Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Amount (Lbs): 12213

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Amount (Lbs): 21110

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Amount (Lbs): 18000

Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Potential Contaminants of Concern: Benzene, Gasoline
Site History: Two underground storage tanks (USTs) and associated piping at the BNSF Railyard, an automotive distribution facility in San Diego, California, were removed on February 15, 1991. The single-walled tanks were located within a walled enclosure in the northeastern

corner of the railyard. Both tanks apparently had been installed prior to 1960, when the property was under previous ownership. Analytical results for the soil samples collected during the removal inspection indicated a maximum petroleum hydrocarbon concentration of 7,900 milligrams per kilogram (mg/kg). DEH Case #H00076-002 was opened on February 15, 1991. A third UST was discovered east of a newly-expanded main office (Administration Building) and removed under #H00076-002 on September 1, 1993. Three abandoned, sand-filled, USTs were discovered approximately 40 feet north of the BNSF Yard Office at 1342 Crosby Street (now Cesar Chavez Parkway) in early 1993 during excavation of petroleum hydrocarbon-impacted soil. Soil impacts by releases from the tanks were initially addressed under DEH Case #H00076-003. However, #H00076-003 was administratively closed on June 20, 2008, and investigation continued under #H00076-002. Initial investigation of soil and groundwater beneath the walled enclosure in the northeastern corner of the site was performed from 1989 to 1990. The investigation included the drilling and sampling of seven borings and the installation of three groundwater monitoring wells. Free product was observed in one monitoring well and dissolved gasoline impacts were reported for each well sample. During expansion of the main office building in May and June 1993, a total of 1,200 cubic yards of impacted soil was removed. Excavation proceeded from the ground surface to the water table at a depth of 15 to 17 feet. Excavation of impacted soil was subsequently performed within the walled enclosure that had housed two former USTs. The soil removal occurred in July 1998 following the demolition of above-ground fuel storage tank foundations located west of the walled enclosure in the northeast portion of the site. Approximately 698 tons of diesel-impacted soil were removed to a depth of three feet below ground surface (bgs). The impacted soil was reused at an off-site location in the County. The consultant (TRC) calculated the volume of gasoline and diesel-impacted soil remaining in place at the site to be 92,000 cubic yards. The original network of three groundwater monitoring wells at the site was expanded in May 1991 (4), July 1992 (4), June 2005 (4), June 2007 (4), and in June 2009 (2). A monitoring well installed for a prior onsite investigation was added as a down-gradient well to the network in 2007. Quarterly groundwater monitoring and sampling of site wells was performed from 1992 to mid-1996. A semi-annual monitoring and sampling schedule was maintained from mid-1996 through February 2011. Free product was detected periodically as a sheen or as a measureable thickness in 11 of the 22 site monitoring wells since 1991. Dissolved gasoline and its constituents [primarily benzene, toluene, ethylbenzene, and xylenes (BTEX)] were detected in the groundwater samples collected from wells located both up-gradient and down-gradient of the former UST areas. Chlorinated hydrocarbons, including 1,1-dichloroethene, tetrachloroethene, trichloroethene, and vinyl chloride, have been periodically detected at concentrations exceeding their respective Maximum Contaminant Levels (MCLs) in groundwater samples collected from wells in the northeastern portion of the site. Groundwater grab samples were collected from two direct-push borings advanced up-gradient of the northeastern corner of the site in June 2007. Analysis of the samples confirmed that dissolved-phase BTEX and vinyl chloride were present in groundwater. TRC interpreted the results as indicating that up-gradient, off-site sources contributed to the dissolved contaminant plume known to have originated at the railyard. The highest concentrations of dissolved-phase constituents

