick leave each year. Employees must be permitted to use paid sick leave for their own illness, injury or other health-related needs, including preventive care; to assist a family member (or person who is like family to the employee) who is ill, injured, or has other health-related needs, including preventive care; or for reasons resulting from, or to assist a family member (or person who is like family to the employee) who is a victim of, domestic violence, sexual assault, or stalking. Additional information on contractor requirements and worker protections under the EO is available at www.dol.gov/whd/govcontracts.

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (ii)).

The body of each wage determination lists the classification and wage rates that have been found to be prevailing for the cited type(s) of construction in the area covered by the wage determination. The classifications are listed in alphabetical order of ""identifiers"" that indicate whether the particular rate is a union rate (current union negotiated rate for local), a survey rate (weighted average rate) or a union average rate (weighted union average rate).

Union Rate Identifiers

A four letter classification abbreviation identifier enclosed in dotted lines beginning with characters other than ""SU"" or ""UAVG"" denotes that the union classification and rate were prevailing for that classification in the survey. Example: PLUM0198-005 07/01/2014. PLUM is an abbreviation identifier of the union which prevailed in the survey for this classification, which in this example would be Plumbers. 0198 indicates the local union number or district council number where applicable, i.e., Plumbers Local 0198. The next number, 005 in the example, is an internal number used in processing the wage determination. 07/01/2014 is the effective date of the most current negotiated rate, which in this example is July 1, 2014.

Union prevailing wage rates are updated to reflect all rate changes in the collective bargaining agreement (CBA) governing this classification and rate.

Survey Rate Identifiers

Classifications listed under the ""SU"" identifier indicate that no one rate prevailed for this classification in the survey and the published rate is derived by computing a weighted average rate based on all the rates reported in the survey for that classification. As this weighted average rate includes all rates reported in the survey, it may include both union and non-union rates. Example: SULA2012-007 5/13/2014. SU indicates the rates are survey rates based on a weighted average calculation of rates and are not majority rates. LA indicates the State of Louisiana. 2012 is the year of survey on which these classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. 5/13/2014 indicates the survey completion date for the classifications and rates under that identifier.

Survey wage rates are not updated and remain in effect until a new survey is conducted.

Union Average Rate Identifiers

Classification(s) listed under the UAVG identifier indicate that no single majority rate prevailed for those classifications; however, 100% of the data reported for the classifications was union data. EXAMPLE: UAVG-OH-0010 08/29/2014. UAVG indicates that the rate is a weighted union average rate. OH indicates the state. The next number, 0010 in the example, is an internal number used in producing the wage determination. 08/29/2014 indicates the survey completion date for the classifications and rates under that identifier.

A UAVG rate will be updated once a year, usually in January of each year, to reflect a weighted average of the current negotiated/CBA rate of the union locals from which the rate is based.

WAGE DETERMINATION APPEALS PROCESS

1.) Has there been an initial decision in the matter? This can be:

* an existing published wage determination
* a survey underlying a wage determination
* a Wage and Hour Division letter setting forth a position on a wage determination matter
* a conformance (additional classification and rate) ruling

On survey related matters, initial contact, including requests for summaries of surveys, should be with the Wage and Hour Regional Office for the area in which the survey was conducted because those Regional Offices have responsibility for the Davis-Bacon survey program. If the response from this initial contact is not satisfactory, then the process described in 2.) and 3.) should be followed.

With regard to any other matter not yet ripe for the formal process described here, initial contact should be with the Branch of Construction Wage Determinations. Write to:

Branch of Construction Wage Determinations
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

2.) If the answer to the question in 1.) is yes, then an interested party (those affected by the action) can request review and reconsideration from the Wage and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7). Write to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

The request should be accompanied by a full statement of the interested party's position and by any information (wage payment data, project description, area practice material, etc.) that the requestor considers relevant to the issue.

3.) If the decision of the Administrator is not favorable, an interested party may appeal directly to the Administrative Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

4.) All decisions by the Administrative Review Board are final.

==========

END OF GENERAL DECISION"

ENGINEER OF WORK

The engineering Specifications and Special Provisions contained herein have been prepared by or under the direction of the following Registered Engineer:

Shapiro, Alan — Digitally signed by Shapiro, Alan DN: cn=Shapiro, Alan, ou=USSDG1 Reason: I have reviewed this document Date: 2020.12.29 11:22:19 -08'00'

1) Registered Engineer (Morena Pump Station)

12/29/2020 Date

Seal:

Nabil Batta

2) For City Engineer (Morena Pump Station)

12/29/20 Date

Seal:

A. CHANGES TO CONTRACT DOCUMENTS

The following changes to the Contract Documents are hereby made effective as though originally issued with the bid package. Bidders are reminded that all previous requirements to this solicitation remain in full force and effect.

B. BIDDER's QUESTIONS

Q1. Drawing C-09 indicates the 60" PLRCP from Station 19+53.01 at Junction Structure No. 1 to 22+30.23 at the Influent Screening Structure wall to be installed using "trenchless construction". Several Mechanical drawings, including M-01 show a series of 3, 4 foot long bell and spigot joints of pipe leading into the screening structure. There does not appear to be a specification in the bid documents addressing this situation, the pipe material requirements, or the parameters for allowable or expected deflection of these pipe joints. Please clarify the designer's intent to install the three short joints of pipe using trenchless methods.

A1. The trenchless construction limits have been revised as shown on drawing C-09, provided in this Addendum.

Q2. Addenda B, Q&A 15 addresses wall ring details and describes an acceptable method for a closure sequence between microtunneled pipe and the cast in place structure wall. Is this same method acceptable for closure between the microtunneled 60" PLCRP and the Screening Structure cast in place wall?

A2. The trenchless construction limits have been revised as shown on drawing C-09, provided in this Addendum.

Q3. Specification Section 03 33 00 requires the Contractor to develop a thermal control plan for mass concrete with a thickness of 2'-6" or greater. ACI 207.1R defines mass concrete as, "any volume of concrete with dimensions large enough to require that measures be taken to cope with the generation of heat from hydration of the cement and attendant volume change to minimize cracking." The amount of construction joints and the size of the pours on the Morena Pump Station greatly limit the possibility of cracking. Please confirm that the requirement for a thermal control plan be concrete that is greater than 4' thick.

A3. Confirmed.

Q4. Addendum A, drawing E-50, provides information regarding the precast concrete pull box in Detail 1; this detail calls for a 4-inch Fiber Optic Conduit. Details 2 and A in the same Drawings calls for 2-inch FO conduit. Confirm that 2-inch conduit is the correct size Fiber Optic.

A4. Confirmed, 2" conduit is the correct size.

Q5. Drawing M-13 calls for all gas piping to be insulated per specification 40 27 00. Specification 40 27 00 states: Insulation - as shown on the drawings. Please provide details for gas pipe insulation (material, thickness, finish, etc.)

Please advise on the DDC control strategy for the Vertical Air Handling Unit (AHU/CU-1). Control detail or points list would be most beneficial.

A5. Insulation shall be minimum ¾-inch thick flexible polyethylene or EPDM rated for -160 to 200 degrees F or better, and covered with Stainless Steel Insulation Shields as specified in Specification 22 10 01 Paragraph 2.04.G.1. Contractor shall provide details per Specification Section 23 09 00 Part 1.4, Item B, Shop Drawings.

Q6. Please advise on the DDC control strategy for the Split System Heat Pump (FC/HP-1). Control detail or points list would be most beneficial.

A6. Contractor shall provide per Specification Section 23 09 00 Part 1.4, Item B, Shop Drawings.

Q7. Please advise on the DDC control strategy for all Supply and Exhaust Fans that are scheduled, some of which has Variable Frequency Drives (VFD). Control detail or points list would be most beneficial.

A7. Contractor shall provide per Specification Section 23 09 00 Part1.4, Item B, Shop Drawings

Q8. How much DDC system operator training is needed after project completion?

A8. Missing Specification 40 98 06 Training is provided in this Addendum.

Q9. Drawings M-12, M-11, M-26, M-13 all call for 3", 4", 6" and 16" plug valves respectively. However, Spec Section 40 27 02 part 2.04B only provides information for plug valves 24" – 48". Please provide the required specifications for the 3", 4", 6" and 16" plug valves.

