

Appendix H

Proposed Plan Adjustments

Model Adjustment was conducted using the following steps for corridors adjustment. Corridor adjustment calculations are provided below.

Model Adjustment Steps:

1. Identify key segment where the Base Year 2012 counts are within +/- 10% of the model projected volume. These locations are considered to be key locations and no adjustment is needed.
2. Calculate the change in Base Year 2012 volume between the key location and adjacent location.
3. Add or subtract the change calculated in Step 2 to the key location in Step 1 to arrive at the adjusted model volume.
4. Subtract adjusted model volume from unadjusted model volume to arrive at the adjustment factor. This factor is referred to as "adj" in the tables below.
5. Repeat the process above for all segments.
6. Review trendline to ensure that adjusted model volume follows the same trend as the Base Year 2012 counts.
7. Consider additional adjustment as needed, depending on results in Step 6.
8. Extract adjustment ADT (calculated from Step 4) and apply them to all future scenarios.
9. Repeat Step 1 to 8 for all corridors that need adjustment.