down-gradient of the former BNSF USTs were detected in wells located adjacent to pipelines underlying the railyard, suggesting that additional, onsite sources were also contributing to the plume. Two, non-BNSF, off-site wells east and up-gradient of the railyard property were also sampled to facilitate delineation of the dissolved plume. Following receipt of groundwater analytical results for the January 2014 sampling round, TRC prepared trend analyses for dissolved benzene that indicated decreasing trends at the plume boundaries and stable trends in the plume interior. TRC estimated the time for benzene concentrations to fall below its MCL (1 microgram per liter) as 4 to 14 years. A passive skimmer system that had been installed at the site to recover free product beneath the site was replaced in August 1998 with a total fluids extraction and remediation system through the second half of 2000. Hand bailing and a passive skimmer were subsequently used to recover product. Oil absorbent socks were later installed in seven monitoring wells. The total volume of product removed by these efforts was approximately 805 gallons. Since the end of 2008, free product has not been detected in nine of the 11 monitoring wells in which it historically occurred. Free product was measured in one monitoring well during the final groundwater monitoring round in January 2014. A Corrective Action Plan (CAP) was received by DEH on April 1, 2011, and conditionally approved on April 21 2011. However, final approval of the CAP was deferred pending assessment of human health risk to employees occupying two onsite buildings (i.e., the Administration Building and Yard Office). The buildings overlie groundwater impacted by BTEX and chlorinated hydrocarbons. A soil gas survey was performed around the Administration Building and Yard Office in February 2009. Analysis of soil gas samples collected from seven locations indicated that BTEX and chlorinated hydrocarbons were detected in the vadose zone around the building peripheries. Analytical results for indoor air samples indicated that air quality within the buildings was similar to that for ambient air samples collected outdoors and upwind of the buildings and at several off-site locations. Although human health risks calculated from the analytical data were in the range of 1×10^{-6} , TRC concluded that both onsite and off-site ambient air conditions were attributable to industrial and commercial facilities in the area rather than to intrusion of subsurface soil gas. Based on the nature of ambient air conditions at the site and its vicinity, decreasing or stable benzene concentrations in groundwater, and the removal of petroleum hydrocarbon-impacted soil at the BNSF railyard, DEH issued final concurrence for the CAPs recommendation of remediation by natural attenuation on July 18, 2014. TRC has recommended no further action and case closure. DEH concurs with these recommendations.

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

 Potential Contaminants of Concern: Lead, Diesel, Gasoline, Total Petroleum Hydrocarbons (TPH), Waste Oil / Motor / Hydraulic / Lubricating

 Site History: The City of San Diego encountered groundwater contaminated with petroleum hydrocarbons during the course of constructing a sewer pipeline at this location. The City obtained historical Sanborn Maps and historic photographs that identified Shell Oil, The Texas Company, General Petroleum, and Mobil Oil as lessees on the BNSF property at Crosby Road and Harbor Drive. The evidence found demonstrates that Shell, Texaco, and Mobil operated fuel tank farms on BNSF's property (corner of Crosby Road and Harbor Drive) from the mid 1920's through the 1970's.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.

Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or those who must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

- Waste code: D001
- Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

- Waste code: D001
- Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Local Case Number: H15784-001
Potential Media Affect: Other Groundwater (uses other than drinking water), Soil
Potential Contaminants of Concern: Gasoline
Site History: A subsurface investigation was conducted at the site for a real estate transaction, since the property was reported to be occupied by a gasoline service station from the early 1920s to the early 1960s. The investigation included the drilling of 8 shallow borings on March 29, 2010, and five deeper borings on September 7, 2010. The laboratory analytical results indicated that soil had been impacted by total petroleum hydrocarbons (TPH) in both the gasoline and diesel ranges. When the results of the investigation were submitted to the Department of Environmental Health (DEH), an unauthorized release, H15784-001 was opened. Additional site assessment activities were conducted to define the extent of soil contamination and evaluate groundwater conditions at the site. Two additional soil borings were drilled in February 2012, and one groundwater monitoring well was installed. The site vicinity is underlain by the Pleistocene Bay Point Formation, characterized by both marine and non-marine near shore deposits. Based on the investigations, the subsurface soil encountered at the site consisted of silty-sand from the ground surface to approximately 25 feet below ground surface (bgs), underlain by silts and/or clayey-silts to approximately 60 feet bgs. Lenses of poorly graded sand between 10 and 50 feet bgs were encountered at some of the boring locations. The hydrocarbon impacted soil is located between 12 feet bgs and 30 feet bgs at three separate locations on the north portion of the site near National Avenue. The location of the former tanks and dispensers is unknown. The consultant has estimated there is total of approximately 66 cubic yards of impacted soil greater than 100 mg/kg TPH remaining at the site. The depth of groundwater at the time of the first sampling event on February 27, 2012 was at 48.15 feet bgs. Groundwater at this site is located within a groundwater basin that has been designated as exempt or having no potential or existing groundwater use. The groundwater flow direction could not be measured, since only one groundwater monitoring was installed. Based on a review of hydrogeologic data from neighboring sites, the groundwater is estimated to flow to the southwest towards San Diego Bay. Results of the groundwater laboratory analytical results showed low concentrations of TPH gasoline, benzene and xylenes. A second groundwater sampling event was conducted on July 11, 2012, and all of the sample analytical results were nondetect. The consultant has recommended no further action based on the low concentrations of contaminants of concern remaining on site. The groundwater investigation has shown there are little or no impacts to groundwater. The building structure existing on site is not located above the soil contamination. This site meets the criteria of a low risk groundwater site. DEH concurs with the consultants recommendation.