A9. Revised Specification 40 27 02 Process Valves and Operators is provided in this Addendum.

Q10. The scope of required settlement monitoring for tunneling is vague. Can the city define what will be required more precisely by indicating required survey points and instrumentation on the plans? This will eliminate misinterpretation by all parties for what is required. For example, we have the following questions:

a. Reference Plan C-25 and Note 2, which states that the minimum instrumentation for tunnel monitoring shall include the monitoring instrumentation at the locations shown on Plan Sheets C-09, C-12, C-13, and C-16. The only monitoring instrumentation that is shown on these sheets is a single Inclinometer on Sheet C-09. Please verify that this is the only required monitoring instrumentation.

b. Note 1 on C-09, 12, 13, 14, 15 & 16 requires bridge monitoring using optical surveying methods. "Several locations shall be marked on the bridge to survey for both vertical and horizontal movement." Please specify how many locations be marked and surveyed at each bridge crossing.

c. Reference Plan C-25 and Note 2, which states that the minimum survey points shall be located at the following five designated locations along the MTS railroad track: 1) At the track centerline, directly above the tunnel installation location. 2) Four Additional Points: at 10 Feet and 25 Feet either side of the tunnel alignment centerline survey point.

i. Are we correct interpreting that Note 2 requires that we have 5 locations for each crossing for a total of 15 survey points?

ii. Do these survey points need to be constructed per detail 2 on C-25 or is a pk nail in the pavement an acceptable survey point?

iii. Are these survey points in addition to the optical surveying methods stipulated at several locations marked on the bridge (As per Note 1 on C-09, 12, 13, 14, 15 & 16)?

d. Reference Plan C-09 and the Sandag MCTC which crosses over the 48" PLRCP via a bridge. Is the 5-point survey array required for this track crossing also or is just a bridge survey required here?

e. Plan C-25 provides detail 3 for Utility Monitoring Points but there is no indication on the plans as to which utilities requires monitoring. Are we to assume all utilities that cross the tunnel alignment require monitoring per this detail?

f. Plan C-25 provides a detail for Surface Deformation Points but there is no indication on the plans regarding the location or frequency of points. If points are located over existing hardscape features (i.e. asphalt or concrete pavement) will a PK nail or anchor bolt be sufficient?

A10. Per Specification 31 71 19, Section 1.04 (8) and 31 50 00, Section 1.04 (E) and Dwg C-09, Note 1, the Contractor shall submit a monitoring plan for review and approval.

Q11. Please confirm that the cost of DCSP is not to be included in the bid since this scope is provided by the City's DSC provided Emerson Process Management as stated in Specification section 40 90 00 section 1.1 C. "A Distributed Control System (DCS), when applicable, as specified in Section 40 90 03, General Requirements, will be provided by the City's DCS provider, Emerson Process Management (EPM). The Contractor shall be responsible for terminating and integrating all I&C equipment with the EPM DCS systems."

A11. The Contractor shall be responsible for the design, procurement, installation, testing, training, and documentation for I&C systems provided under this Contract in accordance with Sections 40 90 00 and 40 90 07, Scope of Work.

Q12. Addendum C contains three answers regarding lining and coating of ductile iron pipe. Per A32 and A61 “All ductile iron pipe and fittings shall be fusion bonded epoxy lined and coated and conform to the requirements of Section 09 90 00 Part 3.07 B.”. This differs from the answer A71 “Lining: Ductile Iron Pipe and Fittings shall be lined with 40 mils ceramic epoxy as manufactured by Induron or equal as required in Specification Section 33 05 19. Coating: Buried Pipe shall be Asphaltic Coated as required in Specification Section 33 05 19. Exposed pipe shall receive Coating System 4 as specified in Specification Section 09 90 00 - Painting and Coating”. If either of these options is acceptable, can we suggest abandoning fusion bonded epoxy requirement and using the lining/coating scheme provided by Q71 as more readily available and less expensive?

A12. Lining: Ductile Iron Pipe and Fittings shall be lined with 40 mils ceramic epoxy as manufactured by Induron or equal as required in Specification Section 33 05 19. Coating: Buried Pipe shall be Asphaltic Coated as required in Specification Section 33 05 19. Exposed pipe shall recieve coating system 4 as specified in Specification Section 09 90 00.

Q13. Question 19- Addendum C. Will As-Built reports for the ground improvement projects for the North Metro Interceptor and the Mid-Coast Trolley be made available to bidding Contractors? A19. The City is not in posession of the requested information. Question 20 – Addendum C. Will foundation plans for the Pacific Highway bridge and the SANDAG MCTC bridge, including any post 1940s foundation improvements be made available to bidding Contractors? The City is not in posession of the requested information.

A13. As was stated previously, the City does not possess the requested information.

Q14. Q21-Addendum C, what is the allowable settlement of railroad tracks for the MTS Trolley? Owner Response A21. No settlement of MTS tracks will be allowed.

All Engineered microtunneling installation consider some amount systematic settlement in the design, it is not possible for a microtunneling installation in these ground conditions to be installed with no settlement allowances. We respectfully request the Owner provide the following related to systematic settlement allowances;

Action Trigger Levels, Contractor Response Levels as a percentage of Maximum Allowable Movement and Maximum Allowable Movement.

Bid item for allowance for ground improvement along the tunneling alignment to protect surface and subsurface structures along with a design to implement.

A14. Bidders are advised that the information in the specification Section 31 71 19 is to be used. Provide details of site monitoring plan including provision of measuring ground movements at shafts and along the tunnel alignment and the monitoring of any existing structures within 100 ft of the centerline of the excavation and tunnel alignment. Submit a plan for actions to be taken in the case of ground movements or movements of structures exceeding the allowable movement limits (Unless otherwise submitted ½ inch movement requires action to be taken as per the plan). Q21-Addendum C, what is the allowable settlement of railroad tracks for the MTS Trolley? Owner Response A21 "No settlement of MTS tracks will be allowed" is modified to ½ inch allowable settlement beneath the rails before action is required to be taken. The MTS LRT tracks are defined as an existing structure.

Q15. Question 50, addendum C; SECTION 31 71 19, MICROTUNNELING; 1.4 SUBMITTALS: A. Submit the following in accordance with the Contract Documents. 8. Provide details of site monitoring plan including provision of measuring ground movements at shafts and along the tunnel alignment and the monitoring of any existing structures within 100ft of the centerline of the excavation and tunnel alignment. Submit a plan for actions to be taken in the case of ground movements or movements of structures exceeding the allowable movement limits (Unless otherwise submitted 1/2in movement requires action to be taken as per the plan)

A. Has the Owner conducted systematic settlement calculation for this project?
B. If so, can they be shared with the bidding contractors
C. If not, how do you know if something less than 0.50-inch of movement is achievable?

Owner Response: A50. Yes, 1/2 in movement requires action to be taken as per the plan.

Please note the Owner has not yet responded to the above items A, B and C above in questions no. 3. The shallowest area along the 66-inch PLRCP tunnel alignment is 11-feet deep to top of pipe or 8-feet from bottom of the surface monitoring point to top of pipe. The calculated systematic settlement is 1.21 inches using an 80.50" OD Pipe, 1.50" overcut, 50% fill of the annular backfill gap, 1% face loss and the settlement trough is 10.22 feet wide. In addition, the 66-inch PLRCP and the adjacent 48-inch PLRCP tunnel alignments have 12-feet of separation, so the settlement troughs will overlap each other which will on increase the systematic settlement. It appears by this conservative calculation the 0.50 inches of movement which requires some type of an action to be taken is greatly exceeded. We respectfully request the Owner provide the following related to systematic settlement allowances;

- Action Trigger Levels, Contractor Response Levels as a percentage of Maximum Allowable Movement and Maximum Allowable Movement.

- Bid item for allowance for ground improvement along the tunneling alignment to protect surface and subsurface structures along with a design to implement.

A15. Responses: A. No, B. N/A, C. Contractor is to include in his bid the risk and cost of possible ground treatment and track levelling required to achieve the settlement tolerance on structures

Q16. Can the 48-inch PLRCP be increased to a 60-PLRCP between Stations 10+52 to 19+28 and 1+15 to 17+75 at no cost to the Owner.

A16. Yes.

Q17. HDPE LINED REINFORCED CONCRETE PIPE FOR JACKING AND TUNNELING; Section 33 05 01.10, 2.02 MANUFACTURE; D. Liner shall be cast at the top 330 degrees throughout the pipe interior, leaving the bottom 30 degrees of concrete pipe exposed at the invert. E. Approved manufacturer – Geneva Pipe and Precast

Several questions were asked requesting a change to a 360-degree lining and the 330-degree requirement remains. Again, we must ask was this considered in during design by the Trenchless Engineers?

Has Geneva Pipe previously produced Perfect Pipe with a liner cast at the top 330-degrees throughout the pipe interior, leaving the bottom 30 degrees of concrete pipe exposed at the invert.

A17. The owner will accept the use of 360 degree, fully HDPE lined and complete 360 degree welded joints at no additional cost to the owner.

Q18. DWG. S-27, Keynote 14 calls for SS ¼" Bent Plate. There is no detail call out for the bend or anchorage detail. Please provide detail for SS bent plate and anchorage.

A18. Callouts added to Detail 1 on Sheet S-63; Detail reference added to KN 14 on Sheet S-27. See revised Sheets S-27 and S-63 provided in this Addendum.

Q19. DWG. S-39, Keynote 15 calls for Aluminum guardrail at the hatches and perimeter or the roof. However, on DWG. S-40 keynote 13 calls for FRP guardrail. Please clarify type of material for guardrails at the hatches and perimeter of the pump station roof.

A19. All railing on the Pump Station roof is to be aluminum. KN 27 added to drawing S-40 and KN reference pointing to roof guardrail have been revised from KN 13, to new KN 27. See revised Sheet S-40 provided in this Addendum.

Q20. What is the schedule for the MCTC contractor? Are they going to be complete by NTP to allow the contractor to begin work in Friars road?

A20. The MCTC Contractor will be completed and demobilized prior to NTP of this Contract.

Q21. Upon speaking with various ready mix concrete suppliers it has come to our attention that there is a Fly Ash shortage due to economic and operational effects at Coal Power Plants that produce Fly ash. The current Ready mix Concrete spec calls out for Fly ash with no detailed substitution. Ready Mix Facilities are currently using Slag as a substitution for Fly Ash. Can these specs be revised to include a substitution for Fly ash? If so, can we be notified of what this substitution be to obtain an accurate bid for ready mix concrete?

A21. Material substitutions will be considered during the construction phase.

Q22. Spec 43 20 05, paragraph 2.2.A.2 calls out to furnish one complete set of Rotalign Ultra system to owner. Contractor is potentially going to sub out machine alignment to professional services. This equipment could cost $35000. Please confirm if district wants contractor to furnish a new set of this system.

A22. Contractor is to provide the system per Spec 43 20 05.

Q23. The 16" piping to the speece cone in the high purity oxygen system is call out to be class 300 ductile iron pipe. Please confirm that the piping material for this 16" pipe in the HPO system does not require to be stainless steel.

A23. Provide piping system as shown on the contract drawings.

Q24. On Drawing C-21 it shows locations of where to use 50’ and 80’ stone columns. However, it does not show the existing 66” RCP that runs thru the southwest corner of the site. The stone columns will be installed at the onset of the project and the existing 66” RCP is to be used later in the project for bypassing and as such, needs to be protected in place during the stone column installation. At a minimum the stone column spacing will need to be adjusted in this area. However, since there are no proposed improvements in this area, would the City consider deleting the stone columns in this area so as not to potentially damage the existing 66” RCP?

A24. If there are no improvements in that area, including utility connections, it is reasonable to consider eliminating the stone columns in the area. This will be reviewed for approval during the construction phase.

Q25. Sheet C-09 refers to sheet E-50 for additional information regarding the CP-DS panels. Can you please provide sheet E-50?

A25. E-50 was provided in Addendum A.

Q26. Are there any sample drawings, elevation drawings, or wiring diagrams available for CP-DS1/2 and CP-DS3? If so, can you please provide them?

A26. CP-DS1/2 and CP-DS3 will be new control panels to be furnished by contractor under this project. Contractor to furnish panel drawings. Refer to Section 409513 for field cabinet requirements.

Q27. City of San Diego typically allows a maximum of 144,000 gallons per day to be discharged into the sewer. Will an exception be granted to allow for 860,000 gallons per day to be discharged into the sewer for this project?

A27. 860,000 gallons per day will be allowed to be discharged as indicated on Diversion Scenarios in Specification 01 50 25.

Q28. The sewer permit states that during and after a rain event the Permit Holder (Contractor) will have to shutoff the discharge (dewatering). By enforcing the dewatering shutoff during a rain event will flood the site's excavation. Please confirm the requirement to shutoff dewatering operations to the sewer during and after rain events will not be required.

A28. Shutoff of Dewatering activities will not be required.

Q29. Please confirm if the sewer discharge fees will be waived. If not, please increase the discharge fee allowance bid item to a value that would include the fees for discharging up to 860,000 gallons per day for two years.

A29. Sewer Discharge fees shall be paid per Bid Item 27 Dewatering Permit and Discharge Fees (EOC Type I). If additional funds are needed for the allowance bid item they will be added as needed.

Q30. Spec 43 42 00, paragraph 3.3.B says that initial tank fill will be supplied by the OWNER for the LOX tanks. Addendum 2, question 36 calls out that contractor is supposed to cover the cost for initial fill and testing of chemicals. Please clarify if district will provide the first fill for liquid oxygen.

A30. Response as stated in Addendum B, A36 is confirmed.

Q31. Will there be an OIT requirement for CP-DS1/2 or CP-DS3?

A31. All monitoring and control functions shall be through local actuator control station.

Q32. In addendum C – Q38/A38 states that Contractor will not be responsible for Acts of God as defined under CA7105. In addendum A – Q41/A41 states that owner is not responsible for all losses as they relate to earthquake. In the event of an earthquake please confirm WHO will be responsible for such losses.

A32. All Pure Water projects are exempt from mandatory requirements of California Public Contract Code 7105 (a). Response to Q38 in Addendum C will be revised via this Addendum.

Q33. Sheet H-02 lists Fans EF-01 through EF-07 and SF-01 through SF-05. Fans EF-01, EF-02, EF-03, and EF-04 are listed in spec section 44 47 28.26. However, is it unclear what spec sections the remaining fans pertain to as there is no indication of this in spec sections 23 34 00 HVAC Fans and 23 34 00 Axil HVAC Fans. Please specify the spec section related to each of the remaining fans.

A33. EF-07 thru EF-11 pertain to section 23 34 00, "Axial Fans" part 2.02.

Q34. Addendum D clarifies that there is a 60 calendar day period prior to the start of the 120 day integration period and also clarifies that the inclement weather activity should be 52 working days with successor being substantial completion. The activities in between Milestone 1 and 2 are the 60 Calendar Day duration, the 120 Calendar Day Integration Period, the 30 Calendar Day Facility Acceptance Period, followed by the 52 Working Day Inclement Weather. This equals more than 202 Working Days. The duration between milestones 1 and 2 is 145 Working Days per contract. Please clarify if the durations should be changed to

maintain the 145 working day duration or if the milestone 2 will be pushed back to accommodate the durations called out.

A34. The 52 working days for inclement weather shall have a predecessor of NTP and days are used up as needed before the substantial completion.

Q35. Reference drawing S-30. Note 8 calls for FRP guardrail per detail 9 on S-06. This detail is for aluminum guardrail. Please clarify.

A35. KN 8 to be revised to Aluminum.

Q36. Reference drawing A-10 notes 27 and 28 calling for liquid waterproofing and waterproofing membrane system, respectively. There do not appear to be specifications, identification of limits, termination details, etc. for this waterproofing system provided in the bid documents. This question also applies to drawings A-11, A-18, A-19 and A-20. Further, similar structural drawings indicate crystalline waterproofing admixture is to be included in the concrete mix (e.g., note 30 drawing S-32) and no mention of liquid or sheet applied waterproofing. Please clarify intent and provide any needed specifications and details.

A36. Crystalline waterproofing concrete admixture is to be used in lieu of externally applied waterproofing at the screening facility and pump station. For structures that require externally applied below-grade waterproofing, refer to specification 07 13 26. Notes 27 and 28 on Sheet A-10 revised to refer to the structural drawings.