Site History: Administrative Closure granted based on request from RP - No excavation work completed, Request is below: Family Health Centers of San Diego plans to obtain a Coastal Development Permit from the City of San Diego for this project. It has been our recent experience that City of San Diego Development Services Department cannot receive the anticipated California Environmental Quality Act (CEQA) exemption approval and maintain critical funding deadlines with an open Voluntary Assistance Program (VAP) case for the property; therefore, it is necessary to close the subject (VAP) case. Family Health Centers of San Diego is requesting withdrawal from the VAP and administrative case closure. Note that a requirement of the anticipated CEQA exemption approval is that the subject VAP case has a closed status on the GeoTracker website.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Site History: Evidence of a hazardous substance release was reported to the County of San Diego, Department of Environmental Health (DEH), Site Assessment and Mitigation Program (SAM). DEH referred this case to the Water Board for follow up. The property owner is the Port of San Diego. The suspected source is a pipeline and the amount released is unknown. The Port prepared a report summarizing the existing data for the site. The Port conducted a soil and groundwater investigation in spring 2017 to assess site conditions and verify that residual contamination does not pose a risk to human health or the environment. The results of the investigation indicated that the site does not pose a risk. Remaining constituents are present at very low concentrations and are present beneath the paved parking lot at depths at least 5 feet bgs. The case has been closed under the State's Low-Threat Underground Storage Tank Case Closure Policy.

Case Worker: TS
RB Case Number: 9UT3532
Local Agency: SAN DIEGO COUNTY LOP
File Location: Local Agency
Local Case Number: H01530-003
Potential Media Affect: Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern: Gasoline
Site History: This case was originally opened after gasoline hydrocarbons were detected in soil samples collected during the removal of two underground storage tanks (UST) in August 1997. In 1998, the case was expanded to include an earlier release case H01530-002 from a UST that was removed in October of 1989, and case H01530-002 was administratively closed. A monitoring well (MW1) was installed in the former tank pit in 2002. Less than one-tenth of a foot of free product has been intermittently detected in this well since it was installed, and subsequently removed by bailing. Three additional wells were installed in 2008 and several soil borings have been drilled at the site. Free product has not been detected in any other wells. The soil borings indicated that the free product is limited in extent. The depth to groundwater is approximately 44 feet below ground surface. The concentrations of dissolved phase gasoline constituents outside of the tank pit area have generally been below the maximum contaminant levels with the exception of benzene. In March 2009, benzene was detected in groundwater at 1.05 ug/l in well MW3. The groundwater is designated as non-beneficial use. The nearest surface water body is San Diego Bay, which is greater than 4000 feet away from the site. A Corrective Action Plan was prepared for the site in which the consultant proposed natural attenuation for remediation of the free product. The consultant estimated that 1,667 cubic yards of contaminated soil are present at the site to a depth of approximately 50 feet below ground surface, covering a surface area of approximately 900 square feet. The consultant stated that the contaminated soil does not pose a threat to utilities that are buried at shallow depths (less than 20 feet). A soil vapor survey was conducted that indicated that the soil did not pose an excess cancer risk for vapor intrusion onsite or to neighboring residential properties. The consultant concluded that the free product was limited in extent, had been removed to the extent practical, and did not pose a threat to either human health, safety or the environment. The consultant requested no further action for the site and DEH concurred.