Q37. Reference drawing A-11 and note 8 calling for coating of influent channel surfaces. The note refers to the structure drawings. Drawing S-33 shows the same section view as A-11 and includes note 15 calling for a coating on influent channel surfaces per another note on drawing S-27. There does not appear to be a note on drawing S-27 regarding this coating. What coating is required on the influent channel surfaces? What are the limits of this coating? Do these limits include the floor slab? Extend the full height of the walls? Is there a special detail for this coating at its termination or across construction joints?

A37. The coating note is located in the lower left corner of Sheet S-27 and includes material and coverage requirements.

C. ADDENDUM

1. To Addendum A, Section B, Bidder's Questions, page 21, Q67 and A67, **DELETE** in their entirety and **SUBSTITUTE** with the following:

Q67. Can you please provide the following information related to the bypass of the 78" NMVI pipeline:

a. What is the diameter of the manhole located in the YMCA parking lot (MH-1)?

b. Can the 78" NMVI pipeline be surcharged above the top of the 78" pipe?

c. Can you please provide as-builts of the existing NMI Junction structure, including the diameters of the manholes.

d. Are there any other sewer lines that dump into the 78" NMVI pipeline between MH-1 (in the YMCA parking lot) and the existing NMI Junction Structure?

A67. It is understood that bypass pumping operation will not fit in a manhole. Due to the constraints of limited property at the upstream manhole and the adjacency to the Mission Valley Preserve it is anticipated that the NMVI will be exposed between NMI Junction Structure and the trolley tracks where bypass pumping can occur. The CONTRACTOR shall develop a plan for approval by the ENGINEER to open top of the NMVI and provide bypass pumping and repair upon completion.

Structure 3 may be constructed without the use of a pumped bypass of the existing 78-inch NMVI. Construction methods such as the use of flow through tubes and construction sequencing shall be performed to maintain live sewage flow at all times through the work area.

The Contractor shall develop a detailed work plan for structure construction and sequencing for approval by Engineer prior to construction. The work plan shall describe the construction sequence and means and methods employed to convey the identified maximum wet weather flow described in

Section 01 50 25 through the work area without the possibility of a sewage spill or surcharging the upstream portion of the NMVI Sewer. The City reserves the right to reject the Contractor's work plan if such means and methods do not provide sufficient protection from sewage spill or provide adequate flow through capacity.

Routing pipes through the preserve will not be allowed.

Record drawings 27256-D and 27152-D links have been provided via Addendum A.

2. To Addendum C, Section B, Bidder's Questions, page 8, Q21 and A21, **DELETE** in their entirety and **SUBSTITUTE** with the following:

   Q21. What is the allowable settlement of railroad racks for the MTS Trolley?

   A21. ½ inch allowable settlement beneath the rails before action is required to be taken. The MTS LRT tracks are defined as an existing structure.

3. To Addendum C, Section B, Bidder's Questions, page 14, Q38 and A38, **DELETE** in their entirety and **SUBSTITUTE** with the following:

   Q38. Please confirm this project is subject to the California Acts of God statute which relieves the contractor from the cost associated with damage caused by an earthquake exceeding 3.5 on the Richter Scale in excess of 5% of the contractor's bid.

   A38. All Pure Water projects are exempt from mandatory requirements of California Public Contract Code 7105 (a).

D. SUPPLEMENTARY SPECIAL PROVISIONS

1. To Technicals, Section 40 27 02, PROCESS VALVES AND OPERATORS, pages 1505 through 1519, **DELETE** in its entirety and **SUBSTITUTE** with pages 18 through 33 of this Addendum.

2. To Technicals, **ADD** Section 40 98 06, TRAINING, to pages 34 through 36 of this Addendum.

E. PLANS

1. To Drawing Sheet Numbers 40421-01-D, 40421-31-D, 40421-68-D, 40421-124-D, 40421-127-D, 40421-137-D, 40421-160-D, **DELETE** in their entirety and **REPLACE** with pages 37 through 43 of this Addendum.

James Nagelvoort, Director
Engineering & Capital Projects Department

Dated: *December 30, 2020*
San Diego, California

1.02 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
    a. Product data sheets for each make and model. Indicate valve Type Number, applicable Tag Number, and facility name/number or service where used.
    b. Complete catalog information, descriptive literature, specifications, and identification of materials of construction.
    c. Certification for compliance to NSF/ANSI 61 for valves used for drinking water service.
    d. Power and control wiring diagrams, including terminals and numbers.
    e. For each power actuator provided, manufacturer's standard data sheet, with application specific features and options clearly identified.
    f. Sizing calculations for open-close/throttle and modulating valves.
    g. Anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Anchorage and Bracing.

B. Informational Submittals:

1. Anchorage and bracing calculations as required by Section 01 88 15, Anchorage and Bracing.
2. Manufacturer's Certificate of Compliance, in accordance with Section 01 61 00, Common Product Requirements, for:
    a. Electric actuators; full compliance with AWWA C542.
    b. Butterfly valves; full compliance with AWWA C504.
3. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection and Testing.
4. Tests and inspection data.
5. Operation and Maintenance Data as specified in Section 01 78 23, Operation and Maintenance Data.
6. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers' Field Services.

PART 2 PRODUCTS

2.01 GENERAL

A. Valves to include operator, actuator, handwheel, chain wheel, extension stem, floor stand, operating nut, chain, wrench, and accessories to allow a complete operation from the intended operating level.

B. Valve to be suitable for intended service. Renewable parts not to be of a lower quality than specified.

C. Valve same size as adjoining pipe, unless otherwise called out on Drawings or in Supplements.

D. Valve ends to suit adjacent piping.

E. Resilient seated valves shall have no leakage (drip-tight) in either direction at valve rated design pressure. All other valves shall have no leakage (drip-tight) in either direction at valve rated design pressure, unless otherwise allowed for in this section or in stated valve standard.

F. Size operators and actuators to operate valve for full range of pressures and velocities.

G. Valve to open by turning counterclockwise, unless otherwise specified.

H. Factory mount operator, actuator, and accessories.

I. Components and Materials in Contact with Water for Human Consumption: Comply with the requirements of the Safe Drinking Water Act and other applicable federal, state, and local requirements. Provide certification by manufacturer or an accredited certification organization recognized by the Authority Having Jurisdiction that components and materials comply with the maximum lead content standard in accordance with NSF/ANSI 61 and NSF/ANSI 372.

1. Use or reuse of components and materials without a traceable certification is prohibited.

2.02 MATERIALS

A. Bronze and brass valve components and accessories that have surfaces in contact with water to be alloys containing less than 16 percent zinc and 2 percent aluminum.

1. Approved alloys are of the following ASTM designations: B61, B62, B98/B98M (Alloy UNS No. C65100, C65500, or C66100), B139/B139M (Alloy UNS No. C51000), B584 (Alloy UNS No. C90300 or C94700), B164, B194, and B127.
2. Stainless steel Alloy 18-8 may be substituted for bronze.

B. Valve materials in contact with or intended for drinking water service to meet the following requirements:

1. Materials to comply with requirements of the Safe Drinking Water Act and other applicable federal, state, and local requirements.
2. Coatings materials to be formulated from materials deemed acceptable to NSF/ANSI 61.
3. Supply certification product is certified as suitable for contact with drinking water by an accredited certification organization in accordance with NSF/ANSI 61. Provide certification for each valve type used for drinking water service.

2.03 FACTORY FINISHING

A. General:

1. Interior coatings for valves and hydrants shall be in accordance with AWWA C550, unless otherwise specified.
2. Exterior coating for valves and hydrants shall be in accordance with Section 09 90 00, Painting and Coating.
3. Material in contact with potable water shall conform to NSF/ANSI 61.
4. Exposed safety isolation valves and lockout valves with handles, handwheels, or chain wheels shall be “safety yellow.”

B. Where epoxy lining and coating are specified, factory finishing shall be as follows:

1. In accordance with AWWA C550.
2. Either two-part liquid material or heat-activated (fusion) material except only heat-activated material if specified as “fusion” or “fusion bonded” epoxy.
3. Minimum 7-mil dry film thickness except where limited by valve operating tolerances.

2.04 VALVES

A. Ball Valves:

1. Type V300 Ball Valve 3 Inches and Smaller for General Water and Air Service:

a. Two-piece, standard port, NPT threaded ends, bronze body and end piece, hard chrome-plated solid bronze or brass ball, RTFE seats and packing, blowout-proof stem, adjustable packing gland, zinc-coated steel hand lever operator with vinyl grip, rated 600-pound WOG, 150-pound SWP, complies with MSS SP-110.
b. Manufacturers and Products:
1) Threaded:
a) Conbraco Apollo; 70-100.
b) Nibco; T-580-70.
c) Or equal.
2) Soldered:
a) Conbraco Apollo; 70-200.
b) Nibco; S-580-70.
c) Or equal.

2. Type V301 Ball Valve 2 Inches and Smaller for General Water and Air Service:
a. Two-piece, full port, NPT threaded ends, bronze body and end piece, hard chrome-plated solid bronze or brass ball, RTFE seats and packing, blowout-proof stem, adjustable packing gland, zinc-coated steel hand lever operator with vinyl grip, rated 600-pound WOG, 150-pound SWP, complies with MSS SP-110.
Manufacturers and Products:
1) Threaded:
a) Conbraco Apollo; 77-100.
b) Nibco; T-585-70.
c) Or equal.
2) Soldered:
a) Conbraco Apollo; 77-200.
b) Nibco; S-585-70.
c) Or equal.

3. Type V306 Stainless Steel Ball Valve 2 Inches and Smaller:
a. Two-piece, full port, ASTM A276 GR 316 or ASTM A351/A351M GR CF8M stainless steel body and end piece, NPT threaded ends, ASTM A276 Type 316 stainless steel ball, reinforced PTFE seats, seals, and packing, adjustable packing gland, blowout proof stainless steel stem, stainless steel lever operator with vinyl grip, rated 1,000 psig CWP, complies with MSS SP-110.
b. Manufacturers and Products:
1) Conbraco Apollo; 76F-100 Series.
2) Nibco; T-585-S6-R-66-LL.
3) Or equal.

B. Plug Valves:

1. Type V407 Eccentric Plug Valve 24 Inches to 48 Inches:
   a. 100% Port, nonlubricated type rated 250 psig CWP, drip-tight shutoff with pressure from either direction, ductile-iron body, exposed service flanged ends with drilling per ANSI/ASME B16.1 Class 125 and flange rating of 250 psi flanged joints ends unless otherwise shown, eccentric plug, ductile iron plug material plug coated with NBR, seats welded nickel, stem bearings lubricated stainless steel or bronze, stem seal multiple V-rings or U-cups with O-rings of nitrile rubber, grit seals on both upper and lower bearings.
   b. Provide quarter-turn electric motor actuator with backup handwheel per requirements of this spec section.
   c. Manufacturers and Products:
      1) APCO DeZurik; Style PEF.
      2) Pratt.
      3) Milliken.
      4) Or equal.

2. Type V405 Eccentric Plug Valve 3 Inches to 12 Inches:
   a. Nonlubricated type rated 175 psig CWP, drip-tight shutoff with pressure from either direction, cast-iron body, exposed service flanged ends per ASME B16.1 or grooved ends in accordance with AWWA C606 for rigid joints, buried service mechanical joint ends, unless otherwise shown.
   b. Plug cast iron with round or rectangular port of no less than 80 percent of connecting pipe area and coated with Buna N, seats welded nickel, stem bearings lubricated stainless steel or bronze, stem seal multiple V rings, or U cups with O rings of nitrile rubber, grit seals on both upper and lower bearings.
   c. For buried service, provide external epoxy coating.
   d. Operators:
      1) 3 Inch to 4 Inch Valves: Wrench lever manual.
      2) 6 Inch to 12 Inch Valves: Totally enclosed, geared, manual operator with handwheel, 2 inch nut or chain wheel. Size operator for 1.5 times maximum operating shutoff pressure differential for direct and reverse pressure, whichever is higher. For buried service, provide completely sealed operator filled with heavy lubricant and 2 inch nut.
   e. Manufacturers and Products:
      1) Pratt; Ballcentric.
      2) DeZurik; Style PEC
      3) Type V406 Eccentric Plug Milliken; Millcentric Series 600.

3. Type V406 Eccentric Plug Valve 14 Inches to 20 Inches:

a. Nonlubricated type rated 150 psig CWP, drip-tight shutoff with pressure from either direction, cast-iron body, exposed service flanged ends per ASME B16.1 or grooved ends in accordance with AWWA C606 for rigid joints, buried service mechanical joint ends, unless otherwise shown. Plug cast iron with round or rectangular port of no less than 80 percent of connecting pipe area and coated with Buna N, seats welded nickel, stem bearings lubricated stainless steel or bronze, stem seal multiple V rings, or U cups with O rings of nitrile rubber, grit seals on both upper and lower bearings.
b. Totally enclosed, geared, manual operator with handwheel, 2-inch nut or chain wheel. Size operator for 1.5 times maximum operating shutoff pressure differential for direct and reverse pressure, whichever is higher. For buried service, provide completely sealed operator filled with heavy lubricant and 2-inch nut.
c. For buried service, provide external epoxy coating.
d. Manufacturers and Products:
    1) Pratt; Ballcentric.
    2) DeZurik; Style PEC
    3) Milliken; Millcentric Series 600.

C. Check and Flap Valves:

1. Type V608 Swing Check Valve 2 Inches to 24 Inches:
    a. AWWA C508, flange drilling confirming to ANSI/ASME B16.1, Class 125, with flange rating of 125 psi, ductile-iron body and ductile iron cover, NBR rubber disc sent, 316 stainless steel sent.
    b. Ductile-iron disc and disc arm.
    c. PTFE Packing.
    d. Type 316 stainless steel pivot shaft.
    e. Type 316 stainless steel bushings.
    f. Ductile-iron counterweight assembly.
    g. Provide air cushion cylinder with speed control assembly
    h. Valve shall have a working pressure rating of 250 psi.
    i. Manufacturers and Products:
        1) Dezurik, APCO CVS-250.
        2) Or equal.

D. Stainless Steel Check Valve (Scum Pumps)

1. Swing Check Valve 2 Inches to 24 Inches:
    a. Flange drilling confirming to ANSI/ASME B16.1, Class 125, with flange rating of 125 psi, stainless steel body and cover, NBR rubber disc sent, 316 stainless steel sent.
    b. Stainless Steel disc and disc arm.
    c. PTFE Packing.
    d. Type 316 stainless steel pivot shaft.
    e. Type 316 stainless steel bushings.

f. Stainless steel hing assembly.
g. Valve shall have a working pressure rating of 150 psi.
h. Manufacturers and Products:
   1) FNW 471A Steel Flanged Check Valve.
   2) Or equal.

E. Sewage Pressure Relief Valve

1. 4 Inches to 48 Inches:
   a. Valve body shall be constructed of gray iron casting that confirms to ASTM Specifications A 126 Class B. Internal stainless steel Components shall confirm to ASTM Specification A-743 Grade CF-8 or CF-8M. The threaded assembly shall confirm to ANSI standards.
   b. Type 316 stainless steel seat ring.
   c. Type 316 stainless steel bushings and fasteners
   d. Type 316 stainless steel seat support assembly
   e. The control assembly shall be rigid red brass no less than 0.5" in diameter.
   f. Valve shall have a working pressure rating of 250 psi.
   g. The valve shall be coated with NSF Certified Epoxy (Tenemec Series FC20 or approved equal). Coating shall be in accordance with ANSI/NSF Std. 61 and confirming to AWWA D102 Inside System No. 1
   h. Manufacturers and Products:
      1) Ross Series 70SWR-E
      2) Or equal.

F. Knife Gate Valves at Pump Station:

1. Body material: 316 stainless steel.
2. PTFE braided packing.
3. 304 stainless steel yoke.
4. 316 stainless steel gate.
5. Painted cast iron handwheel.
6. 420 stainless steel roll pin.
7. 316 stainless steel gland.
8. NBR seat ring
9. 304 stainless steel stem.
10. Pressure rating 150 psi.
11. Wafer-style flanges.
12. Provide multi-turn electric actuators.
13. Manufacturer: Dezurik/APCO or equal.