Potential Contaminants of Concern: Lead, Diesel, Gasoline, Waste Oil / Motor / Hydraulic / Lubricating
Site History: Voluntary Assistance Program (VAP) case #H01530-004 was opened for regulatory oversight of the redevelopment of a former school maintenance facility with known contamination. COMM22 LLC plans to redevelop the site in four phases, including Phase 1- Family Housing, Phase 2- Senior Housing, Phase 3- Residential Lofts, and Phase 4- For-Sale Housing. A Property Mitigation Plan (PMP) was approved by DEH in 2008 which details the proposed mitigation and soil management plans for redevelopment. In 2013, a PMP Addendum proposing that separate property closure reports be submitted for each of the four phases of development was approved by DEH. In April 2015, DEH approved a change in scope of this case (H01530-004) to include only the Phase 1 and Phase 2 areas in order to facilitate their closure following mitigation. The timeframes for mitigation and development of the Phase 3 and Phase 4 areas have not been determined. The Responsible Party agreed to open new VAP cases for these two areas in the future. In 2014, DEH approved the modification of the cleanup standard in the approved PMP for total lead in the landscaped areas to the revised 2009 residential California Human Health Screening Level (CHHSL) of 80 milligrams per kilogram (mg/kg). The commercial use CHHSL for total lead in soil was also revised in 2009 to 150 mg/kg. The site mitigation criteria for total petroleum hydrocarbons (TPH) in soil are 0.5 mg/kg for TPH as gasoline, 10 mg/kg for TPH as diesel, and 50 mg/kg for TPH as oil (typical laboratory reporting limits). Phase 1: COMM22 Family Housing Site: The Family Housing Site was redeveloped into a mixed-use complex with multi-story retail and family housing over two levels of underground parking. Concentrations of the constituents of concern or COCs (primarily lead and TPH) were elevated in soil samples collected across the Site. The 2015 Property Closure Report for the Family Housing Site states that COC-impacted soil was mitigated by excavation and appropriate off-site disposal. Approximately 17,408 tons (11,213 cubic yards) of impacted soil was transported off site as non-hazardous waste or California hazardous waste to appropriate regulated disposal facilities. In addition, approximately 41,812 cubic yards of inert soil was exported for off-site reuse pursuant to the requirements of the San Diego Regional Water Quality Control Boards (RWQCB) Resolution No. R9-2007-0104, Conditional Waiver No. 8, Attachment A. Groundwater beneath the Site has no designated beneficial uses, and was not encountered during site mitigation and building construction. Groundwater and free product impact from an unauthorized petroleum release case was investigated under case #H01530-003, which was closed in July 2011.

In July 2013, soil vapor samples were collected beneath the future parking garage. A human-health risk assessment was conducted, and based on a calculated excess cancer risk below 1.00 E-06 (one-in-one-million) and a non-cancer hazard index of less than 1.0, the consultant concluded that there were no significant human-health risks from vapors. Confirmation soil samples were collected at the final subgrade elevation within a grid pattern. Lead concentrations did not exceed the worker exposure criterion of 150 mg/kg. However, elevated lead concentrations were reported in soil samples collected outside the limits of the construction excavation envelope (CEE). Soil with elevated lead concentrations along the sidewalls of the excavation was excavated to a depth of approximately three feet, and backfilled with inert soil. In addition, soil with lead concentrations above the RWQCBs Tier 1 screening levels of 15 mg/kg but below 150 mg/kg was reused in portions of the Site below hardscaped areas. According to the Property Closure Report for the Family Housing Site, all petroleum-impacted soil encountered in the CEE was exported off-site, and the top three feet of soil in all landscaped or exposed areas on the Site contain lead concentrations which are below the residential mitigation criteria of 80 mg/kg. In addition, clean imported fill was placed in the top one foot of all landscaped areas. Phase 2: COMM 22 Senior Housing Site The Senior Housing Site was redeveloped into a mixed-use complex with multi-story childcare and senior housing over one level of underground parking. Concentrations of the constituents of concern or COCs (primarily lead and TPH) were elevated in soil samples collected across the Site. The 2015 Property Closure Report for the Site states that COC-impacted soil was mitigated by excavation and appropriate off-site disposal. Approximately 912.38 tons (588 cubic yards) of impacted soil was transported off site as non-hazardous waste or California hazardous waste to appropriate regulated disposal facilities. In addition, approximately 6,622 cubic yards of inert soil was exported for off-site reuse pursuant to the requirements of the RWQCBs Resolution No. R9-2007-0104, Conditional Waiver No. 8, Attachment A. A soil vapor survey was conducted at the Site in 2006. No volatile organic compounds were detected in the vapor samples. Confirmation soil samples were collected at the final subgrade elevation within a grid pattern to assess whether the COC-impacted soil exceeded the mitigation criteria. One confirmation soil sample exceeded the residential criterion for total lead of 80 mg/kg, so three additional soil samples were collected in the same grid. Since the reported total lead concentrations in the three samples were below 80 mg/kg, the consultant concluded that further excavation of that grid area was not warranted. Elevated lead concentrations were also reported in excavation sidewall samples extending outside of the limits of the construction area. This soil was left in place because the soil is covered, is located at a depth greater than three feet, and/or contains lead concentrations below the worker exposure criteria of 150 mg/kg. In addition, the consultant states that soil with lead concentrations above the RWQCBs Tier 1 screening levels of 15 mg/kg but below 150 mg/kg was reused on site and incorporated into the cut and re-compaction zone of soil below the parking garage and building floor. The consultant concludes that the known and suspected releases of hazardous substances at the Family Housing Site and the Senior Housing Site have been assessed and mitigated; the remaining lead-impacted soil at the Site is located in areas which will prevent the general public and the future users of the Site from coming into