2.05 OPERATORS AND ACTUATORS

A. Manual Operators:

1. General:
   a. For AWWA valves, operator force not to exceed requirements of applicable valve standard. Provide gear reduction operator when force exceeds requirements.
   b. For non-AWWA valves, operator force not to exceed applicable industry standard or 80 pounds, whichever is less, under operating condition, including initial breakaway. Provide gear reduction operator when force exceeds requirements.
   c. Operator self-locking type or equipped with self-locking device.
   d. Position indicator on quarter-turn valves.
   e. Worm and gear operators one-piece design, worm-gears of gear bronze material. Worm of hardened alloy steel with thread ground and polished. Traveling nut type operator's threaded steel reach rod with internally threaded bronze or ductile iron nut.
2. Exposed Operator:
   a. Galvanized and painted handwheel.
   b. Cranks on gear type operator.
   c. Chain wheel operator with tieback, extension stem, floor stand, and other accessories to permit operation from normal operation level.
   d. Valve handles to take a padlock and wheels a chain and padlock.
3. Buried Operator:
   a. Buried service operators on valves larger than 2-1/2 inches shall have a 2-inch AWWA operating nut. Buried operators on valves 2 inches and smaller shall have cross handle for operation by forked key. Enclose moving parts of valve and operator in housing to prevent contact with the soil.
   b. Buried service operators to be grease packed and gasketed to withstand submersion in water to 20 feet minimum.
   c. Buried valves shall have extension stems, bonnets, and valve boxes.

B. Electric Motor Actuators, 480 Volts:

1. General:
   a. Comply with latest version of AWWA C542.
   b. Size to 1-1/2 times required operating torque. Motor stall torque not to exceed torque capacity of valve.

c. Controls integral with actuator and fully equipped as specified in AWWA C542.
d. Stem protection for rising stem valves.

2. Actuator Operation—General:
   a. Suitable for full 90-degree rotation of quarter-turn valves or for use on multiturn valves, as applicable.
   b. Manual override handwheel.
   c. Valve position indication.
   d. Operate from FULL CLOSED to FULL OPEN positions or the reverse in the number of seconds given in Electric Actuated Valve Schedule.
   e. Nonintrusive Electronic Control: Local controls, diagnostics, and calibration, including limit and torque settings, shall be accomplished non-intrusively. Electronic valve position display with capability to show continuous torque output.
3. Open-Close(O/C)/Throttling(T) Service:
   a. Size motors for one complete OPEN-CLOSE-OPEN cycle no less than once every 10 minutes.
   b. Actuator suitable for throttling operation of valve at intermediate positions.
   c. LOCAL-OFF-REMOTE Selector Switch, padlockable in each position:
      1) Integral OPEN-STOP-CLOSE momentary pushbuttons with seal-in circuits to control valve in LOCAL position.
      2) Remote OPEN-STOP-CLOSE momentary control dry contact inputs in REMOTE position. Integral seal-in circuits for remote OPEN and CLOSE commands; valve travel stops when remote STOP contact opens.
      3) Auxiliary contact that closes in REMOTE position.
   d. OPEN and CLOSED indicating lights.
   e. Integral reversing motor starter with built-in overload protection.
4. Limit Switch:
   a. Single-pole, double-throw (SPDT) type, field adjustable, with contacts rated for 5 amps at 120 volts ac.
   b. Each valve actuator to have a minimum of two auxiliary transfer contacts at end position, one for valve FULL OPEN and one for valve FULL CLOSED.
   c. Housed in actuator control enclosure.
5. Control Features: Electric motor actuators with features as noted above, and as modified/supplemented in Electric Actuated Valve Schedule.
6. Manufacturers and Products:
   a. Rotork Controls.
   b. Flowserve Limitorque.
   c. EIM.
   d. AUMA.

e. Or equal.

2.06 ACCESSORIES

A. Tagging: 1-1/2-inch diameter stainless steel tag attached with No. 16 solid brass or stainless steel jack chain for each valve operator, and valves 6-inch and larger.

B. Limit Switch:

1. Factory installed NEMA 4X limit switch by actuator manufacturer.

C. T-Handled Operating Wrench where shown on Drawings:

1. Each galvanized operating wrenches, 4 feet long.
2. Manufacturers and Products:
   a. Mueller; No. A-24610.
   b. Clow No.; F-2520.

D. Extension Bonnet for Valve Operator where shown on Drawings: Complete with enclosed stem, extension, support brackets, and accessories for valve and operator.

1. Manufacturers and Products:
   a. Pratt.
   b. DeZurik.

E. Floor Stand where shown on Drawings:

1. Nonrising, heavy pattern, indicating type.
2. Complete with solid extension stem, coupling, handwheel, stem guide brackets, and yoke attachment. Stem length as required to connect valve operating nut and floor stand.
3. Stem Guide: Space such that stem L/R ratio does not exceed 200.
4. Anchor Bolts: Type 304 stainless steel.
5. Manufacturers and Products:
   a. Clow; Figure F-5515.
   b. Mueller, Figure A-26426.

F. Floor Box where shown on Drawings:

1. Plain type, for support of nonrising type stem.
2. Complete with solid extension stem, operating nut, and stem guide brackets. Stem length as required to extend valve operating nut to within 3 inches of finish floor.
3. Stem Guide: Space such that stem L/R ratio does not exceed 200.

4. Anchor Bolts: Type 304 stainless steel.
5. Manufacturers and Products:
   a. Neenah Foundry; R 7506.
   b. Clow; No. F5690.

G. Chain Wheel and Guide where shown on Drawings:

1. Handwheel direct-mount type.
2. Complete with chain.
3. Galvanized or cadmium-plated.
4. Manufacturers and Products:
   a. Clow Corp.; Figure F-5680.
   b. Walworth Co.; Figure 804.
   c. DeZurik Corp.; Series W or LWG.

H. Cast-Iron Valve Box where shown on Drawings: Designed for traffic loads, sliding type, with minimum of 5-1/4-inch ID shaft.

1. Box: Cast iron with minimum depth of 9 inches.
2. Lid: Cast iron, minimum depth 3 inches locking type, marked WATER, or SEWER.
3. Extensions: Cast iron.
4. Two-piece box and lid for valves 4 inches through 12 inches, three-piece box and lid for valves larger than 12 inches with base sized for valve.
5. Valve extension stem for valves with operating nuts 3 feet or greater below finish grade.
6. Manufacturers and Products:
   a. East Jordan Iron Works; Cast-Iron Valve Boxes.
   b. Bingham & Taylor; Cast-Iron Valve Boxes.

I. Concrete Valve Box: Designed for traffic loads, sliding type, with minimum of 10-inch ID shaft.

1. Box: High-density, reinforced concrete, minimum depth 12 inches, cast-iron ring seat.
2. Lid: Cast iron, minimum depth 3 inches, marked WATER or SEWER.
3. Extensions: Concrete.
4. Manufacturers and Products:
   a. Christy Concrete Products; G Series.
   b. BES Concrete Products; G Series.

J. Indicator Post Assembly:

1. Cast or ductile iron post head, bell, and wrench with cast or ductile iron or steel barrel.

2. Plexiglas or equal protected window to indicate OPEN and CLOSED position.
3. Padlockable eye bolt for wrench.
4. Adjustable bury depth. Bury depth as required for valve installation.
5. UL Listed and FM Approved.
6. Manufacturers and Products:
   a. Clow; Style 2945.
   b. Mueller; A-20806.

PART 3 EXECUTION

3.01 INSTALLATION

A. Flange Ends:

1. Flanged valve bolt holes shall straddle vertical centerline of pipe.
2. Clean flanged faces, insert gasket and bolts, and tighten nuts progressively and uniformly.

B. Screwed Ends:

1. Clean threads by wire brushing or swabbing.
2. Apply joint compound.

C. PVC Valves: Install using solvents approved for valve service conditions.

D. Valve Installation and Orientation:

1. General:
   a. Install valves so handles operate from fully open to fully closed without encountering obstructions.
   b. Install valves in location for easy access for routine operation and maintenance.
   c. Install valves per manufacturer's recommendations.
2. Gate, Globe, and Ball Valves:
   a. Install operating stem vertical when valve is installed in horizontal runs of pipe having centerline elevations 4 feet 6 inches or less above finished floor, unless otherwise shown.
   b. Install operating stem horizontal in horizontal runs of pipe having centerline elevations greater than 4 feet 6 inches above finish floor, unless otherwise shown.
3. Eccentric Plug Valves:
   a. Unless otherwise restricted or shown on Drawings, install valve as follows:
      1) Liquids with suspended solids service with horizontal flow: Install valve with stem in horizontal position with plug up

when valve is open. Install valve with seat end upstream (flow to produce unseating pressure).

2) Liquids with suspended solids service with vertical flow: Install valve with seat in highest portion of valve (seat up).

3) Clean Liquids and Gas Service: Install valve with seat end downstream of higher pressure when valve is closed (higher pressure forces plug into seat).

4. Butterfly Valves:
   a. Unless otherwise restricted or shown on Drawings, install valve a minimum of 8 diameters downstream of a horizontal elbow or branch tee with shaft in horizontal position.
   b. For vertical elbow or branch tee immediately upstream of valve, install valve with shaft in vertical position.
   c. For horizontal elbow or branch tee immediately upstream of valve, install valve with shaft in horizontal position.
   d. When installed immediately downstream of swing check, install valve with shaft perpendicular to swing check shaft.
   e. For free inlet or discharge into basins and tanks, install valve with shaft in vertical position.
5. Check Valves:
   a. Install valve in accordance with manufacturer's instructions and provide required distance from immediate upstream fitting.
   b. Install valve in vertical flow (up) piping only for gas services.
   c. Install swing check valve with shaft in horizontal position.
   d. Install double disc swing check valve to be perpendicular to flow pattern when discs are open.
6. Solenoid Valves: Install in accordance with manufacturer's instructions.

E. Install line size ball valve and union upstream of each solenoid valve, in-line flow switch, or other in-line electrical device, excluding magnetic flowmeters, for isolation during maintenance.

F. Locate valve to provide accessibility for control and maintenance. Install access doors in finished walls and plaster ceilings for valve access.

G. Extension Stem for Operator: Where depth of valve operating nut is 3 feet or greater below finish grade, furnish operating extension stem with 2-inch operating nut to bring operating nut to a point within 6 inches of finish grade.

H. Torque Tube: Where operator for quarter-turn valve is located on floor stand, furnish extension stem torque tube of a type properly sized for maximum torque capacity of valve.

I. Floor Box and Stem: Steel extension stem length shall locate operating nut in floor box.

3.02 TESTS AND INSPECTION

A. Valve may be either tested while testing pipelines, or as a separate step.

B. Test that valves open and close smoothly under operating pressure conditions. Test that two-way valves open and close smoothly under operating pressure conditions from both directions.

C. Inspect air and vacuum valves as pipe is being filled to verify venting and seating is fully functional.

D. Count and record number of turns to open and close valve; account for discrepancies with manufacturer's data.

E. Set, verify, and record set pressures for relief and regulating valves.

F. Automatic valves to be tested in conjunction with control system testing. Set opening and closing speeds, limit switches, as required or recommended by Engineer.

G. Test hydrostatic relief valve seating; record leakage. Adjust and retest to maximum leakage of 0.1 gpm per foot of seat periphery.

3.03 MANUFACTURER'S SERVICES

A. All valves in this project require manufacturer's field services:

B. Manufacturer's Representative: Present at Site for minimum person-days listed below, travel time excluded:

1. Five person-days for installation assistance and inspection.
2. Three person-days for functional and performance testing and completion of Manufacturer's Certificate of Proper Installation.

END OF SECTION

SECTION 40 98 06
TRAINING

PART 1 - GENERAL

1.1 THE REQUIREMENT

A. The DDC (Direct Digital Control) vendor shall develop and implement a training program that will allow personnel to develop the skills and knowledge necessary to safely and efficiently operate and maintain the all systems of the DCS (Distributed Control System) and related ancillary items.

B. The DDC vendor shall furnish all tools, equipment, materials and supplies, and shall perform all functions and service required to complete the work as specified herein.

C. All training shall be a prerequisite to the Statement of Partial Completion of the Segment, CIP or project. Applicable training specific to any given process area shall be completed prior to cut-over and Beneficial Use of the equipment in that process area.

D. Training shall be provided in the operation and maintenance of equipment manufactured by the DDC vendor, by the manufacturer, and by the manufacturer of specific associated equipment items, other than DCS components. Each of the courses shall be taught by authorized representatives of each respective equipment manufacturer, at the DDC vendor approved staging site, City Operations facility, or other local facility as determined by the City's representative. Each manufacturer's representative shall be fully knowledgeable in the operations and maintenance of their equipment and shall be a full-time instructor under the employ of the respective manufacturer.

E. The DDC vendor shall prepare a complete Training Plan. The Training Plan shall be submitted in accordance with Section 01300, Submittals. The DCS Training Plan will provide the structure and syllabus for training sessions as follows:
   1. In accordance with Division 1, the DDC vendor shall submit a training plan which contains, as a minimum, course outlines and schedules for training to be provided. The training plan shall include:
      a. Course descriptions and syllabuses
      b. Schedule of training courses including dates, duration's, and locations of each class
      c. Resumes of the instructors who will actually implement the plan

2. Courses shall be scheduled in series so as to allow the same personnel to attend more than one training course.
3. The training shall be scheduled in accordance with Division 1.
4. Proposed training materials, including a detailed training agenda itemizing relative emphasis on various topics of each course and support materials shall be submitted to the City's representative in accordance with of Division 1 and Specification 01 33 00, Submittal Procedures.
5. City's representative shall review this outline and provide comments that shall be incorporated into the course.
6. Dedicated hardware and software shall be assigned for training purposes. The live system shall NOT be used for training purposes.
7. Training shall be developed so that home study is not required.
8. Training shall combine classroom and field hands-on training that is structured and scheduled to facilitate trainee comprehension on subject material.
9. The training shall be provided by qualified instructors of the equipment manufacturers or their representative, as approved by the City's representative based on technical and instructional qualifications.
10. Training shall be structured to develop comprehension of the process theory for each system, its component subsystems, and the interrelationship of the operating variables, the responses required for various types of abnormalities, safety precautions, procedures for safe start-up and shutdown, equipment maintenance overview and troubleshooting.
11. Following completion of the training, the DDC vendor shall provide the City's representative six (6) complete hardcopy sets, and one (1) soft copy, of training materials, such as lesson plan, student manual, and support materials for each course.
12. Training shall be provided using the equipment of the same model and family being supplied as part of this project.
13. Training shall be conducted so as not to impact normal plant operations, or the construction schedule.
14. No course shall be provided at the same time as another unless otherwise permitted by the City's representative.
15. All training shall be monitored and approved by the City's representative. Any session or portion thereof deemed unsatisfactory, based on evaluation of the training shall be repeated by the DDC vendor at no additional cost to the CITY.
16. Each course shall be for up to 8 people
17. Training shall utilize actual graphics for each individual plant Segment control services. The use of 'canned' or 'typical' training systems shall be limited to a minimum.

1.2 REFERENCES

1. Divisions 0 – General Conditions
2. Division 1 – General Requirements
3. Specification 01 33 00 – Submittal Procedures
4. Division 26 – Electrical
5. Division 40 – Process Integration

PART 2 – PRODUCTS

2.1 COURSE DESCRIPTIONS

A. Training courses shall be tailored to Operations and Maintenance staff who are already generally familiar with the COMNET DCS. The DDC vendor is responsible for developing several training courses. For each course, the DDC vendor is responsible for developing a curriculum and course materials. The DDC vendor may use its standard training material where applicable.

B. The DDC vendor shall submit a project specific training plan for City review, comment and approval prior to implementing the training.

PART 3 – EXECUTION

3.1 REQUIRED TRAINING:

A. Training is required to educate all system users and selected City representative members. The trainings will occur locally at the DDC vendor approved staging site, Wastewater Operations building or other City facility as directed by the City's representative. Any training aids and/or materials are the responsibility of the DDC vendor.