contact with the COCs; there are no complete exposure pathways; and, subsurface conditions at the Site do not pose a risk to human health and groundwater resources at the Site. The consultant requests DEH concurrence with the assessment, mitigation, and confirmation sampling activities, and recommends no further action for the case. DEH concurs with closure of VAP Case #H01530-004, with no further action required at the COMM22 Family Housing and Senior Housing Sites. Future Phase 3 and Phase 4 mitigation and redevelopment will be handled under a separate DEH case number.

 Site History: Voluntary Assistance Program (VAP) Case #DEH2016-LSAM-000357 was opened for regulatory oversight of the investigation and mitigation of the property for residential use. This site (Site) represents Phase 4 of a larger four-phase development. The first and second phases were completed under DEH case #H01530-004, and the no further action closure letter was issued on May 14, 2015. The third phase of work has not been scheduled at this time. Development plans for Phase 4 include the construction of slab-on-grade, for-sale, multi-family residential units. No below-grade parking is proposed; however, an underground stormwater storage and infiltration (SSI) system will be installed on the property in two separate areas of the Site. As described below, the Site has been mitigated to allow the proposed construction of housing and the SSI system within a buffer zone of clean soil. DEH understands that the new property owner/developer will enter the VAP for regulatory oversight of soil management activities if excavation of deeper utility trenches (i.e., sewer) is required beneath the clean buffer zone. Subsurface investigations were conducted across all four phases of the planned development in 2006, 2008, and 2012. The identified constituents of concern (COCs) were metals and petroleum hydrocarbons, with lead being the primary CoC. To more fully assess the lateral and vertical extent of elevated concentrations of lead beneath the Site, soil samples were collected from thirteen locations in February 2016. Mitigation activities included the excavation of the top three feet of soil across the Site, along with excavation in two deeper areas of the Site to accommodate the SSI system. One area was also excavated to ensure that the petroleum hydrocarbon-impacted soil was removed. Confirmation soil samples were collected after the excavations were complete to document the residual lead and petroleum hydrocarbon concentrations. Twenty-four samples were collected at the final subgrade elevation in a grid pattern, seven samples were collected from the two SSI system excavations, and six samples were collected from the petroleum hydrocarbons excavation. Subsequently, clean fill was imported to create a 3-feet to 5-feet deep buffer across the site

for future residents and construction workers. In the two SSI system excavations, clean soil buffer areas, approximately 2.5 feet thick on all sides and 2 feet deep, were also constructed. The Property Closure Report for the Site, dated January 20, 2017, documented that excavated soil was handled in accordance with the 2008 property mitigation plan (PMP) for the entire project and with the Phase 4-specific PMP Addendum Number 2, dated April 13, 2016. Approximately 720 cubic yards of excavated inert (clean) soil was segregated and exported offsite for reuse under the requirements of the San Diego Regional Water Quality Control Boards Resolution No. R9-2007-0104 Conditional Waiver No. 8, Attachment A. Between October 10, 2016 and November 1, 2016, approximately 3,730.54 tons of COC-impacted soil were transported off-site under manifest to licensed disposal facilities as follows: 432.35 tons of lead-impacted soil was transported as non-RCRA, California Hazardous Waste to the Copper Mountain Landfill in Wellton, Arizona. 3,200.29 tons of lead-impacted soil was transported as non-hazardous waste to the Otay Landfill in Chula Vista, CA. 97.90 tons of petroleum hydrocarbon-impacted soil was transported as non-hazardous waste to the Otay Landfill in Chula Vista, CA. The consultant concludes that there are no complete exposure pathways from residual CoCs to receptors at the Site because all of the impacted soil has either been removed or is located at acceptable depths to minimize the potential contact to future users. In addition, the consultant concludes that subsurface conditions at the Site do not pose a risk to human health for future users or to waterresources, and recommends no further action at the site for the proposed residential use of the property. As noted above, if deeper excavation into COC-impacted areas is required for future installation of underground systems or utilities at the Site, the property owner must enter the VAP for regulatory oversight of contaminated soil management.