END OF SECTION

NC MORENA BLVD PUMP STATION AND PIPELINES

PACKAGE A

CONTRACTOR'S RESPONSIBILITIES

1. PURSUANT TO SECTION 4216 OF THE GOVERNMENT CODE, AT LEAST 2 WORKING DAYS PRIOR TO EXCAVATION, YOU MUST CONTACT THE REGIONAL NOTIFICATION CENTER (E.G. UNDERGROUND SERVICE ALERT OF SOUTHERN CALIFORNIA) AND OBTAIN AN INQUIRY IDENTIFICATION NUMBER.
2. NOTIFY SDG&E AT LEAST 10 WORKING DAYS PRIOR TO EXCAVATING WITHIN 10' OF SDG&E UNDERGROUND HIGH VOLTAGE TRANSMISSION POWER LINES. (I.E., 69 KV & HIGHER)
3. LOCATE AND RECONNECT ALL SEWER LATERALS. LOCATIONS AS SHOWN ON THE PLANS ARE APPROXIMATE ONLY. LATERAL RECORDS ARE AVAILABLE TO THE CONTRACTOR AT THE WATER DEPARTMENT, 2797 CAMINITO CHOLLAS. LOCATE THE IMPROVEMENTS THAT WILL BE AFFECTED BY LATERAL REPLACEMENTS.
4. EXCAVATE AROUND WATER METER BOX (CITY PROPERTY SIDE) TO DETERMINE IN ADVANCE, THE SIZE OF EACH SERVICE BEFORE TAPPING MAIN.
5. CITY FORCES, WHEN SPECIFIED OR SHOWN ON THE PLANS, WILL MAKE PERMANENT CUTS & PLUGS AND CONNECTIONS.
6. KEEP EXISTING MAINS IN SERVICE IN LIEU OF HIGH-LINING, UNLESS OTHERWISE SPECIFIED SHOWN ON PLANS.
7. THE LOCATIONS OF EXISTING BUILDINGS AS SHOWN ON THE PLAN ARE APPROXIMATE.
8. STORM DRAIN INLETS SHALL REMAIN FUNCTIONAL AT ALL TIMES DURING CONSTRUCTION.
9. UNLESS OTHERWISE NOTED AS PREVIOUSLY POTHOLED (PH), ELEVATIONS SHOWN ON THE PROFILE FOR EXISTING UTILITIES ARE BASED ON A SEARCH OF THE AVAILABLE RECORD INFORMATION ONLY AND ARE SOLELY FOR THE CONTRACTOR'S CONVENIENCE. THE CITY DOES NOT GUARANTEE THAT IT HAS REVIEWED ALL AVAILABLE DATA. THE CONTRACTOR SHALL POTHOLE ALL EXISTING UTILITIES EITHER SHOWN ON THE PLANS OR MARKED IN THE FIELD IN ACCORDANCE WITH THE SPECIFICATIONS SECTION 33-UTILITIES.
10. EXISTING UTILITY CROSSING AS SHOWN ON THE PLANS ARE APPROXIMATE AND ARE NOT REPRESENTATIVE OF ACTUAL LENGTH AND LOCATION OF CONFLICT AREAS. SEE PLAN VIEW.
11. CONTRACTOR SHALL ATTEND PRECONSTRUCTION MEETING AS REQUIRED BY THE MITIGATION MONITORING AND REPORTING PROGRAM PER THE ENVIRONMENTAL IMPACT REPORT.

WORK TO BE DONE

THE PROJECT CONSISTS OF THE DEMOLITION OF EXISTING FACILITIES AT THE PROPOSED MORENA PUMP STATION SITE, THE CONSTRUCTION OF A NEW 37.7 MGD MORENA WASTEWATER PUMP STATION FACILITY, INCLUDING ODOR CONTROL SYSTEMS, ELECTRICAL BUILDING, SCREENING FACILITY, HIGH PURITY OXYGEN SYSTEM, MAINTENANCE BUILDING, ASSOCIATED CIVIL SITE WORK INCLUDING STORM DRAINAGE, YARD PIPING, PERIMETER WALLS, ACCESS GATES, PAVEMENT, AND LANDSCAPING.

THE PROJECT ALSO INCLUDES THE CONSTRUCTION OF 48-INCH, 60-INCH & 66-INCH DIVERSION AND OVERFLOW SEWERS, THREE DIVERSION STRUCTURES WITH SLIDE GATES AND JUNCTION STRUCTURE NO. 1.

DECLARATION OF RESPONSIBLE CHARGE

* I HEREBY DECLARE THAT I AM THE ENGINEER OF WORK FOR THIS PROJECT THAT I HAVE EXERCISED RESPONSIBLE CHARGE OVER THE DESIGN OF THE PROJECT AS DEFINED IN SECTION 6703 OF THE BUSINESS AND PROFESSIONS CODE AND THAT THE DESIGN IS CONSISTENT WITH CURRENT STANDARDS. I UNDERSTAND THAT THE CHECK OF PROJECT DRAWINGS AND SPECIFICATIONS BY THE CITY OF SAN DIEGO IS CONFINED TO A REVIEW ONLY AND DOES NOT RELIEVE ME, AS ENGINEER OF WORK, OF MY RESPONSIBILITIES FOR PROJECT DESIGN.

ALAN SHAPIRO — 10/07/20 DATE

MONUMENTATION/SURVEY NOTES

THE CONTRACTOR SHALL BE RESPONSIBLE FOR SURVEY MONUMENTS AND/OR VERTICAL CONTROL BENCHMARKS WHICH ARE DISTURBED OR DESTROYED BY CONSTRUCTION. A LICENSED LAND SURVEYOR OR LICENSED CIVIL ENGINEER AUTHORIZED TO PRACTICE LAND SURVEYING IN THE STATE OF CALIFORNIA SHALL FIELD LOCATE, REFERENCE, AND/OR PRESERVE ALL HISTORICAL OR CONTROLLING MONUMENTS PRIOR TO ANY EARTHWORK, DEMOLITION OR SURFACE IMPROVEMENTS. IF DESTROYED, A LICENSED LAND SURVEYOR SHALL REPLACE SUCH MONUMENT(S) WITH APPROPRIATE MONUMENTS. WHEN SETTING SURVEY MONUMENTS USED FOR RE-ESTABLISHMENT OF THE DISTURBED CONTROLLING SURVEY MONUMENTS AS REQUIRED BY SECTIONS 6730.2 AND 8771 OF THE BUSINESS AND PROFESSIONS CODE OF THE STATE OF CALIFORNIA, A CORNER RECORD OR RECORD OF SURVEY, AS APPROPRIATE, SHALL BE FILED WITH THE COUNTY SURVEYOR. IF ANY VERTICAL CONTROL IS TO BE DISTURBED OR DESTROYED, THE CITY OF SAN DIEGO FIELD SURVEY SECTION SHALL BE NOTIFIED IN WRITING AT LEAST 7 DAYS PRIOR TO CONSTRUCTION. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE COST OF REPLACING AND VERTICAL CONTROL BENCHMARKS DESTROYED BY THE CONSTRUCTION.

FLATIRON

ATTACHMENT A – LETTER OF ASSENT

To be signed by all Contractors awarded work covered by the Project LaborAgreement prior to commencing work.

March 4, 2021

City of San Diego
525 B Street, Suite 750
San Diego, CA 92101

Attention: Lea Fields-Bernard

Re: City of San Diego Project Labor Agreement for Pure Water Program Phase I Project

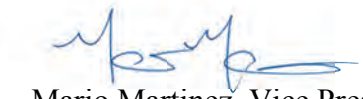
Dear Lea:

This is to confirm Flatiron West, Inc. agrees to be party to and bound by the City of San Diego Project Labor Agreement for Construction of Pure Water Program Phase I Projects, effective May 1, 2020, as such Agreement may from time to time be amended by the negotiating Parties or interpreted pursuant to its terms. Such obligation to be a Party and bound by this Agreement shall extend to all work covered by the Agreement undertaken by this Company on the Project pursuant to City Contract No.K-21-1801-DBB-3-A, Morena Pump Station, and this Company shall require all of its subcontractors of whatever tier to be similarly bound for all work within the scope of the Agreement by signing and furnishing to you an identical Letter of Assent prior to their commencement of work.

Sincerely,

Flatiron West, Inc.

By:



Mario Martinez, Vice President

[Copies of this Letter must be submitted to the Project Labor Coordinator and to the Councilconsistent with Article 3, Section 3.3(b)]