Citation: 2014-0057-DWQ - Industrial General Permit
Violation Description: SW - Deficient BMP Implementation
Violation Notes: I identified a discharge of liquid (CRV container recycling wastewater) from the sink area adjacent to the CRV recycling area. The discharge exits the site at the Commercial Street entrance/exit. There is also evidence of discharges of recycling CRV container liquids to the street at the entrance on Cesar E Chavez Pkwy. I identified uncovered buckets of various liquids in the covered materials storage area. Liquid materials and wastes stored on the ground without lids and without secondary containment. There is an open hole in the concrete floor in the covered materials storage area that receives a discharge of liquid via a hose. I was unable to determine where this open drain or sump discharges to, or, if it is a self-contained vault.

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

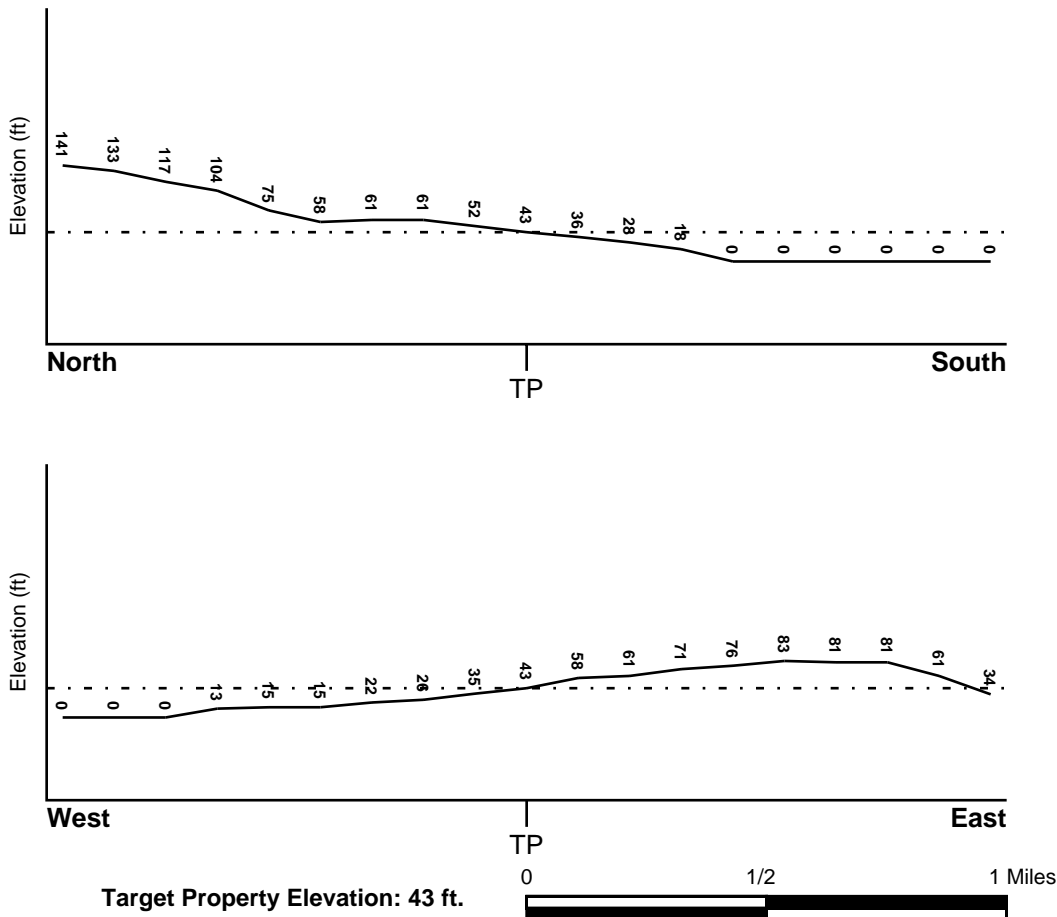

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Ms. Medzhibovsky co-researched a new method of determining soil bulk density for soils with loose consistency using dental plaster to serve as a proxy for soil volume. Results of her research indicated that soil bulk density results did not differ significantly from traditional methods of determining soil bulk density. The Plaster Cast Method introduced a simple approach to determining the volume of soils that, by nature of their loose consistency, were difficult to measure.
